captivity there. An adult badger will lift flagstones too heavy for a man to shoulder, and though little Blairo was so small and seemed to have no idea of escaping, it was decided not to take the risk of his tearing a way out of the kennels. The coal cellar, to be sure, would hold him, but he would probably burrow down among the coal and hide himself. They were, indeed, rather at a loss as to where to keep the young badger now that they had acquired possession of him, till some one thought of the courtyard. That was paved with flags four or five feet square, and from every side of it the dungeon-like walls of the Castle rose to the eaves. A bear could not have escaped from that courtyard, so a box of straw was placed in one corner for warmth and shelter, and there Blairo was quartered for the night.

Dawn showed that he had not been idle, for he had scratched the moss from the walls all the way round, and worn a distinct footpath on the green and seldom-trodden flags. Also, he had attacked a fern rockery in one corner. The rockery was centuries old; so were the ferns it contained—or, rather, had contained. The stones and the earth were littered broadcast, as were the shells of scores of snails. No, Blairo had not been idle during the night, and small wonder that he did not want his breakfast!

At first the little badger regarded himself as most blessed when the children left him alone. He did not want to wear a dog-collar and to be taken out for walks, so he would not stir from his box when they called to him, but merely curled himself the tighter in his characteristic attitude, sucking one fore-paw. Soon, however, he learnt to listen and to wait for them, and when the massive door of the yard creaked open on its rusty hinges, he would jog over and stand with his fore-paws on his master's or his mistress's knees for his collar to be buckled. Then, through the house he was taken—sometimes to the breakfast-room, where delicious scraps of bacon fat and such like delicacies were forthcoming. He was a comical little fellow, with his broad back, his little bowed fore-legs, and his stump of a tail, and his ways were winning and amusing in the extreme. If made to do anything he did not want to do he would sit down hard and refuse to budge. Next, when further pressure was applied, he would try to stand on his head, turning somersault after somersault; after which he would tackle the undesirable task with such vim that he usually upset the calculations of every one.

The children's parents became very fond of the little creature, and ere long it was customary for Blairo always to be present at breakfast-time. He would eat practically anything given him, but best of all he loved marmalade—preferably marmalade with a wasp in it; and thanks to his natural trick of turning somersaults, Blairo was easily taught to perform this feat as a request for food. On some dainty being held just out of his reach, he would sit up and gaze at it. Strangely enough this attitude had the effect of making him giddy, and slowly, quite unconsciously, he would topple over backwards in the most laughable manner, evincing much surprise as he met the floor full length. Then, becoming impatient, and a little annoyed because every one had laughed at him, he would turn several somersaults 'out of spite.' This always resulted in the food at once being given him, so that in due course he learnt to cut out the preliminaries, and to come straight away to the somersaulting. And when there was an extra delicious aroma Blairo was one continuous somersault.

These strange antics this quaint little beast more than once performed before royal spectators, and all who saw him loved him for his quiet good-nature, and for his slow, droll ways.

At one time both the children were laid up with some childish ailment, and it was during this period that, for the first time in his life, Blairo was heard to give tongue. During the greater part of one morning he sat in the centre of the cold courtyard, miserable and immobile, and howled like a dog. Having thus expressed his opinion, he retired to the innermost corner of his box, and refused to leave it. That evening the courtyard door was found ajar, and the badger was gone. The whole household turned out to look for him. The cook looked in her cupboards and behind her pastry boards; the scullery maid sought behind the buckets and inside the wash-tubs; the butler traversed the length of the drive, beating every rhododendron bush, to spread the news to the lodge and thence to the village; the stable boys organised a hunt on their own, which rapidly deteriorated into a rat hunt. But Blairo could not be found, and at sundown the lady of the house went quietly to the children's room to break the sad news.

Suppressed giggles greeted her, and anxious though the little people might have been to keep their secret, the novelty of the situation made secrecy impossible. So little Blairo was finally discovered cuddled down in the warmth at the feet of one of his playmates, and on being forcibly removed he somersaulted all the way back to the courtyard.

III.

But, great as were the times that Blairo had indoors, he enjoyed himself even more when afield with his playmates, for there he had

another playmate—Turk, a little wire-haired terrier of his own size. Turk was only a puppy, and he had never resented the badger, as the other dogs resented him till they became used to his presence. Even then they tolerated him with superior disdain, but from the first Turk threw himself whole-heartedly into the little badger's friendship. From Turk Blairo learnt to wag his tail—or rather to wag his whole stubby little body, since there was really not enough tail to wag; and from Turk he learnt to be a little demonstrative—to offer a lick of greeting and to look a little pleased. Otherwise he was just a solid little stoic, while Turk was excitable, volatile, and an optimist of the first water. Always the two accompanied the children, and great were the games they had. One of the youngsters would turn up a stone and cry, 'Beetles, Blairo! beetles!' while simultaneously the other would tear open the crown of an ant's nest and shout, 'Ants, Blairo! ants!' And the little badger, unable to judge distance accurately, would amble towards one, then back towards the other, undecided which way to go, while the terrier charged up and down, colliding with him, rolling him over, till finally Blairo sat down in solid disgust, and would have nothing more to do with any of them.

As the nights became colder it was decided that Turk should share Blairo's bed for warmth, and so this strange friendship between dog and badger grew in strength, until truly they were inseparable. Certainly they quarrelled at times, and Blairo bit Turk rather severely once or twice, while he himself carried more than one scar on his tender nose. Yet that winter they were the closest chums, sleeping, eating, and living side by side, and spring found Blairo a big powerful beast, though as peace-loving and as quiet as ever.

Still the possibility of his biting the children had to be considered, for, tame though he was, he sprang from wild ancestry, and there is no telling with such pets when the veneer of civilisation may fall aside and the wild beast rise again. The bite of a badger is no slight matter. It might result in a crippled hand if nothing worse; but so attached were the children to their pet, so faithfully did Blairo keep the peace, that the inevitable separation presented a problem. It would be unfair to turn Blairo out in the wild, for, regarding man as a friend, he would certainly suffer a rude and remorseless awakening; moreover, his food had always been found for him, and he would probably be unable to fend for himself. So a half measure was decided upon. The box was placed on the lawn, and for a long time the badger and his canine chum regarded it as their special home.

With free run of the estate, Blairo's wild instincts were slowly waking. He took to wandering a little farther and yet a little

farther afield, but always accompanied by Turk. The keeper at first held strong objections to a creature 'with fangs like those' being given free run of his sanctuary of sanctuaries; he held that even if the two did not destroy his birds they disturbed them, and that, at any rate, some night the dog and the badger would run amock on the sheep pastures. But none of his fears came true, albeit many a night the excited 'yap-yap' of Turk was heard as he accompanied his plantigrade friend.

The amusements of the two were simple ones. Every night they made their way to the rookery, where Blairo would amble about, looking for dead rooks, while Turk hunted mice or yapped hysterically at the frogs and toads started in his rambles. Once or twice they found a rabbit fast in one of Pat's snares, while Blairo enlarged most of the rabbit holes, and, accompanied by Turk, crept in and out of them for hours. Certainly they did not feed themselves, nor would their hunting ever be sufficiently serious for that, so long as there was food enough at the Castle.

IV.

One night they fell in with a gipsy man whose name was Vap. What he was doing in the Wilderness we had better not inquire, but, having a 'strange way' with him, he won their hearts, and an hour or so later Blairo was safely boxed up in a three-ply tea-chest, while Turk, since he refused to leave his friend and bade fair to give the show away, was contentedly sleeping on a sheep-skin inside the caravan. And at daybreak the caravan creaked off in its year-long voyagings, and disappeared down the hard white road along which Blairo, with a string to his hind-leg, had first journeyed into the world of men.

No hue and cry was raised this time. Many times before Blairo had been absent from home two or three days, choosing to sleep in one of his rabbit burrows, though certainly it was strange that Turk also had disappeared. High and low the children searched about all their accustomed playgrounds, but when dusk came they returned heavy-hearted, for their pets were gone. Thereafter the question of their whereabouts was dismissed with the query 'I wonder?' and no one seemed to regard it as within the range of human possibility to fathom this mystery of the wild.

Twenty miles from home Turk was turned out with the order, 'Go home with ye, dorg!' He was chased with a whip and pelted, but he knew very well that Blairo was in the box on the top of the caravan, and he refused to go home. So, perforce, he became part of the outfit, but whereas, hitherto, he had been a white terrier, he mysteriously acquired a black fore-leg and one black ear, which entirely changed his appearance and his expression. Perhaps

this was why the mother of the tinker clan took to calling him 'Twink'!

He was a sagacious little dog, quick as a weasel, and now, truly, a new phase of life opened for him. He learned the trick of seeing without being seen. He learned to regard every man as a foe unless he knew him to be a friend. Sometimes alone, sometimes accompanied by a lurcher, he ranged wide over moorland or covert while the line of creaking caravans followed the white highway. No one ever saw 'Twink'; only the tinkers knew that he was there. And on the shafts at Vap's side was a greyhound, swift as an antelope, watching lynx-eyed, though often she appeared to be drowsing. And she, too, knew that 'Twink' was there on the windward side, and that if he found anything he would see to it that it fled across the road, whereupon the greyhound would leave her perch in one lightning bound.

There were nights, too, of wild thrill and deadly peril—nights when 'Twink' was sometimes called to lie low in mortal fear of the man with the gun, and watching there among the leaves, he would sneak back like a coyote, making his way to the road by circuitous routes, there, with his nose to the ground, to follow up the line of the caravans. So Turk or Twink, as you choose, a gipsy and a poacher by instinct, became a gipsy's and a poacher's dog, and all this wisdom came to him because, early in his career, Vap saw to it that he came to associate the appearance of a stranger with a gun with the stinging blow of a charge of shot. In short, one of Vap's camp mates, disguised in tweeds, fired at him in order to teach him the first lesson which the poacher's dog must know.

V.

As for poor little Blairo all this time—his life was in a very different setting, though on the whole he did not fare so badly. The gipsies had enough respect for him to keep his quarters clean, and so he never endured the outstanding misery of so many captive badgers. Luckily, also, he was quite content to sleep away three-fifths of his life, so long as he had sufficient food, and he was as happy in his tiny box as most animals would have been with a whole cage to sport in.

When the show came to rest and the tents were raised, the one which contained Blairo bore a startling and surprising placard, one of those notices by which a knowledge of 'natural history' is grafted into the public mind. It read:

MONSTER BADGER

Which terrified the District with its
Destruction of Sheep and Cattle, and
Caused so much alarm as to cause Parties of
Men with Dogs and Guns to essay its
Capture, in which they succeeded
After a Desperate Fight,

TO BE SEEN HERE ALIVE.

And those who paid their sixpence were treated to the vision of poor little Blairo squatting stolidly in the centre of his little wire pen, occasionally raising his head to look about him with his little almond eyes. Sometimes he turned somersaults, but not often, for on the whole he seemed rather fed-up with life. His arena was strewn with cods' heads, and the woman who exhibited him stated that badgers live chiefly on fish when in a wild state, an assertion which hardly seemed to tally with the information on the poster without.

At such times, when the show was at rest, Turk would curl himself up just outside the wire pen, and there sleep the hours away, and sometimes he and Blairo would lick each other's noses through the wire. But in truth the heart of Blairo was becoming very, very heavy. He did not like the flare of the paraffin lamps; he hated the ceaseless tread of strangers; he was sick beyond everything of cods' heads. So one night when all was quiet he tore a great hole in his box and stole out into the starlight, and Turk, who was doing sentry-go, ran up to greet him.

VI.

So, through the dimly lighted streets, over the gleaming pavements, these two strange little adventurers went their way, and a policeman on night duty swore next morning that he had seen a bear cub and a terrier running flank to flank. But no one else saw them, for it was a quiet little market town, and when day came they slept curled together in the heart of a hardwood forest. Once footsteps drew near, and it was now that Turk's recent training stood him in good stead—he stole secretly away to a more remote thicket, and Blairo followed him.

The tinkers, fearing that they might be called upon to foot the bill for a sheep-worrying affray, did not advertise their loss, and for many nights Turk and Blairo were alone in the Wild. Turk seemed to be going somewhere, and Blairo patiently followed. They made a circuit of one great town, the myriad lights of which lit the heavens for miles away; once their progress was barred by a mighty river, and in the chill of daybreak they crossed it by a man-made bridge. But the weeks of confinement had softened Blairo's paws, and often he curled himself up in the most perilous places, refusing to stir, while Turk went off to explore village rubbish-heaps, thus keeping down his ever-growing hunger.

But Blairo was becoming hungrier and hungrier. He knew not where they were going, for it was Turk's bump of locality which was guiding them. Turk's was the master mind, and all Blairo knew was that he was too restless to rest, too hungry to eat, and too lame to walk. Those feet of his were meant to tread the cool mosses and the moist leaves, not life's hard and gritty highways, and the day came when little

patches of red marked his steps, and when, every few paces, he would lie down to lick and suck his paws. Still that strange little pair stuck together, as they had stuck so long, borne up by a common impulse, perhaps by a common love, till in the still and starless night there came to their nostrils a scent they knew and for which they were searching—the scent of the pine and the heather.

They had not travelled very far, and certainly Turk alone could have achieved the journey in a day or so, yet, cold and starving though he was, he had stuck to his slow-footed little chum for many, many days—slower than ever now that winter sleep was calling to him.

So, one day, a little faded skeleton of a dog, with one faded black ear and one faded fore-leg, sat in the bushes near the Castle door till the door was opened. Would his little master know him?

'Turk! Turk! Our little Turk!'

They were on their knees now, his little master and mistress, their arms about his neck, while Turk showered his kisses upon their cheeks. 'Where's Blairo?' queried the boy. 'Ants, Blairo! ants!'

But the gray bundle in the box on the green-sward did not stir. They went over and thrust in their hands, but he slept on, one red and swollen fore-paw in his mouth. They pulled him out, fearful that he was dead, but still he slept and sucked his paw. They changed his bedding and bundled him back to an unbroken accompaniment of snores, but when some one appeared with a saucer and shouted in his ear, 'Marmalade, Blairo!' he sat up with a start, and very wearily, very drowsily, turned a half-hearted somersault.

ICHABOD.

WHEN earth was new and fancy flew

On wide, unfettered wings,

Man still could see the witchery

Within the heart of things:

The nymph that glows within the rose,

The sprite that greens the shoot,

And early strews the pearly dew

On leaf and flow'r and fruit;

Could see the gnome that mines the gloam,

The elf that lights the morn,

And gilds with gold the broomy wold,

The crocus, and the corn;

The naiads slim and dryads prim

That haunt the valley glade.

The fauns that prance in wanton dance

And revel in the shade.

Now earth is old, and fancy cold;

Man neither sees nor hears:

Pan pipes forlorn, and Triton's horn

Resounds in heedless ears.

No more is heard the honeyed word

Of leaf to budding flower;

No more is seen the kiss between

The shadow and the shower.

WILLIAM DOUGLAS.

Chambers's Journal

SEVENTH SERIES

385

GREENWICH OBSERVATORY.

By Professor GEORGE FORBES.

PART I.

I.

THE situation for Greenwich Observatory in the park, on the summit of the hill, surrounded by foliage, was well chosen; and the structure designed by Sir Christopher Wren, the friend of Sir Isaac Newton, and himself no mean astronomer, has an unmistakable charm. The building itself, as seen from the gates of the park, in its bold and comely outline against the sky, strikes a chord of harmony with the ever-present and ever-successful struggle in pursuit of the real eternal truth that has been waged within its precincts during an existence of 250 years, under the reign of nine successive Astronomers Royal.

The most salient part of Wren's building is the wide octagon tower, surmounted by meteorological instruments and the time-ball, by whose fall at one o'clock the chronometers of our merchant ships can be set, when they start from the Thames on voyages to all parts of the globe, for guidance in getting their longitude while at sea.

In contrast to this Jacobean portion of the edifice, we also see from here Sir William Christie's great dome, enclosing the powerful 28-inch refractor—a feature still more suggestive of the astronomer's night-labours with the stars. The oriental character imparted to this fine dome—by the overhanging of its spherical form beyond the building on which it rests—adds grandeur to our first view of this home of the oldest, the truest, the most enthralling of all the sciences.

The modern part of the observatory, also due to Christie, is not seen from the park gates, nor until we have passed through the door in the old brick wall enclosing the grounds. These grounds include observatories, libraries and work-rooms, as well as the residence and clean garden of the Astronomer Royal.

On the first Saturday of June—the date has hardly ever been changed—the learned 'Visitors,' who have the right, under the Admiralty, to control the operations and policy of the observatory, assemble in the great octagon room of Wren's building to hear the annual report of the Astronomer Royal.

On this 'Visitation Day' invitations are extended to a large number of those concerned with the progress of astronomy. During the afternoon they are free to wander all over the place. When they inspect any instrument, or the room in which astronomical photographs are displayed, they find a courteous assistant on the spot, ready to supply all the information that may be sought.

Let it be supposed that the reader of these lines has secured this greatly-valued privilege of inspection.

He enters that solid doorway in the brick wall, which is flanked by standards of length built into the wall on the left; and by the great Greenwich mean-time clock, with twenty-four hours on the dial, on the right, a constant object of curiosity to all passers-by.

He finds himself in the open courtyard, facing both the residence and the octagon tower, with an outside wooden staircase to the roof. On his right are small observing huts, housing instruments generally for temporary observations. But, on his left, he is almost touching the wall that encloses the most important instrument in the world for fundamental astronomy of position, the Greenwich transit circle, located, where we now stand, on the zero of longitude for the whole world, the Greenwich meridian.

The passage to the left, between the transit room and the eastern wall of the grounds, leads to the oriental dome of the 28-inch telescope and, farther on, to the great new building on the top of which are the 26-inch refractor and the 30-inch reflector.

Do you prefer to look at these, or to stay in the old part of the observatory, where are all the principal instruments for measuring time, and also the exact positions of the heavenly bodies?

Most people would desire to see first the big telescopes used for magnifying and showing distinctly the markings on the sun, moon, and planets, their satellites and Saturn's rings, the shapes of comets and nebulae, and hundreds of millions of stars, some isolated, some in revolving pairs, some in clusters, and most of

them massed in the star-clouds of the Milky Way.

These objects cannot be seen during this inspection, but we can have a look at the telescopes that are such a source of joy to the really keen astronomer.

There are two classes of telescope used by astronomers, 'refractors' and 'reflectors.' The rays of light from a star which pass through the object-glass of a refractor are converged by it to a point at the focus, where they might be received on a sheet of ground glass as in a photographic camera, and be examined with a magnifying-glass, or eye-piece. But the ground glass is not wanted here, so the telescope consists essentially of an object-glass and an eye-piece. These are the important parts of a refractor. On the other hand, in a reflector, the light from a star which strikes the hollowed or concave surface of a speculum, or mirror, is also converged after reflection to a focus. But, for examination by the eye-piece, these rays must first be reflected, by a second mirror, out of the telescope tube, to prevent the observer's head from shutting off the star's light from the speculum. This may be done in more ways than one. In the Newtonian design the observer looks through a hole in the side of the telescope tube towards a small diagonal mirror. In the Cassegrain design he looks through a central hole in the middle of the speculum towards a curved mirror in the axis of the tube.

The size of the telescope is usually stated as being the diameter of the object-glass or of the reflecting mirror. At Greenwich, the largest refractor is the 28-inch. There are larger ones in America. At Lick Observatory, the great refractor is a 36-inch, at the Yerkes Observatory of Chicago, a 40-inch.

For larger telescopes than these, reflectors are always used. Lord Rosse's, in Ireland, was a 72-inch. So is the splendid one at Victoria, British Columbia. The only one in the world bigger than these is the 100-inch, at Mount Wilson, in California.

II.

Let us now have a look at the great 28-inch refractor in the oriental dome. Climbing the steps inside the building, we pass the chronometer-room on the first floor, with its heated chambers and its ice-cooled chambers, where chronometers and watches are tested for the Admiralty under varying conditions of temperature.

On the top floor we reach the great room with its spherical roof, left open over one segment of the sky by means of a shutter. The whole of the dome is mounted to turn on a circular rail at the top of the wall. Thus, with very little effort, the open shutter can be brought in place so as to expose any part of the sky.

Inside this room the huge telescope is mounted on a lattice girder frame which rests in an inclined direction that points up to the pole of the heavens. This girder is mounted upon pivots at the top and bottom so that it can turn about its axis. The telescope itself lies inside this girder framework, and is pivoted at its middle to the girder; thus it can be rotated so as to point to stars that are at any distance we please from the north pole of the heavens.

The girder, too, can rotate about its pivots; and by these two rotations the telescope can be pointed to any star in the heavens. Only in the direction of the pole is the view obstructed in this form of mounting.

Lastly, the lower end of the girder is connected by geared wheels with clockwork mechanism that rotates the whole framework with the telescope at a regular speed to follow a star when, without this device, the telescope would be carried, by the earth's rotation about its axis, away from the direction where the star is, and the star would pass out of the field of view.

This mode of mounting the 28-inch refractor is extremely rigid. But the equatorial mounting of the other telescopes will be seen to differ from it, and to render the polar region of the sky accessible to our vision.

This splendid telescope has been of great service, especially in the study of a remarkable class of stars that are seen to be double, wherein the two stars are found to change their relative positions. A lengthy series of observations, extending through many years, has demonstrated that they are revolving round each other in elliptic orbits, as the planets revolve round the sun, but often taking hundreds of years to complete a revolution, instead of one year as our Earth does.

This discovery of solar systems among the stars was one of many great discoveries in sidereal astronomy made by Sir William Herschel 150 years ago. The telescope we are looking at is one of those that have splendidly carried on Herschel's work. Sir William Herschel's discovery was the first indication given us that Newton's law of gravitation is universal, and that it extends beyond the solar system.

In some cases, a study of these binary stellar systems has enabled astronomers to calculate the masses of the constituent stars. It is a remarkable fact, or coincidence, that the masses of the stars so far examined are, in almost every case, nearly the same as the mass of our sun.

The most difficult and, in the present state of accurate astronomy, the most desirable datum that is sought for is the distance of the stars. Now Mr Jackson, the chief assistant here, saw that if he accepted the above condition of equality of masses of stars as being generally near the truth, he would then be able to tell the distance from us of any binary system. In this manner

he has calculated the distances of many stars with a greater probability of accuracy than others had been able to attain by more doubtful methods. In this and in many directions, our great national observatory at Greenwich continues to maintain its splendid reputation of 250 years.

In the days when I was a worker at the observatory, under Sir George Airy, the largest telescope was only a 12-inch refractor, in this same building now occupied by the 28-inch. At that time the dome was cylindrical in form, very ugly, like a gasometer. The bulging form given to the new dome has the merit of beauty, but it was really an ingenious device for making room for the much longer telescope.

III.

Without further delay, let us now go to inspect the contents of the great new observatory which occupies the south end of the grounds.

This building contains not only two great telescopes, but also the accommodation required for the staff of assistants, in their daily occupations of calculating and summarising the work of the observatory. It also contains the study, or office, of Sir Frank Dyson, the Astronomer Royal, a man who has proved himself here, as he had already done as Astronomer Royal for Scotland, at Edinburgh, not only a worthy upholder of the traditions of unrivalled accuracy and continuity bequeathed by his predecessors at Greenwich, but a leader as well in the modern extension of outlook into the structure and evolutions of the stellar universe. Among his many activities his name will always be associated with his observations to discover the proper motions, magnitudes, and distances of the stars, and the relation of their distribution to the plane of the galaxy. It was mainly owing to his energy that, during the total eclipse of the sun in 1919, our British observers were enabled to prove that the rays of light from a star, while grazing the sun, are deflected towards the sun, out of their course in a straight line.

Entering the new building, we ascend the stairs and go first into the dome of the great Thompson equatorial at the top of the building.

The mounting of this double telescope differs from the 28-inch, and follows a more usual type of construction. The polar axis, pointing to the pole of the heavens, is not supported at an upper pivot. It is held and directed entirely by a cast-iron pedestal on the floor which contains the driving-clock. At the top of the polar axis, and at right angles to it, is the declination-axis. The peculiarity of this instrument is that two large telescopes are mounted, one at each end of that axis, and by turning on this declination-axis, each telescope can be directed to a star near the pole or at any angular distance from the pole. Each telescope serves as a

counterpoise to the other on the declination-axis.

One of these telescopes is a 26-inch refractor; the other is a 30-inch reflector. No description can afford the same satisfaction as a personal inspection by the fortunate person who is free of the observatory on Visitation Day.

Such a visitor will climb to the gallery that goes round the room. Standing up there, he can look down into the open mouth of the 30-inch reflector, and see the light of the sky brilliantly reflected from the silver surface of the great mirror. The mirror itself is made of glass, ground to the proper shape, polished, and then silvered by placing it in a bath containing a silvering solution. After that, the silver is polished.

The visitor on the gallery, looking down the tube, can also see the smaller reflector, which reflects the image of any heavenly body to the outside of the tube, and so to the eye-piece, or else to the photographic plate. He can likewise see the hole in the middle of the mirror, through which, on the Cassegrain plan, the rays can be so reflected by a small mirror higher up in the tube.

This reflector has accomplished much splendid work, and one of its greatest triumphs was the discovery, by an assistant, Mr Mellotte, of the eighth satellite of Jupiter.

Galileo discovered four conspicuous moons revolving round Jupiter. They form beautiful objects even in a small binocular—four dots all in a line with the planet. Of late years five more have been added, making nine in all. The fifth one revolves very close to the great planet. But the sixth and seventh, outside the others, were detected on photographs with great skill, for they are extremely minute (seventeenth magnitude).

It then became important, at Greenwich, to observe the exact positions of these two satellites, from night to night, so as to determine their orbits conformably with Newton's theory of gravitation. For this purpose the 30-inch mirror was resilvered and polished, and it was then used for the research on the sixth and seventh satellites. Mr Mellotte, the assistant whose duty it was to take these photographs in hand, noticed upon many negatives, night after night, a very faint spot always nearly in the same position with respect to the sixth and seventh satellites. It could not be a photographic fault, for it was repeated so often. It could not be a star, for Jupiter and his moons, in their orbit, changed their background of stars every night. At last all doubt was dispelled. This almost invisible dot of the eighteenth magnitude, invisible in the telescope to the human eye, was undoubtedly a new satellite, Jupiter's eighth moon.

After examining the position of this satellite upon different nights, in order to compute the

orbit in which it travels round Jupiter, the chief assistant, Mr Cowell, found that it revolves in an orbit outside all the others, highly inclined to the planes of these others, and, most remarkable and unexpected, he made the announcement that it goes round Jupiter in the

opposite direction to all the others that were then known.

If this were all that the 30-inch reflector had discovered, Greenwich Observatory would still be proud of it.

(Continued on page 409.)

FORESTALLED.

CHAPTER V.

THUS the work continued, and day after day the rivals toiled in that lovely, lonely valley, never speaking a word to each other, never exchanging a glance even, Old Man Mervyn and Joyce ignoring Big Tom Moore as utterly as he ignored them, so that a passing stranger might have imagined some magic spell had been laid upon them to make them unaware of each other's presence.

If the two men chanced, as sometimes happened, to meet face to face, they sauntered by with elaborate unconcern; if Joyce and Tom encountered each other, not so much as the flicker of an eyelash showed that the girl was even conscious of the young man's presence. She would walk right by with a general air of taking him for one of the valley trees or for one of the big rocks that littered its surface. Once, when they found themselves going to the creek together for water, they walked the whole way there almost side by side, since for either to draw back would have betrayed consciousness of the other's existence. They dipped their pails together; they rose and returned to their camps that were not fifty yards distant; and it would have been impossible to tell that either man or girl had so much as seen or heard the other.

The shafts they had begun to sink were completed without either yielding any trace of gold. They started afresh, working across the valley in the same direction, so that these new shafts they sank were almost as close as the first had been; and these also they completed without discovering any sign of gold.

So they continued, day after day and week after week, working their way across the valley, and never once admitting by word or sign, by look or gesture, that they were conscious of each other's presence. Even the snatches of talk between Joyce and her father that the wind sometimes bore to Tom's ears never betrayed on their part the least consciousness of his existence. Their talk was as it might have been if not a living soul were within fifty miles; and Joyce would carry a heavy burden of dry wood for their camp-fire right by where Tom was sitting in the shade, and put it down to rest, and pick it up again, and go on with the most perfect air of not even knowing that he was moodily watching.

Indeed at times he was almost driven to believe that he had grown invisible to her, and that the sound of his shovel and pick never reached her ears, so perfect was her manner of no longer being aware of his presence in the valley.

'Guess I can stand it as long as they can, though,' Tom used to mutter to himself; but for the first time in his life he was beginning to sleep badly, and now he often lay awake far into the night, watching the glory and the wonder of the shining stars above, and remembering with what mysterious grace had moved that small, swift shadow he had watched gliding to and fro in the uncertain light of the camp-fire burning not fifty yards away from his own.

'Reckon she never stays awake,' he thought bitterly; and later, a little before dawn, because he could not sleep and was weary of lying still in his blankets, he rose and wandered aimlessly away into the night that was still black and intense, but that was nevertheless shot through with a faint hint and promise of the coming day, to which the swiftly revolving Earth was turning herself, as the beloved to the arms of her lover.

Big Tom Moore was not a man who hitherto had ever thought much of the beauties of earth and sky, or of those of the swift returning seasons, amidst which his life was passed. Though he would have told you, perhaps, that town stifled him, and by town he meant any little settlement of a few score wooden huts or frame shanties, where it would have seemed to most that the winds blew as freely as in the depths of the wilderness.

But that beauty was his companion all his days was an idea that had never occurred to him; and it was only during these last few weeks that he had begun to find a certain vague and strange pleasure in watching the splendours of the dawn or the crimson beauty of the sunset, or that the thought had come to him to step out of his way so as to avoid treading on any of those small clusters of flowers that studded the valley here and there, and that looked like baby stars fallen from heaven to shelter in this quiet place till they grew bigger.

Now it was almost unconsciously that he took his way towards a certain spot whence could be obtained the first glimpse of the magnificence

of the Sun, as the great hills in the east swung slowly back with the revolving Earth to reveal his steadfast glory. Already a glow was spreading there in the east above the hills to tell of the joyous day the Earth was hurrying to meet. A cold wind blew keenly down the valley, and then, as he came out from the midst of the trees into this open space he was making for, he saw Joyce standing there, her face upturned to watch the coming wonder, so that already the growing light showed it glimmering, palely beautiful.

'Oh—oh!' he exclaimed, extraordinarily surprised.

Her self-control was better. But possibly the sound of his footsteps approaching through the trees had warned her, and she was less taken by surprise. Not a muscle of her face moved, not an eyelash quivered. His cry might have been unheard, his arrival unperceived. To all appearance she did not even know that he also was there, come to watch the dawn.

A great anger stirred in him. She had no right to act like that, to behave as if for her he did not even exist. No matter what he had done or how he had offended, it went beyond the limits that she should stand there unmoved to watch the dawn and ignore him standing by her side.

But he would not, he told himself, be driven away. He would stick it out, even though to do so needed a courage and resolve greater than any he had ever required when fortune had frowned persistently on his enterprises, or when, perhaps, some hard-fought fight had seemed to turn against him.

He walked forward deliberately a yard or two till he was on a level with her and almost at her side. She took no notice. She remained still and motionless. He could hear her breathing, and he noticed that it was quick and irregular, but never dreamed that only by such an effort of courage and resolve and will as he himself had needed did she keep her place there, side by side with him in the lonely night, to watch the wonder of the coming dawn.

Tense and silent they stood thus, for a very long time as it seemed to them, while in the east the glory grew, and the great hills bowed lower and lower as they swung slowly into the presence of the Sun.

Then at last the miracle was accomplished, and the Earth, faint with her long quest through the blackness of the dreadful night, had found her lord the Sun once more. With a little sigh Joyce stirred, and held out both hands as if to bathe them in that golden sunshine, and in a moment she turned and was gone, and Tom followed slowly after.

'Anyway,' he thought, 'I've watched sun-up with her.'

This thought, that came into his mind like a ray from the risen sun itself, surprised him greatly, for he was not used to have such ideas,

and he was still more astonished to find that somehow it filled him with a queer and poignant exultation.

'She may let on she don't know I'm there,' he thought, 'but all the same she knows we watched sun-up together.'

He went back to his camp and made his breakfast; and again the smoke from his fire and from theirs rose straight into the calm air, aloof and hostile, two straight black columns that never met or mingled.

Again they went out to their work and toiled all the day with less than fifty yards between them, and went down to the creek for water, and in the evening returned to their camps to sup and sleep, without once having, by word or sign, shown any consciousness of each other's presence.

And when these shafts also had been sunk to a sufficient depth without revealing any trace of the precious metal that they sought for, they moved on again, and began once more still fresh shafts, and still in close proximity.

Joyce and her father had the great advantage that by working together they could help each other, while all that Tom did he had to do himself. But he had the advantage of knowing better what to look for, since it was one great legendary pocket of gold for which he sought, and consequently he did not sink his shafts as deeply as they did theirs, and he 'tried out' the gravel less carefully. Then, too, he was a magnificent worker, so that on the whole he kept up very well with his two rivals, and when this new shaft they had sunk proved another failure, he also was ready to abandon his and start again.

Side by side like this, still utterly ignoring each other, they worked their way across the breadth of the valley, striving to hit on the ancient course of the little creek that bubbled by. And by this time, since so far no hint of any probability of success had come to reward their efforts, they were all in reality willing enough to give up and proceed to some more hopeful spot. Only on neither side was there any intention of being the first to quit.

'I don't know what for we're trying out this valley the way we are,' Old Man Mervyn used to grumble at night by the camp-fire. 'It don't seem anyways likely to me.' And to himself Tom used to mutter as he fried his bacon for supper at night, 'This place ain't no good. The tale I heard about it is all lies. Wish I had never listened to the blame yarn.'

This latest shaft, too, that they had sunk Joyce and her father abandoned, and began a new one, so close now to the side of the valley it seemed this shaft must be their last. Tom had been a little behind with his, and had hardly dug more than three or four feet down, but he abandoned it when they abandoned theirs, and moved on with them, keeping always about the same distance to one side.

'I knew he would,' Joyce thought gloomily. 'It's just too awful.' And once again she was tempted to release her father from his promise. 'He ought to be whipped, and dad says he could do it,' she thought; 'and it would be just lovely if he did, and I don't see you could call that really fighting—only they would hurt each other so awfully, and I suppose I mustn't let them.'

Then she sighed regretfully, and a sudden cry her father uttered startled her and made her run swiftly towards him. Evidently Tom also had heard that loud and quick cry, for the stroke of his pick ceased for a moment and then stubbornly began again.

'Brute,' she thought to herself. 'Dad,' she called, running.

The accident was not serious, but still sufficiently annoying. Old Man Mervyn had been in the act of lifting a big stone they had come to as they started their new shaft, and it had slipped back and bruised his foot badly, so badly that he was able to walk only with difficulty, and would be clearly incapable of work for some days.

CHAPTER VI.

THOUGH Big Tom Moore had continued his digging with such apparent unconcern, yet he was quite well aware that an accident had happened, and he was in secret a good deal disturbed. 'Maybe it's bad,' he thought.

It is as much a point of honour among the pioneers of the wilderness to give each other every help in their power when an accident happens, as it is among sailors to run every risk in order to help those in danger at sea. 'What has happened to him to-day may as likely as not happen to me to-morrow,' is the dominating thought in each case; and though this special accident might be only trivial, Tom felt he must find out for certain.

He reflected that he would have to go to the creek for water soon, and why not now? Throwing down his shovel, he jumped out of the beginnings of the shaft he had started, and picking up a pail, sauntered away towards the creek. Not for the world would he betray any interest if the occasion did not really demand it. In a moment or two he came in sight of Old Man Mervyn painfully limping campward, his hand on Joyce's shoulder, evidently hurt and in pain, and, equally evidently, not in any way really seriously injured.

'Stubbed a toe or something,' Tom thought with a certain relief; and strolling on towards the creek, he noticed the big stone at which Mervyn had been working when the accident happened. Tom guessed at once what had occurred. 'Trying to prise that rock up, and it slipped and went on his foot,' he thought. 'Well, that ain't much, though I dare say he'll

have to lay up awhile. Wonder what the girl'll do about it?'

He drew a little nearer. The stone was a big one, certainly far beyond Joyce's ability to deal with. She could both dig and use the pick fairly well, and were that stone out of the way no doubt she could go on with the work for a time. But while it lay where it did, and so long as she had no one to help her deal with it, Tom did not suppose that she would be able to do much.

He looked round guiltily. Joyce and her injured father were out of sight now. Suppose he heaved that rock aside for her? She would be able to get on then. Probably she would never know what he had done—in any case she could hardly object. Subconsciously he had the idea that it would be pleasant—even curiously pleasant—to listen as he worked at his own shaft to the sound of pick and shovel near, and know they were wielded by Joyce.

He bent over the rock. A big one, certainly. Still, if one got the pick well under it and gave a good heave, that ought to shift the thing, especially as it did not seem very firmly set. However, the task proved harder than he had anticipated, and it took him quite a long time, and demanded the exercise of all his strength and all the skill he had in moving heavy weights, before at last it heaved ponderously up—and there where it had lain was a colour in the earth that made him forget all else in a wave of sudden excitement.

With all his strength he drove the pick once and once again into the earth. Eagerly he stooped to look more closely. There could be no doubt now. It was gold, and gold in rich profusion. The tale that had made him search so long and so tirelessly for this valley was no idle invention. It was true, true beyond all his hopes and dreams. In a frenzy of excitement he worked on feverishly, fiercely. The point of the pick struck a stone—a soft stone—it was a nugget weighing at least a pound. And there were others too, plenty of them. At last he had found the famous 'pocket' of gold he had dreamed of so long—discovered it at last in the mouth of a shaft that had been sunk by another and not by him.

A clear, indignant voice broke in on his ecstasy of astonishment, of wonder and of joy, a clear and angry voice that cried out loudly, 'How dare you! What are you doing there?'

He glanced up. Joyce was standing looking at him with cold indignation and surprise and scorn. Then all at once her expression changed, as suddenly she caught sight of the treasure he had unearthed. She saw in his hand the first nugget he had found and that he had picked up to examine more closely. She pointed a trembling finger at it. 'Oh, oh,' she stammered; and then she called out, very loudly, 'Thief, thief, thief!'

HERALDRY AND MEN OF LETTERS.

By C. A. MALCOLM, M.A., Ph.D.

IS heraldry becoming more popular with the average reader? Is there a demand by thirsting students of the 'noble science' for systematic instruction in its elements? It would seem so, if the prospectus of the London County Council's educational scheme is a criterion. For that body has already begun a course of lectures on the subject. The idea is excellent, and we may look for developments in other places, so that by-and-by a rudimentary knowledge of what heraldry stands for may be possessed by a much larger section of the public than one finds now.

In mediæval times every one knew something about heraldry. The knight going forth to battle or to tourney, armed at all points, could be recognised only by the coat-of-arms painted on his shield, or by the crest that surmounted his helm. His 'signature' to a deed was identified only by these same arms on seals, for gentlemen then considered themselves 'above' the monkish habit of writing their names.

Thanks to St Bothan, son of mine,
Save Gawain, ne'er could pen a line.

Even in the seventeenth and eighteenth centuries, when widely different conditions prevailed, the educated person was not ignorant of the elements of heraldry. As Froissart and Montaigne in France, as Dunbar, Henryson, and Sir David Lyndsay in Scotland, and as Chaucer and Spenser in their day had made use of the herald's tongue in their works and had adopted in their several ways each a coat-of-arms, so did in time Shakespeare and Milton. Scarcely a comedy or a tragedy of the great master but contains an allusion to the symbols of heraldry. And you will recollect that he induced his father to apply to Heralds' College for a coat-of-arms in order that he, William Shakespeare, might then obtain arms for himself as a 'gentleman.' John Milton made it a rule to have all his agreements with publishers attested, not merely by his name but by a seal bearing his arms, 'Argent, a spread eagle with two heads gules, legged and beaked sable.' In other words, on a silver ground was a two-headed eagle with spread wings, the heads being red, the beak and legs black.

With knightly days receding, the charm lent by distance seems to have grown stronger—at least to students of history and to the romantic poets. Not only the sight of an old stone-cut escutcheon placed over an ancient ruin, but the quaintness of the heralds' terms deeply impressed the imagination and the language of many of the modern poets. Thus Keats, in *The Eve of St Agnes*, makes Porphyro hurry through the

dim hall, where noble escutcheons were revealed 'in all their thousand heraldries.' The window that threw 'warm gules on Madeleine,' that lady's 'azure sleep,' the 'argent moon and sable night,' all point to the poet's love of and indebtedness to heraldry.

It may be objected that it was only among poets of aristocratic leanings that such a fervid care of heraldry was nurtured. Well, here is one of the most democratic gentlemen of all ages to prove that the charm was shared by him. Robert Burns, far enough from 'the boast of heraldry, the pomp of power,' writes to his friend, Allan Cunningham: 'I lately lost a valuable Seal, a present from a departed friend, which vexes me much. I have gotten one of your Highland pebbles which, I fancy, would make a very decent one, and I want to cut my armorial bearing on it. . . . I am a bit of a herald and shall give you, *secundum artem*, my arms: "On a field azure, a holly bush, seeded proper, in base; a shepherd's pipe and crook, saltier-wise, also proper, in chief. On a wreath of the colours, a woodlark perching on a sprig of bay tree, proper, for crest. Two mottoes: round the top of the crest, "Wood Notes Wild"; at the bottom of the shield, in the usual place, "Better a wee bush than nae Bield."' "

Heralds' College or Lyon Office in Edinburgh would have insisted on an alteration of the azure of the poet's prospective arms by substituting for the azure field one of silver or of gold (*Argent* or *Or*); for it is one of the canons of heraldry that a colour must never be placed upon a colour, nor a metal upon a metal.

It is pleasing to note that this very coat-of-arms devised by Burns was, with the alteration of the azure field for a silver field, actually registered by his kinsman, Dr James Burnes, a famous officer of the Indian Medical Service, and brother of Sir Alexander Burnes, both of whom were murdered while on duty in Kabul in 1841, after brief but brilliant careers. And again, the coat-of-arms was 'matriculated' in 1905 by a descendant of the poet's brother Gilbert, the azure field being then changed to gold and the shepherd's pipe to a hunting-horn.

Though neither Wordsworth nor Byron paraded heraldry in his verse they were each alive to its claims, and each had his coat-of-arms properly registered. The Poet of the Lakes symbolised his quiet, melodious life by showing a shield bearing 'Argent, three church Bells azure.' Byron had his family arms altered to 'Argent, three bendlets gules.'

Sir Walter Scott, as might have been ex-

pected, was a student of heraldry, but, though he adapts it to his various purposes with great effect throughout his verse and prose romances, he is not free from committing heraldic blunders. There he was the antithesis of Thackeray, whose use of all the 'blazons' is always correct.

For the most pictorial treatment of the subject one must go to Tennyson. Take, for example, the following lines from 'Merlin':

I once was looking for a magic weed,
And found a fair young squire who sat alone,
Had carved himself a knightly shield of wood,
And then was painting on it fancy arms,
Azure, an Eagle rising or, the Sun
In dexter chief; the scroll 'I follow fame.'

There you have the soaring spirit of heraldry in blank verse by one who was a herald after the manner of Heralds' College, one who, indeed, mourned:

Poor old heraldry, poor old poetry, poor old
history, passing hence
In the coming deluge drowning old political
common sense.

None of these men of letters was a close student of heraldry in the sense that Sir George Mackenzie, the Lord Advocate of King Charles II.'s time, was, who in addition to his hateful political services, his legal and moral studies, found time to write a *Science of Heraldry*; nor in the misguided way of Sir Walter Scott's character, Sir Arthur Wardour, in 'poring over Guillim o' nights.'

Enough for them the meaning of the symbols, the fascination, the glamour of all that heraldry stood for. They would have agreed with Ruskin, and with the London County Council, in urging the teaching of heraldry to 'all young men and maidens, because it provides a key to the past.'

A GIPSY OF THE NORTH.

CHAPTER XVII.—continued.

SOME time in the afternoon Norma stirred and opened her eyes. She lay in such a position that Roy was the first thing upon which her gaze fell, and he saw a look of wonder leap in her face, and then the blue eyes kindled with gladness. 'You?' she whispered. 'You?'

'Yes,' he answered smilingly; 'and Billy.'

'Billy?' she cried in joyous surprise. 'I thought that he—that he——'

'He was wounded only, not sufficiently to prevent his following us. But he has been hurt again since, and has a nasty wound in his foot.'

A swift look of trouble drove the gladness from the girl's face, and she asked quickly, 'How did it happen?'

'Standifer shot him.'

'Standifer?' The look of trouble became accentuated as recollection surged in her mind, and then she spoke a little fearfully. 'Where is he now?'

'I do not know for certain. After Billy had shot the priest in the church——'

'In the church?' As she cried the question her brows contracted as if in the effort to remember, and Carwyke answered quietly, 'Yes, you had been drugged, I think; and that rascally priest was in the act of marrying you to Standifer when Billy and I reached the church. Billy shot him at the altar, partly to save you, partly because he was the man who years ago stole his Eskimo wife from him at Unapik.'

'I can't remember,' said the girl thoughtfully. 'Everything seems confused. I remember Mr Mardock coming to my room and giving me a pistol, and telling me to shoot Standifer rather than marry him, and I remember him asking me for it at breakfast when I was feeling very strange; but whilst I was giving it to him,

Standifer leaped right across the table and flung the other man against the wall—but after that things are mixed up, and—and—oh, I think I remember hearing a rifle, and I seem to see some one in shining raiment falling towards me.'

'That would be the priest. He was a gorgeous figure.'

'I can't remember anything else.'

'Just as well you can't,' answered Carwyke quietly.

'But tell me what happened?' pleaded the girl.

'Mardock evidently recovered from the drug which, as I guess, was given to him and you earlier than was judicious. I think he must have felt himself incapable of doing much for you himself, and he was trying to release Bull and me when Billy showed up to his help. He guessed what was taking place, and set Billy and me running for the church. Billy shot the priest, and as Standifer came out of the church with you in his arms, between us we took you from him. I ran with you to the house, and then saw Billy helping Mardock. Standifer was firing with a pistol, and hit both Mardock and Billy, killing Mardock outright. I carried Billy to the house, and barricaded the door. After what Billy had done, I never thought we should be allowed to leave the place alive, but we had great luck. Many of the Indians hated Arloff, and there was one, who had been south, and whose father the priest had killed, who came to our help, and induced the others to let us go—and here we are!' he ended lightly.

For a moment Norma remained silent, then her eyes sought the backward trail. 'Standifer and that other man are following us?'

'I do not know. They are somewhere in the woods, but whether they have the means to follow us, I can't tell. Anyway, we must be well ahead of them, and if it were not that Billy seems to be in rather a bad way we should have little need to worry over them. But if Billy gets worse, and we have to camp——' He broke off, and, without finishing the thought, asked, 'I wonder if you could handle a paddle?'

'I think so,' answered the girl, raising herself cautiously, and then, as her head spun a little, clung with arms outstretched to each side of the canoe.

'You feel dizzy?' he asked.

'Yes; but it is passing.'

'If you can work the paddle it would help enormously. The farther we get down-river before we camp the better.'

'I will try,' she said simply; and presently she shifted her position, swayed a little, but, taking up the paddle, bravely set to work.

The canoe drove forward at a quicker pace, and the apprehensions that had been in Roy Carwyke's heart died down a little. Norma was very capable, and if they were imprisoned by winter in the wilderness would be a helpful rather than a hindering presence. The one haunting fear that remained was that relating to Standifer. If he followed, great care would have to be taken, lest by any chance the scoundrel had secured a rifle. Billy's exploits proved what a single armed man carefully shadowing a party might do, and the thought that now the conditions might be reversed was an uncomfortable one. The man Bull did not trouble Carwyke quite so much. He was just as likely to attack Standifer as to follow them; and, in any case, he had not the other's measure of intelligence, nor, as a sailor, his experience of the wilds.

Billy's voice broke suddenly on the stillness, and he looked quickly towards him. As he did so, apprehension surged afresh in Roy's heart. The man's face had a deep flush, and he was moving restlessly, whilst the words that came from him were disconnected and meaningless. Norma shot an anxious inquiring glance over her shoulder.

'Paddle your hardest,' Carwyke said. 'We must keep on for the present; but soon I am afraid we shall have to camp—for Billy's sake.'

For another hour they drove forward, and at the end of that time, the wounded man's babblings having become almost continuous and his eyes having the unmistakable glitter of fever, they turned up a quiet creek of sluggish current, and a mile from its junction with the river landed, not far from an open place in the woods. It was a desolate spot enough, but it suited their purpose very well; and having made a bed of spruce and thrown over it a blanket, they carried the sick man to it.

Whilst Carwyke built a fire and prepared a meal the girl watched over Billy, damping his

hot temples with the cold river water, soothing him when he was restless, and listening to the jumble of words that came from his dry lips. Once or twice she caught her own name; and once he shouted, like a man who has stumbled on a startling thing, 'Ther Russian! I thank thee, God!'

Presently, however, as he grew quieter she was able to go to Carwyke's assistance, and she was engaged in pounding coffee-beans between two stones when, noting a glance of Carwyke's in the direction of Billy, she asked, 'You are troubled? You think we shall have to stay here a little time?'

'A day or two, I expect—longer if Billy is not better. We must do what we can for him. He has done so very much for us.'

'Yes,' she answered simply.

'We shall have to keep watch,' he said, 'though I do not think there will be need to do so to-night, except so far as Billy is concerned. We have come a long way, and if either of those two men is trailing us, he will not be here yet awhile.'

They ate the meal in silence, and remembering that Billy must have been without food for practically the whole day, the girl managed to get him to drink a little soup, though he asked only for water. That the food did him any good Carwyke was more than doubtful, for very shortly after taking it he was delirious again, shouting wild words that seemed to ring through the stillness of the wilderness. Norma gave him water, bathed his forehead, and soothed him with voice and hand, until the violence of the delirium gave place to an intermittent, low-voiced babble.

Carwyke stood watching her, a tender light in his eyes. The sick man fell silent altogether for a space, though his eyes, a-glitter with fever, stared wide-open at the trees above him, seeing neither the man nor the girl. In the silence that had fallen Norma looked up, to find Carwyke's eyes watching her, and a sudden flush dyed her face as her eyelids dropped. In that moment Billy began to babble anew. At first the words were disjointed and meaningless, conveying absolutely nothing, then one sentence sounded with startling clearness—the very words that Carwyke had remembered in the canoe. 'There's Missy lookin' back for yo'!'

Norma, who could scarcely have understood the reference, looked up at Carwyke, and what she saw in his eyes again brought the swift blood to her face. The man, knowing his moment had come, took a step towards her. 'Norma!' he whispered. 'Norma!'

She rose quickly from her knees, facing him, a light of shy expectancy in her blue eyes. 'Yes,' she whispered back.

'I love you, girl,' he said hoarsely. 'I never meant to tell you till—till we were out of this. I am not sure I am acting rightly even now.'

But—but I think you must have known. Did you?’

‘Yes,’ she answered simply, as became one so virginal.

‘I want you—will you marry me? When you get to the great world outside you will need some one. Will you? Will you?’

‘Yes,’ she whispered again, without shyness, and with a great gladness in her eyes.

He took her in his arms, and found that she was trembling. ‘Afraid?’ he asked softly.

‘Oh no,’ she answered back. ‘I think it is because I am so glad.’

And then, their enemies behind and the perils before utterly forgotten, he kissed the lips that, trustfully as a child’s, were lifted to meet his own.

(Continued on page 402.)

SMALL-GAME SHOOTING IN CANADA.

PART II.

III.

THE most luxurious shooting I ever enjoyed in the North-west was some years ago, when a party of us travelled on a private train. It was a branch-line, which has since been absorbed by one of the big trans-continental railroads, and two of us were high officials of the Company, so that we could move about pretty much as we pleased, there being comparatively little traffic in those days. The train was made up of a private car for ourselves, a sleeping-car for the men, and a baggage-car for the setters and general equipment.

Our usual plan was to travel at night and shoot during the day, but sometimes it was necessary to move from one ground to another by daylight. On these occasions it was our habit to put the private car in front, tail foremost, so that we could sit on the ‘observation platform’ and look at the scenery. ‘Chicken’ are very fond of coming down to a railroad track, especially towards sunset, in order to dust themselves. When we sighted a covey ahead we would pull the communication-cord, stop the train, and climb off to shoot. Generally, however, we were up before daylight, and spent the morning after duck in the small lakes that abounded along our line of route; we returned to the train for lunch, and put in the afternoon with the dogs, chicken-shooting.

There was an American in the party who was the most hopelessly selfish shot it was ever my misfortune to encounter. (He shot one of the party in the face eventually, and came quite literally within a hairbreadth of destroying his eyesight; then, with commendable presence of mind, accused another perfectly innocent gun of being the culprit. Luckily the victim himself and another eye-witness spoke up and exonerated him.)

We soon gave up any attempt to get him to walk in line, and always encouraged him to start off on a solitary beat of his own. Even then it usually occurred that when our dogs had found birds and were working slowly on the line, he would appear suddenly from nowhere, and drift across our beat as if we didn’t exist.

He owned a rather good-looking Gordon setter, who had been trained not only to retrieve but also to sit up with the dead bird in his mouth, so that his master could take it without stooping.

One day, when we were driving to our ground in a farmer’s cart, we came suddenly on a huge stubble-field that appeared to be covered with snow. At the first glance we half thought this was the case, and then discovered that the snow was really flock after flock of ‘waveys,’ or white geese, and white cranes scattered amongst them. Of course they rose in a great cloud before we got within a couple of hundred yards of them.

That evening, when we returned to dinner, we missed the Yankee and another man, an old Harrovian, nobody having seen anything of them for two or three hours. We were too hungry to wait, and they arrived, tired and rather cross, when we were about half-way through dinner.

They were curiously reticent about their proceedings until late in the evening, when, under the soothing influence of cigars and whisky-and-soda, they became more communicative.

It appeared that they had conspired to steal a march on the rest of us and get a shot at those waveys when they returned to the stubble late in the afternoon. In order to accomplish this knavish trick they had slipped away, hired a buckboard from a neighbouring farmer, and made a bee-line to the stubble. Once there they dismissed their driver, climbed up to the top of a rick, and covered themselves over with straw. The New Yorker was peculiarly pathetic in his description of their subsequent sufferings. They lay full length, and the straw tickled him everywhere; the mosquitoes were the very devil; he wanted to smoke, and the ex-Harrovian wouldn’t let him; he wanted to swear, and every time he opened his lips the ex-Harrovian kicked him in the mouth with his heel and fiercely told him to shut up. This went on for a couple of hours or so, till it got so dark they couldn’t have seen to shoot, even if there’d been anything to shoot at, which there wasn’t. So they lowered themselves sadly and stiffly to the ground, and found their driver

waiting to see whether they wanted a lift to the train. He had been there all the time, with his horse hobbled close by, while he walked to and fro smacking his shoulders to keep the circulation going, like a London cabman. He was a Galician, or a Mennonite, or something, and it never occurred to him that he was acting as a highly effective scarecrow.

This business of shooting from a private car was, for obvious reasons, more common among American millionaires than among North-western Canadians, and it is in connection with one of the former class that there happened the funniest shooting episode I can remember.

I will call him Baumann, though that is not in the least like his real name. He arrived in one of our Western cities in a private car with silver door-handles and hinges. He had a letter of recommendation to the local manager of a big business, in which he held considerable interests. This local manager I will call Coppinger. Now Coppinger was really a very good fellow, with only one fault—that he was a Personage, with a capital P, and that he was too well aware of the fact. He was stout, with a fair beard, carefully trimmed to a point, a florid complexion, and a thick neck. When he spoke of younger men in his own line of business, he would say, 'Very promising young man, So-and-So; very promising indeed.' Then he would plunge in thought again, and add reflectively, 'I taught him all he knows.'

Apart from that he was a kindly, if dignified, host in his own house, and he made such a favourable impression on Baumann that he was invited to join the party. Coppinger declined gracefully on the score of business, thinking it unnecessary to explain that he hardly knew one end of a gun from the other. Unluckily for him, his directors down east got wind of it, and wired to him to accept, for reasons of policy, so that Coppinger had to change his mind and go.

For two or three days he rather enjoyed himself; there wasn't much shooting, and he managed to get along without making any conspicuous *faux pas*. Then came a day when Baumann decided it would be pleasanter to lunch in the open, and the party sat themselves down alongside the railroad track, and had their food brought out to them. Baumann was sitting on his 'hunkers,' with his plate between his knees, eating like a hungry Indian. Coppinger had, by a miracle, killed a brace of prairie-chicken, right and left, that morning, and was inordinately puffed up in consequence. He strolled up, carrying his gun loose and easy, to address some pleasant remarks to Baumann, and let off one barrel just between the millionaire's legs. He didn't hit him, but he started a sort of eruption of dust and pebbles which peppered all over his plate and his person.

Baumann was annoyed. He cursed with an exuberant fluency that spoke well for his early training. To say that Coppinger was confounded is pitifully inadequate. Had the accident occurred to an ordinary individual it would have been bad enough, but that he, Coppinger, should have been selected by a malignant fate to commit such an enormity—it was unbelievable. He started to apologise, and he went on apologising, and the more he apologised, the madder Baumann got. At last the millionaire could stand it no longer, and he announced that he would be everlastingly—Heaven and Baumann alone know what—if he was going to be shot at by his guests; he would return to the car and finish his lunch by himself.

So off he started, followed by Coppinger, still apologising. Baumann climbed up the steps, followed by Coppinger, still apologising. Baumann turned down the narrow passageway into the aisle, with Coppinger's apologetic hand on his shoulder, vainly trying to soothe his outraged feelings. How it happened no one will ever know, but Coppinger loosed off the other barrel just past Baumann's ear, and pulverised a priceless mirror at the end of the car. Baumann hurled himself sideways onto a sofa, clapped his hands over his ears, and went into a sort of fit; he was still kicking when the rest of the party arrived, but quite speechless.

Two or three years later I heard a first-class idiot make a distant reference to the subject one day in the club, when Coppinger was lunching at the same table, and I cut in quickly and switched the conversation. I had seen Coppinger's face, and I remembered that thick neck.

IV.

It has always been a mystery to me that shooting accidents were not more common in the West. In the early days most of the townsmen were Easterners, and many of them had never previously handled a gun in their lives. Several of them, whom I knew personally, learned to shoot straight enough, being naturally adapted to do so, but I could count on the fingers of one hand the number who became properly 'gun-broke.' It was quite hopeless to try to accustom them to take proper precautions in carrying their weapons, in drawing their cartridges, in keeping line, and, lastly, they never could learn to keep their mouths shut.

A man has to be caught young to learn all that. If you catch a boy waving a loaded gun on a line with your head, you can send him home, and he won't do it again; but if you catch a grown man doing the same thing, you may swear at him, and he may or may not apologise, but he'll do it again the next day. As for hunting mute, I have heard a man lectured for ten minutes on the subject, and

on the necessity of keeping line. I have seen him drop a bird immediately afterwards, stone dead and lying in plain view some twenty or thirty yards ahead of him. Uttering a jubilant roar, he will rush forward to pick it up, while frightened coveys are rising everywhere within earshot, but not within gunshot. Then he will stop and swing round with his gun at his shoulder, only to find he has forgotten to reload it.

I have a vivid recollection of a day when I was breaking trail through snow which was nowhere less than knee-deep, and into which you constantly sank up to your waist. I happened to glance behind me, and found my companion laboriously planting his feet, one after the other, exactly in my footsteps. He was carrying his rifle at full-cock, level with his hip, and pointing directly at my spine. When I asked him if it was loaded, he replied, with pained surprise, that of course it was; and when I asked him to draw the cartridges, he was quite annoyed.

Another day I was paddling in the bow of a canoe up a river that was full of snags and 'dead-heads'—that is, submerged logs. I turned my head to speak to my companion in the stern, and found a ten-bore gun, with the safety-catch off, balanced on the thwart behind me, so that the barrels were within an inch or two of my back. Just as a precaution I asked if it was loaded, rather expecting the man to be indignant at such a fool question. He calmly replied that it was, and that he was keeping it there in case a duck flew over, when he could drop his paddle and pick it up. When I pointed out the danger of a sudden jolt from our running on to a snag he was quite angry, and said the gun was all right, because he had his eye on it. It was only by threatening to run the canoe ashore, and get out and walk, that I induced him to draw the cartridges, and then I think he concluded my nerves must be out of order.

Once I was out duck-shooting on one of the big lakes in company with a Hudson's Bay official and—among others—a distinguished lawyer who was afterwards made a judge. It happened that he and I were told off to shoot opposite to one another across a big stretch of open water. Each of us had a paddler, his being an Indian, and mine a rather raw white boy, a deck-hand on one of the Company's steamers. Our canoes were tied up in the reeds as usual, but each of us was in plain view of the other. For the first hour or so all the duck flew across on his side, and I never got a shot. He, however, was blazing away merrily, and his shot were dropping like hail among the reeds all round us. My boy got a bit rattled at first, till I explained to him that, at that distance, dropping shot were harmless. After that he amused himself by collecting such of them as

actually fell into the canoe, until he had got a small handful of them.

Then the luck changed, and the birds began to fly across on my side. I hadn't fired more than two or three shots when I heard a distant shouting, and saw my friend signalling frantically. Thinking that this meant that word had arrived for us to move elsewhere, I reluctantly cast off and paddled across to him. When I was within earshot, I was greeted with a perfect storm of invective. What sort of man did I call myself to go out shooting? Didn't I know better than to shoot straight another man? Was I aware that it was only through the interposition of Providence that I hadn't killed himself and his Indian? and so on, *da capo*. When he stopped to take breath, I said mildly, 'It's all right, S., the shot wouldn't hurt you at that distance.' That started him off worse than ever. 'At that distance? Wouldn't hurt him? What did I know about distance? Didn't I know that distance across water,' &c. &c., and again he asseverated that only luck had saved him from death and me from blood-guiltiness.

When he had ended the second lesson I turned to my boy and asked him if he still had those shot. He had, and I told him to produce them. Then I explained, slowly and patiently, just how we came by them; that these were only a sample of what we had in the canoe at the moment, to say nothing of the copious downpour which had rained into the reeds behind us; that I had no reason to believe that my gun shot any farther than his did; and that, anyway, after I had been steadily bombarded for over an hour, I thought it was only fair I should have a chance to shoot back. My boy gurgled softly, and even his Indian grinned behind him. But S. never forgave me.

V.

Most of the swamps where we used to shoot and camp have now been taken up by 'clubs,' who have more luxury and less shooting. To repeat our experience we should have to strike farther north. Even in our time there was a so-called club whose members went regularly, year after year, to a point within two or three miles of one of our camps. As a matter of fact it consisted of half-a-dozen friends who had selected a likely spot and, so to speak, squatted there. They were a cheery lot, and we knew them all well. One of the party had a turn for mechanical engineering, and had built an engine for a tidy-sized launch, which took them down and back a bit faster than we could manage in canoes, though, to us, the canoe trip was half the fun. They were keen enough, in a way, but a bit lazy, and shocking bad starters. Five minutes in the early morning for a long canoe journey will often save an hour or more later in the day. They did themselves well, and usually had a fair supply of whisky, though they were

by no means hard drinkers. It happened one year that they had left the arrangements for the return trip to the last possible moment. The fact that there was more whisky still on hand than it seemed desirable to carry back to civilisation may have had something to do with this. Anyhow, it was pretty nearly dark before they got under way.

Their course lay nearly due north for a couple of miles along a narrow side-channel, and then they had to turn sharp to the left into the west channel of the delta to get into the main river. The country is perfectly flat, and there is hardly a landmark to be distinguished, even by daylight. By the time they got to the bend it was pitch-dark, and, once in the delta, they had to feel their way carefully in order to avoid snags and shoals. They were too cheerful to worry about it, and lay comfortably on deck on their tents and bedding, smoking, chatting, and chaffing the engineer, who poked up his head at intervals and demanded a small drink to wash the coal-dust out of his throat. She was steering beautifully, not a snag did they strike, and the engine was running as smoothly as even the engineer could desire. It was against stream, but at their ordinary rate of speed they expected to reach the settlement where they meant to pass the night in about four hours.

The time passed quickly, but at last some impatient member of the crew struck a match, looked at his watch, and wondered when they were going to see the lights of the village. Nobody paid any attention at first, and then another man began to sit up and take notice. He remarked suspiciously that they were taking a devil of a time to pass a particular bush on the opposite bank; he'd had his eye on it for the last fifteen minutes and they hadn't gained an inch. That scared them, and they all sat up and got busy. They were still at the corner of the first bend, where they had run her nose

right into the reeds, and for the last four hours they'd been bucking the mainland of the Dominion of Canada.

In a very few years I expect to see Old Country men establishing bungalows of their own over here. Besides all the indigenous small-game, they will be able to shoot pheasants, which were introduced from the Orient into the island of Vancouver, and have since spread to the mainland, and are steadily working east. Pretty much the same thing has been done, with similar results, in the case of the Californian quail. In 1908 a number of Hungarian partridge were imported into the United States. In April of the following year, and for some years subsequently, a number of these were brought into Alberta by the enterprise of local sportsmen. No shooting was permitted until 1913, and they are now there in thousands. They average about fourteen to the covey, and have been found to thrive in British Columbia.

The visitor from the Old Country may not find all the luxuries which attend some forms of shooting over there. He can hardly expect to have his birds driven to him, and he will probably have to work his own dogs and find his own game. He will probably like it. There will be no head keeper to tell him exactly where to take his stand, and he probably won't miss him. You won't find ponies to take you from one butt to another, but there's nothing to stop you driving all day over the prairie in a buckboard if you choose to do so. You will find that the dogs here will range a bit wider than you are accustomed to, having been trained to do so for this very reason. The dogs are bred from the best kennels in the United States and in the British Isles. Lastly, you will be seeing a new country, breathing a new air, and learning a lot of new tricks about shooting and other things.

THE END.

BLOOD AND SALT.

By JOHN EYTON.

I.

'FOR all thy days and their days, thou and thy sons shall seek to slay Kale Khan and the children of Kale Khan—sleeping or waking, sitting or walking, in the valley or on the hill—for that Kale Khan's father stole the daughter of thy father's father and so made enmity for ever—'

The words were spoken in Pushtu, strangely soft for such a message, by a father to his son. They were following a straggling flock of sheep along the stony side of a brown hill, near the source of the Tochi River, where Waziri land meets Khost. The father's name was Zikhariah

Khan, and the son's Yakub Khan, and both carried out in their faces the Hebrew quality—origin too, maybe—of their names. Each had dark eyes, deep sunk, low browed, close set; each a long nose curving disdainfully down and drawing up hard lines from the corners of the mouth to the nostrils; each a cleft in the forehead, caused by constant gazing into distances; each a thin upper lip, a thick lower lip, a little chin. In feature the son was the pattern of the father, and in stature he had the same promise. Their differences lay in this—Zikhariah was shaggy and red; Yakub was slim and smooth and dark. The former wore a brown pugaree carelessly twisted over his red

locks, which, roughly shorn, straggled in odd lengths on to his dingy white shirt. Round his body he wore a cartridge-belt, on his legs full pyjamas of the same hue as his shirt, on his feet cloth bandages lapped across and across. He carried a Martini rifle, slung over his shoulder for all to see, and a long knife, less visible, at his waist. He walked with free big strides. The son, a boy of sixteen, was clad in shirt and pugaree of dark blue—good setting for his smooth face and coal-black hair—and he carried a bow and arrow, half weapon, half toy. He walked behind his father.

Theirs was a hard life, set in barren ways. There was no wide companionship for them in a place where family feuds barred a semblance of free intercourse—where the fittest survived, like animals, through alertness, and alertness only. Their one interest in life was that interminable war with Kale Khan and his kindred across the valley which lay now at their feet—a deep red ravine, where a slender stream threaded the shingle and the rocks. Before he had seen six years, Yakub Khan had seen some of the fruit of that feud. He had seen his father stop dead on that very hillside, unslinging his rifle, and fall flat on his face. Instinctively he had followed suit and had seemed to understand why. He had watched a little figure among the rocks by the stream, and a moment later had seen that same figure crumple up and roll over, face to the sun. Then as a young leopard frisks first on to his mother's kill, he had run up to the dead man and dabbled in blood.

Since that day Yakub Khan had seen many men so crumple; seen, too, the spurt of red earth at his feet and heard the song of a bullet from across the valley. He had never been surprised. Death stirred him. Escape stirred him. The first made him hot, the second cold; but both sensations were born, as it were, with his blood.

There had been no schooling for him, as there had been none for his father. The only lore that father handed on to son was this daily, hourly, repeated legend of feud and fight and treachery, spread over three generations. This was the education of Yakub Khan, and this he might have handed on in turn to his own son, had it not been for one circumstance—he betrayed his blood.

II.

It happened in his eighteenth year. They had driven their sheep down the long road by Dardoni and Miranshah, Edak and Saidgi, to the sheep market in Bannu bazaar; and at the gate of the bazaar, called the Takhti gate, he had met face to face a dark girl riding on a donkey. She had sombre eyes, the colour of blue grapes, and a very perfect chin. He was on fire for her at once, and followed her and told her of his love, for she had looked at him

questioningly in passing. Nothing loth, she named a palm grove on the Kurram Road, and a time. Then she rode on.

But when he met her in the palm grove, and gave her roses for her hair and scented leaves, she was strangely backward. She would be wooed, not won. She put her fingers to her lips, and glanced at him mysteriously, and spoke of the morrow. She would not even say her name, for all he gave her his. Then she slipped away from him, and he turned in the gathering dusk for the road. Before he had gone ten paces he came face to face with his father.

There was a look on his father's face that he knew well—a drawn, hard look, such as he connected with the killing of a man.

'Know'st thou with whom thou art dallying?' asked Zikhariah Khan.

'She would not tell me,' his son answered.

'And with reason, for she is the spawn of Kale Khan—and thou art—a traitor.'

As he shot out that word, he seemed to gather himself for a spring. His thin hand went to the haft of his long knife—Yakub Khan saw death very near. There was no hope in argument, he knew well—no possible plea of ignorance. He had offended against the law.

He saw his father's hand fumble for an instant, as if the knife were caught in the folds of his clothes. In that instant he turned and fled through the trees, expecting to feel the knife-blade between his shoulders. He heard his father crash through the undergrowth in pursuit, and dodged to the right, and to the left, and to the right again. Then he knew that he was running alone. But he still ran.

III.

Yakub Khan had been saved from death, and Zikhariah Khan from being a second Rustum, by no greater thing than a loose pyjama string. He was doubly saved, did he but know it, for on the morrow the daughter of Kale Khan waited long in the grove, with a bright little knife concealed in her bosom—while, to make assurance doubly sure, Kale Khan himself was at hand, with a horse-pistol.

But Yakub Khan was far up the Tochi Pass by then. He joined the Dardoni Militia. Upstanding, keen-eyed, wiry, he had no difficulty in passing the recruit's test. Nor were his motives greatly questioned, for he was not the first who had walked warily in on a morning and asked to throw in his lot with the Sircar. Blood feuds and love affairs were among the main recruiting agents.

So in time he came to put on khaki, and, because he was wiry, they gave him a horse, and found that he shaped well. Time came when he went out on *gasht* (patrol) over the hills, riding in the little troop which picked its way among the rocks, knit to his lean, clever pony—as fine a figure as any.

He had qualities—as his squadron officer, Captain Agar, found. He was discreet, talked little, and gave no trouble. Further, he was as hard as the hills could make him, keen as a hawk with his eyes, and amazingly steady on the range. Soon he was tried as an Acting Lance Duffador—one stripe on his arm—and did so well, and had withal so quiet a manner of keeping order in his little charge, that thereafter he went from strength to strength. He became a jemadar—the youngest in the corps—and got his troop.

Captain Agar, who was a good judge of men, had a personal liking for Yakub Khan, for he had a quiet humour about him. The jemadar could touch tender spots when he was so minded, having been at pains to learn the family history of every man in his troop, without revealing his own. He did remarkably well, too, in an affair of pickets in the neighbourhood of Spinikaisura fort, when part of his troop turned doubtful. It was this affair that gave him the reputation of being specially reliable. Captain Agar, who had seen men go back after five, ten, fifteen years' service—refusing to die in uniform—would have bet long odds that Yakub Khan would never be one of them.

'Yakub Khan's ours all right,' he would say, when possibilities were mooted.

While Yakub Khan was rising in the estimation of his British officer, his father was not idle in the hills. Goaded by the thought of his son's apostasy, he made such havoc in the family of Kale Khan that he became quite a prominent figure on the border—where status is often judged by the number of nicks in the rifle butt. Five years had furrowed his forehead deeper, flecked his red beard with gray, hardened his eyes, and drawn the blood from his lips. But five years had quickened his mind. He was a lone figure, with no axe to grind, and, moreover, with a pleasing quality of sheer implacable hate that appealed to the tribal *jirgha*. They liked sting and fire in a speaker.

But when he learned that his son was eating the salt of the Sircar, he came into his own. He began to preach *Jihad* (Holy War) as it had never before been preached south of the Kurram. Men called him 'mullah' then.

His word went forth through the hills, and the bitter and the hard-faced and the hungry came in to hear him, and hearing him, stayed. Little by little a *lashkar* (force) of some six hundred men was collected. Zikhariah Khan was one of the leaders, and he saw to it that the objective should be Dardoni fort—the walls that held his son. In all that motley band he was the most single-minded, for, whereas others had come in for excitement, or loot, or advancement in this world or the next, he went out to bring back his son's head. Nothing less than that, he felt, would wipe out the stain.

The *lashkar* was led swiftly and silently

across the hills, to occupy a series of rough stone *sangars* (entrenchments) commanding the Dardoni plain. These *sangars* were sited on either side of the gorge which opens on to the wide expanse of grass and shingle, treeless and waterless, in which the fort stands.

So, on an evening in October, the fort patrols brought in word of men swarming into the gorge from the west, dotted already on the hill-sides. And, at the same time, the tribesmen were looking down on the high walls of gray mud, and the square perimeter, and the barbed-wire entanglement which constituted Dardoni fort, and sighting their rifles for sniping. As night fell, a bullet whined high over the transport lines. The night was still and starry. The hills were black shadows, the plain a sweep of gray. But far up in the gorge little lights twinkled like red stars as the tribesmen lit their fires.

IV.

The officer commanding the garrison preferred to fight by day-light. He was quite content that the tribesmen should eat their dinner, so long as they would permit him to eat his. In fact, it was practically an understood thing that there should be no serious business before dawn. All night the fort looked very quiet. Not a light showed. There was no sound of men. Only occasionally in the transport lines a mule scuffled, or a horse whinnied. But, in the small hours of the morning, two companies of infantry, under Captain Beasley, stole silently through the east gate and wound, like a long ghostly snake, up a path behind the hill. It was their duty to take up a position in the rear of the enemy.

Then, just before dawn, Captain Agar's squadron of mounted men moved out by the west gate, with a clank here and a jingle there, but no sound of voice. As soon as they were clear of the perimeter, the first troop dropped into a trot and went forward to patrol the advance, two sections flitting away to right and left to cover the flanks.

The first troop was Yakub Khan's.

V.

The rest of the story is best told by Captain Agar himself, since he wrote of it—in a letter to his father in England—with the event still vivid in his memory.

After giving the dispositions and a short account of the local features, with a rough sketch, he continued as follows:

'We were across the plain before there was any light to speak of, and I doubt whether they saw us before we saw them. Yakub Khan was well ahead—say a hundred and fifty yards—and had got his troop nicely extended. I kept well up, for I was anxious to be in touch with Yakub Khan. As you will see from my sketch,

the plain narrows into a steepish gorge west of the fort, and the *lashkar* was dotted about along the sides of the hills overlooking the gorge. I believe they had all been asleep, but they evidently woke up when Yakub Khan approached the gorge, for there was some wild shooting, and I could see a few old shaggy warriors bobbing among the rocks. Then they saw the main body, with the result that there was a lot more shooting, and the hills were like bee-hives. However, they stuck to the high ground. Yakub Khan wisely dismounted his troop and got his horses away. I did the same and extended the squadron.

'Well, it was a case of advancing by short rushes and making much ado about nothing till old Beasley should get busy in the rear of our friends—and this we proceeded to do. It hotted up pretty quickly, and I got orders from Creighton to withdraw—on to the main body. In fact, I was just instructing my signaller, when the really dramatic event of the day happened.

'An old chap with a great red beard—tall as Tiwana—suddenly shot up from behind a rock and came jumping down the hill like a markhor, yelling and brandishing a sword half his own length. He headed straight for Yakub Khan's troop. I simply cannot describe the agility of the man, nor his utter disregard of danger—for the troop were plugging it in hot and strong—but on he came, his clothes fluttering, as if he had wings, his eyes staring, and his great beard blowing out like a flag. I think both sides stopped to watch him—I know we did—expecting every moment to see him roll over like a rabbit with a bullet in his head. But he had a charmed life, if ever any one had. He came right on to the troop.

'Then we all gasped. Yakub Khan came out alone to meet him. I thought he had gone mad.

'You know I thought a lot of Yakub Khan—brave enough, but with more commonsense than to expose himself for a star turn like that. I couldn't believe my eyes when I saw him doing the V.C. stunt on that old madman of a mullah. But there was more in it than I knew of at the time, and I sha'n't blame you if you take a pinch of salt with this.

'Yakub Khan had nothing in his hands.

'When they were five yards apart, both of them stopped dead. The shooting had died down. I am sure that every man in the hills, and every man of ours, had his eyes starting out of his head over this *tamasha*. I know I had. I heard old Beasley's men open the ball far ahead, as if I were hearing something in a dream. For five minutes we completely forgot our battle, our horses, and ourselves. I know you will say that I deserve to be court-martialled—but I couldn't help it. I was watching the most absorbing play I ever saw.

'Well, as I say, they stopped and faced each other. The old chap raised his sword, looking like a picture of some biblical warrior, and Yakub, with a sort of dramatic gesture, pulled his coat open, literally baring his breast for the blow. So they stood, the one threatening, the other inviting, for what seemed ages. They must have spoken—though God knows what they said—for the old man pointed at Yakub, and Yakub in a sort of frenzy began tearing off his kit—one thing after the other. In a second or two he was standing there in his shirt. I understood that. He was not going to die in uniform. But why?

Then it ended. Yakub Khan seemed to urge the old chap to make a job of it, for he moved forward a step. The red-beard waved his sword. I could see it flash. Then it fell with a clatter among the rocks. He had chucked it away!

'You won't believe it, but those two fell into each other's arms. Then, in a second, they parted and dodged up the hill and out of sight—my best troop officer and their leading mullah, Dad! Father and son!

'We made hay with the *lashkar* after that, but we never saw that pair again. They must have wriggled away together through the hills—and, knowing one of them and having seen the other, I'm not surprised. But the romance of it! No one talks of anything else. The battle's a mere side-issue. Already there is a new Border legend—a true one this time—of how a father and son quarrelled, of how the son ate the salt of the stranger, but the father raised *Jihad*; of how they met, and both were so brave that they couldn't kill each other, and how, after all, blood tasted stronger than salt.'

GHOST SHIPS.

IN the star-strewn hours of midnight,
When the world is wrapped in sleep,
I think the ghosts of all old ships
Arise from out the deep;
With sails of cobweb fineness,
And masts of beaten gold,
Merry crews on every deck,
Lost cargoes in each hold.

And many a valiant sea-lord,
Drowned in the long ago,
Returns from some far haven
To the barque he used to know.
Not all the countless ages
Could lull their hearts to rest,
And their slumbering souls give answer
When the sea-call thrills each breast.

So, when the moon is waning,
O'er the highroads of the sea,
And the singing winds bring echo
Of some mermaid melody;
When in the hush of morning
The stars pale one by one,
The phantom fleets go sailing home
To ports beyond the sun.

SEVENTH SERIES

WATCHERS ON THE HILL-TOP.

A MIDSUMMER NIGHT FANTASY.

By HILDA SKAE.

MIDSUMMER NIGHT.—In the obscurity we cannot see the fern seed freckling the under side of the fronds that brush against us as we climb. The shortest night of days long past no doubt saw bonfires on all the heights, and young men and maidens trooping from the village yonder to take part in ceremonies whose meaning was lost in the mist of ages; mysterious rites through which their forebears sought to propitiate forces of good and evil. In the half-ruined priory within the churchyard walls the prior and his military monks held the vigil of St John, patron of the day and of their order. In the palace by the drowsy town may have lain a king of Scotland, with, perchance, a beauteous queen, sleeping the sleep of the just after a long day's hawking with their ladies and nobles—for we are looking down upon part of the ancient hunting-ground of the Scottish kings.

Stone pillars, still erect, mark the boundary of the sanctuary where fugitives might claim the protection of the monastery in bygone times. In the hall, traced now only by a row of crumbling stones, no longer do the Knights Hospitallers give stately entertainment to emissaries from the mother-house in the far-off islands of the south, or on cold winter nights afford a shivering outlaw a warm meal and a seat by the fire. Roofless walls are all that is left of the palace where the lovely ill-fated Queen of Scots first saw the light, while her father, dying on the other side of the Forth, muttered of his heritage, 'It cam' wi' a lass and it will gang wi' a lass.'

The oak and the pine that sheltered the tracks followed by king and noble chasing the deer are gone. New villages have arisen; the solitude has become peopled with farms and manors; but the peaks of which they caught glimpses from the forest glades still rise towards the sky. Fantastically shaped summits are among them, outlined against a heaven where in the summer-time night subdues but does not altogether conquer the forces of day. The scattered woods on valley and hillside are derived, it may be, from the very acorns that dropped at the feet of king or churchman

when duty or pleasure took him through the forest.

The hush of a summer night broods over the vast panorama. In the hollow sleeps the house, nestling among its trees. From its chimney a drowsy trail of smoke wavers up in the air. On this side the woods climb steeply up to a little below the crest of the hill, where granite crops up, gray and lichen-clad, among the heather and the juniper bushes. Perfumes of wild growths hover around. Through the stillness faint sounds are creeping: the windless, stirring of trees; the far-off movement of water; and, nearer at hand, the breathing of cattle and of black-faced sheep asleep among the boulders.

The night sky looks tranquilly down upon far-off streaks of blue, indicating the course of the river, the 'mazy Forth' whose windings are partly concealed by the irregularities of the ground. Towards the east broadens out the wide estuary opening upon the North Sea, its banks studded with towns and villages and its waters with dim islands. On the farther side sleep the Ochils; and scattered chains run westwards until they join hands with the Campsie Fells and with the mountains of Rob Roy's country. Above their ridges in clear weather the Highland hills rear their lofty summits against the sky.

The wide strath, meeting place of Highlands and Lowlands, has been the scene of immemorial strife. Far in the west glimmers faintly on its rock the castle of Stirling, built to hold the turbulent clans in check. Walls and battlements are steeped in traditions of Mary, Queen of Scots; of her helpless infancy; of her impetuous wooing by Darnley. Down below, among the shadows, sleeps the field of Bannockburn, where the freedom of the north was won. Just visible in the summer twilight, the Wallace Monument watches from its crag. Jacobite and Hanoverian met in strife among the uplands; then a century and seven decades of peace was broken into by the Great War.

Over the sleeping towns and villages the eye travels to where, below the mighty span of the great bridge only discernible now as the faintest tracery in the darkness, the fleet of the Empire

kept its unresting watch. The war vessels are dispersed now; the iron nets have been removed from the mouth of the river; aeroplanes no longer hover night and day upon the horizon; once more the strath sleeps in safety.

A wandering breath stirs the leaves of the copse, answered by a movement among the trees of the old house. A sigh passes. On a low height stands out in the obscurity a pillar that has not long been there. Other memorials, dwarfed by distance, come dimly in view beside villages and on the heights, silent witnesses, pointing upwards to the night sky.

The scars of war heal slowly. Of the great houses slumbering beside their trees but few shelter the same sleepers that lay there before the War. The old manor that lies in the hollow, breathing comfort in its placid sleep, has not long been the dwelling of the watchers on the hill. Inhabited by a joy-loving and open-handed race for so long that warmth and geni-

ality seem inherent in its very walls, it knows its former masters no more. He who was the heir sleeps in Gallipoli; his only brother beneath the waters of the North Sea; the old man was carried to where the Knights Hospitallers rested before him and lies there—the last of his race.

New faces are in the old homes. The cloud-vapours wreath and disperse themselves dreamily beneath the midnight sky. The Wallace Monument keeps watch and ward upon its hill; the Castle looks down upon Bannockburn; and by a sudden transformation for an instant all seem to become memorials, silently asserting themselves in the glimmering summer night. There is a whisper among the leaves; a breath of wind passes, precursor of the dawn; the night has become magical on the vigil of St John and the turn of the year—and there is fern seed on the under side of the fronds in the wood.

A GIPSY OF THE NORTH.

CHAPTER XVIII.—THE MAN IN THE WOOD.

'If ther boy only has ther sense——'

In the stillness of the northern night, with Norma sleeping on the farther side of the fire, Roy Carwyke sat watching the sick man, and listening with pity to his delirious outbursts. To what did he refer? Were there other things in the ex-whaler's life of which he had not spoken, relationships that had nothing to do with the bleak life of Unapik, but that forced themselves upon him in these delirious hours, or——

'I been sorta father an' mother to ther kid.'

As the words broke on his ears Carwyke understood to what boy the other words had referred, and smiled a little when, looking across the fire at Norma, he thought of the news he would have for this self-constituted and faithful guardian of the girl. Billy would be pleased; it would do him a world of good when he was able to hear it; and Roy found himself wishing that he could in that very moment convey the information to the faithful fellow's fevered mind.

Billy fell silent again. For a time the watcher imagined that he was sleeping naturally, and lighting a pipe, became immersed in his own thoughts. Twenty minutes or so crept by, then he was startled by sudden laughter on the part of the sick man, and heard him say chucklingly, 'It'll be a fair knock-out when I tell him, but I ain't going to do it till——' The sentence went unfinished, but a moment later a new one was begun. 'He'd cut his tongue out first if he knew! Ther durned pride. . . . It fair passes belief thet a nice feller can be such a fool.'

Again the sick man's babble dribbled away to silence, but it left Carwyke wondering. He had no doubt the words referred to himself, though their meaning was hidden from him. But what odd thought was it that had moved the sick man to this delirious merriment? Was it of something conjured up by his fever-ridden brain, or was it of something that had external reality? He could not guess, and, hoping to find some help from the other's ramblings, he listened carefully, but in vain.

Now Eskimo Billy was on a seal hunt, and in his excitement it was as much as Roy could do to hold him down; then he was back in the past, whispering words of amazing tenderness to that Eskimo girl for love of whom he had chosen to live in the igloos of her people on the bleak Arctic coast; another time he was living afresh through quite recent events; and once he gave a hoarse cry that reached Norma—half-awakened her, so that she turned in her sleep.

'Ther Russian, by——'

There were other things, revelations of the man's most intimate life, broken references to things he had endured in grimy fo'c'sles, to his far-away boyhood down in the blue-grass country, to Mr Mannering, with whom he was arguing some serious point, and interspersed among them were mere strings of disconnected words, inarticulate sounds which stood for words that went unshaped. But there was no reference to anything that would help to elucidate the problem set by his previous words, and though Carwyke listened with exceeding carefulness, he learned nothing further. Presently

a silent spell took the place of the fevered volubility, and after wondering for a long time without advancing any nearer to the heart of the mystery, growing a little cramped, Roy rose, and walked to the edge of the camp.

The northern horizon was aglow as if with the reflection of some great volcanic fire; and whilst westward the sky was of duller hue, to the east it was like ruddy gold. There was a faint murkiness in the air—a suggestion of damp exhalations, which, however, did not obscure the view of the hills and the long woods or the straight reach of the creek above the spot where the camp was pitched. No living thing gave any sign of its presence, and the ripple of the water merely accentuated the oppressive silence. In his wandering and solitary life as a prospector he had moved often through such silence, and had grown accustomed to it; but to-night as he looked southward with contemplative eyes, he would have given much to have heard that silence shattered by the roar of the trans-continental express, or the clamour of steamers' bells and sirens. It was so far to the point where the wilderness merged with the cultivated places, and he had not the vaguest idea whither the river they followed was leading, except that it was bearing steadily southward.

He stared across the river to the silent woods, a grave thought in his mind. If they were delayed many days a winter in the woods would be inevitable, and the terrors of such a winter he knew well. One thing, however, brought consolation. Both Norma and Billy were accustomed to the extremest of all winters, and here among the wooded hills no storms could equal those which raged across the open tundra. They also were children of the wilds and—

A musk-rat splashed in the water, the plop of it breaking the intense silence. In the same instant there was the sound of movement behind him, and, turning swiftly, he saw Norma moving towards him. He went to meet her, a protest on his lips. 'It is not yet time, Norma—'

'No,' she interrupted, with a smile. 'But I awoke, and, as I cannot sleep again, you must rest while I watch Billy.'

'But—'

'I insist; and again the smile came on her face. 'You are my man now, and it is my duty to cherish you. I know how tired you are, Roy, and I will not lie down again until you have slept. So there!'

'Rank rebellion,' he said, with a laugh.

'No; commonsense. If either of those two men is following he will not be here yet awhile, and in case it should be possible to continue the journey to-morrow you must have rest, or we shall not be able to go fast or far.'

He was compelled to admit the cogency of her words, but glanced towards the sick man doubtfully. 'I am afraid we shall not be able

to start in the morning. Billy will be in no condition to travel.'

'Possibly not. But if those men should come to-morrow and find you worn out—'

He set his hands upon her shoulders and laughed. 'You shall have your way, Missy. I did not think you could be so insistent.'

She flushed a little, but made no reply, and he spoke again. 'You must wake me if anything unusual occurs, or if you require help with Billy. He is quiet now, but he is likely to be delirious—'

'I shall not be afraid,' she said simply, 'with you at my side.'

Her confidence in him moved him even more than his answer betrayed. 'Please God, you shall never need to be.'

He kissed her once, and together they returned to the fire, the girl seating herself by the sick man, and Carwyke rolling himself in a blanket, to pass into sound dreamless sleep almost immediately. Three hours later he was awakened by the girl's low-voiced cry. 'Roy! Roy!'

He sat up immediately, all his senses alert. 'What is it?'

'I heard a rifle-shot.'

A second later he was on his feet. 'Are you sure, Norma?'

'Quite sure. It came from the woods up there.' She waved a hand northward as she spoke. 'It was a long way off, but I am sure it was a rifle-shot.'

He looked at her doubtfully. She was a stranger to wooded country, where sounds often occur that might mislead unaccustomed ears. 'Perhaps it was a dead tree falling. In these woods—'

'No,' she interrupted positively. 'I am sure the sound came from a— There, again!'

Right on her words had come the sound that to Carwyke's experienced ears was unmistakably made by the discharge of a rifle.

'You heard?' Norma whispered. 'It was—'

'Yes. But, as you said, it is a long way off.'

'But who can it be?'

'Some Indian hunting—or a half-breed trapper. There must be such up here, though we have seen no sign of any. There's nothing to worry about, Norma, dear.'

'No; but—'

The distant rifle spoke again, and on the heels of it came a series of fainter reports, then once more the deep unbroken silence settled on the world.

'What is it?' she whispered, as she caught sight of his face. 'What does it mean?'

'How can I tell, dearest? Except that it seems clear that at least two people are firing, and that one of them is using a pistol, there is nothing to be known.'

'You think they are fighting?'

'I don't know. It is a queer thing to happen up here. It may mean that Standifer and Bull

have met. Whilst we were in the church Bull may have got hold of a rifle.'

'Perhaps they have killed each other,' she whispered hopefully.

'The Kilkenny cats, hey? It may be so. Bull was no friend of Standifer's. If it is so, all the better for us. Or, if only one of them has survived, it will make things easier—though we shall not yet be out of the wood. There is one thing, however, that is rather disturbing.'

'What is that?' asked Norma quickly.

'It is that they should be within sound of a rifle-shot of us, supposing that they are behind the shooting. We travelled a long distance yesterday—thirty miles at least—and they could not have made a third of that distance through these woods, and if they had built a raft they would have travelled little faster than the current, which means that one of them must have secured a canoe. When I carried you from the church there was no canoe at the landing. Probably all had been withdrawn to prevent you or myself or even Mardock escaping. In that case Standifer might know where they were cached, and, finding things going against him, may have secured one and made his getaway.'

'But he must have been in front of us.'

'Not necessarily. He may have made a line in the woods, carrying the canoe with him, and launching it out of sight of the village. He would not be able to move very fast on the land, and we may have been well down the river before he reached the bank again.'

'In which case he would be behind us?'

'Yes.'

A look of trouble came on the girl's face. 'Oh,' she whispered, 'I hoped we had done with him for ever!'

Carwyke laughed reassuringly. 'I imagine we have, in any case. Standifer cannot know of Billy's sickness, and if he has a canoe and is able to travel, he will drive it down-river on what he believes is our trail. He will scarcely stop to explore all the creeks on his way down. It will be some time before he discovers that we are not ahead; and by that time his own safety may have become his first concern.'

The troubled look on Norma's face persisted. 'He may wait for us.'

'He may—but I do not think it likely. He will know what it means if the summer passes and he is caught in the heart of Alaska unprovisioned and unprepared for the winter, and he—'

A little spate of delirious words broke from the sick man, and as both turned to look at him, a new fear leapt in the girl's mind. 'And if we are caught—'

The man laughed with forced lightness. 'Oh, I am an old hand in the woods, and both you and Billy are accustomed to Arctic winters. We shall have to build a cabin and hunt for

our meat. There must be plenty of game up here—'

'We have seen little,' broke in Norma.

'True; but when we look for it we shall find it, and the dark months will pass quickly enough when we are together.' He laughed again as if he found the prospect as cheerful as it was really bleak, and then, as she continued thoughtful, he hummed a line of the woodcutters' chanson—

'Here shall I build my cedar house—'

'What is that you sing?' she asked, diverted from gloomy thoughts, as he had hoped she would be.

'It is a song I sang to myself on the first morning after our flight from Unapik. You turned and looked at me just before I left the camp, and that song came to me as I walked up-river, though I had not thought of it for years. Let us sit down by the fire, and I will tell you of the dream of mine it voices.'

The girl sat down and, seated at her side, Carwyke told her of the home he hoped they might together build after she had seen the life of cities. Deliberately he painted his dream-house in glowing colours, and Norma, her fears forgotten, listened enchanted.

'I know there is money waiting for me, so there will be no difficulty—'

'Oh,' cried the girl, 'it will take much money?'

'A fairish amount,' he answered, with a smile.

'But there will be no difficulty, no?' laughed the girl gleefully, and clapped her hands.

'I hope not,' answered the man. 'The mine in which I have a half-share promised well, and the man who was working it is an honest man.'

'But even if your mine hasn't been a success, we shall still build our cedar house,' said Norma, with joyous confidence.

'Yes,' he said; 'it will mean harder work, and—'

'No! No!' she laughed. 'We shall wave a fairy wand, and, like the city my father used to speak of, our walls shall rise to music.'

(Continued on page 421.)

DAWN.

Now the gray tide of dawn has brimmed the hills,
 Paled the blue deeps of night, and drowned the stars.
 The shadowy bowl of earth is vast and dim,
 And low upon its brooding rim sleep the long hills
 Wrapped in the mist of morning-time,
 A broadening band of gold along the East
 Made tremulous through wind-stirred leaves,
 Long bars of rifted cloud of palest lavender,
 And then

A silvern rill of sound into the cup of silence falls,
 A thrush among the aspens, and the faint sweet
 scent

Of lilac wet with dew.

The Eastern pines are stirring in a golden haze,
 And so there dawns in fragrant peacefulness
 Another day.

A DAY WITH THE HAUSHABI.

I.

IT was my misfortune during the winter of 1918, immediately following the Armistice, to find myself part of a small mixed column trekking aimlessly about the Aden hinterland, showing the flag, and generally mopping-up the remaining small isolated Turkish posts, which up till then had not surrendered, by reason of their being too far from any allied garrison.

About Christmas, the column being in semi-permanent camp, I availed myself of a few days' leave to penetrate north into the tangle of arid mountains which form the link between the well-cultivated lands of the Lahej delta and the highlands of south-west Arabia. Besides enjoying a bit of rough shooting, I wanted to explore the wadis* and passes debouching into the fertile Lahej oasis, and also to cement a friendship, started many years before, and considerably strained during the War, with the sultan of the protected tribe immediately adjacent to British territory.

Christmas week saw the three of us (myself and two sporting doctors, equally keen on probing the little-known) camped in the rocky plain at the foot of Jebel Manif, the first of the many peaks rising sheer out of the surrounding desert. The camp was pitched at a suitable distance from the wadi, the happy hunting-ground of the most malicious anopheles; shade being a negative quantity, the surrounding rocks and hills reflected the sun's rays with the intensity of a frying-pan. Our work, however, for the past few years had not led us along the paths of luxury, or even comfort, and the misery of the long hours while we lay beneath our tent-flaps, and the heat simmered on the plain and the frying-pan dispensed its lingering charms, was forgotten in the enjoyment of the hour when the sun dipped behind the ridge of the *jebel*,† and we stretched our sunburnt limbs and sallied forth to enjoy the last few grateful hours before darkness enveloped the valley.

It was at the close of one of those evenings that, trotting back to camp thoroughly pleased with our mixed bag of pigeon, sand-grouse, and teal, we saw from a distance that things were not normal in our small camp. Where we had left a couple of sowars and a cook, there was now a large knot of people, evidently Arabs, from the flutter of white clothes. Increasing our speed, we swept down on the crowd which had dared to penetrate the privacy of camp, and kneeling our camels outside our tents, dismounted and strolled over to see what the fun or the trouble was. A respectful crowd of *jebellis* ‡ parted as we drew near, and we learnt that Ali Mana, the

Haushabi sultan, hearing of our proximity, had come down from his mountain stronghold at Musaimir to meet us, and hoped that we would return with him on the morrow and accept his hospitality, as he hoped to accept ours this night.

As this was the very fellow we were out to fraternise with, we accepted forthwith his invitation, and departed to gather together my most knowledgeable sowars to deliberate on what special preparations the occasion demanded. Ali Mana was resting for the moment in a tent vacated for his use; there was therefore a small respite for the local entertainment committee to consider the necessary social obligations.

It appeared inevitable to kill at least two sheep to feed him and his followers, who numbered some twenty, also to prepare a more comfortable tent, and to mattress the ground for him to recline on, chairs being yet quite uncouth in Musaimir. Local musicians and dancers were summoned from the neighbouring villages. This was too easy, as it had been with the greatest difficulty we had avoided the nightly attentions of the local choral society, whose terpsichorean efforts we had unfortunately encouraged the first night, and deeply regretted each successive night.

A bath, a change, and then the sunset drink beneath a star-studded sky, a delicious breeze rustling down from the hills compensating for the tortures of the day. All the discomforts and long hours of torment by sand and sun are forgotten when the desert thirst, nurtured throughout the whole gasping day, comes into its hour at sundown. At peace with the world we awaited the coming of Ali Mana.

II.

There were the usual salutations and a good handshake, and soon we were all chatting on the best of terms. Dressed very much like any other hill Arab, only in rather cleaner cloth, with a lean wizened face, short red beard, and thin wiry frame, Ali Mana explained to us that since the Turkish occupation of the delta he had had no opportunity for intercourse with the British, and welcomed this chance of reopening friendly relations.

We were very careful not to dilate too fluently on these relations, as since the Turks had crossed the Anglo-Turkish boundary and marched south through the Haushabi country, and we had not extended to the Haushabi the protection promised by treaty, nothing remained for them but to throw in their lot with the invaders, or have their crops, villages, and herds wiped out. For the last four years this tribe had therefore been fighting actively against us, not of their own free will, but because any other course meant

* River-beds.

† Mountain.

‡ Hillmen.

extermination, the Turkish expedient in such contingencies.

We were now in the ascendant, hence the desire of the under dog to lick his new master's hand. We were therefore very careful during our stay with the Haushabi to refrain from allusions which might conjure up the past and recall memories of faithful tribesmen and villages bombed out of existence by our planes.

The sultan left us at the hour for the evening meal, and joined his tribesmen round a large fire kindled in one corner of the camp, presumably to fall upon the fatted sheep which had been killed in his honour. Towards the end of our simple meal the wailing of an Arab pipe and the insistent throb of a tom-tom announced the arrival of the local musicians, and we joined the crowd round the fire, in the vain endeavour to show interest in the monotonous gyrations we had witnessed so often before.

There is no evolution in the Arab dance, and like all Eastern dances it is guaranteed to bore one rigid after the space of time it takes for the novelty to wear off. There is nothing of the sensuous undulations, the spotless diaphanous clothing, and the gorgeous setting of an Eastern dance so familiar to the London theatre-goer. The oriental imaginings of a London producer are no more redolent of the East than the Savoy characterises a Limehouse lodging-house.

The setting I have always in mind of an Arab dance is, above all, the vault of star-studded sky, the flames leaping up from the *jowari**-fed fire; the circle of faces in the glow of the firelight; the cross-legged musicians nursing their instruments, and coaxing out a discordant monotony of notes; two or three of the oldest female inhabitants busy warming the tom-toms, to stretch the skin more tightly over the frames.

The dancing couple are as serious as any couple at a sergeants' dance, the next dancers treading time to the music, awaiting their turn to enter the circle of light, each man with his *jambia*† held point downwards on the thigh, fingers interclasped with his partner's in true Western style. Of the onlookers, some are tensely excited, some asleep, but all are imbued with the unquenchable spirit of the East: we are prepared to sit here apathetically happy until the dancers tire, or we fall asleep.

We distribute largesse among the crowd, and intimate that it is our pleasure the entertainment should end. This is necessary, otherwise they would dance and the musicians play till dawn. The fire is quenched and the crowd breaks up. A ceremonious good-night to the sultan. The bed beneath the open stars stands ready. The last impression before losing consciousness is the breath of the desert wind on one's cheek, and the occasional challenge of a sentry from the heights above, where the sultan, never

trustful in the night watches, has placed his tribesmen.

One is on the very threshold of sleep when an appalling din from a neighbouring tent brings one to one's feet, groping beneath the pillow for a revolver. One hoarse voice insists above the murmur of others, and calls upon many unknown Arabs for help. Voices answer from the rocks above, and camels and goats join in the general pandemonium. It only wants one shot from an over-excited Haushabi and our little party will have ceased to exist.

We rush over, and find the greatest volume of sound issuing from the guest-tent, in which we discover an indignant sultan ripping into fragments with his *jambia* the mosquito-net which kind and thoughtful hands had endeavoured to lower around his wizened form. We explain that, far from endeavouring to net him in its toils, our one kindly thought was to preserve his epidermis, almost bullet-proof after fifty years in the Wadi Tiban, from that dreaded scourge the anopheles.

Our explanation accepted, but still mistrusted—I noticed two of his followers remained within call—we again seek the comfort of our flea-bags, and mentally condemn all sultans to die a painful death.

III.

We were astir with the first glimmering of dawn, the camels loaded and all ready for a start long before the first rays of sunlight lit up the sombre valley. The tribal pickets had been called in from the heights and were gathered in a chilly knot around the fire. We decided to push on ahead with the sultan, attended by our orderlies and two of his bodyguard, and leave the baggage and the remainder of his men, who travelled on foot, to follow more leisurely. Ali Mana was riding a small, useful Arab stallion, which cantered just ahead of us over rocks and pebbles, a great revelation as to what an unshod horse, bred to it, can do over hard ground.

We travelled by the same route taken by the Turks in their march from the Yemen into the Aden hinterland in August 1915, by the rough and stony track over which they brought their horse, foot, and guns through an almost sterile country at the hottest season of the year, a remarkable feat of audacity and endurance, the feasibility of which was dismissed by local intelligence in their appreciation of the military situation by the words: 'Invasion of the Aden hinterland from the land side is extremely unlikely and practically impossible.'

This very route was travelled by Husein Bey, Bimbashi of the Sanaa military district, in October 1913, ostensibly in order to arrange Turkish credit with the Aden merchants. He avoided the Aden authorities and returned by the above route *via* Mawiyah and Taiz, alleging that the usual thoroughfare by way of Mokha and Taiz was

* Sorghum, or Indian millet.

† Knife.

closed by the tribes. There is no doubt that this journey was in the nature of a strategic reconnaissance.

At occasional halts we came on piles of used cartridge-cases, where over three years ago the local Arab friendly had put up an ineffectual resistance, hourly expecting promised British co-operation. More especially were these in evidence near the ruined watch-tower of Tannan, where the track narrows to a few feet, the gloomy, inhospitable ranges of *jebel* towering on either hand to well above three thousand feet. Hold this and you possess the key to unlock the door to the Lahej oasis, and eventually the fortress of Aden.

As we trotted along in the shadow of the great ridge running east and parallel with the track, bunches of Haushabi tribesmen left the rocky peaks on our left and ran forward to greet the sultan with their customary salutation, kissing him behind the knee, and then joined in the ever-increasing cavalcade behind. It transpired that these precautions were necessary to prevent molestation from the Subaihi, an adjacent unfriendly tribe ever ready to plunder a Haushabi *kafila*, and only too anxious to test a newly-acquired Mauser on the august sultanic person.

Past Jol Mudram, where the village turned out to give us a great reception, the majority of the local youths running alongside us for a mile or so, occasionally loosing off their rifles into the air, the bullets raising the very hair from our scalps, and the adjacent hills ringing with sound.

The subsequent route followed can bear little description. A typical Arabian hill-track, strangely reminiscent of the North-West frontier. Rugged boulder-strewn heights, sparsely covered with mimosa and acacia bushes, loomed on either hand; underfoot the rocky apology for a track occasionally dipped steeply into an arid wadi. Dreary and deadly monotonous, almost menacing, a lifeless country devoid of vegetation or game!

After several hours of increasing heat we passed beneath the frowning buttresses of *Jebel Mana*, and descended once again to the cultivated bed of the *Wadi Tiban*. The appearance of crops denoted the proximity of a populous village.

After many lean months spent straining one's vision over white, hot deserts the eye rested gratefully on the bright green *kirbi*. Here we met the first outpost from the village, presumably placed to warn the inhabitants of *Musaimir* of our approach. His method was to fire off an antiquated rifle over our heads as soon as our backs were turned. I always maintained it distinctly unfair, but, in the light of after events, it served to prepare us, or rather to further unnerve us, for what was to come.

From the top of the far bank we could see the village, about a mile up the rocky valley, and the sultan cantered forward to prepare his

subjects' welcome. As we drew near the collection of stone and mud huts clustered round the central keep we saw that the mass of the female population were gathered on the roof towers, and the males at the gate leading into the courtyard of the palace, if it may be so termed.

To our horror we saw a guard of honour of some twenty *jebellis* raise their muskets in the air to accord us welcome; some few merely fired from the hip, and the valley rang with the roar of the discharge and the whizz of the ricochets.

IV.

We dismounted in the courtyard, and were conducted to the winding staircase leading to the first floor. At the foot of the steps our attention was drawn to a brass cannon, a present from Queen Victoria to the late Abdali Sultan as far back as 1860, captured by the Turks, and handed back again on the Armistice. We passed it hurriedly, with many a backward glance lest it should emulate the example of the solitary sentry in the wadi and the guard of honour. Climbing the winding stairway, we found ourselves in an open veranda leading into several well-garnished rooms. Into one of these we were ceremoniously ushered, and there left to our own devices.

A look round showed us a well-swept room, devoid of all furniture save a confusion of cushions and mats of divers colours heaped upon the floor. Choosing two or more apiece, we were soon reclining in perfect oriental comfort, removing putties and boots from tired limbs, and opening up our scanty store of bread and tinned food. An unceremonious entrance of the *daffadar*,* to warn us of the approach of food, resulted in a panic to hide the already opened stores and bottles.

To produce our own food was a great breach of manners, so, hastily tucking it out of sight under the cushions, we lay back in feigned unconcern and true oriental indifference to food.

A small procession entered, bearing Arab mats heaped high with curried chicken and meat, honey, chupatties made from local *jowari*, thick savoury soup and mountains of rice. A mat apiece by way of a plate, and we all helped ourselves from the central pile of food. In the absence of cutlery we had recourse to our fingers, intense hunger adding zest to our meal.

The only means of conveying food in any quantity to one's mouth was to roll a handful of rice into a ball, dip it in honey, and then gather what one could from the surrounding dishes by a process of capillary attraction. By this time the overcharged rice-ball was stone cold. At the termination of the meal we were well up to the elbows in honey and gravy, and the greater part of our faces a congealed mass of chicken

* Cavalry sergeant.

and rice. Nevertheless I have seldom tasted such a savoury mess, and we issued forth to wash in one of the many *chatties** placed outside for our use; our ablutions were watched with interest from the roof-tops by the entire Haushabi harem.

With distended stomachs, swathed in our mosquito-nets, surrounded by the debris of the fly-blown feast, we stretched ourselves luxuriously on the cushions and slept the sleep of the overfed until the heat of the day had abated, when we issued forth with an escort of twenty hillmen to scale Jebel Musaimir, a rocky eminence rising steeply on the far side of the wadi west of the village.

An extensive view stretched north, up the valley, dominated by the towering peak of Jebel Warwa. A cluster of dark dots, strung out one behind the other, crossing the Mavia plain, denoted a caravan from the Turkish Yemen. South, the foreground was blocked by the massif of Jebel Mana, but beyond shimmered the deserts of the hinterland, while seventy miles away gleamed the waters of the Gulf of Aden, and a cluster of fleecy clouds hid the barren pinnacles of little Aden. Elsewhere, as far as the eye could see, rose range upon range of bare *jebel*, rocky valleys and arid watercourses; a scene entirely devoid of any soothing feature, with nothing to bring relief to the strained and tired vision; a typical Arabian landscape, fierce and merciless, yet strangely alluring.

A rough landscape sketch, and, still surrounded by our escort, we stumbled down the rocky hillside to find a pool in the wadi for our nightly bath. Getting rid of our over-attentive escort, we found a convenient rocky pool, and as the sun sank behind the western pinnacles and buttresses we cooled our tired limbs in the grateful Tiban waters. Gradually the banks filled with Arabs, and by the time we rose from our ablutions to dry ourselves with our only shirts, each rock had its knot of interested spectators, chiefly women, furtively peeping at the red-faced men with the white bodies. Covered in confusion, we hurriedly dressed and beat an undignified retreat to the sanctuary of the palace, where, in the privacy of our apartments, we finished our interrupted toilet.

The small guest-chamber was alive with mosquitoes, so we settled down on the open veranda, surrounded by high walls pierced with narrow loopholes, and the hum of the Arab populace and the strange odour of Eastern cooking rose from the courtyard and habitations below. A strange situation: three Englishmen accepting the hospitality of an Arab sultan actively fighting against us three months before, whose last lodgers were our late enemies the Turks. With no white man nearer than Lahej, sixty miles away, we felt strangely isolated, and

distinctly interested as to the future behaviour of the Haushabi during the course of the evening.

Arabia is essentially a land of swift abductions, and the value of hostages as a means to enforcing an end is universally appreciated.

After all, this is the jest of living, not the drab monotony of an ordered existence which knows no uncertainty.

V.

Later, as the lamps started to twinkle in the village beneath, and the sunset glow faded into a perfect desert starlight, the *wazir* came to us to announce the sultan's desire for an audience. Deeming it more fitting to receive him in the oriental splendour of the becusshioned guest-chamber, we withdrew to the mosquito-haunted room, into which he was shortly ushered.

The visit was highly ceremonious, as he brought with him his son, a stripling of about twelve, the *wazir* or prime minister, and two of his most trusted sheikhs. The three of us and my interpreter faced them on the cushions in an atmosphere that baffles description. A smoking hurricane-lamp illuminated the circle of faces, throwing all else into shadow. The pungent odour of Colonel M——'s cigars, which he resourcefully produced and tactfully offered to the sultan, only to bring about his own confusion, as Ali Mana insisted on his sharing one with him, puff by puff; the drone of the myriads of mosquitoes—all produced a feeling of intense somnolence, against which, for the sake of decency, we struggled frantically.

After half-an-hour we signified our desire to close the audience—fortunately still the prerogative of the white over any dusky guest—and the mosquitoes, gorged with blood, settled down to digest their meal. We dined on the roof from our own stores, and eggs and chickens from the village below. Afterwards we threaded our way down the rickety steps, through clusters of sleeping armed Arabs, into the palace courtyard. There, in the glow of the firelight, we saw Ali Mana, his son, and the leading members of his court, seated on chairs and stools, watching the dancers, who were none other than the troupe who had importuned us nightly with their gyrations at Nohat Dakim. This, then, was the promised dance tendered as a bait to induce us to visit Musaimir. Oh, Ali Mana! No wonder you fail to meet our inquiring gaze as we look vainly round for the promised Circassian girls and Taiz dancers.

Our disappointment was soon mellowed by the right proportion of whisky and wadi water, and I tasted for the first time 'kat,' the local herb so coveted by the Yemen Arab for its exhilarating effects, also for its power of inducing sleeplessness and a state of nervous activity necessary to carry one through an extra heavy night. Ali Mana is a slave to the habit, and every few moments fresh bunches of this weed were placed

* Earthen pots.

before him; and with the instinct of a true host he plucked me the tit-bits, which he watched me devour with envy.

Apart from a pleasing sensation of internal warmth and well-being, equally attributable to the whisky, the 'kat' had no apparent effect that night, but left me struggling with a green mouth and a distinctly nauseating taste the next morning.

The scene was indeed a strange one, in a wild and typical Yemen setting. The frowning palace walls rising on all four sides wrapped the courtyard in gloom, save where a stray moonbeam filtered through a narrow loophole and threw a brilliant ray upon some darkened corner. In contrast to this pure light was the glow from the fire burning brightly in the centre of the courtyard, which suffused with a ruddy flicker the dancers and musicians and the crowd pressing eagerly forward to catch a glimpse of the entertainment.

One caught the flicker of flame on *jambia* and sword-blade; occasionally some belated desert-dweller, leaving his camel tied to a convenient boulder, would enter, and casting off his coat of skins—the usual garb of the hillman—join the crowd around the fire.

As the entertainment dragged and required revivifying, I prevailed on one of my companions, a true border Scot, to initiate the Haushabi in the intricacies of a Highland fling.

After much persuasion and a renewed uncorking of the revitaliser, he leapt to his feet in the circle of light, and scattering the dancers and most of the fire, broke into a wild and rather unsteady fling. Fortunately the band stopped automatically, and for a few moments the crowd, roused from its lethargy, watched with an eager interest, which soon lapsed once again in 'kat'-induced apathy.

Having shot our terpsichorean bolt, nothing

now remained for us but to make a dignified exit. We soon gained the privacy of our upper chamber, and washed the 'kat' from our mouths with a liberal whisky-and-soda in an atmosphere freed of restraint and conventional politeness.

As the anopheles were out to kill, we sought the protection of our mosquito-nets. Gradually the fires and lights of the village were extinguished, all but one, which burned the whole night through in the upper room of the main building, where Ali Mana gave himself up to an orgy of 'kat.'

From our beds, beneath a clouded moon, we lay and watched the constant play of light and shadow on the desert, which stretched away to infinite distance. Occasionally the moon struggled clear of the clouds, and the vast empty spaces were bathed in light until they merged into the velvet shadows of the distant hills.

Morning came, and we bade farewell to our host and his household, and once again threaded the many arid miles back to camp. The sun being well up, and the fever mists dispersed from the wadi bed, we left the main track and visited our favourite bathing-pool, nicknamed the Cauldron. Here, to the music of the stream gurgling between the boulders, we bathed our hot and camel-cramped bodies in clear cold wadi water.

Only those whose ways have been set in a land of sun-scorched deserts can truly appreciate the sight and sound of the merest trickle of running water.

Thoroughly refreshed, we trotted homewards, filled with an even firmer conviction that *Arabia Infelix*, with its crude scenery and even cruder people, still holds a subtle charm, and an indescribable lure for the seeker after the little-known.

L. M. H.

GREENWICH OBSERVATORY.

PART II.

IV.

THE twin telescope on this mounting is the 26-inch refractor. It is largely used to take photographs of stars, for showing their relative positions on the negative. The mode of inserting a plate in the focus should be inspected. The telescope mounted alongside, and used as a finder, or as a guiding telescope, while the large one is taking a photograph, is the old 12-inch, which, in my days at Greenwich, was the largest telescope in the observatory.

If we were asked what is the greatest research to which the 26-inch has been put, the answer would be 'the systematic measuring of the distances of stars from us by the ordinary method

adopted by surveyors, but with the use of a base whose length may sometimes reach 186,000,000 miles.'

This is the distance between two positions of the earth six months apart, due to her revolution round the sun. If one star of a group that appears on the negative be much nearer to us than the others, photographs taken six months apart exhibit a minute displacement of it with respect to the others. These displacements (called 'parallaxes') are measured with great accuracy under a microscope, and already the list of parallaxes published by the present Astronomer Royal forms a notable addition to our knowledge about the stellar universe. Fifty years ago such a catalogue of stellar distances was

unattainable, so difficult were the observations by heliometer, which was then the best instrument for the purpose. The invention of the gelatine dry plate in photography has given the opportunity, and astronomers have seized it. For understanding the structure of the heavens and the movement of the stars, there is no class of facts more urgently required by astronomers than these stellar distances. The good start that has now been made by photography is promising, and already much has been done.

V.

Having inspected all the wonders of these twin telescopes, and particularly the superbly ingenious mechanism of the clockwork for driving the telescopes round the polar axis smoothly and regularly, you will find a host of objects of interest displayed in this great building on Visitation Day.

You can look at some of the negatives of the great photographic chart of the whole heavens that was completed by Mr Franklin-Adams.

You can see a model, in wire, showing the path of the eighth satellite round Jupiter since its discovery. Jupiter is so far removed from this outer satellite that his controlling power is feeble, whereas the gravitation-attraction by the sun, a thousand times more massive than Jupiter, is a powerful disturbing factor. This is shown on the wire model by the twists and deviations of the wire from a true ellipse, in which figure it would travel if it followed Kepler's law.

Then, on the ground floor, on this day, charts can be seen relating to sunspots and magnetic storms, all illustrating the latest discoveries about the wonderful, unexplained, eleven-year period of sunspots, terrestrial magnetism, and auroræ.

But the most interesting side-show of all is to-day displayed in the astrographic room. Here you can see the micrometers in use for measuring the relative positions of stars on the photographic plates, whence we derive the parallaxes and distances of the stars.

And all round the room may be seen the wonderful astronomical photographs that have been secured, both here and abroad, of the sun, of total eclipses, of comets, of star-groups, and those marvellous pictures of nebulae that have revolutionised our notions about the universe during the present century.

VI.

Our steps now naturally turn back to their starting-point, where the instrument most representative of Greenwich Observatory stands on the zero of longitude. This is the transit circle. Its purpose, besides getting true time for correcting the clock-error, is to enable the astronomer to define with the utmost accuracy the direction in which any one of the heavenly bodies lies with respect to all the others.

The work now being done by this instrument, and the work that has been done by it or its predecessors since 1676, for nearly two hundred and fifty years, is the work for which Charles II. founded Greenwich Observatory, now the premier observatory in the world. This was about the same time that he founded the Royal Society, now the premier scientific body in the world. He had been impressed by learning that the longitude of a ship at sea could become known if the moon's place among the stars could be predicted. He was convinced that the commerce of Britain and the safety of her mercantile marine would gain from the development of this scheme. For this reason he founded Greenwich Observatory.

From that date to now the positions of the moon, planets, and stars have been recorded here with more continuity, and generally with greater accuracy, than anywhere else. Hence mathematicians are now able to foretell at any time the position that will be reached by the moon at any time in its monthly track round the earth, among the stars. Thus the moon is like the hour-hand of a great celestial clock, and the circle of stars lying along its track mark the hours in Greenwich mean time. Sailors and explorers carry with them the *Nautical Almanac* containing these predictions. In this way the traveller in distant lands or seas can learn the true Greenwich time at any moment when he can see the moon. He can also find, very easily, by observation, his local time. And the difference between ship's time and Greenwich time gives the sailor his longitude. This makes the traveller independent. He need not then rely upon a chronometer to show the Greenwich time.

Look now at the transit circle; it is a telescope with trunnions at its middle, like a cannon. These rest upon V-shaped bearings rigidly fixed on the foundations. The trunnions must be level, and must point east and west. The telescope can turn round on its trunnions to any elevation above the horizontal position, to catch any star at the moment when it passes the 'meridian,' which is an imaginary north and south line in the sky. The observer can measure on a divided circle the altitude to which the telescope points. He can also record the exact moment when the star passes the meridian wire in the focus of the telescope. These two records suffice to define the direction of the star as compared with all others.

It would take up too much space here to describe the beautifully accurate details, in construction and use, which render the observations made with a transit circle as nearly perfect as anything depending upon human workmanship can be.

Improvements are constantly being introduced. But to-day there is only one transit circle in the world that is acknowledged to be superior to the Greenwich one.

It is a matter of pride to us, and especially to us Scotsmen, that the most perfect transit circle in the world is the one designed by our countryman, Sir David Gill, set up by him at the Royal Observatory at the Cape of Good Hope, and completed in 1901.

That splendid Scot was the finest astronomical observer of his age, with a genius for designing instruments and using them, so that all errors, known or unknown, should be nearly cancelled out. With unbounded energy he built up the Cape Observatory from rudimentary beginnings, and, after twenty-seven years, left it in 1906, only when he had made it the premier observatory for all purposes in the southern hemisphere, and the finest observatory of position in the world.

To indicate the perseverance and skill of David Gill, three researches of his at the Cape should be mentioned.

He took a bar of steel, 4 metres long, to Paris, and compared it with the standard metre there. He took it to South Africa, and measured with it a base-line on the ground. Starting from this base-line about two miles long, he surveyed the country over several degrees of latitude, and so he measured the diameter of our globe.

Using part of this diameter as a base, he extended his survey to get the distance of the sun, and the diameter of the earth's orbit.

Using part of this last diameter as a base, he extended his survey to get the distances of a number of stars, all measured in terms of the Paris standard metre.

Any one of these researches might have taken a lifetime. And each required skill of the very highest order. He did them all, to the admiration of the world.

VII.

To return to our inspection, there are three other instruments deserving more detailed description than can be bestowed upon them in this article. There are the Altazimuth, the Astrographic telescope, and Cookson's zenith telescope.

The moon cannot be well observed on the meridian when it is near to the sun. Consequently, the observations of the moon used to be defective during that part of her orbit. In order to increase the reputation enjoyed by the Greenwich lunar record, Airy set up an *altazimuth* for getting her position when not on the meridian. It is really a glorified theodolite. The calculations required for deducing, from observations of this kind, the true longitude and latitude of the moon are a little severe. Fifty years ago it used to be narrated that every assistant who up to then had had this duty had either committed suicide or died in a lunatic asylum. I cannot vouch for the truth of this statement. But the fact of its being made

shows that the work of reduction was not considered child's play.

The *astrographic telescope* is one of eighteen made, after a congress of astronomers at Paris in 1887, by many countries to enable them to take part in a systematic charting by photography, and cataloguing, of the stars of heaven at this period of the earth's history. It was an ambitious scheme, and has for the most part been carried out with splendid success.

The Greenwich astrographic telescope was dismantled in 1922, and carried out to the antipodes to test the Einstein theory during the total eclipse of the sun. Bad weather prevented its use then. Such are the kinds of disappointment that astronomers learn to bear.

The *Cookson zenith telescope* and its mounting are floated on mercury; so that, even if the instrument be turned about the vertical through 180° , the photograph of a star in the zenith still comes on the same part of the photographic plate. It is used for finding, with great exactitude, the direction of the vertical, and the latitude. It has been discovered that, all over the world, the latitude varies from month to month, and from year to year. In other words, the axis of the earth about which she rotates moves about in the earth itself. This floating zenith telescope is perhaps the most perfect instrument for measuring the amount of this shift.

It might perhaps be truly said that the most important instrument in the observatory is the sidereal clock, which is corrected by star-observations. Without it, the transit circle itself would lose its value. The clock-room is full of interest to the specialist. So is the wireless-room, where the exact time, as indicated by sidereal clocks in foreign observatories, is received from Paris or Bordeaux, or elsewhere, and can be compared with the Greenwich clock. But the great attraction lying in these rooms is of so very technical a character as to be unsuitable for these pages. The chronograph is a revolving drum covered with paper, upon which an electric pen makes marks. These are made by electric signals from the sidereal clock, and also from the transit circle when a star is on the meridian wire. This enables the assistant to find the time, true to a small fraction of a second, when the star crossed the meridian.

By this visit to the observatory we have gained some insight into the instruments and processes available to the astronomer, but there is one thing that can only be dimly visualised by a mere inspection. This is the great skill, patience, and tenacity that must belong to every astronomer who adds by his discoveries to the glory and fascination of his beloved science.

For without that personal devotion no man can become a real astronomer. There is always something lacking in the man who makes use of the Queen of Sciences for his own advance-

ment, or in the quibbler for priority of discovery. The heavens declare the glory of God. The observatory shows the handiwork of man. And further, it shows the almost God-like humility and perseverance of astronomers who, with

incredible precision of measurement and the absolutely accurate reasoning by mathematical processes, go on from truth to truth in the interpretation of the wonders of creation.

THE END.

PELORUS JACK.

PELORUS JACK is not the name of a person, but of a fish (if a dolphin can so be called)—perhaps the only fish that ever had a special Order in Council enacted for his benefit.

The word dolphin is sometimes rather loosely applied, and may be said to embrace the grampus and the porpoises which are commonly found on British shores. Of course, the dolphin is not a true fish, but a mammal, and it appears to have something akin to human feelings, for when trapped it utters distressing and human-like cries. Pelorus Jack was of the class known as Risso's dolphin, the scientific name for which is *Grampus griseus*. For the long period of thirty-five years—so far as is actually known, though the real period is believed to be longer—Pelorus Jack acted as pilot of all ships sailing through French Pass, on the voyage between Nelson and Wellington, New Zealand. When the steamer was making its way through the narrow channel of the Pass, passengers leaning over the bow-rails would suddenly see a giant fish shoot upwards from the depths of the ocean and take its position directly ahead of the ship, and only a few feet below the surface, being distinctly visible. He would settle down to the serious work of piloting the ship through the narrow channel, keeping some twenty or thirty feet in advance of the bow. After all dangers had been passed, Jack would dart off to one side, turn, and watch the ship pass, and then go back to the depths, waiting there until another ship called for his safe-conduct. He was about fifteen feet long, had a bluish nose, a humped forehead, and a narrow fluked tail. His general colour was bluish-white, tinged with purple and yellow, and with irregular brown-edged, scratch-like lines in all directions. These scratches were supposed to be caused by his wrestling encounters with cuttle-fish, which form part of the dolphin's food-supply.

Jack was attached only to certain ships, for he knew them all by sight, and was shy of new steamers, showing himself solely to those that had already visited the Pass, and he totally ignored all sailing-vessels. It is a curious fact that whales (which belong to the same family) pursue the very opposite tactics, as they approach sailing-vessels with confidence, but seem to be frightened away by the propellers of steamers. Can it be that the rhythmic beat of the propellers has an attraction for the dolphin? We know from the ancient story of Arion, as well

as from more authentic sources, that the dolphin is susceptible to musical sounds. Or is it love for the companionship of man!—another trait of his character which is supported by tradition. The albatross will follow a ship at sea for days together; but this is not from mere curiosity, nor from the desire for companionship in the lonely waste of the ocean; it is believed to be owing to the fact that the bird is aided in its soaring flight by the swirl in the air created by the vessel as it cleaves its way through the waters. This is a very probable supposition, as can be confirmed by any one who from the deck of a steamer has watched the flight of an albatross.

Certainly, Jack showed evident signs of joy on recognising steamers which were old acquaintances; he would gambol playfully round their bows and leap in the air, his antics reminding one of the joyful bounds of a dog who recognises and welcomes a long-absent friend. Sharks are said to follow ships in order to seize the remnants of food thrown overboard. The habit was perhaps acquired by the chance capture of the scraps which are thrown overboard every day, and all animals soon come to recognise those sources from which food can be habitually expected. But this attraction did not exist for Pelorus Jack; it was said that he never partook of food when on his journey.

We have all heard of the story of Arion, who was robbed by pirates and thrown overboard, when he was rescued by a dolphin, which bore him safely to shore. Before he was thrown overboard, he asked of his captors as a last favour that he might be allowed to play on his lyre, and it is supposed that the tuneful strains attracted the attention of the dolphin. The story, if not strictly true, is probably founded on fact; nor, indeed, is it any stranger than the authentic accounts given of Pelorus Jack and his devotion. This tradition of the friendliness of the dolphin for man is found in the folklore of many peoples—even among the Maoris of New Zealand, whose 'sea-god' and marine protector of man was a dolphin.

Once or twice foolish tourists tried to shoot Jack, hence the Order in Council specially protecting him and all his family 'in the waters of Cook Straits, or the bays, sounds, and estuaries adjacent thereto.' Apparently the New Zealand Government was somewhat puzzled as to the nomenclature to be employed in describing him—'the fish or mammal,' says the Order.

Jack's career was not without accident. In 1905 he was hurt by the bow of the steamer *Penguin*, and for months afterwards was absent from his beat. However, he reappeared later, but in future carefully avoided the bows of steamers. The scar caused by the blow was clearly visible ever afterwards. Shortly before the outbreak of the Great War Jack disappeared, and, so far as the writer knows, he has never been seen since. Whether he died a natural death, became a victim to the many perils of the deep, or simply went out of business, is not known. In any case, he had a long innings.

That the dolphin is not a true fish but a mammal is evident from the fact that it breathes by lungs, emits cries of distress, and suckles its young. Moreover, in true fishes the maternal instinct is almost or entirely wanting, while in the dolphin it is developed to an abnormal extent. Fishes and reptiles generally lay their eggs and then leave them, relying on Nature to hatch them and provide for the young. With the dolphin it is far otherwise.

There is a species of fresh-water dolphin found in South American rivers which is proverbial for its maternal solicitude. If a young one of this species is killed or captured, it is easy also to kill or capture the mother, for she will not abandon her offspring. These dolphins are said to have the habit of clasping their young to the breast by means of their flippers when suckling, and a mother-dolphin, emerging from the water with her

infant clasped to her breast, may well have been the origin of the fabulous accounts of mermaids.

The manifestation of grief shown by the fresh-water dolphin when her young one is killed or wounded is said to be most painful to witness. A friend of the writer's, who had been an eye-witness of such an incident, gave orders to his native labourers not to kill or injure any of the young dolphins which were to be found in a river that traversed his property. Finding that his orders were disregarded, he worked on their superstitions by telling them that the killing or injury of a young dolphin was certain to bring bad luck to the person who perpetrated the injury. It was useless to make any appeal to their sense of humanity (of which they had little or none), but this appeal to their superstitions was more effective, and the young dolphins were left unmolested. It is probable that the dolphins which inhabit the sea are quite as affectionate as those which frequent the inland waters or rivers, but unfortunately we have not the same facility for investigating their habits.

Evolutionists tell us that all vertebrate animals were descended originally from mud-fishes. If that is the case, then the dolphin, after evolving into a terrestrial animal, must have again taken to the water. That its habits were formerly terrestrial is proved by the fact that it breathes by lungs, and will be drowned if kept long under water. But such metamorphoses are common in the history of evolution.

FORESTALLED.

CHAPTER VI.—*continued.*

TOM went very red, and then deathly pale, as pale as she was herself, save for those burning spots of crimson in the centre of each cheek. He flung the nugget down and scrambled out of the hole, the beginning of the shaft, in which he had been standing. He faced her, his eyes meeting hers that accused him so fiercely. 'I'm no thief,' he said.

'What are you doing here?' she retorted. 'That's our claim. No honest man comes poking in some one else's claim—that's our claim.'

'Registered it?' he asked; though why he said this he did not know, only that he had to say something, and it was evidently no good uttering denials she would not believe, or protests she would not listen to.

'We will, at once,' she answered; 'and if you dare touch another thing, I'll go straight to the Mounted Police.'

'Oh, will you?' he muttered.

So that was what she thought of him! Well, he supposed, he might have expected as much.

'Yes, I will,' she repeated. 'Oh, I never knew men like you existed—the very moment my dad hurts himself—coming sneaking round

—thought you were safe—thought it was all right with dad hurt and only a girl left—oh, you coward, you thief!'

There was something almost daunting in the intensity of her anger and her contempt. He felt himself shrink before her as though he had been the guilty thing that she believed. And it was no good trying to explain. She would never understand, or believe. He stood looking at her with a kind of dull and sullen reproach that had in fact very much the effect of the consciousness of guilt she took it for. She turned upon her heel with a gesture of a monstrous scorn, and walked quickly away.

He experienced an impulse to run after her, to catch hold of her, to force her to listen to him and to understand. But this impulse died away at once, smothered beneath the immensity of the depression he felt. It was all no good—she would always and for ever think of him as a sneak-thief. How she had looked at him as she turned away! Not from the most loathsome reptile that crawled upon the surface of the earth would she have turned away with such an air.

He made up his mind to quit right away.

Impossible, intolerable, to remain any longer in her neighbourhood when she thought of him in such a way, while her clear blue eyes burned for him with such an utter scorn—no, he would get off just as soon as he could be ready.

He began to collect his belongings, to make up his pack ready for morning. While he was thus busy with his preparations he noticed Joyce watching him. Perhaps she would be satisfied now, he thought dully. He saw that she went back into the shack and brought out her father to look, too, though he was able to drag himself outside only with evident difficulty and pain. But no doubt she thought it worth it, to see their enemy departing, the man she believed to be a thief. Possibly she would think his departure less utterly contemptible than somehow most of his actions seemed to appear to her. He could not hear what they were saying, but he could see that they were talking with a good deal of animation and excitement. Congratulating themselves, Tom supposed bitterly, on his departure. Only they did seem to him to be showing their interest and excitement rather more plainly than was necessary. He went on with his preparations, and when he looked again Joyce had vanished, and her father was sitting there alone, watching Tom with a very gloomy and angry expression.

'Don't look a bit pleased, even if I am clearing out,' Tom thought to himself, slightly puzzled, for he did not understand why Joyce and her father should show either so much excitement or so much anger. He would have expected them to be too much taken up with their good fortune to have any thought left for him, and yet it seemed as if they were thinking of nothing but him and his preparations for departure.

A little later Joyce appeared again. She had a stick in one hand and a small pack on her shoulders. Tom was more puzzled than ever. Surely she could not be intending to leave her father? He could not be so bad that help and a doctor were necessary? No, that was not possible. Only, then, why had Joyce the appearance of being about to take to the trail?

In her free hand she held two small stakes. Carrying these she went to the scene of the recent discovery and drove one in, then paced the requisite distance and drove in the other. Evidently she was staking out their claim. But now, instead of returning to her father and their camp, she pushed on at a rapid pace down the valley. Tom watched her wonderingly till her small figure had finally vanished from sight, while in the west the sun slowly sank, and in the east the darkness of the coming night spread slowly over the earth.

'Well, if this don't beat all,' Tom muttered, utterly bewildered. 'Sure, she ain't never going to be such an all-fired little fool as to start off to make town now, . . . and, sure, her dad would

never let her. It'll be night in half-an-hour, and every chance she'll miss her road in the dark and get lost, or maybe break a limb.'

Indeed, her enterprise appeared mad enough if, as almost seemed to be the case, she had really started off to town to register their claim. Why could she not at least wait till dawn? No fear of their being forestalled, he thought bitterly, as he had been, since no one—then as in a flash he understood. They had seen his preparations for departure; they knew he knew about the gold, since it was he himself who had made the actual discovery; they both believed him to be a villain; and they had supposed, when they saw him preparing to leave, that he was intending to get to the government office first to register the discovery and the claim as his own.

'Mean—they think me mean, all right,' he thought bitterly.

No doubt they had supposed he would think this quite easy, since Old Man Mervyn had hurt his foot and only the girl was left. So, desperately, she had started out in face of the coming night; and all through the darkness she would be pressing on across the wilderness, so as to be the first to register the claim that meant fortune for her father and herself, the claim she believed Big Tom Moore intended to try to rob them of.

There was nothing to be done. He could never overtake her before dark, and in the dark he would never overtake her at all. It was awful to think of her making her way through the lonely wilderness, through the lonely night, mile after mile, hour after hour, without help or guidance, a little lost figure against the immensity of that wild land, of the all-surrounding night. He felt as though he could not bear it, and yet there was nothing to be done.

'First thing in the morning,' he thought, 'I'll make for the river, get my canoe out, and I guess if I hurry, going with the stream and paddling hard, it won't take more than five hours to make town. If she's got there, all right; and if she ain't, I can scare up search-parties to go out and hunt. But her dad ought to be lynched for letting her. It's the maddest thing—close upon fifty miles across wild country in the dead of night, and her a slip of a girl like she is!'

CHAPTER VII.

THAT night, as he had come to do of late, Tom slept badly, or, rather, did not sleep at all. It was as though he saw perpetually a small, lonely figure wandering through the dark night by stream and tree, by hill and valley, surrounded by all the strange terrors of the wilderness, lost against that enormous background of the darkness and the wild, and yet never ceasing by the faint guidance of the stars to pursue her determined course.

Plumb crazy,' Tom muttered, wiping his forehead, on which, in spite of the chill night air, thick beads of perspiration gathered. 'There ain't one chance in a hundred she'll ever do it. Fifty miles in the dark across such country! She'll miss her way and never be heard of again—she'll fall and break a limb, and lie till she starves.'

While it was still night he rose and made his fire and breakfasted, for he knew he would need all his strength. Then by the light of the fire he gathered together what he needed, and in a darkness that was still profound—for the night was heavy and the sky often overcast with clouds—he started off.

He did not make good progress. The night betrayed him at almost every step, making him blunder into thick bushes from which he could extricate himself only with difficulty, or stumble against trees that had the effect of leaping out of the darkness to attack him with heavy blows. Or else, while he was cautiously avoiding trees and rocks, he would put his foot into some hole in the ground and go sprawling. He had trusted to the stars to guide him till the sun appeared, but clouds often hid them, and he had to wait till they appeared again, or else risk taking a wrong direction. But the worst enemy of all was the feeling of confusion and helplessness he experienced as he stumbled and blundered along.

For what use was his strength or his tried skill in woodcraft when he could not see to put one foot before another? Of what good to him was all his long experience the darkness would not let him use? Softly the night mocked him; it seemed to laugh at him from every side, to envelop him with a quiet and silent scorn that hid the grimmest terror, for once at least his foot, as he pushed it cautiously forward, swung in space, and he found presently that he was on the edge of a sheer cliff with a twenty-foot drop to rock beneath. Another step forward would have sent him crashing to his death, and as he sprang back into safety he wiped his streaming face and wondered if all these perils of the night had been escaped by Joyce.

'It's no good,' he thought; 'I must wait for sun-up. But I'll bet she never did—not her.'

And again he had a vision of that small, undaunted, indomitable figure pressing on through the wild—through every terror of loneliness and the night.

Fortunately, dawn was not far off. Before he had been waiting long, the first glimmer of light showed in the east, and even through the black night around there ran, as it were, a rumour of the approaching day.

As soon as it was light enough to distinguish tree from rock and level ground from broken, Tom started off again. He made good speed now that the friendly day had come to his aid, and before very long he was in sight of the river. As he hurried along he made rapid

calculations. So long to paddle down-stream, the current helping him. A certain time to tell his story and get search-parties organised and started. Of course, all that might be quite unnecessary. Joyce might come walking into the settlement and ask coldly what all the excitement was about—but he did not think so. At any rate, he calculated that up to the present she could not have covered, at the most, much more than half of the way. No one could travel either far or fast in the dark, and, judging from his own experience, he doubted if, in fact, Joyce had been able to cover during the night more than eight or ten miles. Perhaps not so much if she had met with any accident. 'Her dad ought to be lynched for letting her,' he thought again.

All the same, he felt more cheerful now. At any rate he was doing something, not merely waiting and watching for day. He would soon have his canoe launched; he would soon be scudding down the river with all the speed paddle and current could give together.

As he came within sight of the bushes under whose shelter he had hidden the canoe he gave a loud cry of anger and dismay; for there was the canoe, lying out in the open on one side, and it needed only a single glance to see that a big hole had been knocked in its bottom.

He ran forward furiously. His mood was murderous for the moment. Who had done this, and why? What sneaking skunk had played him such a trick, and why? A fury of dim threats filled his mind. When he came a little nearer, he saw on the soft ground by the river's edge a line of footprints, sharply marked, clear small prints, such as he had seen too often by the side of the creek in the valley he had just left not to recognise at once.

Joyce had been here before him. Those were her footprints. Under the spell of the strange and sinister misunderstandings in which somehow they seemed always entangled she had come here first of all, and had herself destroyed his canoe by which he had hoped to help her. Her motive had been to prevent him from using it to forestall her in registering the claim. She would not use it herself; her pride had not allowed her to run the risk of being accused of being what she had called him—a thief; so she had not taken the canoe, but she had felt justified in preventing him from using it.

If it was to be a race between them to see who could reach the settlement first with news of the discovery of the gold, at any rate she meant it to be a fair race; her strength and speed against his, her courage and resolution against his. She had no idea of letting him drop easily down the river in his canoe, while she toiled wearily across all those miles the wilderness stretched between her and her goal.

'If she don't beat all,' he muttered.

It was almost like a challenge thrown at

him, he thought, as he stood staring at the hole gaping in the canoe. 'Beat me if you can,' she seemed to say; 'but fairly, on equal terms; the same conditions for us both, even though you're a man, and a big one, and I'm only a girl.'

'She do surely beat all,' he muttered again. 'But I'll take her up, and, what's more, I'll get there first.'

And as he stood there in the early dawn, with the river at his feet and the vast untrodden wilderness around, he swore a great oath that he would reach the settlement first, or never look on Joyce's face again.

He turned, and, plunging into the woods, resumed his journey, guiding himself by the rising sun, and when the great, close-growing trees hid the sky, then by the hundred signs that tell those who know them which way to take.

His direction lay south of west, and this he kept to as closely as was possible, choosing to crash his way straight on rather than to turn aside for any obstacle.

As a rule the country was fairly open, but at one time he was climbing over great piles of fallen trees, heaped up ten and twelve feet above the ground as they had fallen through the centuries, with death or a broken limb as certain penalty for any slip he might make. And at another time he would be scrambling and sliding down the rocky side of some steep ravine where one false step would have sent him crashing to the bottom, or else picking his way through swampy ground where at any moment a stroke of bad luck might have seen him up to his middle in mud. 'And she,' he thought, as he still hurried fiercely on—'she came this way by night—'

It seemed to him almost certain she must have met with some accident. She could never have escaped all these dangers in the darkness. Perhaps she was lying somewhere quite near—the thought urged him to greater effort.

When the ground was open he ran; when he came to another ravine he hurled himself down its steep sides, heedless of the risk of accident; and still mile after mile slipped behind him, while still the sun rose slowly in the heavens. Once he had the good fortune to find a stretch of ground so smooth and open he could run on it for nearly an hour. He had flung away his coat long ago; he had tossed aside every ounce of unnecessary weight. A strange wild figure he must have made as thus, bare-headed, coatless, he fled through the wild as for his life; and still mile after mile he tossed behind him, and still the sun rose slowly in the heavens, and still the settlement lay far ahead.

He came to where the river crossed his path again, making a big loop. The shortest way would be to swim it, the quickest might be to go round, more especially as to swim now

would mean swimming again when the river turned once more. He was still hesitating as he hurried on, and then to his astonishment a voice hailed him—a voice from the wilderness that had seemed to him so alien and aloof, so indifferent to his hurrying speed and to his dreadful inner terrors. Turning sharply, he saw an old, white-bearded man standing under a tree near at hand, a pioneer of the wild, who was perhaps a hunter or a prospector like Tom himself.

'Hello,' this stranger called, 'you're in a mighty hurry! What's happening? There was a girl, a crazy girl, just now—'

'Did she pass here?' Tom asked sharply.

'She did,' the other answered. 'Who is she, and what's the trouble? I hollered when I saw her, for I reckoned something was after her the way she hustled, but she took no notice; and when she got where you are standing, blamed if she didn't jump straight in and swim across!'

'Did she?' asked Tom. 'How long ago?'

'Oh, maybe an hour, and maybe two, or it might be more or less,' answered the other vaguely; 'jumped right in and swam across, she did, and me not being able to swim, I couldn't follow. Say, I reckon—'

'Ah, you can't swim!' interrupted Tom. 'I can.'

As he spoke he sprang into the water, leaving that old man standing staring, more utterly bewildered and amazed even than before.

The current was strong, the river broad, and Tom by no means a good swimmer. Somehow or another he managed to splash his way across and reach the other side, though when he drew himself out of the water and lay down on the bank to rest he was nearly exhausted. But soon he was on his feet again and hurrying on, heartened to know that Joyce had passed that way, and that, so far at least, she had escaped accident.

(Continued on page 427.)

SOUVENIR.

(The Blind Poet to his Love.)

WHEN the love-sick winds are laden with a breath
That is brief,
And the roses in your garden bleed to death
Leaf by leaf,
Will you gather in those hours,
From the death-bed of the flowers,
'Mid the weeping of the showers,
Aught but grief?

On the faded crimson flower-beds, as you pass,
You may find,
Hid, like some sad souvenir, Love, in the grass
By the wind,
Like some jewel from the skies,
On the rose that ruined lies,
This—a tear-drop from the eyes
Of the blind.

W. L. FERGUSON.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

ANOTHER great sporting season, as it is declared, is being opened now. Each summer in these years we listen to the same kind of proud and hopeful announcement. It is one with which Britain, of all the greatest sporting traditions and achievements, is specially pleased to be so closely associated. People speak of the new extensions of sport and the splendours of a season's programme packed with international contests, as if thereby the world was leaping to its most brilliant destiny, and all else, the general affairs of nations, anxious though they be, should stand aside and be disregarded. The arguments for the attitude have a certain kind of plausibility. The strain of life is great, and we cannot always be thinking of France and Germany, nor yet of our taxation. Then there are our sporting instincts to be served; it is all considered to be very good for us, even though there be more thousands for the watching than units for the playing. And this is to be one of the greatest of all sporting years, because it contains the Olympic games, which are being held in France. Thus the international side and its advantages are stressed, and it is the excuse for all great international engagements in games, lavishly and more lavishly staged, as they are, with enormous organisation and expenditure, that they are good for us all in the international political sense, that they conduce to amity among nations, than which nothing is more needed now. There is a somewhat doubtful sincerity in this contention. It seems strange if games are to be brought in to do business at which statesmen most meant for it fail. It is hard to believe that if M. Poincaré sets us against him in some respects, the difficulty may be in any measure mitigated by the appearance of Mlle. Lenglen on the tennis-courts of Wimbledon. Some fancy it might be the other way, and that if sporting publicity were more developed in France, where it is nothing compared to what it is in our own country, M. Poincaré might be seriously concerned to repair the ravages that are caused by the inimitable Suzanne, who has certainly a rather provoking way with her, an exaggerated conceit as some say, a disposition to caprice and fault-finding. It is not so easy to

produce perfect political results from these international games. It is true that some of them are making a world appeal, and all the better for the world. Perhaps the best and most popular games we know are cricket, the two footballs, lawn-tennis, and golf. Of these the last two are everywhere now. Association football is all over the Continent to an extent few people realise at home; and the manner in which France now excels at Rugby football is one of the most remarkable sporting phenomena of the times. It almost seems that, music apart, there is nothing capable of making such a general appeal to all peoples as games. Enormous sums of money are being spent in Japan at the present time upon the construction of splendid golf-courses; and in the United States—and nearly everywhere—this game, of the subtlest and most powerful fascination and the most glorious traditions, is established as it is in its own home, and more so. This very internationalism is forcing it now to a new era and great changes in organisation and tendencies. I am half afraid for golf, that I have loved and played for all my life that counts. When I first saw football matches in Spain, some twelve years ago, saw how exactly a football match and football players, caparisoned like our own, reproduced the scene at home, making the Castilian ground look like a bit of Britain, a sense of the universal appeal and the common character and instinct of games was realised acutely. The spread of games is good for all the nations; but when it is a matter of international rivalry national temperament is insufficiently considered, and also the further point that, despite all that is said, sporting standards and instincts are by no means the same in all countries, and that, with so much intensified publicity being done, nations emphatically do not like being beaten. They are prone, despite themselves, to make excuses, and from excuses accusations spring. It happens always.

* * *

At the back of the mind of those who set about the starting of our modern series of so-called Olympic games there was, perhaps, a certain dim ideal of a purification and ennoblement of modern sport as it is being indulged in by the people. Although this effort comes within the memory of such as are still able

to participate in sorts of games themselves, publicity, propaganda, professionalism and commercialism in sport, the overwhelming and deadly combination, had scarcely started. The Metropolis, from which most of such evils spring, had hardly looked at Association football except as played occasionally by amateur teams; and in Scotland, Lancashire, and the Midlands an attendance of four thousand people at a match was considered creditable to the game and the community, whereas forty thousand might be expected to-day. The danger may have been scented then, though the advent of a period when nothing should be held safe from commercialism and publicity stunting could scarcely have been apprehended. More definitely a vague and somewhat shoddy political pretension was made that such things as these Olympic games would be conducive to world understandings and beautiful international amities. But mostly there was no great motive or object; there was just the effort to organise a new sort of show, attach an ancient name to it, as we would call a theatre a Coliseum, and endeavour thus to work upon an artificial sentiment. The atmosphere, the spirit, the flavour of those Olympic games of old can never be revived unless the world by catastrophe goes back to a re-beginning and there is a grand purification from materialism in its crudest form, and all the tricks of publicity. Not that the old Olympic games—of the character and circumstances of which not one person among many of those associated with the modern thing has any notion—embraced, upon any standard, such a really perfect sporting idealism of unselfish effort and disinterested achievement as is imagined or assumed. There were politicians in those days also, and whenever or wherever there are politicians there is guile in some degree, and the least desirable of human characteristics and tendencies are exerted and exploited. The politicians, at the root of so many evils, had surely a finger in the old Olympic games, just as you will see them plausibly and insidiously concerning themselves with what takes place this year. The many archaeological excavations that are carried out in these days reveal more traces of the ancient politicians. Some months ago I was at Pompeii again, after an absence of ten years, and found that in this splendid ruin new excavations and remarkably skilful and intelligent reconstructions were taking place, having for their effect a complete reversal of some old assumptions concerning the aspect and construction of this once beautiful Roman city, and the manners and methods of its inhabitants. Among them it is discovered that on the walls at the time of the great catastrophe from Vesuvius were bold announcements which the politicians had had painted there, appealing to the electors for their votes, and stating their qualifications, the number of people they employed at their

works, and so forth, in just the same old way. Greece likewise had its insidious politicians; indeed they exist as soon as civilisation emerges anywhere. One time the Greek games, exerted towards the production of the perfect form of masculine physical beauty as displayed in Greek art, were, no doubt, as has been said, the noblest spectacle in the world, but from that they degenerated sadly, and all sport with them, the politicians being evidently associated with the decline, until at last the stage of fights between wild beasts in amphitheatres was reached. Even as our new Olympic games are begun, without any possibility of their exerting any beneficent physical or artistic influences, a certain savagery is observed in some of our so-called sports, and corruption is rampant. Perhaps, while any sense of pride remains in man, a true Olympic ideal is unattainable, for such an ideal should essentially exclude all selfishness and ambition. One should strive, with a great independence and unaided effort, for a victory that should be stripped of all distinction save the fact of victory and perhaps the wreath of bay, while, following it, there should be a speedy and modest lapse to obscurity. It is a humanly impossible ideal, but by sincerity a fair approach may be made towards it, such as is seen in our University contests, and displayed splendidly in the protest of the Scottish Rugby Union a few months ago against special material awards, even though comparatively small in amount, to the members of a Welsh team that had distinguished itself. This gesture has stood finely alone amidst an increasing mass of vulgarity and decadence as a sign for purity and sincerity in sport.

* * *

I should like to see how the people of the cinema, with all their ubiquity in investigation and in matching, would represent one of the old Olympiads when they were held in that region of Elis, when Olympia was next to Arcadia in the east, and really far away from Attica and Athens. Olympia, gloriously situated in the valley, was called 'the fairest spot of Greece,' and there, according to the Greek idea, the communities of Hellas associated together, and by these games, as a part of a religious festival, celebrated their belief that Zeus was best honoured by discipline of both body and mind, and that the human body had its glory scarce less than that of the spirit and the intellect. The city of Elis was some thirty miles to the north, and it was to the gymnasium of Elis that the athletes who were ambitious to participate in the games had to proceed first of all in order to be trained and tested. This period lasted about ten months, and it was through this preparation that the real athlete was made. It was not a case of men achieving distinction, breaking records and the like in their own regions, and then being sent by the public sub-

scriptions of their own people to participate chiefly in the games. There would obviously be local encouragement and perhaps some assistance, but in the nature of things the better and more beautiful simplicity of life in those days, eight centuries or more before the Christian era, in conjunction with what may be called the religious basis of the festival in general, must have conduced to the establishment of a far finer ideal than is possible now, even if men and means were much less vulgar than they are. Games and athletic contests were not organised as now, commercialism and publicity in sport had not begun, and though victors became heroes, there were no newspapers to advertise them two or three times a day, telling of what they ate, and of the literary works that they most graciously favoured, nor yet to marvel that after months of hesitation two boxers might be brought into the ring together to fight for a few minutes for money prizes of a value equal to the fortunes of wealthy men. They had a better sense of worth and proportion in Hellas then. Yet the Greeks were not all purity and idealism, and it was inevitable, human nature then as now being assertive, that the victors, their bosoms filled with pride and their minds surging with new ideas born of the intoxication of popular acclamation, should consider how they might make the most of it. In the early Olympiads valuable prizes were given, but eventually this prodigality ceased, honour was refined, and all that was bestowed upon the victor, that being splendidly enough, was the garland of wild olive that with the golden sickle had been cut from the sacred tree that Hercules had brought from beside Ister's dark fountains, that it might be a shelter for all men and a crown of noble deeds. When the athlete had won, the crown was laid upon his brow, a palm was given into his hand, the trumpets blared, and the herald gave out his name, his country, and all the essential particulars concerning him. His name was passed for registration in the Greek calendar, and as he proceeded to the temple of Zeus flowers were strewn in his path, gifts were tossed towards him, and the strains of the old song of Archilochus rose in the air. Propaganda and the press, the wealth of nations, and the results of what we call progress can do many things, but they cannot reproduce the thrilling ecstatic emotion of those great hours, when, as Cicero said contemptuously, an Olympian victor received greater honour than a triumphant general in Rome. Such was this hero-worship then that once when Brasidas, the great general who had saved Sparta, returned to Scione, he was given such a reception that it was said that he, wearing a wreath of gold, was honoured as greatly and fervently as if he were an athlete! The different regions gave new honours and rewards to their athletic heroes on their return, according

to their principles and ideas. The Spartans would give to their man the most glorious place in battle; the Athenians might give him a substantial sum of money and the means of existence for the remainder of his life. The sculptors made statues to exhibit the divine beauty of his limbs; the poets composed songs in praise of him. Once at least, when an athlete went home victorious to his native place, a new opening was made in the stone walls of the town that he might enter by it and not through the common gate. 'Die, Diagoras,' they said to him who had himself been an Olympian victor, and had lived to see two sons of his crowned victors too on the same overwhelming day, 'for there is nothing less than divinity left for thee to yearn for.'

* * *

There has lately been a picture in the papers of Mr Dempsey, the American fighting man, lying asleep in grand and wealthy idleness upon the sands of a seaside resort where people looked upon him with awe, and subsequently it was announced that he had been received at the White House by the President of the United States, the only one that day; but Mr Dempsey, though he can win fifty or sixty thousand pounds with half-a-dozen punches of his famous 'right,' did not go out to the Great War, which the American newspapers considered to be strange, and he will never know real glory like that won at Olympia of old. I remember that in 1912 I was crossing the Atlantic westwards in the same ship that was carrying the American athletic team back home from the Olympic games in Europe in which they had been competing. I talked to some of what they had seen and done, and one thing I clearly remember is that two of them jointly and severally complained that the German competitors in some events were not as clean as they might have been, and that this idea occurred to them especially when swimming races were being conducted in the baths. Those Americans were of opinion that the Olympic games did not 'cut much ice,' and never would. When our ship came up to the quay at New York those Olympians assembled on deck, and, in a lusty chorus, cried out one by one the letters 'A-M-E-R-I-C-A,' and then three times shouted the great name they stood for. It was a proud and a worthy gesture. But there was no answer from the quay. America had not then entered upon her great winning streak; she had not really started to lick all creation, and nobody seemed to care. The quay was not carpeted, no band played 'The Star-Spangled Banner,' America was as unmoved as the Statue of Liberty out at the harbour mouth. The athletes just stepped ashore, and opened their baggage for the customs men to see most carefully if they had brought anything back from Europe for which they should pay special duties, and a runner from St Louis told

me he was most mightily anxious about some cutlery at the bottom of his trunks. It is different now; the Great War has intervened, and in many ways America has advanced. She goes first in nearly everything, and she is acquiring dignity, with a bold sense of it, as we perceive particularly in the new style of immense and massive architecture that she is adopting; but whatever sincere homage and respect she may pay to the great traditions of old Europe, she can never acquire a trace of the rare Hellenic feeling of the Olympic games. She can only reflect wonderingly upon the white tents of the ten judges of Elis who had been appointed to determine upon the games, and who had been preparing themselves for many months for their duties. To them came the athletes after their ten months' training in the gymnasium at Elis, and gave the required proof of the goodness of their character, which had to be spotless, and of their Hellenic birth. Later, when they trod the line, the people were asked to challenge any of them whom they suspected of a fault. They had to swear that in three trials, verily sacred as they were, they did exert no trickery in any form whatsoever. And so they strove. At one Olympiad, Ladas the Spartan fell dead as he leaped to the end of the foot-race. There was boxing, but it was well controlled, and there were no traces of the horrors of the combats of the Romans. Here at Olympia, if a competitor died in the contest his opponent was disqualified, and might, according to his deserts, be visited with severe penalties. The introduction of the great chariot-races at the twenty-third Olympiad, constructed on such a scale that only the rich could enter, and the wild excitement and sometimes horror when the chariots made their sharp turns, and often were upset, marked some change in the spirit of the games.

* * *

So of old. Then, according to one's feeling, compare the spirit and the circumstances of the Olympic games as they are being conducted in France this year. More pertinently, perhaps, think of the possibilities of all our sports in the not distant future when commercialism, exploitation, and publicity advance much more and rapidly, as is inevitable, it seems, if we bear in mind the manner in which all progress, as it is called, is applied to these affairs. It may be realised what a tremendous difference the telegraph has made to sports of every kind. Can it then be guessed what effect the new wireless broadcasting business may not have upon some form of what is called sport? Nowadays the most acceptable information upon games to a large section of the public is that which the players distribute before and after the events, by their pens, wielded in deputy by others for them, and in other ways. After one of the big fights—big with the money, big with the talk, but little in

their duration and less in their sporting quality, for but lately a prospective winner struck at his opponent when he was down—it is the printed words of the contestants that are most sought for. It is natural, perhaps. They might have liked the idea at Olympia, had there been newspapers then, though I fancy those ten stern judges, who set themselves to inquire into the character and dispositions of the men who came before them as competitors, would have had something to say upon a thing like this. When in some public institutions there may be seen every afternoon from two o'clock till four a large number of persons to whom is attached the proud and particular name of sportsman gathered round the tape telegraph-machines, waiting for the results of races which it would be too much trouble or inconvenience or expense to go to see, and when there may be seen the same spirit and practice in a varying degree applied to other forms of sport, the tendency and the ultimate consequence may partly be perceived. Some say that the prize-fighting business is flagging, and that it is necessary that new excitements and novelties should be attached to it. It appears possible, then, such is the public craving, that long before the fight, for days or weeks, perhaps, the contestants will tell you all about it, and what they feel and think, and what they propose to do, by means of the broadcasting. Sandwiched in between an item of grand opera and a lofty speech by the prime minister, one who goes by the name of Young Kidd of White-chapel may tell you at 9.20 what he has had for dinner, may report upon the state of his hands, and will expound emphatically, and with as little sincerity as modesty, perhaps, the plans by which he proposes to smash to many bloody bits his rival, Corporal Sloggs of Bermondsey, when they meet in the ring on the date that has been announced, the big purses awaiting them, the lords and ladies in attendance, and the fierce glare of intense lights beating upon them for the purposes of the cinema shows which must have the fight-film on the following night, this being one of the most important parts of the whole enterprise. This being done, it is difficult not to believe that during the contest Kidd and Sloggs will not be required to speak some words of description and comment into the broadcasting business attached to the corners of the ring. Then after the first round—if it lasts longer than that, for these people do not like to prolong their contests as in the good old days when the pugilists would hammer at each other for fifty or sixty rounds—Kidd will murmur to a hundred thousand homes or more that he thinks that in the next round he may get in an upper cut that will knock his man senseless, and Sloggs, hearing the declaration, will comment with another, deriding him, exposing him. There is such a keen remembrance upon the manner in which these warriors have been accustomed to

engage with each other upon questions of prizes and money, and even upon the fighting prospects for many days and even weeks in advance, through the usual mediums of publicity, all being considered for the good of the cause, that it is difficult to resist completely an idea that so eager will they become in those ring declarations and explanations that they will forget to go on with the fight; and there would be the excuse, after all, that the public at its fireside, and some of it in bed, liked this kind of thing, these most succulent intimacies. And we, too, should hope for it, for in this manner might the business at last be ended. Something of the kind, modified according to conditions and circumstances, might probably be expected in relation to other sports and pastimes. Why should the Association football-man stand up

with fifty thousand others around the arena on a wet and chilly afternoon, courting all the fevers, when he, too, might loll at the fireside—or in the bar, if he liked that better—and listen to a famous International describing every kick and movement, how the goals were scored, and all about it? The world, as we all feel, is on the edge of great events, of more and more startling discoveries, of ingenious applications, of most modern changes. Our games, through which, as we all know, we won Waterloo, and many an historic battle afterwards, will participate in the great development. All publicity and propaganda and all officialdom indicate that they should and must. The public, with its craving and with its exhaustless demand for novelties, decrees. The public is master, and the players are but a little and a temporary part.

A GIPSY OF THE NORTH.

CHAPTER XVIII.—*continued.*

ROY looked at her curiously, wondering what was in her mind. Her face was flushed and her blue eyes were dancing with the excitement of some secret thought. What it was he could not even guess, nor did he try. It was sufficient that he had banished from her face the fear which had shadowed it, and that for the time being she had no thought of Standifer. So he talked on, until the sick man called for attention; and when once more Billy relapsed into silence the new day had begun, and it was time to replenish the fire and prepare the morning meal.

Through that day Carwyke, without betraying his anxiety, kept watch. Once he walked through the woods to a place where the creek joined the main river, and carefully surveyed the reaches of the latter, to find them empty of life. Gradually as the day passed his fears of any intervention by Standifer or Bull died down, though every hour or two he walked a little way into the wood, and stood to listen carefully for any sound that might indicate the coming of the men whom Norma had such cause to fear. The girl was not blind to these comings and goings, and understood the cause of them very well. As he returned from one of his little excursions she voiced her knowledge. 'You are afraid these men will come, Roy?'

'No,' he answered confidently. 'Not afraid; I am merely taking precautions that we shall not be surprised. No man can come through these woods silently, and I go out to listen.'

'And you have heard nothing?'

'Nothing whatever.'

'Then perhaps they will not come.'

'If we get through to-day and to-morrow without their putting in an appearance, I shall

be very sure of that. Our only anxiety then will be Billy.'

'He is worse, I think,' said Norma, a little quiver in her voice.

'That is the fever,' he replied, with an assurance that he was far from feeling. 'It must move to its climax, I suppose. The foot is going on nicely, I think. In a day or two he will probably be better.'

'I pray God he may,' whispered the girl fervently.

As events befell, it was a week before the fever passed, and Billy's pale eyes, opening after healthy sleep, looked out from his worn face with the light of reason in them. He was weak, but he had the strength to ask, 'What's up, Mista Carwyke?'

'You've been ill, Billy—fever, you know, and we had to camp.'

'Camp with them rotters——'

'Lie still,' commented Carwyke, 'and I'll tell you a little that has happened. It isn't very much, but I think you'll find it interesting.'

He told of the shooting they had heard on the first night of their camping. The invalid listened carefully, his eyes closed, and when the story was ended he asked abruptly, 'How long since was it?'

'Eight days.'

'And yo' ain't never heard or seen anythin' since?'

'No.'

'Then, whatever happened, I reckon they're off ther pay-roll.'

'Yes, I think so. And there's another thing I have to tell you, Billy. When we hit civilisation, Norma and I are going to be married.'

'Glory!'

As the sick man cried the word, his worn

face was alight with pleasure, and he thrust out a weak hand. Carwyke took it, and as he did so, saw the pleasure in the other's face give way to a look of apprehension.

'What is it, Billy?' he asked quickly.

'Guess I've been bug-house for a while. Did I talk a lot, Mista Carwyke?'

'A whole lot!' said Carwyke, with a laugh.

'Private life, an' all thet, hey?'

'Some of it,' laughed his friend. 'You must have been a lively spark; but there was nothing that you need be ashamed of. There are worse sinners.'

Billy did not seem particularly comforted by this assurance. His gaze was fixed oddly on Carwyke's face, as if there was something that he sought to learn there, and as he noticed the stare Carwyke dropped his laughing manner. 'What's up, Billy?'

'Talked a lot about Missey here, too, I reckon?'

'A goodish bit.'

'Say anythin' in particular?'

'Nothing that mattered.'

'An' I didn't say nothin' about her father?'

'Never a word that I heard. But what's got you, Billy? Is your head bad again?'

'Nope! An' nothin' hev got me,' the sick man laughed sanely enough. 'Put this cross-examination down to rude curiosity. Naturally a feller who's been gassin' for a week is anxious to know what he's said; an' it ain't nice to hev said things yo'd a deal sooner not hev said, an' thet without knowin' it.'

Carwyke laughed his understanding. 'I know what's biting you, Billy. I knew a parson once who wouldn't have gas at the dentist's because of the things he might say when coming out of it. But as I told you, there was nothing that you need blush for.'

Billy heaved a sigh as of deep relief. 'It is good ter know thet,' he said, and his eyes grew less keen. Then he made a movement and

added, 'Lor, I feel like a new-born infant. A fly could walk over me.'

Carwyke laughed. 'It's something that you're here for it to walk over, old man. You've had a real bad time, and more than once I thought you'd cross the divide. But you'll soon mend now, and as we're quit of Standifer—'

He broke off sharply as a sound came from the wood. Then he rose quickly to his feet when the sound was repeated, and as some heavy body crashed through the undergrowth he jumped for his rifle and jerked a shell into the breech.

'What is it?' whispered Norma.

'It might be a moose—a bear—anything,' he whispered back. 'But I think it is a man.'

'A man!'

He saw the sudden fear leap in the girl's eyes, but he did not reply. His eyes were fixed on the wood whence the sounds came. The crashing continued. Once there was a stumble, and then a little interval of silence. All three of them waited tensely for what was to follow, and a moment after the noise made by the progress of the unseen individual in the wood was resumed. Two minutes later Carwyke saw a man advancing between the trees without any attempt at concealment—a man who swayed drunkenly as he walked. On he came, apparently unconscious of the nearness of the camp. There was a dirty bandage round his head, and as he came nearer his clothes were seen to hang in ribbons, his face was gaunt, his eyes were sunk deep in their sockets, his cheeks and chin had a swarthy stubble. It was not until he was quite close that Carwyke recognised him, and when he did, he cried out in sheer surprise, 'Standifer, by Heaven!'

And at his cry the man stopped dead, his hand against a tree to steady himself, staring at Carwyke and the others with burning eyes.

THE SAPODILLA TREE.

By F. J. L. MURE.

THIS tree, reputed as being a native of Central America, is also found growing in other parts of the tropical world, including Southern Mexico, British Guiana, and the West Indies.

The fruit, when ripe, should be picked and kept for two or three days, thus making it soft and mellow, and a more luscious and agreeably cool fruit is hard to find in the tropics. Both tree and fruit go under different names in different countries—which is rather confusing. In Jamaica it is known as Naseberry, Nispero in Venezuela, Sapatilla in Santo Domingo, Sapote in Central America and in

Peru, Sapodilla and Bully Tree in British Guiana.

The tree exudes a milky sap when the bark is cut, and it is from this latex that the product known as 'chicle' is obtained; but it has to go through a process of purification before it becomes the gum of commerce. The purification process consists of removing all impurities, such as vegetable matter, silica, &c., without in any marked degree affecting the original flavour, weight, and plasticity of the crude gum, after which the purified product is mixed up with suitable artificial flavouring essences and sweet-scented oils.

It is on record that as much as six million pounds avoirdupois of crude 'chicle' was imported into the United States in a single year, all of which, it is believed, was manufactured into chewing-gum. Nowadays, however, a cheaper article has been obtained as a substitute, and the demand for 'chicle,' although still great, is somewhat lower.

In British Honduras the government collect an export-duty of three cents per pound on 'chicle' passing through Belize, which brings in a revenue somewhere in the vicinity of £20,000 a year. The greater bulk of blocks of this gum shipped from Belize comes in transit from Guatemala and Mexico for shipment to the United States and Canada.

The Sapodilla tree luxuriates on loam, clayey loam, and sandy loam soils; in fact, it will grow on most soils containing a mixture varying from twenty-five to eighty per cent. clay, climatic conditions and surroundings under which it is grown being predominating factors. Up to the

present day no attempt has ever been made to cultivate this tree on plantation lines, and the entire quantity of 'chicle' collected for commercial use has been obtained from trees growing wild. (The term 'wild' is applied to the 'true' sapodilla and not to the 'bastard' variety.)

As each tree will yield about nine pounds of crude gum, it is logical on this basis to conclude that a cultivation on systematised plantation lines would turn out to be a paying proposition, but consideration should at the same time be given to the fact that beyond the requirements of the United States and Canadian manufacturers of 'chicle' there is no market.

From a general utility point of view, the Sapodilla tree could be profitably grown on cocoa, coffee, cane, and such-like plantations, where the crops would be the better for or actually require wind-breaks and shade trees. Under such circumstances the cost of production of the gum would practically be just the cost of collecting.

THE CAPTAIN'S MATE.

By G. B. DOWN and J. VICTOR.

I.

THE liner *Delaware*, New York for London, was a little to the westward of the Scillies. Her commander was pushing her ahead, so as to arrive in port in time to pay off the crew and complete the business of the voyage as speedily as possible.

He was having a final slumber before entering the Channel, when a quartermaster roused him and presented a note from the chief officer informing him that they were just running into a thick fog-bank.

The captain swore. The task of picking up a given point upon a treacherous coast is always dangerous, and a fog increases the difficulties tenfold.

The whistle bellowed forth its deep warning as the skipper buttoned up his coat and climbed the ladder leading to the upper bridge. He glanced quickly round in every direction, and then turned to the chief officer. 'Ring down half-speed.'

The order was obeyed.

'Got a man on the look-out?' he asked next.

'Yes, sir.'

Both men kept under the shelter of the weather-dodger, continually peering ahead into the impenetrable mantle of white.

The captain was a thoroughly efficient mariner, but did not, as is common with some experienced men, underrate the danger and responsibility of the situation. 'Take a cast of the lead and continue doing so every half-hour.'

The other departed, and after a short absence returned to the bridge, holding the piece of soap from the bottom of the lead for his superior's scrutiny. 'Forty fathom—rocky bottom,' he reported.

The skipper nodded, and the chief officer handed the soap to a quartermaster with instructions to lay it in the chart-room.

Slowly, with almost human caution, the ship went ahead into the damp, misty folds, and on her bridge the dreary vigil was resumed, both watchers keen, alert, and silent.

With startling suddenness the silence was broken by a rousing tune. It was only the bugler sounding the summons to dinner, and almost before the echo had died, the second officer came up to relieve the chief.

'I sha'n't be down to-night, so you'd better take my place; make things lively, and tell the purser I'll stand the drinks. You might send my servant up with the menu,' said the skipper as his chief officer went down.

II.

In the saloon dinner progressed merrily enough, thanks to the efforts of those in authority. The chief officer, the purser, and the doctor, each at the end of a long table, kept up a lively round of conversation, and any nervousness caused by the bellowing fog-horn was soon dispelled. Corks popped, glasses clinked, and the ship's band gave selections from the latest musical comedy.

And the man upon whom rested the safety of the vessel with her human freight was en-

veloped in fog up on the bridge, chafing at the delay.

The fog was annoying. If it delayed the ship much he would be unable to conclude his duties and commence his holiday leave. And he had pressing reasons for wanting leave.

Twenty years ago he had left the paternal roof in anger. His father—a stern, narrow-minded man of Puritan instincts—made the mistake of trying to force his son into a profession for which he was wholly unsuited. The youngster had many excellent qualities, and would doubtless have made a name for himself in the Army or the Navy, instead of which his father decided on the Church.

At college John, entirely uninterested in his studies, did not achieve the success which his father anticipated. The only good results he obtained were in the sports field. Always extravagant and a trifle headstrong, he incurred debts which strained the paternal exchequer considerably. He had a similar effect upon the stock of paternal patience, which culminated at last in a bitter quarrel between them, the young man being ordered out of the house and forbidden to return.

He drifted into a bad set, and after a time, finding himself penniless, joined a barque, bound for Australia, as deck-boy.

As the years passed, and he slowly climbed the ladder of his profession, his bitterness vanished, though some of the evil habits contracted during those early days still remained. It was known among his intimate friends that he was addicted to drink, and more than once it seemed almost by a miracle that the ship under his guidance had escaped disaster.

He sometimes found himself thinking of the old home he had left, with its well-kept lawns, the roses and the fruit-trees. And above all, he wondered if his mother was still there. He remembered his sister too—little Joan. Thirty years old she would be now, and most likely married, with kiddies of her own.

He had pondered these things a lot during the last months, and curiously enough on the outward voyage of the *Delaware* were some passengers who knew his native village on the Kent coast. From them he learnt of his father's death. They also spoke of the widow and her daughter, and the chance information set his thoughts working furiously.

At New York he cabled asking if he might come home, and received the answer on sailing morning, 'It is our dearest wish.—MOTHER.'

All the way across the sweet simplicity of the answer called him, and he chafed now at the unlooked-for lengthening of the passage.

III.

The chief officer went up to relieve the second, leaving the passengers still at the tables talking over their coffee.

The usual 'last' dinner toast was just being proposed when there came a sudden crash, followed by a long, scraping noise. Then the ship stopped and listed over to port.

With one accord they all rose, and, amid a few feminine shrieks, started for the entrance, where stood the second mate, cool and smiling.

'What's the matter here? You all seem in a great hurry. There's nothing seriously wrong, so I should advise you all to sit down and finish dinner; besides, I detest dining alone,' he added laughingly, well knowing that his chance of dining at all that evening was very remote.

The purser backed him up admirably, and their coolness inspired the passengers with confidence. As they resumed their seats the second officer escaped unnoticed to the deck. He went direct to the bridge. The engines were going astern, but without effect, and the carpenter reported several feet of water in the fore-hold.

As the long Atlantic swell pounded at her side the ship bumped uneasily, and the skipper knew she was doomed. It was a catastrophe liable to overtake any mariner, and no human foresight could have averted it. But neither shipowners nor the Board of Trade are prone to consider strandings with undue leniency, and the skipper knew it. He knew also that it was time for action and not for vain regrets.

'I'll remain in charge here, Mr Hammond; you help the chief with the boats—he's gone to tell the purser about getting the passengers up. The starboard boats can't be used with this list on her. Women and children first as usual,' he said, walking to the telegraph and ringing the engines off.

The helmsman still stood at his post in the wheel-house, and the skipper motioned him away. Never again would the ship answer to the touch of man.

Gradually the wind increased and the fog lifted, revealing a light away on the port bow. With the rising wind the sea became more violent, and the *Delaware* threatened to break up.

'Send up a rocket there, one of you,' said the captain, and turned to the chief officer.—'Get the boats away as soon as you're ready; tell them to look out for rocks near the shore and steer for that light.'

IV.

Several of the crew remained after the boats had got away, and the skipper addressed them kindly. 'Well, my lads, this old ship won't hold together much longer; you've done all you can, and it's every man for himself now.'

One or two answered, more from force of habit than anything else, 'Ay, ay, sir!'

Silently and slowly, almost reluctantly, they discarded their footwear and dropped over the side, one by one.

The chief officer stood by, watching. The

magnitude of the disaster was very apparent to his nautical mind, and a great compassion for the skipper possessed him. They had been juniors together in the line, working up the ladder to their present positions, and were good ship-mates, although the subordinate viewed many of his senior's escapades with disfavour.

'It's no use waiting—she's a total wreck—like my ticket,' the captain said bitterly. The other did not reply. He realised that it was one of those occasions when silence is more eloquent than speech.

'There's one thing more you can do, John,' the skipper continued, taking a letter from his pocket. 'Take this letter in case I go west. Take it and deliver it personally; you'll know what to say.'

'Ay, ay, sir!'

'Come into my room and have a parting drink—I've not had one since dinner, and goodness knows when we'll have another.' Sympathy dictated assent, and the chief followed without a word.

The seas continued their ceaseless bombardment, and the *Delaure* was slowly breaking up. The decks were swept clean, the starboard boats were all damaged, and the funnel was liable to carry away at any moment.

'We may as well make a start,' the captain said, helping himself to a second drink; and then added reflectively, 'Wonder if those other poor beggars got to land all right?'

Strange to relate, he was the only one injured in the attempt to get ashore. A blow from some floating wreckage rendered him unconscious, and the half-submerged rocks near the shore would have completed the work but for the ready aid of a coastguard.

V.

Joan Thornham stood looking out of the window on to the little garden sparkling with frost in the wintry sunshine.

She was tall and slim, brown-haired and gray-eyed, with an elusive something in her expression that strangers put down to coldness. It was really the mark that ten years of a rather lonely life, spent in nursing her invalid mother, had left, and in repose her face was often very sad.

She had several times that morning looked towards the end of the short road, though there were no real grounds for believing that her brother would come that day. They had no idea of the name of his boat, and if one judged from the time that had elapsed since his cable had been received, he could have been home some days before.

But her mother was so certain that she would see her boy again that day. She had talked of little else, and it was evident that only the hope of the prodigal's return was keeping her alive.

Joan herself could scarcely remember her brother. To her he was a dim memory of a

happy, jolly boy coming home from school for his holidays, and a slightly clearer memory of a young man whose college vacations cast a gloom over the home, and made the father strangely irritable.

The old doctor, who had known Joan from childhood, had shaken his head sadly that morning. 'It's only a question of hours now, my dear. I hope the boy will come to-day.'

She watched him now as he went along the road, and then, just as she was turning from the window with a sigh, a stranger came in sight. He swung down the road, looking at the names on the gate-posts. As he came nearer and she saw that he was big and broad and sunburnt, Joan gave a sob of relief and flew to open the door. He was coming up the path now, and as he reached the door, Joan, her eyes full of happy tears, put her arms round his neck and kissed him.

He did not speak, and she drew him into the little hall. 'Oh, my dear,' she said, 'how glad I am you have come, but you are only just in time. I think mother has just been keeping alive till you came. She can't see you, John—her sight failed a year ago; but if you knew how she has wanted you to come!'

She led him softly into the sick-room. 'John has come back, mother,' she said gently.

The old lady turned her head in his direction and held out her hands as if to embrace him, and he knelt down at the side of the bed. 'I knew he would come to-day; now I can die happy,' she said faintly.

She took a hand of each and murmured, 'God bless you both!'

The words were scarcely audible, and they were the last she uttered. An hour later her feeble hold on life relaxed, and she slipped peacefully out of this world to rejoin her husband and tell him of the prodigal's return.

VI.

The prodigal himself was very silent, and seemed ill at ease. 'I should very much like to have a talk with you when you can spare time,' he said to Joan that afternoon.

'I'll come in a very few minutes,' she replied.

He paced up and down the little sitting-room, wondering how he could best tell her his news, and before he had come to any conclusion, she came in.

She stood before the fire, shivering slightly, and he saw that she was very pale, and there were dark shadows of fatigue under her eyes. A sudden feeling of compassion for her loneliness filled him, and made his first words sound almost brusque.

'My name is John,' he said, 'but I am not your brother.'

'Not my brother!'

'No. My name is John Warrender; I was

chief officer on the *Delaware*—your brother was captain.'

Joan stared at him reflectively. 'Then why did you pretend to be my brother, and where is he?'

'I never really meant to; but when you told me how ill your mother was, and how she had been wanting your brother to come, I thought perhaps there would be no great harm in just letting her think he had come—I could see at once that her time was short, and perhaps it comforted her a bit.'

He went on to tell her of the wreck in the darkness and fog, of the captain's injuries which had proved fatal, and gave her the letter entrusted to him.

Joan stood holding it, apparently listening to him unmoved; but she was trying to arrange all these new facts in her mind. She had lost her mother, but had found some consolation in the thought that she had a brother to turn to. Now that comfort was gone. For him, personally, she could not grieve overmuch, as he was little more than a name to her; but suddenly she realised that she was now quite alone in the world. And this man, whom she had taken for her brother before he had time to speak, and whom she had kissed so warmly, was a stranger!

Warrender stood looking at her rather miserably, trying to read her thoughts, as she still gazed into the fire. 'You know,' he said at last, 'your brother and I were real friends for years. I should like it, Miss Thornham, if you would let me try to take his place a bit, now that he is gone, and look after you.'

'That is very kind of you, Mr Warrender, but you must not bother about me. You have only just landed, and I am sure you must be wanting to get to your home.'

'I have no home,' said Warrender simply; 'I have no people. And when I'm in England, I just put up at some hotel; so if I could be of any use to you, I can just as easily stay near here.'

VII.

A few days later Mrs Thornham was laid to rest in the churchyard beside her husband, and that evening, sitting over the fire, Joan thought gratefully how Warrender's help and presence had lightened her own load, making the last few days much less dreadful than they would otherwise have been.

While she was still deep in these thoughts he came in, bringing with him such an atmosphere of cheer and kindness that the little room, which had seemed so empty, and quiet, appeared quite changed. 'Well, Miss Thornham,' he said, 'I have come to say good-bye. My owners have given me a command, and I must be off to-night. I think we have pretty well settled up all your business now; and if any-

thing goes wrong, you must write to me—this paper will tell you how to address me.'

Joan took the slip of paper. 'I shall never forget all your kindness to me, Mr Warrender, and I wish I could hope ever to repay it.'

'There is nothing to repay,' said Warrender; 'only too glad to help you. But if you really would like to do something for me, Miss Thornham—'

He hesitated, and Joan looked up expectantly. The firelight gave warmth and colour to her pale face, and her pretty gray eyes were animated. John Warrender, looking down at her, felt a sudden pang that he had no home to come back to after his wanderings, and no woman like this to make some place a home for him. Perhaps it was this thought that made him speak more eagerly than he had intended.

'You wouldn't write to me, I suppose, Miss Thornham? I don't mean only if things go wrong, but just letters to tell me what you are doing, and—and—that sort of thing,' he ended lamely.

'Why, yes, of course I will if you would like it, Mr Warrender.' Then she added mischievously, 'I beg your pardon, I mean Captain Warrender—I'm really glad you've got promotion.'

He laughed, a boisterous hearty laugh, feeling bolder now that his overtures had not been repelled. 'So am I—it will make quite a big difference in my position in many ways. A captain, though, always wants the help of a chief officer—a good mate,' he said, and left Joan standing in the porch wondering.

And so it happened that these two became fast friends, and when Warrender walked into the cottage quite unexpectedly some months later, he found a welcome that must have satisfied the most exacting of friends.

Joan was in the kitchen cooking when she heard his voice in the little hall, and she called out to him gaily to come in and help. 'Come right along in; but I can't shake hands with you yet—I am smothered in flour.'

Warrender strode in, almost filling the little kitchen. He looked at Joan, enveloped in a big white overall, her face flushed and happy with excitement; then, without a word, he leant across the narrow table and kissed her.

'But really, John, I can't think how you could do such a thing,' said Joan, an hour later—an hour filled with talk and happiness as they sat in the firelit sitting-room—and with Annie in the kitchen, too.'

'Well, darling,' said John, evidently unashamed, 'I really don't think it was half as bad as what you did. You kissed me, you will remember, before we had even spoken to each other. And I didn't look half so shocked then as you did this evening!'

FORESTALLED.

CHAPTER VIII.

ONCE again Tom had to swim the river, but this time the task was easier, as he found a spot where it was much narrower. Then towards evening, when he had been on the trail twelve full hours, and Joyce nearer twenty, he had a glimpse of her in the distance, beginning to climb the long, slow slope of the hill on the farther side of which the settlement lay between it and the river.

The sight gave him renewed strength. He settled down to a steady run, for here the ground was fairly level beneath the shade of great, scattered trees, and soon he was able to assure himself that he was swiftly overtaking her.

After a time he saw that she had become aware of him. Her slow, staggering walk, to which her rate of progress had sunk, changed and quickened. She even attempted a run. The settlement was not far now, and her lead was still considerable, so that even though his appearance in the distance had been for the moment a great shock, she reassured herself with a conviction that her success was certain. He could not, she thought, catch her up before she reached the settlement that was only the other side of the hill. But the slope she was ascending tried her terribly; and when she ventured to glance behind her again she was terrified to see how quickly he was coming, and with what long, swift strides he seemed to be covering the ground. For he had forgotten his fatigue and weariness; he was running almost as strongly as though he had but that moment started.

And she was near exhaustion, how near she had hardly known till this need for new and fresh exertion had arisen. A dreadful weariness oppressed her. Only by an intense effort of will could she contrive to lift again each foot once she had set it down. But still a dull determination drove her wearied body and aching and exhausted limbs. She was conscious of hardly anything except that she must press on—on—even though each breath was a stabbing agony, and each movement a torment.

Then misfortune overtook her, for as she looked round to see how much nearer her relentless pursuer had drawn, she put her foot in a hole and fell. And where she fell, there for a time she lay, conscious of nothing save the intense relief of lying still. But then recollection came to her—she remembered. She got to her knees and looked back, and with panic she saw how much nearer her pursuer now seemed, and how much more swiftly he appeared to be coming.

She staggered to her feet then, and ran unsteadily on her way. The summit of the hill

was quite close now. Soon she would have reached it, and the worst would be over, since then there would remain only the comparatively easy descent to the river's edge where the settlement lay. Surely, surely, she thought with desperation, it could never be that she was to fail with her goal in sight, almost within arm's-length.

But the sound of swift footsteps behind drew ever nearer and nearer still. She dared not look behind, for she remembered how she had fallen that other time and lost so much precious time. But now the summit was within a yard or two, now she had reached it, and there in full view below lay the few scattered houses that composed the settlement, within their midst the square frame building where government business was carried on.

A thrill of exultation passed through her; her long and dreadful journey through the night, and the dawn, and the heat of the day had not been in vain, for here was her goal that now she would soon have reached. Upon her ears fell ominously the sound of heavy footsteps coming swiftly up behind her.

She began to run, but already he was at her side. She gave him one swift glance of uttermost anger and defiance, and then she settled down to run as she had never run before.

At first, taken quite by surprise, he was out-distanced. But then he increased his speed; with long strides he caught her up, and for a little thus, side by side, they raced down the hill.

For full two hundred yards they ran together side by side, their elbows almost touching, their breath almost mingling, yet never exchanging so much as a single look, so that it was almost as though each was unaware of the other running there.

But this effort that she had made was Joyce's last. Her speed slackened, her stride faltered, she reeled as she went, she almost fell, but recovered herself again. Despair came upon her, for she was beaten, and she knew it. The earth seemed to rise and sink under her feet; the trees and bushes she passed were merged in an indistinguishable mist; only the fierce determination of her passionate will kept her still upright and her feet still moving. How she hated her rival for the steady length of his stride and his firm and upright bearing! The thought came to her that he, running so freshly and so strongly, could outdistance her feeble, staggering trot any moment he chose; and that if he had not done so, it must be because he wished to torment her by letting her get as near their destination as possible before finally drawing ahead.

That was like him, she thought; so cruel, she sighed; and as her strength gave way at last she fell forward on her face and lay there, prone, while the bitterness of failure and defeat rolled in over her soul like a sea.

Suddenly she was aware that something was happening to her. She felt arms placed gently round her. She felt herself being carefully lifted. This surprised her greatly, and vaguely she realised that she was resting, not uncomfortably, on something soft and warm. Also it appeared that she was being borne along, for she was dimly aware of a sense of movement, and somehow she was reminded of days long gone, when she had been a child and tired, and her mother had carried her in her arms.

That was an absurd idea, of course, but all the same it was lovely to lie still, quite still, and to feel thus strongly held and carried, to be free from that awful need for driving on exhausted muscles and fainting nerves, beautiful to lie like this and rest and be still.

On a sudden, as her faintness began to pass and her mind to clear, she realised that it was in the arms of a man she was being carried, that it was a man's shoulder on which her head rested as once it had rested on her mother's—and that this man was Tom Moore, Big Tom Moore, her rival and her enemy, from whom she had raced and fled all through a night and a day.

'Oh, oh,' she muttered, trying feebly to free herself; 'oh, put me down.'

But his reply came soft as the whisper of the wind through the trees at noon. 'Lie still, my heart,' he murmured; 'my own love.'

This so utterly astonished her that she obeyed instinctively and lay still for a little, lost in utter wonder. She had an idea that perhaps she had gone mad; she fancied she might be delirious; she thought she dreamed; and again she tried to struggle, and called out loudly, 'Put me down; put me down at once.'

And again the soft, slow, caressing answer came. 'Lie still, my heart, my love. We are nearly there.'

She could not understand it. Why did he say such things, and why, when he said them, did they vibrate so oddly in her heart?—just as if—

It was altogether bewildering—beyond comprehension—how strong his arms were, how firmly he held her, how comforting it was to be borne along like this, held in these strong, protecting arms. How much better than to have to toil painfully forward alone, every ounce of strength needed to cover each fresh yard of ground.

She surrendered herself utterly. Her fatigue possessed her so, she felt nothing could be better than to be held thus tenderly and carried thus gently—nothing else mattered.

They had reached the settlement now, and people were all running and staring. They all

knew Big Tom Moore, but to see him thus emerging from the forest carrying a girl in his arms, with her head upon his shoulder, was an amazing thing. But he took no heed of their staring, and gave no answer to the questions they called out. Like a conqueror he strode on with the girl in his arms, and came to the square frame building over which the flag floated, and where now two or three men had come to the door to watch with wonder his approach.

When he was quite near he paused, and put Joyce down and said, 'This young lady wants to register. She and her dad have made a strike. She had to come herself, and hurry, because her dad hurt his foot, and they were scared a skunk who knew about it, a scallywag, a fellow mean all through—and very ugly as well—would try to get in ahead.'

CHAPTER IX.

JOYCE'S fatigue was so great it was all she could do to complete her business. But when that was done, and after they had given her a little food and some strong coffee, she felt better. By this time the whole population of the little place had assembled, for news that a 'strike' had been made had already spread abroad, and nearly every man was preparing to rush off to the spot described by Joyce in order to seize his share of the good fortune she had won.

'Some of the boys is starting to-night,' one man said to her. 'Sure thing, that mean fellow you was afraid of will have to get a move on if he wants any kind of a look-in.'

'Ah, yes,' said Joyce slowly. 'Yes—that mean fellow—well, never mind about him, but do you know where—'

She paused, and blushed slightly as she remembered how she had made her appearance in the settlement, borne in Tom's arms, with her head resting on his shoulder. But though she did not complete her sentence they understood her well enough, and one of the bystanders said, 'The big fellow as toted you along? I don't know—where is he?'

But what had become of him no one knew, till finally he was discovered in one of the adjacent shacks, one belonging to an old chum of his. In spite of his exhaustion he was beginning to make preparations to resume his journey down the river, and was trying to secure a canoe and stores on credit, since he had no money left. When some one came in and told him Joyce was inquiring for him he answered gruffly, 'Tell her I am all right. Tell her I'm hitting the river-trail right away.'

They all stared at this declaration, and one man ventured on a jesting observation which brought him a prompt challenge to fight, a challenge as promptly declined. Some of them

went back and told Joyce what he said, and she answered, 'You mustn't let him go; please don't. Tell him I want to speak to him very much indeed. Tell him I feel too ill and bad to come to him; if he won't come, tell him I said "please."'

'If that don't fetch him,' they told her, 'we'll roll him in a blanket and tote him along that way.'

But this extreme measure proved fortunately unnecessary, and presently Tom made a slow, an embarrassed, and an exceedingly stiff and limping appearance in the room where Joyce was resting on an improvised couch.

'I—I only wanted to thank you,' said Joyce.

'Huh!' grunted Tom. 'Nothing to thank me about. I only came along to see you didn't get lost—a plumb crazy trick it was, starting off the way you did.'

'Are you scolding me?' asked Joyce meekly.

'You might easy have got lost,' declared Tom with undiminished severity, 'and starved, or broke a limb and starved, and no one ever known a thing—or—'

'Only I didn't,' interrupted Joyce; 'did I?'

'No,' said Tom.

'And I got there, didn't I?' continued Joyce.

'Yes,' agreed Tom.

'Thanks,' said Joyce softly, 'to you.'

'Wasn't much I did,' said Tom gruffly.

'Well, guess I'll be going. I'm off down-river to-night.'

'Oh, you can't,' declared Joyce. 'Why, there's all sorts of things to see about, and I feel so bad someway I don't think I can, so you must.'

'But——' he began. 'I've no call,' he said. 'Of course you have. Isn't there the claim?'

'That's nothing to do with me, and there's plenty of folk.'

'But when the claim's half yours,' she interrupted; and he in his turn interrupted quickly, 'It isn't. What do you mean?'

'What I say,' she flashed. 'I registered in our name and in yours as equal partners.'

'You, you,' he cried furiously—'you never dared!'

She sat upright and glared at him. 'Tom Moore,' she said, 'you just understand there isn't anything I don't dare.'

'By gosh,' he admitted reluctantly, 'I believe that's true. But this'll have to be put right. I——'

'It can't be altered,' she interrupted; 'it's done. I just knew somehow you would want to slip away, and now you can't, because you're our partner, and if you aren't there, we can't do anything at all.'

He had moved away towards the door, but now he came slowly back to her. He had become very pale, and when she saw his face all at once she was afraid. 'Oh, oh, Tom,' she whispered.

He knelt down beside her, and somehow, he hardly knew how, his arms went round her once again. 'Joyce, Joyce, my heart, my own love, do you mean it?' he whispered.

'I think I always did,' she murmured, her face hidden against his coat. 'Ever since we watched sun-up together—only I did try not to,' she added, with a little contented sigh that at last that struggle at least was over.

THE END.

THE MONTH: SCIENCE AND ARTS.

SUPERSEDING THE FOG SIGNAL.

APART from strikes, fog is the railway traveller's worst enemy. It is impossible with any arrangements at present available to maintain the full speed of trains in a thick fog. Punctuality must be sacrificed if accidents are to be avoided. On the electric lines what is known as the 'electric fog repeater' is used during fogs. This device is fixed in advance of the signal it 'repeats'; that is to say, the train reaches the repeater before it arrives at the permanent signal, and the distance between the two is great enough to allow of the train being pulled up. It gives a brilliant light of the same colour as the permanent signal, and at the level of the driver's eyes. These fog repeaters are switched on by the signalmen when fog comes on, and their colour alters with that of the permanent signals. They can, however, only be used where a supply of electricity is available. Most of the signals on our main lines are out

of reach of an electric supply. To overcome this difficulty, a fog repeater worked by acetylene has been devised. This takes the form of a hollow cast-iron standard, enlarged at the bottom to house the cylinder of compressed gas, and fitted at the top with the lantern. The gas used is acetylene dissolved in acetone. To economise in gas, the light is given in flashes, the intervals between the flashes being longer than the flashes themselves. With 200 flashes a minute, however, there is not the slightest chance of a driver passing the repeater without seeing it. In fact, the flashes arrest the attention more certainly than a steady light. These repeaters are controlled by electricity, but the current required is easily supplied by a battery. A pilot light is left permanently on, and the flashing mechanism is worked by the acetylene. All the signalman has to do, therefore, is to switch on the flashing device on the approach of fog and to control the colour as required. The electric 'repeaters' have enabled the electric

railways to dispense with fog signalmen, and there is no doubt that the acetylene variety will be equally effective. One charge of acetylene enables the 'repeater' to flash for thirty days of twenty-four hours each, which even during a foggy winter would be equivalent to a three months' service; while with a clear season it might last for six months.

THE PASSING OF THE DRUMSTICK.

Although it looks simple enough to the uninitiated, it is only a highly-skilled performer who can satisfactorily play the drum and the supplementary instruments that go with it. The makers of an invention to supersede drumsticks claim that the average person can become proficient with this device in as many days as it takes months to learn the correct handling of drumsticks. The device consists of two wooden knobs or beaters mounted at the ends of metal rods. The opposite ends of these rods are fixed into wooden blocks, which are mounted on springs at the side of the drum. Standing up from each wood block is a finger-plate of thin metal strip bent into the form of an inverted V, but with a rounded apex. Simple manipulation of these finger-plates produces any drum-beat required, including a perfect roll. Check springs are fitted at the back of the wood blocks, and a stop is fixed behind the finger-plates to prevent too big a movement, which might strain the springs. The device is played with one hand, leaving the other free to play other instruments supplementary to the drum in an orchestra, or to hold the drum in the case of marching. This clever substitute for drumsticks was invented by Miss Violet Alma, who is a well-known musical performer.

THE SMALLEST MOTOR LAWN-MOWER.

The earlier motor lawn-mowers, of which an example was described in our issue for August 1921, were produced only in the larger sizes. A smaller machine has been brought out recently that will interest both the professional gardener and the man who looks after his own lawn and garden—at any rate, if a tennis-court is included. With a 16-inch cutter, this mower is driven by a $1\frac{1}{2}$ horse-power two-stroke petrol motor of the air-cooled type. A cross shaft above the cutter is driven by the motor through a roller chain, while further chains, one at each end of the shaft, drive the cutter and the roller respectively. To facilitate turning the roller is in two parts, which are driven through differential gear, like the rear wheels of a car. The machine is started and stopped through a clutch which is controlled from one of the handles. Owing to the weight of the motor this mower makes an excellent garden roller, and a clutch is provided for putting the cutter out of gear when it is being used solely for this purpose. The starting handle turns the motor shaft through multiplying gear

at a comparatively high speed, which ensures good sparking. The pinion of this gear automatically disengages itself from the gear-wheel connected to the starting handle when the motor starts, a device which is common in electric starters. A cylindrical petrol tank is mounted above the motor and a tool-box at the back. One of these little motor lawn-mowers transforms the arduous task of mowing a big lawn into a pleasant occupation, while the cost for petrol is so little as to be scarcely worth mentioning.

POULTRY HOUSE CLEANING MADE EASY.

Every keeper of poultry will agree that the cleaning of the houses is the most unpleasant part of the business. A new poultry house of special design greatly facilitates the cleaning process, and possesses other good features. Intended for six hens, this poultry house is 6 feet long by 3 feet wide. It is divided horizontally into an upper portion for roosting and a ground floor which forms the run. The outstanding feature, and the one that makes cleaning so easy, is the mounting of the house on four wheels, which run on wooden rails 12 feet long. By moving the house from one end of the track to the other one half of the run is exposed, and can be raked over and the litter changed. Cleaning is also facilitated by making the nest-boxes, the perch, and the dropping-board movable, and hingeing one side of the upper storey. The lower part is enclosed by wire-netting along both sides and one end, a door being provided at the other end. For protecting the run in bad weather a loose shutter is provided, which can be fixed along either side. One side of the gable roof is hinged to open for ventilation in hot weather, a hinged wire-netting door under it preventing the escape of the birds. The roof is made water-tight by 'Pluvex' felt. A lock and key complete the outfit of this unique and compact poultry house.

A FOLDING-STOOL WITH AN AIR-CUSHION

For fishing, shooting, or travelling a stool that will fold up into a small space is a great desideratum. Yet it must be firm, strong, and comfortable. One which meets these requirements has been recently brought out. The top is constructed like an umbrella, but with a smaller and much stronger frame, and it is flat when opened out. An air-cushion takes the place of the cover. When deflated, this folds up with the frame. What corresponds to the umbrella-stick is a stout piece of drawn-steel tube which terminates at the bottom in an aluminium casting. This casting has three sockets for as many detachable steel-tube legs. These project downwards and outwards from the centre casting, and they are of different diameters, so that one may be slipped inside another when they are detached, thus saving

space. When the top is deflated and folded down, and the legs are detached and 'nested,' the stool will go into a case 12 inches long and 3 inches square. Enamelled black, the umbrella ribs and struts are hinged into a brass socket and a brass slider respectively. The steel tubes are nickel-plated, and the air-cushion is covered with waterproof fabric. It may be mentioned that the seat will swivel in the aluminium casting.

A DISAPPEARING LOFT LADDER.

In these days of small houses and exorbitant building costs, the storage accommodation for boxes, &c., afforded by lofts cannot be ignored. Hitherto the only means of access has been by ladders and trap-doors. In many cases a ladder has to be brought from elsewhere, placed in position, and removed after use. Sometimes it is hinged at the side of the trap-door, and, when out of use, the free end is hauled up to the ceiling by a rope over a pulley. But there is not often space enough to allow of stowing the ladder in this way, while, at the best, it is unsightly. Still less often is it practicable to leave a loft ladder permanently in position. Another drawback to the present arrangement is the necessity of pushing up a heavy trap-door, and afterwards closing it again, from the top of a ladder. All of these difficulties are obviated by a mechanically-worked loft ladder and trap-door which has been lately invented. To understand this device, let us suppose for a moment that the ordinary loft ladder is pushed up into the loft when out of use and pulled down when required. While the ladder is being pushed up it will slide over the edge of the trap until the upper part overbalances that below. This overbalancing movement, can, however, be prevented, and the ladder can still be pushed farther through until the lower end is short enough to pass the back end of the trap, when the ladder will lie on the loft floor. Let us now suppose the trap-door to be attached under the lower end of the ladder and to go up into the trap with it, thus filling up the vacant space. It would be a very awkward job to push up a ladder in this way, but mechanically there is nothing impossible about the performance. The new loft ladder is provided with a simple mechanical gear, worked by a handle below, whereby the ladder is pushed up into the loft and the trap-door placed in position with very little effort. A spindle along the edge of the trap has a toothed pinion at each end, which engages with a toothed rack at each side of the ladder. When this spindle is turned in the right direction the pinions propel the ladder upwards by means of the racks. Supposing that some one could hold the lower end of the ladder, and the spindle could be turned from below, the ladder could be stowed in this way; but it would take two persons to

do the job. To avoid this difficulty, the upper end of the ladder is attached to the end of a radius rod, which compels it to move in the correct path until it comes to rest in an almost horizontal position and the trap-door is in place. The spindle is worked from a wall below through bevel and worm gearing and a vertical shaft. Turning the handle in the reverse direction opens the trap-door and lowers the ladder. If space is limited in the loft the ladder is made in two parts, the one sliding upon the other; but the principle of working is the same, the ladder extending itself as it comes down and the extension sliding up when being stowed. For reaching the lofts in bungalows these ladders are particularly useful. They may be made of any kind of wood or of fire-resisting material, and would give ready access to roofs in case of fire. The stairway is lowered into position with both ease and speed—indeed the operation may be carried out by a child.

KEEPING HOT THE RADIATOR.

A car standing at the roadside with a rug over the radiator is no uncommon sight in cold weather. Automatic protection from cold for the radiators of cars is now available. This takes the form of a light steel frame, fitted with steel louvres, which fits the radiator front. The louvres, when open, admit air freely to the radiator, while they are almost air-tight when closed. By a system of levers a thermostat at the top of the frame opens and closes the louvres according to the temperature, opening them automatically as the heat of the radiator rises above 130° F., and closing them again when it falls below that temperature. The louvres may be closed by hand immediately the car is stopped, to be automatically opened when the car is started again. In addition to preventing freezing, this device maintains the cooling water at the most efficient temperature in the winter. It is quite possible to have the water too cold, in which case some petrol is wasted. If it becomes too hot the water will boil away. A temperature of 130° has been chosen as giving the best all-round results. This radiator protector will fit any radiator with a flat front, and it can be fixed in a few minutes. It is finished in black enamel, and improves rather than detracts from the appearance of the car.

A QUICK-HEATING DEEP FRYING-PAN.

Every cook knows the advantages of complete immersion in boiling fat for frying fish, potatoes, fritters, and other foods. The ordinary sauce-pan, owing to its shape, requires a large quantity of fat to give the necessary depth; it needs, also, a lot of gas to keep it hot. A new type of pan for frying, stewing, or boiling, which effects considerable economy in the amounts of fat and of heat used, is in the form of an aluminium

bowl. Now a given quantity of water heats up more quickly in an enamel bowl than in a saucepan when placed over a stove or a gas-ring. The bowl shape is therefore good in itself; and the rapid-heating effect is enhanced by a deep collar over which the turned down rim of the basin fits, this collar giving the utensil, at first sight, the appearance of an ordinary saucepan. It confines the heat to the bottom and sides of the basin, being composed of an outer thickness of aluminium and an inner layer of steel, with asbestos between the two. Through a collar so constructed very little heat can pass. A few holes near the top allow the hot gases to move slowly upwards instead of remaining stagnant. Supplied with the pan is a basket which fits the bottom. When the food is cooked the handle of the basket is attached to that of the pan, so that the basket is held just above the fat, for the food to drain and at the same time keep hot. The pan can be lifted out of the collar for cleaning. Kettles are also made with bowl-shaped bottoms which fit into similar collars, with the result that they boil much more quickly than those of the usual form.

A MINIATURE PLANT SPRAYER.

Those with small gardens and conservatories will be interested in a plant sprayer which has been specially designed for use with an ordinary bottle. In this device the pump and the spraying nozzle are ingeniously combined. The pump barrel extends to the bottom of the bottle, and is provided at the top with a tapered cork that will fit the neck of almost any bottle. A tubular rod, connected with the pump bucket, terminates in the spray nozzle at its upper end. Outside the pump barrel this rod is bent into a loop to take a finger of the operator. When the plunger is drawn upwards, the liquid is sucked into the pump barrel through a ball valve. On pushing down the plunger the liquid is forced through a non-return valve in the bucket, and up the tubular rod to the nozzle, whence it issues in the form of spray. The parts of this sprayer are made of steel and are nickel-plated. It can be used for disinfectants as well as for insecticides. By attaching a rubber tube to the lower end of the pump, a bucket full of liquid can be sprayed. Lastly, the price is so low as to place this sprayer within the reach of every amateur gardener.

A HUGE STEAM TURBINE.

Although the steam turbine seems certain to be superseded by the oil engine for the propulsion of ships in the near future, and the predominance of even the steam locomotive is also threatened from the same quarter, steam still reigns supreme in the big electric power stations of this country. So cheaply can electricity be generated in the coal-mining dis-

tricts that almost every factory takes its supply for power purposes from the nearest central station. This means very big machinery in the power stations situated in manufacturing areas. At Rotherham, for instance, so rapidly has the demand for current grown that it has been deemed advisable to lay down a generating unit of no less than 40,000 horse-power. This unit consists of a huge steam turbine and an electric generator, coupled together on one base-plate. The turbine is the largest built in the British Isles, if not in the world; some particulars, therefore, will be of interest. With a speed of 1500 revolutions per minute, electricity is generated at a pressure of 6600 volts. The consumption of coal is only a trifle over one pound per horse-power per hour, a remarkably low figure. Taking up a floor space of roughly 47 feet by 20½ feet, the turbine and the electric generator stand up 12 feet above the floor level, and weigh 300 tons. In its biggest part the shaft is 21 inches in diameter, while the bearings are 16 inches and 14 inches for the low-pressure and high-pressure ends respectively. It is of vital importance that the revolutions per minute should not exceed the full speed by more than a small percentage, as, if this were to happen, the turbine would fly to pieces. To guard against such an accident the two main steam-valves are held open by triggers, and these are tripped by an emergency governor if the speed rises above a predetermined limit. The steam passes through fourteen turbine wheels from its entry into the machine at a pressure of 200 lb. per square inch until its rejection to the condenser at almost no pressure at all. These wheels become larger and larger, the biggest being nearly 12 feet in diameter, which means a peripheral speed of 918 feet per second. The centrifugal force tending to burst the wheel is, of course, greater in this wheel than in any of the smaller ones. It was, therefore, tested in a bomb-proof pit by running it at 25 per cent. over the full speed, which increases the centrifugal force by about two-thirds.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, Chambers's Journal, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

SEVENTH SERIES

THE HIGHBINDERS.

By DICK DONOVAN,

Author of *Young Lochinvar*, *In the Queen's Service*, *Tracked to Doom*, &c.

PART I.

I.

A BUGGY horsed by a big, raw-boned animal, driven by a Chinaman, drew up at the entrance to a substantial wooden building in Santa Agata county of Los Angeles. The horse was gray with foam, for the heat was terrific, and driver and vehicle alike were powdered with the white alkaline dust of the shadeless road, though the driver seemed cool and composed. After the manner of his kind it required something more than even extreme heat to upset his equanimity.

Santa Agata was an extensive orange and vineyard plantation covering some thousands of acres, giving employment to many hundreds of Chinese coolies, with a large contingent of white overseers. It was owned by a wealthy American syndicate, and was one of the best conducted and most flourishing concerns of the kind in that part of California.

When the buggy had come to a standstill a powerfully built white man with a sun-tanned, determined-looking face climbed down, and dragging from the vehicle a large, heavy canvas bag, dumped it with a sigh of relief on the steps of the veranda. A Chinaman stood on the veranda and greeted the traveller. 'You've had a hot journey, boss!'

'Infernally hot—and I'm parched,' was the response.

The white man was Mr Sefton Skindle, who had been the manager of the estate for nearly twenty years. He had driven in from Los Angeles, where he had been to the bank to draw money for the payment, on the morrow, of the wages of the orange section of the coolies. Telling the Chinaman on the veranda, Lee Ah Fook, his confidential clerk for many years, to carry the bag of money, which contained upwards of twenty thousand dollars, into the house, he proceeded to his office, and flinging his broad-brimmed felt hat onto the table, he mopped his wet face, flicked the dust from his clothes, and called for an iced drink.

When he had refreshed himself, changed his coat, and rested for a while—for the long drive

No. 706.—VOL. XIV.

under the burning sun had somewhat exhausted him—Skindle and his clerk opened the bag, and checked the money, which consisted mainly of gold pieces and fractional silver coins. They found the sum correct, and dividing it into varying amounts, placed each amount in a separate bag, numbered, with the total marked on the outside. That done, the chief foreman of the section to be paid, Lie Ling, whose duty it was to pay the labourers, was summoned, and seven thousand dollars were handed to him, that being the amount required for the first batch the following morning. Payment was to be made early, as each squad of men, on receiving their month's wages, were allowed a holiday for the rest of the day. Lie Ling was a valued and trusted servant, and had also been in the company's service for years. He carried the bags of money over to his office in the Chinese quarters near the manager's house, and locked them up in a large chest. This arrangement had been in existence for a long time, and had worked satisfactorily.

II.

The following morning, just as day was breaking, Mr Sefton Skindle was suddenly startled from his sleep by loud shouts and yells coming from the Chinese quarter. Springing out of bed, he hastily dressed himself, thrust a loaded six-shooter into his hip-pocket, and rushed out to ascertain the cause of the disturbance, which was so unusual that the manager felt sure there was trouble of some sort. As a rule the coolies were most peaceful, and pay-day generally passed without any disturbance.

Skindle found an excited mob of Chinamen yelling like maniacs, and hustling each other in an effort to gain admittance to the foreman's office. When the 'boss' appeared on the scene they made way for him, and hurrying into the building, he entered the office, to find the place in a state of the utmost confusion. The large chest used as a safe had been battered to pieces, while Lie Ling lay stretched upon the floor, apparently lifeless. Three other men, one badly cut about the wrists and bleeding freely,

[All Rights Reserved.]

JUNE 7, 1924.

were trying to obtain some explanation from the foreman, but he was unconscious.

Chairs and tables were thrown over, and there was other evidence of a desperate struggle having taken place. The chest had been rifled, and was empty, with the exception of the wage books and business documents. Blood had been splashed on the walls, while the floor where the body lay was slippery with it.

Skindle grasped the situation at once. The foreman and his assistant clerk had, as it seemed, been attacked, the chest broken open, the money stolen. Those were the obvious facts, but the manager knew the uselessness of seeking for information from the mob of excited coolies who were clamouring for their wages. Lie Ling was unable to speak, but the wounded clerk's explanation was that he was dressing himself in his sleeping quarters, having been aroused by his chief, who was on his way to his office, when he was alarmed by a great cry coming from the office. He rushed down to the room, which was in darkness, and as soon as he entered somebody struck at him with a knife. Putting up his arms to protect his face, he was cut about the wrists. For some moments he was so dazed that he could do nothing. As soon as he recovered his self-possession he procured lights, and was horrified to find that the chest had been broken open, and that the foreman was lying on the floor in a pool of blood.

Skindle summoned the estate doctor, telling him to come at once. When the medical man arrived he examined Lie Ling and found that he was still living, and he expressed an opinion that he had been rendered insensible by being beaten on the head with a sand-bag; he had also been stabbed in the shoulder, but though the wound had bled freely it was not serious. The other wounded man had received several nasty cuts on the wrists, but the wounds were not dangerous. The foreman was carried to Skindle's house, where, under medical treatment, he recovered consciousness and told his story.

He had risen an hour before daybreak, and having aroused his assistant, he descended to his office to make preparations for paying the wages, but the moment he opened the door he felt a strong current of air blowing through the room, and saw that one of the windows was wide open. He was immediately confronted by a tall white man whom he did not recognise, and who, without a word, struck him with a knife. He screamed loudly for help. Then he received a terrific blow on the head and remembered nothing more, though he had a vague idea that he saw some of his countrymen rushing in before his senses entirely left him. Chin Ah Kit, the assistant clerk who had been cut about the wrists, could add nothing to what he had already stated, beyond corroborating the story of the open window. As the room was in darkness when he entered it he could not recognise

his assailant, but he saw a figure jump out of the window, and he was sure it was not the figure of one of his own countrymen.

This was all the information that could be obtained, so that the whole affair was shrouded in mystery. It was a serious business, and broke the record of years during which the working of the estate had never been interrupted by any untoward event beyond squabbles occasionally among the coolies themselves when disputes arose over their winnings at fan-tan and card games. Mr Skindle was greatly upset, as well he might be, for not only had a large sum of money mysteriously disappeared, but his faithful and trusted servant, Lie Ling, had come within an ace of losing his life. He resolved, therefore, that at all costs every means should be taken to find and severely punish the thief or thieves, in order to restore discipline and prevent similar occurrences in the future. His first step to that end was to notify the chief of police at Los Angeles, and his second to wire to the celebrated Durland Detective Agency of Chicago, with a request that they should send one of their best men immediately.

III.

The police did their best to solve the problem, but their methods were stereotyped and somewhat antiquated; moreover, they were faced with a complicated Chinese puzzle in a Chinese colony. They examined every coolie on the estate; they searched their boxes; they dug in the orchards; they peered into every nook and corner; they cross-examined and worried everybody, Mongolians and whites alike. The whites were greatly embittered against the Chinese, and declared that Lie Ling had lied in saying that a white man had attacked him. But Lie Ling stuck to his story, though he said he felt sure that it was not one of the white men employed on the estate, as he knew them all. Notwithstanding this qualification things looked very ugly at one time, and Mr Skindle feared that the bitter feeling might lead to an anti-Chinese outbreak. The mystery baffled the police, and they confessed it.

In due course the Chicago man arrived. He was an astute, ferret-eyed, quiet fellow, who, like the sailor's parrot, thought more than he spoke. He smiled sarcastically when he heard all that the Californian police had done. 'It occurs to me,' he remarked dryly, 'their grandmothers would have done better.'

Having learned every detail from Mr Skindle that that gentleman could give him, he wandered about the estate for a couple of days in an apparently aimless sort of way; he had a pleasant talk with Lie Ling and his assistant, both of whom were making a good recovery. He commiserated with them in their misfortune, asked them a few questions about their own country, how they liked California, and whether

they had saved enough money to enable them to return home, so that in due course they could lay their bones in Chinese soil, which is the soul's desire of every Chinaman when he is abroad. Finally, he informed Mr Skindle that he was going away for a few days, possibly a fortnight, but would be sure to return on his way back to Chicago. Mr Skindle was rather disappointed, and did not rate the Chicago man very highly, but deemed it prudent not to give expression to his thoughts.

The Chicago man journeyed to Los Angeles, where, disguised as an opium pedlar, he visited all the Chinese laundries and other places dear to Mongolians, and as he spoke Chinese fairly well, he had an advantage over the regular police. He frequented the shops and shanties in Spanish Town, and engaged in many pleasant chats with the ladies who resorted to the saloons and bars of that delectable quarter. He failed, however, to gain any evidence likely to be of use in a criminal court. He knew that if he haled a celestial before a magistrate and failed to obtain a conviction he would become a laughing-stock. Nevertheless, his suspicions had been aroused; he had come to certain conclusions and formed strong opinions; but he was perfectly well aware that the great difficulty where the Chinese were concerned was to secure evidence. They will not 'peach' on each other in the white man's courts.

IV.

The fortnight passed, and once more the Chicago man sat with Mr Skindle in that gentleman's office, enjoying the fragrance of an excellent cigar, and occasionally cooling his throat with sips of iced 'Bourbon.' He liked the Californian climate and the manners of the Californian people; both were much better than in the eastern states. He frankly owned that he had not been successful. 'I've failed, boss,' he said, with a drawl, 'because the ways of the heathen Chinese ain't the ways of the Westerners; but you can bet your boots, boss, that the story of a white man attacking your foreman is a put-up.'

The boss was ruffled. 'Good Lord!' he exclaimed, 'do you want me to believe that Lie Ling, who has served me faithfully for so many years, has proved false at last? Besides, you forget how seriously the poor chap was injured.'

The Chicago man smiled his dry smile. It was a smile that meant much. 'I don't want you to believe anything you ain't a mind to, boss. I allow your good and faithful servant was bludgeoned and cut some, but that wasn't the act of a white man. If a white had been concerned, I'd have netted him sure by this time. No, siree, nary a white man was in the job. The loyal and faithful Lie, and his partner, Chin Ah Kit, who was slashed a bit, staged a clever little drama. They've done you in, boss.'

'I don't believe it!' snapped Skindle hotly.

The Chicago man smiled again. He was not in the least perturbed. He pulled at his cigar, and took a draught of the cold Bourbon. Then he continued as if unconscious of the little interruption. 'Now, ain't it a bit curious that not one of the other inmates of the house, nor nary a one of the coolies waiting outside for their money, heard any shouts for help? I understand that the good Lie Ling had given you notice of his desire to resign his post, as he is anxious to return home to see his pa and ma. It's astonishing how these almond-eyed gentlemen love their pas and mas.'

The manager admitted the correctness of the resignation, but added that he was unwilling to let Lie Ling go, and had promised him that if he would prolong his term of service he would increase his salary.

'Wal, you see, boss, it's like this,' persisted the Chicago man; 'Lie Ling had set his mind on returning to his beloved country, and when a Chink gets smitten with home-sickness, he's got to go or die, and he doesn't like to die in a foreign land. Now it occurred to Lie that as he was about to quit California, the nice little sum of money you had entrusted him with would be very useful when he returned to China, and he was prepared to stand a good deal of bludgeoning to secure that nest-egg. A Chinaman's skull is mighty tough, and can take a lot of hammering before it cracks.'

'But if you are so sure of Lie's guilt, why in the name of blazes don't you get a warrant of arrest?' growled the manager, still irritated.

'That's where I'm up agin a stone fence, sir,' replied the Chicago man, not in the least ruffled by the manager's irritability. 'I have plenty of evidence to justify suspicion, but not a jot that would ensure conviction in our courts. There is not a magistrate in this country who would sign a warrant for the arrest of a Chinaman on mere suspicion. John Chinaman has the best of it all the time if the evidence depends on his own countrymen, because they will dare hell, and swear by all their josses in favour of the accused, rather than have one of their compatriots convicted in a foreign land. That's where the trouble comes in. See, boss? We Westerners ain't built the same way as these almond-eyed gentry. We don't understand 'em. Our laws don't square with their notions of justice. We are too tender.'

V.

Mr Skindle was still unconvinced. He could not bring himself to believe that his faith had been misplaced. Lie Ling was still suffering, still on the sick-list, and notwithstanding his long experience of the ways of the heathen Chinese the manager's confidence in his trusted foreman was hard to shake. After ruminating for some moments, he said, 'So you evidently

see no prospect of recovering the money, or of arresting the guilty parties?'

'None—except——' The Chicago man did not finish the sentence.

'Except—what?' asked Skindle anxiously.

'Except you will follow my advice.'

'What *do* you advise?'

'What I shall advise smacks somewhat of compounding a felony; it's not exactly what a good American citizen ought to do, as it makes our constituted legal authorities take a back seat, so to speak. But I have nary a doubt in my own mind that if you adopt my plan it will lead to the recovery of the money.'

'But what about the punishment of the thief or thieves?'

Once more the detective smiled. He evidently considered Mr Skindle was a very simple gentleman.

'Wal, sir, you needn't concern yourself about the punishment of the guilty parties—it ain't our business. You may bet your bottom dollar they'll suffer enough.'

'Well, what do you propose?'

'Bring your complaint before an Asiatic tribunal, and set Uncle Sam and his courts aside. The tribunal has much better ways and means of dealing with Chinamen than the white man has. Its mode of procedure is strictly oriental. There is no squeamishness and none of the milk of human kindness in its methods. It's iron-handed justice, and the Lord help any one upon whom that hand descends. The tribunal I allude to is the only one that knows how to deal with a mysterious case of this kind, and its means of obtaining evidence seldom fail. Its decision is final, and there ain't a yellow man in the whole of the United States who would dream of disobeying its decrees, much less of setting it at defiance. If he did he would be doomed. If he tried to escape he would fail. Not a loophole would be left to him. The "Highbinders," as we call their police and spies, would hunt him down were he in the loneliest gulch in the Sierra or the darkest slum of Chinatown. Our system ain't no match for theirs.'

VI.

The Chicago man again moistened his throat with the very agreeable iced Bourbon, and lit a fresh cigar. Mr Skindle's face wore an unusual look of trouble. 'From what you tell me,' he said, 'I realise the difficulty of bringing the rascals to book through the ordinary channels of American justice, and unless they are caught and punished the safety and discipline of this place will be seriously jeopardised. The business of a great estate like this, depending as it does on Asiatic labour for its efficient working, cannot be carried on unless discipline and honesty are enforced. It's the first time during my management that any trouble of this

kind has occurred, and I clearly see how imperatively necessary it is that the criminals should be detected and punished, otherwise we shall have no security in the future. Now, what do you advise me to do?'

'Go to 'Frisco, but don't let anybody here know that you are going. Secrecy is most important. Call at the headquarters of the Highbinders in Spofford Alley, and send your card in to the Chief Inquisitor of the "Asiatic Discipline and Welfare Association." It's high-sounding, but that's how they describe themselves, and the chief is called "The Secretary." Explain to him very fully what has happened. Not but what he knows already, but he will express the greatest astonishment, and will be equally grieved to hear that any of his peace-loving and virtuous countrymen have wandered from the straight path. He will tell you that it's almost unbelievable, as his association keeps such a maternal and fraternal watch over the colonies of celestials that wrong-doing on a serious scale is very rare. Of course you can put your tongue in your cheek at all this eyewash; but mark you, boss, I'll allow that these Highbinders do some good; leastways they can trace criminals where we Westerners fail, though their methods are not ours, and that's where we are handicapped. One thing you must make clear to the chief, that so far there has been no newspaper account of the robbery, and that you will do your best to keep it from the press; for if it is once made public nothing will induce him to have anything to do with the matter. When the police system of this country is baffled in these Chinese crimes—and they are baffled pretty often—the authorities turn a blind eye to the doings of the Highbinders, while not approving of them. The bland and humane secretary—who burns a great deal of incense to his joss—will no doubt advise you to leave the case in the hands of the "Melican Police," who are so clever at unravelling crime mysteries. That will be more eyewash; and you will reply that in your opinion 'Melican Police are duds, and that is precisely the reason why you have appealed to his Mightiness for assistance. If he consents to take the matter up he will insist on having a perfectly free hand, and that the *officials* he sends here to investigate must not be interfered with in any way. I warn you that those will be the conditions, and you will have to keep in the background. If you do that, I'm open to bet a thousand dollars to a dime that the stolen money will be restored, and you will never again have any trouble with your coolies.'

'You seem to be very confident,' remarked Mr Skindle in a tone of sarcasm.

'I am confident because I know,' answered the man from Chicago with emphasis. 'I can spot the thieves, but I can't get the necessary

evidence. Now, where I fail in that respect the Highbinders will succeed. Only Asiatics can deal with Asiatics. East and West ain't on the same plane. Now, boss, what do you say?'

Skindle reflected for some time, then replied, 'I will adopt your advice. It seems to me the only course; something must be done.'

The detective rose and stretched himself. 'Bully for you,' he said, by way of approval. 'And now with your permission I will have a

ramble over the estate, and leave to-night by the north-bound express, and perhaps you'll allow me to take back a hamper of those black and white grapes of yours. We don't get fruit like that in Chicago.'

That night the Chicago man returned home, carrying a large hamper with him.

The following morning Mr Sefton Skindle left for 'Frisco.

(Continued on page 462.)

COUNTRY HOUSE CURIOSITIES.

By CHARLES G. HARPER.

I.

NO museum can by any possibility claim the interest that attaches to those private collections of rarities and curiosities which have come down to their present owners from their ancestors: relics, archaic and out-of-date to-day, which once were objects of everyday use. They are personal things; they have always 'belonged' here, and are not like those detached and labelled exhibits in public collections: things ravished away from their setting—impersonal, and hardly more like the real object than a dried flower resembles one growing.

Only the occupation of a house by one family for long generations can make of it an intimate ancient storehouse of curiosities with a personal and human note. A mere collection, got together by an amateur of rarities, is little better than exhibits in a public museum. The items are alien to him; only the power of the purse has made them his. How different the furnishings and relics preserved from olden times in the ancestral homes of England!

At Wollaton Hall (just outside Nottingham), built for Sir Francis Willoughby between the years 1580 and 1588, and owned to-day by his descendant, Lord Middleton, are still preserved in an upstairs room called 'Bedlam,' where some curious seventeenth-century bedsteads are kept, the clothes of many a Willoughby of centuries ago. Lord Middleton can say, as he gazes upon these costumes, many of them exhibited on frames, 'that farthingale was worn by my great-great-great-grandmother'; or 'that cavalier's outfit belonged to a Willoughby two hundred and seventy years ago.' Many a man can point out the tombs of his ancestors, but scarce one could display his great-great-grandfather's breeches—and wear them, if he felt so disposed.

At Powick Court, near Malvern, a Tudor house externally remodelled in the eighteenth century, the house is filled with heirlooms and relics of the Lanes, almost wholly undisturbed since the seventeenth century. Of this family was the celebrated Jane Lane, who helped Charles II. to escape after Worcester fight;

and one likes to think that the pillion for ladies' horse-riding preserved here may have been occupied by her when Charles on that romantic flight was riding the country disguised as her servant, Will Jackson, while she sat behind him, holding on by his belt, as ladies riding pillion behind their servants were then accustomed to do. The ancient chairs, tables, mirrors, and furnishings generally at Powick Court, and the spinning-wheel and stock of homespun sheets, present a picture of old English domestic economy not readily to be matched elsewhere.

Miles away from Powick, at Long Marston near Stratford-on-Avon, stands the country house called 'King's Lodge,' the old seat of the Tombs family, occupied by Mr John Tombs at the time when the fugitive king and his party arrived there on the night of 10th September 1651. 'Will Jackson' was dismissed to the kitchen, where the cook asked him to wind up the roasting-jack, a service he did not know how to perform. 'Why, what countryman are you,' she asked, 'that you know not how to wind up a jack?'

Charles evaded this natural query by remarking that at his home they rarely had meat. The historic jack is still preserved at 'King's Lodge,' but it is now in a glass case, and the kitchen has been converted into a dining-room.

Chastleton House, in Oxfordshire, built by Walter Jones, 1603-30, and still in possession of his descendants, is rich in portraits and relics of that family, and you have the curious experience, not often gained, of examining the portraits and seeing the actual clothes and jewellery worn by the folk portrayed. There they are, the Joneses from the early years of the seventeenth century, looking down from the walls, and from the ancient cupboards and presses can be brought the original raiment in which they were painted. Nay, more; here are relics of the Civil War, including the rapier of Arthur Jones the Cavalier, who fought at Worcester and came riding home on the night of that disastrous day, to take shelter in one of the old hiding-places of Chastleton. A search-party was at his heels,

and finding his reeking horse in the stables, concluded, reasonably enough, that he could not be far away. He was saved only by his wife drugging the refreshments with which she entertained the enemy. By the time they had recovered, Arthur Jones had gone. A perusal of these authentic, but scarcely credible, stories convinces us that our ancestors must have numbered among them some remarkably simple souls. It might have been thought a first principle not to accept refreshment in the house of an enemy; at least, not until the search was completed.

II.

There seems to be more staying-power in the very old families than in the comparatively new. The Peels, who made their great wealth over a century ago in cotton-spinning, secured a baronetcy in the family, and achieved, in the second Sir Robert Peel, a prime minister, and founder of the London police-force (called, after him, 'peelers'), founded also what looked like proving a long line of Peels of Drayton Manor, Staffordshire. But the glory of the Drayton estates, and the pictures and heirlooms have disappeared. Does that curious relic yet remain there—the hoof, mounted in gold, which belonged to the horse Sir Robert Peel, the prime minister, was riding in Hyde Park when he was thrown and fatally injured, 29th June 1850? The chief honours of the Peels have been acquired by a younger branch, Mr Speaker Peel having been created Viscount Peel in 1895. The Speaker was the youngest son of the prime minister.

Chequers Court, now the country residence of British prime ministers, given for that purpose by Lord Lee in 1917, contains as interesting a series of portraits and personal relics as any country house in England. The most prominent among these are relics of Oliver Cromwell. The Protector had no personal connection with Chequers, which in his time belonged to the Hawtreys. The collection came to Chequers through his daughter, Frances Cromwell, who had secondly married John Russell of the Cambridgeshire Chippenham, son and heir of Sir Francis Russell. This daughter of the great Oliver died in 1721. She probably never lived at Chequers. The connection arises through her grandson, Sir John Russell, the sixth baronet, marrying Joanna Revett, who was the heiress of Chequers in those days. But the genealogical descent of this noble mansion and of its contents is too complicated for a concise description. Let it then be said that in due time this Russell family died out, and that from the Astleys, its last representatives, and those of the Franklands, the house and the collections, as a whole, have come into final national possession, never again to be subject to family vicissitudes.

These Cromwell relics combine the belongings not only of Frances Cromwell, but also of

her elder sister, Mary, widow of Lord Fauconberg, who, between them, had preserved these interesting articles associated with their father. They comprise portraits of Oliver Williams (for that was Cromwell's real name, historically considered; his great-grandfather, Richard Williams, having assumed the name of 'Cromwell' from his patron Thomas Cromwell); a mask taken of the Protector's face during his lifetime; a portrait of his mother; his wife's Bible, printed 'by His Highness's Printers,' with the title 'Highness' carefully scratched out by some Royalist; his son Richard's Letters Patent as 'Protector' in that fleeting period of five months during which the amiable 'Tumbledown Dick' reigned; and two of Oliver's own swords, together with a ledger containing army accounts. To these collections have been added numerous letters and two pistols of Napoleon.

Queen Elizabeth left a good many articles of personal attire in various parts of the country in the mansions she honoured so freely with her presence, alike as princess during the reign of her sister Mary and as herself a reigning queen. The completest collection of these is probably that to be found at Ashridge Park, Hertfordshire, for many years the seat of Earl Brownlow. There is a very special reason for this. Ashridge has been rebuilt since those times, but it was then one of the numerous royal country residences, and it had been given by the boy-king, Edward VI., to his sister, the Princess Elizabeth. There she was residing in 1554 when the Protestant rebellion under Sir Thomas Wyatt in London threatened for a while to overturn Queen Mary. Suspected of complicity, Elizabeth was arrested, hauled out of bed, where she lay with a real or assumed illness, and conveyed on a litter to London, and to prison in the Tower. Thus does the possession of a crown, and the desire to retain it, affect sisterly affection! Those sent to bring Elizabeth to London were fully instructed for any emergency, and declared they 'would take her, dead or alive.' They took her so quickly that she left behind her toilet requisites; so to this day the visitor may see not only her bed, but her shoes and stockings, and the furniture of a dressing-table, including two singular and gigantic hair-brushes like besoms. Together with these articles is an odd collection of baby-linen, of remarkable interest; none other, indeed, than the clothes being worked by the Princess Elizabeth for her sister's expected child.

She was not long in the Tower of London, and later was permitted to reside, under surveillance, at Hatfield, then a royal palace, and not yet become a property of the Cecils. Three years later, while reading under an oak in Hatfield Park, she learnt of her sister's death. The broad-brimmed hat she was then wearing is still preserved in a cabinet in the library, together with her silk stockings.

Three years later Queen Elizabeth was at Helmingham Hall, in Suffolk, the guest of Sir Lionel Tollemache. A lute she played upon on that occasion, and gave to her host, is still preserved in a glass case. Again, at Brickwall in Sussex, near Northiam, visited by the queen in 1573 on one of her 'progresses,' is a pair of her old shoes which she changed here for new ones.

III.

Among the large collections of curiosities at Parnham, the seat of Lord Zouche, near Amberley, is a Roman 'pig,' or block of lead, together with the Early English leaden font brought from the ruined chapel of Llancaut, between Chepstow and Tintern. At Ashburnham Place, also in Sussex, in the neighbourhood of Battle, are relics associated with Charles I. All were given by the unfortunate king, when at that last scene at the scaffold on that bitter 30th of January 1649 in Whitehall, to John Ashburnham, his Groom of the Bedchamber, whose descendants are the Earls of Ashburnham. These articles include the king's watch, his shirt, a pair of silken drawers, and the blood-stained sheet afterwards thrown over his body. The very fine cambric shirt has a faint rose-coloured stain round the neck; a blood-stain partly obliterated by the misguided zeal of a former Lady Ashburnham, who owned a kind of laundrymaid-mind, and had the shirt vigorously washed. The king's watch was formerly in Ashburnham church, to which it was bequeathed in 1743 by Bertram Ashburnham, 'to be deposited and kept among the plate and linen belonging to the said church, where I desire and direct the same may remain for ever.'

That it has not so remained for ever is due to the action of the late Earl of Ashburnham, who removed it, together with the shirt, contending that the testator, being a younger son and not head of the family, could not legally alienate these objects.

A relic of warring in Flanders over three centuries ago is a curious feature of Biddesden House, near Ludgershall. It is an old bell hanging in the tower: a bell dated 1660, and inscribed in Flemish, 'The gift of Bernhard Ernest Goss, to God's House.' It was captured at the taking of Lille from the French by General Webb in 1708 in Marlborough's great campaign. At Tabley House, Cheshire, is another warlike relic, the banner of Lord Byron, carried at the battle of Edgehill, where he was wounded, 23rd October 1642. But far more romantic is the elaborately-painted 'Drake's Drum,' still preserved at Buckland Abbey, Devonshire, the seat of his kinsfolk to this day at Buckland Monachorum. It is that drum of mystic fame, whose beat is said to be heard at the time when England is in danger. Opportunities for that roll of the drum came of late years, and there were marvel-mongers who claimed to have heard it. The

legend is entirely of a piece with the West Country temperament which has peopled the weird region of Dartmoor and the rocks of Cornwall with all manner of wild stories; and has elevated even so historic a character as Sir Francis Drake, that great Elizabethan, whose doings might be thought too well known for legend to have a chance, into a mystical champion of the supernatural brotherhood of King Arthur himself.

It is a remarkable drum, painted elaborately with the extraordinary coat-of-arms granted to Drake by Queen Elizabeth in 1581. The shield bears, heraldically expressed, 'a fesse wavy between two pole-stars argent, on a field sable'; that is to say, silver on a black ground. The crest is even more astonishing: a terrestrial globe supporting a ship under full sail, with a golden hawser flung about it by a hand appearing out of a cloud, on the cloud being the words '*Auxilio Divino*,' and on the bulwark of the ship a red dragon looking at the hand. The motto beneath the shield reads, '*Sic parvis magna*.'

The Harveys of Ickwellbury, near Tempsford, Bedfordshire, still preserve there, among the many other curiosities, the silver-mounted hunting-knife given to John Harvey at the beginning of the eighteenth century by the Prince of Hesse-Cassel, whose life had been saved by the squire during a boar-hunt.

What is 'bad form'? Briefly, it is the doing what the public opinion of one's time considers ought not to be done—or the converse. One might easily, in a long life, live to see such changes come to pass as would change 'good form' into bad, and *vice versa*. In those so-called 'good old days,' which really were not so good, by a very long way, as the glamour of the years gone by would have us believe, it was the best of good form to get extremely drunk on every possible occasion. No host was accounted really hospitable who did not see to it that his guests had so much to drink that they ended the evening under the table, and had to be carried upstairs to bed. The literature of the eighteenth century is full of that kind of hospitality. No one who refused a challenge to drink was accounted a true good fellow. This attitude was a very old one indeed; so old that in some ancient halls there remain evidences of the severe things done to any one who 'shirked his drink.' Such an engine of punishment is to be found at Haddon Hall. It is a quite simple affair, nothing more than an iron handcuff or wristlet fixed on to the panelling of the screen in the Banqueting Hall. The guest who did not put away enough liquor to please the company had his wrist placed in this custody, and the drink he had left untasted was then poured down his sleeve, amid the jeers of the more hearty toppers.

A much more grim article in the way of

olden punishment is kept at Doddington Hall, Lincolnshire. It is a 'branks,' or iron mask, one of those several cures for scolds and shrews and tale-bearing women which used to exercise the ingenuity of our ancestors, like the ducking-stool and such implements of public indignity. The 'branks' was an iron mask provided with a slip of iron for the mouth, so that the 'unruly member,' the tongue, could not wag. The social history of Doddington Hall does not reveal to us for what persons this specimen was intended, but it is a particularly gruesome-looking object, with a long spike projecting from the chin.

IV.

Among the many old English customs long since fallen into disuse is that which obtained in feudal times—the training of young gentlemen by great nobles for the duties of knights and the profession of arms. Most of the greater mansions and castles of England in those days were, in a manner, academies of such arts, and to them were sent the sons of lesser men for that purpose. Those places, in fact, exercised some of the functions performed by public schools to-day. Such a place was Knole, near Sevenoaks, long the seat of the Sackvilles. It is a vast house, full of all kinds of treasures and many curiosities which require some sort of explanation. Among these, away up in the attics, or the 'wardrobes,' as they are called, is a strange-looking contrivance known as the 'dumb-bell.' It closely resembles a windlass, or the framework seen over wells. It is provided with a roller, over which is wound a rope that descends into a lower room. Iron arms projecting from the roller, and tipped with leaden weights, complete this singular-looking object, which was, in fact, what we might now style a 'home exerciser.' It is thought to have been suggested by the bell-ropes in church belfries, and afforded muscular exercise for the youths in training.

There were times when not every one might keep dogs. A reminder of this is found at Browsholme Hall, in Yorkshire, near Clitheroe. That region is the ancient Forest of Bowland, an old-time hunting-warren. None there might interfere with the game save the lord of that manor and his guests, and none might keep dogs of a larger size than could pass through the curious 'dog-gauge' still preserved at the Hall. This was to make sure that only small dogs, incapable of hunting, could be allowed. Free-hunting, not in the least to be distinguished from cattle-stealing, was the everyday occupation of the English and Scottish borders until well into the seventeenth century. All indulged in it. Often these cattle-raiding forays developed into battles, when raider and raided met. The Charltons of Hesleyside, Northumberland, were exactly like all their neighbours. When the larder was growing empty, the lady of the

house was accustomed to give her men-folks an eloquent hint. On the table, served like food under a cover, appeared a spur. This was an intimation that it was time the men rode away and replenished the household store. The 'Charlton spur' is still kept at their old home.

Portraits and picture-galleries are the usual features of ancestral homes, but often we find exceptional specimens. Such a one is the portrait of Algernon Sidney at Penshurst Place, the old home of that knightly and chivalrous family. The unfortunate Algernon Sidney came to an untimely end. Accused of complicity in the Rye-House Plot, by which Charles II. was to have been assassinated, he was beheaded on Tower Hill. He made a brave and striking end. As he knelt at the executioner's block, the headsman asked him, 'Are you ready, sir? Will you rise again?'

'Not until the Resurrection,' answered that intrepid soul. 'Strike on!'

The portrait at Penshurst, painted after his death, shows the Tower of London in the background, and the executioner's axe.

Finally, there may yet be seen at Nacton Hall, Suffolk, the old home of the Broke family, the figurehead of H.M.S. *Shannon*, the British ship which fought the Homeric fight with the American *Chesapeake* in 1813. It is one of the finest examples of the lost art—which was a very great art—of figurehead sculpture.

THE COUNTRY OF THE YOUNG.

ONE night a little man in blue,
When moonlight glittered on the bay,
Jumped on a cockle-shell that grew
Into an aeroplane, and flew
Across the moon's face far away.

I watched another run with speed,
Shaking the gold flakes from the furze;
I saw him stoop and pluck a reed—
Instant it was a fiery steed,
With starshine bright on bit and spurs.

And once a tiny smith in green,
Who shaped and sharpened spears of mint,
Spied me, and vanished from the scene.
I ran to where his forge had been,
And found an arrowhead of flint!

So when the moon is round and white,
And fairy bells are faintly rung,
These little wanderers of the night
From some mysterious land alight
Upon the Country of the Young.

They drink from cups of cowslip gold,
And spill the sparkling dew at dawn,
Or frolic in the moonlight cold—
But sudden one day we are old,
And Childhood's little men are gone.

And yet when life is on the lees,
They peep through sunset's golden bars;
Again we sail uncharted seas,
And hear their laughter in the breeze,
Or see them riding on the stars!

J. CUTHBERT SCOTT.

A TALE OF THE DOWNS.

By G. L. TACON.

I.

NO stretch of water in the world has a more evil and sinister record than that which lies between the North and South Forelands of Kent. Steam, which enables the mariner of to-day to defy currents and winds, and the chain of lightships with powerful foghorns which now encircles the Goodwin Sands, have combined to rob the place of much of its former terror. But the deadly quicksands and the treacherous currents are still there; great gales from the black North Sea will blow, as of old; and dense sea fogs are frequent here, as they ever were. Despite all the aids which science and skill may give him, the sailor dreads this place. He knows that the peril of the Goodwins exists, and is likely to exist so long as men go down to the sea in ships bound for the Port of London.

The importance and danger of this maritime highway in those long centuries of sail of which we now living have but just seen the ending evolved along its coast a very remarkable race of men. They came down almost without alien admixture direct from true old viking stock. Born by and reared on this water, boy and man, generation after generation, they have served it, dared it, fought it with the accumulated wisdom and hardihood of a thousand years. True craftsmen—if there be any such—with the pride of tradition and a whole heart for their daring, the world has seen no better or braver boatmen. Famous as such among all seamen, if they had a reputation, too, for driving a hard bargain betimes with needy ships at desperate case in their waters—that's as may be. They had mouths to fill and their living to make; often enough their lives proved to be part of the bargain. Certainly their hazardous and exacting calling never led them to any opulence. Life-boat and other records attest that these men have never hesitated or counted the cost when helpless life was at stake.

The Goodwin Sands and its perils are still there; but the race of men thus trained to combat them has all but passed away. Its long career is over. Steam has killed it.

With occupation gone, a dwindling remnant of aging men is left to lament the calamitous chance which has left them thus, with all their skill and love of calling, mere stranded hulks unwanted in a changed, unheeding age. Day by day they haunt the beach and overlook the scene so interwoven with the fabric of their life—that majestic panorama of the seas which moves across the setting of the Downs from hour to hour, and year to year, from century to

century, by day, by night—ever changing, never ceasing; as the ships of all the world go by with the living freight and commerce of imperial London. Their thoughts are in the past; and they dearly love to unburden them to the sympathetic stranger. He, if he have time to listen, may hear now and again from these old men some tale of strange experience, told with unconscious humour and simple strength.

Here is a story of war-time as it was told to me by an old boatman while we sat together one sunny afternoon on the beach by Walmer last summer. The tale is true in all essential features, including the name of the American steamship involved; and it can be verified easily enough by any one sufficiently interested.

II.

'It was a dirty mornin', early in February of 1915,' began old Dick, 'about four o'clock, or, say, two hours afore daylight, when four of us put off from here in my galley-punt to see if there was anythin' doin'-like. Half a gale of wind was blowin' from nor'-nor'-east, makin' a nasty sea—snowin', too, an' bitter cold. A lot of foreign shippin' was about here them times, for our navy patrol stopped all such, an' most of 'em was sent in here to be searched. Us chaps was makin' good money, meetin' 'em down Channel a bit, an' pilotin' 'em in here to safe anchorage. We done best in bad weather, for then, of course, we was most wanted, as always was with us folk. So, bein' dirty-like, this were a likely mornin' for us to get a hovel; an' as you know, bein' bred to sea yourself, us chaps ain't afear'd o' weather much—we're 'customed to it.

'We had been out a matter of a couple of hours or so, castin' about, an' no luck, when, just as dark was liftin', we see a big steamer, goin' slow, loom up close by. We hailed her an' hurried alongside, an' see then she was American. They throwed us a line from amidships, an' the captain looks over her rail an' asks what we was, an' could we give him his position. I says as he's about two and a half miles east-sou'-east of Dover; an' I'm a Deal pilot.

"Then come aboard," he says; "I want to talk to you."

"I can't come aboard yet, captain," I says. "Where are you bound to, an' what's your cargo?"

'He says "This is the *City of Memphis*, of New York, from New Orleans for Bremerhaven with cotton, an' I wants a pilot for a German port. If you cares for the job," he says, "I can pay you well."

'The cheek of it nearly knocked me over.

"I can't take you there, captain," I says. "We're at war with Germany, an' no Englishman will take you to a German port. An' you'll have to be examined by our own navy afore we can come aboard. If they let you through, I'll take you to the Downs an' safe anchorage. You'll likely find a pilot there to take you across the North Sea to a Dutch port, not to Germany."

'By this time it were growin' pretty light, an' I see a navy cutter makin' for us. I calls out, "Here comes the patrol now, captain; am I to stand by?"

'He says, "Yes, stand by. An' come aboard soon as you can."

'They pass a gangway out, an' soon the cutter hove alongside with a young lieutenant in charge. I telled him how things was, an' asks can I go aboard. He says, yes, provided I do nothin' till he instructs me. So up he climbs, an' me after him.

'He shakes hands with the captain, an' they goes aft together. I looks round a bit, an' then goes up on the bridge, where the mate was in charge.

"Mornin', Mr Mate," I says.

"Good-mornin'," says he, affable.

'I asked him had they a good passage across. He says they have a very good trip till yesterday, when this head-wind an' sea got up, an' weather very thick.

'Neither him nor the skipper had been in the Channel afore, an' they was both of 'em pretty scared, an' had been on deck all night, him forrard an' the "Old Man" on the bridge.

'They picked up the light off Folkestone all right, an' then the South Foreland; an' they come on from there half-speed, feelin' their way along for the South Goodwin lightship. The weather got worse as they went on, until about twelve o'clock, when they reckoned they ought to have made the lightship, an' seein' nothin', they sort o' felt somethin' was wrong. They went on dead slow, tryin' to pick up the light. Then, all of a sudden, in the trough of a big sea, they felt the vessel touch sandy bottom. They rushed her hard astern all they knew, an' when well clear, as they thought, turned back for shelter at Folkestone. When they got the light there again, they stood off an' on, waitin' for day—intendin' then to work east round the Goodwins, an' so up into the North Sea. Their charts was old, an' they hoped to pick up a pilot afore they got far.

'That's how they was when we found 'em.

'I says, "The South Goodwin lightship was moved last week half a mile to the west'ard, to put them German destroyers wrong. So you must have been well up over the Sands last night, an' can thank your lucky stars as you come clear like you done; for if you'd a-stuck, with this sea an' tide runnin', you'd likely be all dead men by now, an' the ship smashed to pieces

or sunk. An' as for goin' east'ard round the Sands, the North Sea is all mined from the Goodwins close up to the Dutch coast, an' you not knowin' the field, if you'd a-got in there, you'd 'a been blowed up in no time."

'He says they was mighty pleased when they see us, anyhow.

III.

'Thinkin' it's about time the officer was through, I makes my way down an' along to the captain's cabin. I knocks, an' opens the door, an' puts my head in an' says, "Excuse me, sir; but if you're finished, can I come in? It's a bit cold out here."

'The captain says, "Yes, come in, pilot. Mr Lieutenant here has seen my papers, an' is satisfied; so I'll want you now."

'Seein' I was nigh perished with cold, he says, "Have a whisky—go on, man, take a good one; it's good Scotch, an' won't hurt you." So I takes about half a glassful, an' drunk it nearly neat, an' it tasted good. Then he give me a cigar, an' lit it, an', "Now," he says, "let's talk business."

'I turns to the officer, an' I says, "Askin' your pardon, sir, but can I speak to you a minute?"

'We goes outside, an' I says to him, "Is this vessel free to go on, sir; an' how do I stand?"

'The officer says, "I've examined the ship's papers an' the master, an' I've give him a clearance. So you are free, pilot, to take this ship to wherever the master wants to go."

'I says, "But, sir, this ship is carryin' cotton to Germany for explosives to kill our men with."

'The officer pulls hisself up at that, an' says, "That's no business of ours, pilot. It's my orders to pass American ships carryin' cotton an' such-like to Germany. My duty is to obey my orders. . . . An' my private advice to you is, take her to the Downs if you wants a job, or others will."

'Yes, sir, in February 1915 it was, an' them's a'most his very words. I seen many a Yankee ship passed through after that, too, for Germany, right bung full up to the hatches with cotton. This were the first I come across; an' me with my boy fightin' 'em over there in France—well, I was rather took aback-like.

'The lieutenant says, "If you take this ship to the Downs, an' the master wants to go ashore, I have told him he can do it. But you must not leave him while he is ashore. He must report to the officer at Deal soon as he lands, an' do his business, an' come straight aboard again. An' you will be responsible as he does it."

'An' then he whispers to me, "An' make the beggar pay all you can."

'Well, I thanks him, an' we goes into the cabin again; the officer says good-bye, an' goes off.

'I went out on deck, an' see the boat was

made well fast; my mates come aboard, an' I see they was looked after.

'Then the captain an' me set down an' talked. He wanted me bad to take him to a German port. I showed him as no Englishman durst go nigh a German port, for he'd be nabbed quick for prisoner of war.

'He laughed at that, an' says, "If that's all there is to it, pilot, don't be scared at all. Why, I've got papers here as can make you into a real slap-up American citizen inside of five minutes, so as no German can put a hand on you. And as for money, look'ee here!" With that he opens a drawer, an' takes out a big bag full up of five-dollar gold pieces. "Name your own price," he says.

"It's no good, captain," I says—and he was a real nice pleasant-spoken young chap too—"it's no good, captain. You'll not get any Englishman to take you to any German port—not for all the money you've got. An' as for me, I ain't agoin' across the North Sea neither, for I dursn't leave my job here. I'll take you into the Downs an' a safe anchorage. At Deal you can get a pilot as'll take you to Rotterdam, say, in Holland; and there you could surely find a pilot easy for a German port."

'So, seein' as I meant it, he says at last, "Well, and what's your price to take me to the Downs?"

"Captain, for takin' this vessel to a safe anchorage in the Downs, my price is thirty pound."

"Whew! Why, that's a bit tall, ain't it?"

"That's my price, captain," I says.

"Well, if it's your price, I guess I'll have to pay it."

'So with that we makes out a short agreement, which he signed; I put it in my pocket, and goes out on deck an' took over.

IV.

'In a hour or so I brought the ship up to a nice position about two mile offshore, abreast of Deal, and dropped anchor. The captain paid me the thirty pound, an' I gave him a receipt.

"An' now, captain," I says, "I suppose you'll be wantin' to go ashore."

"Yes," he says; "I must report to my agents at once, so get your boat ready."

"Very good, sir," I says; "but what about the money for the boat?"

"Why? I've paid you for that."

"Oh no, captain, you ain't," I says; "you paid me for bringin' this vessel to a safe anchorage in the Downs, which I done. Now, if you wants to go ashore, my price for the boat is five pound a day, to stand by an' tend the vessel while she's here."

'He argued a bit, and then he says, "All right; five pound a day for the boat."

'We goes ashore, an' I took him to the shore officer, as the lieutenant said; then to the bank,

where he changed some American for English money. Then he wanted the best hotel, an' we went to the Clarendon. He was a long time there, telephonin' to the agents in London. By-and-by he come out, an' says the agents agree to what I advise him; he were to get a pilot for Rotterdam at Deal or Dover.

'We goes into the private bar for a drink, an' while we set there, in walks a pilot from Sunderland as I knew from bringin' him ashore from ships. His name weren't Branson, but I'll call him that.

"Why, see that chap across there as just come in, captain—him with the beard? Well, he's a regular North Sea pilot, an' just the very man you wants."

'He says to get Branson over, so I fetched him an' interduces them. They was soon pretty thick, for they found they was both free-masons; an' they wasn't long afore they made a deal of it. The terms was to be eighty pound for the run to Rotterdam, paid in advance; an' Branson to be ready to leave next day. They sent off to Dover for the latest chart of the North Sea, for the lights an' buoys was always bein' moved to stop the German submarines an' destroyers always gettin' through our minefield.

'Now, I knowed Branson for a close man, an' so I didn't expect to get nothin', but I thinks as I'll try him; so after a bit I says to him, "Seems to me, Captain Branson, as I've been the means of puttin' eighty pound into your pockets."

"Well, an' what about it?" he says. "You don't expect none of it, do you?"

"Yes, certainly I do," I says. "I reckon what I done for you is worth all of ten pound of it," I says.

'The Yankee, he just set back an' laughed like it were a great joke.

"Do you? Well, you'll get nothin' out of me," says Branson nasty.

"Oh, so that's how it is!" I says.

"Yes," he barks. "That's how it is."

'I kep' my temper, an' I says, "Well, Captain Branson, after me doin' what I done for you, if you go for to treat me that way, you'll find when you wants to get off with your kit to the *City of Memphis* as you'll have to jolly well walk there, for not a man nor a boat on this beach will take you off when I goes outside an' tell 'em what you done to me. We don't eat one another here," I says, "whatever they do where you come from."

'With that the Yankee chips in an' reckons as I was entitled to somethin'.

'So at last Branson forked out three pound, an' we argued a bit, but he wouldn't give any more, so I took it.

'They sailed away next day, an' I never see 'em again.

'What happened to her, sir?

'The *City of Memphis* was blowed up an' sunk in mid-ocean by a German submarine as soon as America came into the war. An' her crew was killed an' drowned like dogs, as I was told. She kep' bringin' over cotton to Germany right to the last; an' that's what happened to her.

'Yes, sir, as you say. Blowed up, like enough, with some of the very stuff she took to 'em!

'But what us chaps can't make out is, why they let all that cotton stuff through to Germany like they done.'

MONASTIC GHOSTS.

By HALLIWELL SUTCLIFFE, Author of *Ricraft of Withens*, *A Bachelor in Arcady*, *Wrack o' Doom*, &c.

THE house I write in was once attached to a great abbey, and it is haunted ever so tenderly by a ghost I have not seen as yet. We meet on the stair, she and I, and as I make way for the unseen presence to go by, the scent of sandalwood goes with her. Or I shall be gardening by the stream, and grow aware suddenly that I am not alone—that *she* is watching what I do with absorbed and plaintive interest.

The companionship is altogether pleasant. The house and garden are dear to her. She wishes well to both. Some day, I think, I shall hear her voice at last, and she will tell me just what she wants done. Not all ghosts 'walk' because they are earth-bound by their sins aforetime. There are some, like my guest who carries the scent of sandalwood with her, that are kept here by a woman's zeal for sacrifice.

She is staying on because some big wrong cries to be righted about this house that was old when they dissolved the monasteries. That is my belief, and I wait patiently till *she* has trust enough in one weak mortal to tell him what she needs.

There are other monastic buildings in our midst less happy. That could not fail to be, in a wide countryside that was once altogether church property. The corn-mill, a half-mile from my door, that ground corn for our local manor—the pilgrims' rest-house, with its holy well—the gray tranquil church, its graveyard lapped by Wharfe River—lived and had their being in far-off Fountains Abbey. At Thorpe-in-the-Hollow, a busy hive of cobblers worked for the monks of Fountains, stepping it overfell with their bags of new-soled boots, and stepping it back again—thirty miles and odd of steep and rutty going—with other boots that needed soling.

Fountains Abbey, in those days, was a house of prayer, of praise and incense rising up in worship higher than its stately height, as a great tree is higher than the saplings that find root beneath it. It was also a friendly tavern for all wayfarers who came for a night's lodging.

Great nobles halted for the night there. So did the Thorpe cobblers, and tramping folk who

lived by their wits, and travellers of all occupations or of none. Some dined at the abbot's table, and some below the salt; but all were welcome, without thought of creed or station.

Was it not natural, then, that some few of the weaker brethren should break away from their vows? They heard strangers talking constantly of the outer world they had forsworn, till the old allurements beckoned them out of their sombre robes and over the hills of freedom.

Then remorse followed wild debauch, and they crept back to confession and the sure penalty awaiting vows so grossly broken. Is it surprising that the spirits of those lost monks should live, with a dreadful haunting, about their graves? The grave was no usual one, prone and peaceful, but upright, built of stone. For the penalty was to be walled-up, alive and standing, and the mind recoils from the sheer horror of the thing.

Within a few miles of my room here are three houses, each attached once to Fountains Abbey. All are haunted evilly—two by monks' figures clothed in brown habits, the third by a nun's, clad also in brown. I am not repeating mere gossip legends when I say that they are haunted. The people who vouch for this—unemotional, steady-minded folk—*have seen*. In the case of the nun, indeed, I have to admit that a certain grim humour attaches to my last meeting with the owner of the house she haunts.

He has no pride in his undoubted gift of ghost-seeing. It worries and perplexes him; and he has taken pains to have the wandering spirit exorcised. The house was untroubled for a month and a week. His health and cheeriness palpably improved, till I found him plunged in gloom once more.

'She's back again,' he said. 'The other evening, when I slipped into the library for a quiet hour with a book before dinner, *she* was sitting in a chair in front of the fire—my favourite chair, confound her!'

He was so in earnest about his double grievance that I had to laugh, and he rebuked me. But evidence of this sort—plain, practical, threaded with humour unsuspected by the

witness—has all the essentials of verity. It would, I think, secure approval from a jury composed entirely of judges and barristers.

It puzzled me that, in three hauntings so near home, the ghosts should all be habited in brown, till I remembered an old friend who is wise in spirit-lore. He lives far down the Dale, and is rector of a country parish known the world over for its beauty and its long traditions. The church and the rectory are part of glorious ruins that were once a priory circled by its river; and the rector himself, when I found him, was following mediæval practice and fishing in a well-stocked stream.

I put my query to him by-and-by, and he was nettled. This puzzled me again, until he explained that a neighbouring sceptic had been over early that morning.

'He asked me if it was true that I was constantly meeting the ghost of a monk in brown about the house. I said it was. Then he smiled—the sceptic's nasty smile—and queried why that should be, since the monks of this special priory were habited in black? And I had no answer.'

He was ruffled and impatient as we came to the rectory, and he showed me the outer wall where workmen had been digging to get a better down-flow for rain-water from the roof. Their picks had driven through what showed palpably

as the upright grave of one who had not died in peace.

'I gave his bones Christian burial,' said the rector, who has always had one sincere foot planted in this world and a sincere foot in the next. 'It seemed to me that he'd worked his passage by this time. And there's no ghost about the rectory now.'

As I got to horseback later on and said good-bye, I knew that the sceptic's gibe was rankling still with the rector of an ancient parish. It seemed that I *had* to solve it for him, as he had solved the mystery of the monk's unquiet haunting.

I was wandering through the library that night in search of some book that would help me in the quest, when I was guided, somehow, to a fat, gray tome. I drew it out and opened it at random.

The firm, black print of a far-off day looked up at me.

'Whatever garb fallen monks wore before this foul apostacy, be it known to all men that, on the brink of the upright grave they merit, they shall be habited in brown. And, do a nun fail, she shall be garbed in brown. Holy Church ordains it.'

I shall ride over to the rector to-morrow and tell him that, after all, he was right as to the colour of the ghost-monk's garb.

A GIPSY OF THE NORTH.

By OTTWELL BINNS, Author of *A Mating in the Wilds*, *A Hazard of the Snows*, *Clancy of the Mounted Police*, &c.

CHAPTER XIX.—A STARVING MAN.

FOR a moment Standifer stood where he was, hand against the tree, a stricken look on his haggard face, a strange light of fear in his dark eyes; then he lifted the other hand and passed it across his eyes as if to clear his vision. At last his cracked lips moved, and in a hoarse voice he inquired stammeringly, 'Is—that—y-you, Carwyke?'

'Yes!' snapped the man whom he addressed. 'Put up your hands before you move a step nearer.'

'Sorry not to—to oblige you, Carwyke,' answered Standifer, with a weak laugh. 'B-but I just can't. If I leave hold of the tree I shall fall. M-man, I've eaten nothing but a handful of berries or so for a week.'

Carwyke looked at the scoundrel carefully. As stated, his face had a gaunt look, and the glitter in his eyes was that of either fever or hunger. 'Then stand where you are, and I'll—'

'Send ther rascal to ther right-about,' broke in Eskimo Billy's voice vindictively. 'Let him starve.'

Carwyke took no notice of the advice. The

man in front of him was clearly in an evil case, and mere humanity demanded that, scoundrel though he was, he should not be set adrift again to die of hunger. He handed the rifle to Norma. 'Keep watch.' Then he moved forward to Standifer and searched him carefully. The man's only weapon was a knife, which he took from him. As he did so he asked sharply, 'The pistol—where is it?'

'Threw it away. I had no s-shells, and—it was just so much—junk!'

'You can go to the fire. I'll give you a meal.'

Standifer staggered forward and dropped down by the fire, quite indifferent to the presence of Norma and Billy. Carwyke began to prepare a meal, disregarding Billy's whispered protests, and before it was ready Standifer rolled over and lay on the ground fast asleep.

Norma looked at him with repugnance. 'What are you going to do with him, Roy?'

'I don't know yet,' he answered. 'I am trying to think what is the best course to follow.'

'Yo' ain't thinkin' of takin' him along with us?' asked Billy.

'No! I am afraid that is quite impossible.'

'Good thing too!' commented the sick man. 'He plugged me, an' he'll strangle both of us if yo' give him half a chance, Mista Carwyke.'

Carwyke thought that was very likely, and he had no intention of taking the risk. As he worked he glanced from time to time at the sleeping man. His clothes were mere rags. His boots had gaping holes, and he was muddled to the waist, proving that somewhere in his wanderings he had fallen in with muskegs. His haggard face had been severely ravaged by mosquitoes, and whilst he slept his hands twitched convulsively, betraying the ragged state of his nerves. For the moment, at any rate, Standifer was beyond any hostile action, but the problem of what to do with him was not easy to solve.

After a time, however, a plan occurred to Carwyke. He would make up a small pack of food, give the man a couple of fishing-lines and an axe, and leave him to his own resources.

He whispered his decision to Billy, who protested weakly. 'Ought to be shot, an' if I had my way he would be. He'll do us a mischief yet.'

'I don't see how he can.'

'Nope, yo' don't know how black he is! Where's that other fellow—Bull, I mean? If he's back there in ther wood an' they're actin' together, where are we? Remember we've got Missy to think of, an' I ain't no good for a scrap.'

'I've thought of all that, and I shall question him when he has eaten.'

'Eaten!' The ex-whaler made a grimace. 'I don't hold wi' that feed-yo'r-enemy business. It ain't a workin' proposition up in Alaska here. I holds by ther law of ther gun, an' him thet uses ther gun shall perish by ther gun. But yo'll hev yo'r way, I reckon.'

'I reckon I shall,' answered Carwyke, with a smile.

When the meal was ready he walked to Standifer and gave him this advice. 'Eat slowly. Don't bolt the grub. Chew every fraction of it. I don't suppose you've ever starved before; but I've been through the experience, and I know what I am talking about.'

Standifer eyed the food voraciously, but he took the advice, visibly checking himself when he found himself eating too greedily; and when he had finished and had swallowed a pint of tea he was much revived, and with something of his old masterfulness inquired, 'How did you get away from that hole up there?'

Carwyke, however, was not disposed to be questioned, as he had questions of his own to ask. 'Where's Bull?' he demanded.

Standifer started at the question, and a mask of surprise came on his face as he retorted truculently, 'How should I know?'

Carwyke marked the truculence, and answered

sharply, 'I imagine you know very well. We heard firing eight days back—a rifle and a pistol—and this district isn't so packed with white men as to leave much doubt as to who were behind the guns. You'd better speak out if you want favours from me. Where is the man? I want to know.'

'You can wait till hell freezes,' replied Standifer.

'You think so? Well, get to your feet.' Standifer stared at him in surprise and made no move. 'Get up, I say!'

There was that in Carwyke's voice which made the other rise. 'You're not going to man-handle me before the girl, Car—'

'Man-handle! No! I'd love to, but I won't soil my hands that way.' Carwyke lifted the rifle which he held in his hand. 'Right about face! March!'

'Ma-arch!' Standifer's truculence visibly wilted. 'Where to?'

'I don't care. Back to the woods—anywhere!'

A shudder shook the gaunt frame, then Standifer spoke again. 'You're bluffing. You don't mean it, Carwyke?'

'I do!' was the reply, in a tone that carried conviction.

Standifer turned. 'I'll own up,' he said. 'Bull's dead. I shot him. He was stealing the canoe, and leaving me to starve.'

'The canoe! You had a canoe?'

'Yes. The canoes had been cached, but I had bribed a boy to take one with stores in it down the river a mile or so in case of trouble, for I didn't trust that priest any too much. After I quit that racket I took to the woods, meaning to work down to it, but there was some one between me and the river following me, and I had to dip deeper into the timber, trying to get away from him; and it wasn't till three hours had passed that I discovered it was Bull. He had a rifle, which, I gather, he had picked up in Arloff's house, and I'd only a pistol with an extra clip of cartridges in my pocket; but I knew about the canoe, which he didn't, and in the end we joined forces, and worked back again. My great fear was that the canoe might have been removed, but we found it right enough; and as there was no end of a racket in the village, horns blowing and the bell ringing, we decided it was a healthy place to be leaving, and quit.

'I didn't trust Bull too much, and when we camped I kept an eye on him. But I'd had no sleep worth speaking of for two days, and I went off dead in spite of trying to keep my eyes open. When I woke I looked round, and saw Bull just shoving the canoe off. I knew then that the treacherous dog meant to leave me to starve, and whilst I was pulling out the pistol I shouted to him. He replied with a shot from the rifle, and then shoved the canoe off. I

didn't shoot right off, for just as he was afloat and beginning to drift he made a discovery.

"'Jerusalem!' I heard him shout. 'The paddles!' He'd left them on the bank, where we'd thrown them when we landed, and as I saw them I laughed, and keeping well in the bushes, I followed the canoe, which was bobbing along close to the bank, waiting for my chance. Bull knew what I was after, and tried to paddle with the rifle-stock. It wasn't much of a success, and he couldn't get out into the current; and then I suppose he must have seen me, because he fired at me twice, and the second time nearly got me, for the bullet grazed my temple and cut a strip out of my scalp. I fell, and thought I was done for; and Bull thought so too, for he caught an overhanging branch and pulled the canoe up. It was then I emptied the pistol into him. I saw him pitch head foremost from the canoe, and suddenly it came to me that I wasn't no ways near dying; and I picked myself up, to see the canoe bobbing down the river, Bull's lurch as he fell out and the splash having sent it into the current.

'I started to wade after it, but the river was full of deep holes, and I can't swim a stroke. I fell into one and was nearly drowned, and when I'd kicked my way to the bank again the canoe was farther off than ever, and going like a winner. I chased after it along the bank, hoping it would strand somewhere; but it didn't, and when it wasn't much more than a speck, I saw that the river made a bend, and looking at the lie of the country, I thought that I might have the luck to cut it off if I made a traverse. I started, and in an hour was as completely lost as if I'd been dropped there blindfolded out of a balloon.' He broke off, shuddered, stared for a second or two into the fire, and then added with a quietness that carried conviction, 'I've had the hell of a time! These God-forsaken woods are just awful.'

For a moment after he finished his narrative no one spoke; then Eskimo Billy broke the silence in a weak but vicious voice, 'Serve yo' right!'

At that Standifer looked up sharply from the fire, considered Billy for a moment, and then turned to Carwyke. 'You'll bury the hatchet?' he asked quickly. 'You'll take me out of this?'

'That is a matter that requires consideration,' answered Carwyke slowly.

'But, man——'

'I don't see how you can expect it of us,' interrupted Carwyke. 'You haven't shown much consideration for any of us. You tried to kill Billy there when he was helping Mardock. You would have married Norma against her will; and what you would have done with me, Heaven only knows.'

'Arloff would have sent you out when I was well away,' explained Standifer hurriedly. 'I had arranged that with him. I had paid him——'

'But you didn't trust him. You said so just

now, and I can guess what my chances of getting out would have been.' Carwyke was silent for a moment, then he asked abruptly, 'Why did you drug Mardock?'

'Because I had an idea that he meant to interfere—as I proved he did. He fell in love with the girl and wanted her for himself.'

'That last is a lie,' said Norma quietly. 'He just wanted to help me to get away from you.'

An abashed look came on Standifer's haggard face, but he did not reply; and after a moment's silence Carwyke spoke again. 'After all that's happened, you really expect consideration from me, Standifer?'

With a brazen look Standifer met the eyes sternly regarding him. 'Well, as a white man, I expect——'

'A white man? You! There isn't a Siwash in Alaska that isn't better entitled to the name! But you will get from me more than you deserve.'

'What's that?' asked the other quickly.

'A small pack of stores, a couple of fishing-lines, matches, and an axe——'

'You mean to send me adrift?' asked Standifer savagely.

'I am giving you a chance that you don't deserve. I'll help you to make a raft that will carry you down-river, and possibly you will find yourself outside——'

'It's less than a dog's chance!' cried the other.

'It is the only one you'll get anyway; you can take it or leave it. We've no room for you in this outfit, and so you take the raft or go back to the woods—which you like.'

The scoundrel did not speak for a full minute. He glanced round at the dark woods behind and shuddered; then he stared into the fire, and a swift malicious gleam came in his eyes. 'You said stores and an axe?'

'Yes!'

'And matches? You said matches. I'll need to make a fire when I camp.'

The man's concern about the matches struck Carwyke as a little odd at the moment; but he dismissed the matter without further consideration, since what the fellow urged was true enough. 'Yes,' he answered carelessly. 'A single tin box. We can't spare more.'

Standifer laughed harshly. 'I guess I'll make the voyage—after a sleep. You'll let me have that?'

'Yes.'

'And another good square meal?'

'Yes.'

'Then I'll turn in if you'll let me have a blanket.'

For a second Carwyke hesitated, the man's impudence was so brazen. Turning, he found a blanket, and threw it to Standifer, who promptly rolled himself in it and composed himself to sleep.

Carwyke seated himself by the fire and waited until the man's steady breathing told that he slept; then he rose, walked round the fire, and drew the blanket aside to make sure that the scoundrel was not foxing. Having assured himself on that point, he went and whispered instructions to Norma, gave others to Billy, who, with a rifle trained on the sleeping man, set himself to watch. With an axe over his shoulder Carwyke walked a little way up-river, and presently the sharp sound of the steel broke on the stillness.

When he returned two hours later Standifer still slept, and after looking at him for a moment Carwyke proceeded to make a small pack of provisions. That done, he took one of the towing-lines from the canoe, and carrying the pack and a spare axe, departed up-river once more.

On his second return Standifer was just sitting up. He was still haggard and worn-looking, but was a far different man from the one who had staggered out of the woods; and as in silence he watched Carwyke prepare a second meal for him, the old sardonic gleam was in his dark eyes.

When the meal was ready he ate it with slow deliberation to the last fragment, drank a pannikin of tea, and laughed abruptly. 'When does the pilgrim start?'

'Now.'

'But the raft, man? You said——'

'It is ready, waiting for you a hundred yards up-river.'

Standifer laughed again. 'I'll say one thing for you, Carwyke—you speed the parting guest with a vengeance.'

'There are some people whom one is glad to help away,' replied Carwyke frostily.

'Oh, you need not rub it in! And the grub-pack?'

'It is on the raft with the axe.'

'And the matches? You promised——'

'Here!' The other thrust the precious box of firesticks towards him.

Standifer grasped it eagerly, concealed the box in his rags, and then emitted a short exultant laugh, which made all three of those who had suffered at his hands look at him keenly. But as he staggered to his feet his face told them nothing, and only a ferocious gleam in his eyes broke its wooden expression. 'I'll quit,' he announced. 'Which way?'

'Up-river! Walk first.'

The villain waved a hand to Norma, did not so much as look at Billy, but started up-river, walking stiffly. Carwyke, rifle in hand, followed half a score of yards behind.

They reached the place where the raft was moored, and Standifer surveyed it critically. 'A dandy craft,' he commented, and stepping down to it, handled the sweep. 'Will do!'

Carwyke, standing by the tree, cut the moor-

ing-line. The other poled the raft out of the shallows, when he looked round and gave an odd laugh.

'*Au revoir*, Carwyke.'

'That is hardly the word, I think,' replied the other dryly.

Standifer pushed the raft farther out, and laughed again. 'We'll make it the long farewell, then.'

He busied himself with the sweep, the current caught the raft, and as it began to drift forward he looked back at the bank, and a single word shot from him vindictively, 'Fool!'

Carwyke looked at him, and then at the rifle in his hand. Had he been wise in letting the man go? As the doubt assailed him he half-lifted the rifle, then dropped it again. Folly or wisdom, he could not fire upon an unarmed man; and after watching the craft for a moment, he turned and walked along the bank to the camp. There Norma met him. 'He has gone,' he said to her.

'Yes. I saw him go. He waved his hand and laughed as he drifted by. He is a terrible man. I hope I shall not see him again.'

'You never will—unless we pass him on the journey out,' he said reassuringly; but even as he spoke the words the doubt which he had felt as he watched Standifer go lifted up its head anew. Perhaps it showed in his eyes, for the girl spoke swiftly.

'Something is troubling you, Roy?'

'Yes. Maybe I ought to have shot the black-guard. It would have made things sure then.'

'But you could not have done that,' said Norma. 'You could not have shot a man, however bad, who came to the camp as Standifer did.'

'No,' he answered, and again looked down the river towards the raft, which showed a dark blur on its sunlit reaches. 'No.' But under his breath he added, 'It might have been better if I had done it, all the same.'

And in his ears as he stood there rang anew the rascal's vindictive cry, 'Fool!'

(Continued on page 452.)

AN ANGLER'S CONFESSION.

As the sun dips low in the evening cool,
I take trail for the old trout pool
Along the banks of the twining stream,
Where wild flowers watch and willows dream;
The curlew calls on the hillside lone,
And the wagtail hops from stone to stone.
With rod and basket on I press,
But it often happens, I must confess,
When at last I reach the favoured nook
There is never a fly drawn from my book.
Basket and rod neglected lie,
For the green has gold of earth and sky;
While I often sit till the moon is full
And dream by the edge of the old trout pool—
To an empty creel I am well resigned
If I bring back peace and a tranquil mind.

Chambers's Journal

SEVENTH SERIES

ON THE ISLAND.

By the Rev LAUCHLAN MACLEAN WATT, D.D.

I.

IF one must be honest about it I should say that perhaps the finest bit of loch scenery in combination with mountain grandeur is this Lochcarron in the west of Ross. My loyalty of blood ought, of course, to intervene, and my fidelity to friendships old and true should speak of other places. But Truth makes me say that if there is a more romantic combination I have never seen it yet, anywhere.

'But'—asks the island of my own folk—'would you forget me? And the graves where the tired ones are sleeping, with just a gray mossy stone at their heads?' No. One could never do that. Yet even Skye is at its fairest seen from where I sit, on this rock in the mountain-girdled loch.

The scabbled peaks of the Coolins bar the western horizon—all crowding to look up the loch, as though to see whether I have forsaken the memory of my cradle songs. I give them a wave of the hand each morning. My last look is theirs ere I go in and shut my door upon the night. But yet:

I could not love thee, dear, so much,
Loved I not honour more.

Over to my left are the huge buttresses of Applecross, their great glens running down between them to the sea; and, at their feet an island, uninhabited, where I should love to live. But no one knows who owns it; and there is a tragedy which no man has written, nor would care to write, among the tumbled stones of the forsaken dwelling there. The highest road in Scotland runs through that middle gorge. You can see it breasting the brae, winding up the steep acclivities, like something forgotten, tangled beyond use. It toils up through absolute stillness that is broken only by the cry of the deer, the broken sob of the wind, or the roar of the swollen torrents when the melted snow makes the sigh of the stream that goes tinkling among stones a sudden angry giant of the wilds. The grass is growing on the track now, for even the mails go round by sea to the village on the other side, but for many a day Rory the Post went through the desolation, and often felt other footfalls than his own weirdly following.

No. 707.—VOL. XIV.

Over the corner peep the peaks of Torridon and Gairloch, trying to see how the tide runs here. And on the other side rises as fine a range of precipices as there is in all broad Scotland, and a castle with towers and many rooms, but no man sitting in them, no woman singing or sighing there, no children's feet or laughter running through them. It was the last bit of a kingdom that once stretched almost from sea to sea, saved for, painfully, under Eastern skies, and lightly parted with by the next who held it but loved London better than the place that was precious to his sires.

It is a land of passionate old romance—of memory and regret; and those are gone for ever who would have loved like life itself to have sat with me and looked at those dear mountains.

We have been having some days of storm, and now there is a regatta of rainbows. Loch Reraig has all morning been hanging on to one that Applecross has lent her.

The myriad gulls, neighbours of my bounty when I have a bone to share with them, are communists like us all, till my gift spins out to them from my sea-wall above the cliff. It was a genius who invented that phrase—'a bone of contention.' My gulls are a living commentary on it every day.

My house is on the edge of the rock, farthest from the mainland—a rugged clump that stands high when the tide ebbs. There was once a light in the tower for the ships that used to pass to and fro between the Isles of the Sea and Ströme. I remember when that rotting pier up there was very busy; and I have seen the old light-keeper out on the tower when the Skye boat came zigzagging down among the skerries. A man needed to know the road to the isles if he wished to get safely through my salt-water park.

'Can you sleep out there?' they ask me often. 'Are you not afraid?' ask the old women, coming to the door to give me a greeting when I am ashore—old living bits of Highland homespun, with a scent of peat that will cling to their bones. They think that strange shapes must haunt the crags at midnight, and faces uncanny peer through my window in the dark. They think my house should be slipping off

[All Rights Reserved.]

JUNE 14, 1924.

seaward some of these nights, when the spindrift is whirled about it and the jabble of the seas joins in the shouting chorus of the winds. Let them shout their loudest. They and I are friends. Hasn't the one set carried me and my goods out often to my rocky home, and the other sung songs to me in the night? And as for sleep—I could send parcels of it away to the children of Insomnia everywhere if I could only get bottles that would hold it. There would be a great trade in it. The Chancellor of the Exchequer would have an unexpected surplus out of his duty on my 'Sleep-in-sealed-packets' if only it would keep on the journey, and not curdle into bottled snores and nightmares ere it reached its destination.

Up yonder is Strome, as the Norseman aptly called it when he felt its forceful currents grip his galley's keel long ago. If you are pulling a boat up or down through that narrow gullet you have to calculate on these. You cannot pull against them; while if you get their favour you may rest on your oars for miles. A few minutes late in starting make all the difference for your journey's ease.

On either side of you there range row on row of ancient sea-levels. The narrow boundary at the mouth of the strait speaks of the early days when within lay the fresh-water loch, and without the salt tides of the ocean beat, till came the sudden conquest of the greater force, and the waves broke in along the mountain sides, and ships sailed up to where the cool streams of the river bring the secrets of the hills down with them to the sea. Port-a-Chuillin, with its old-world row of peat-browned thatch roofs and blue smoke, looks as though it had come there shortly afterwards.

A few stones on a crag is all that remains of the old Castle of Strome. It was a focus of strife between the Macdonalds and the Mackenzies; and at last it was blown into the air, one of the earliest experiments of that kind in Scotland, and certainly one of the most effective. Farther up, in the village of Jeantown, is the site of another, the ancient hold of the Macnairs; but the only traces of it are its crag and the name it gives to a cottage underneath its shadow. 'Castle Cottage' makes an appeal to the city holiday-seeker from afar who has a penchant for style.

They were grim places those old keeps. The piano had not been dreamt of then for a baron's hall. But a clairschach rang sometimes there when a wandering bard would come. If one were quite sure that he was not a spy of the Macdonalds or the Mackenzies, as the case might be, he would get in, and his supper was cheap when he paid it by praise of the clan, or in songs of love, or sorrow, or the passion of chivalry, or the rude, stumbling, quick-footed rush of the foray—and how we chased the knaves, and how they fled, the white-livered

foes—whoever they were. There was a sigh that was almost a sob as the breathlessness ended with the clash of the last chord. And we looked at one another to say in that look, 'That's what we were like, by God. We—'

But the trembling-fingered minstrel is long away. There is not a print of his foot anywhere—not a song of his passing—long since faded up the glens into nowhere, as a mist along the mountain side. Yet he and his kind were once plentiful, before 'McCulloch's Course' and the 'Royal Readers' saw the light. Tonight if there is a concert in the school, it will probably be a man from Glasgow that will sing a syncopated scrap of music-hall bunkum, and pretend he forgets the dear old Gaelic songs that are in our memory of the past like little bits of lichen left on an old wall.

II.

The wind is rising. The gulls are away swinging along its track. Whoop! down flashes a solan goose after a fish, and off in haste to a place of her own with the treasure-trove. Wild things eat solitarily. A table with two who do not quarrel over tit-bits or leavings is civilisation. Even a restaurant does not secure it. There is a savage solitude there in the individual plate. The savages squatting round the calabash of roasted missionary or stewed sailor, all dipping their fingers in the brew for tasty pieces, are at a friendlier stage.

But there are two gulls that sit together on the rock before my window till the last splash of the full tide sweeping over it floats them off. Together, heart by heart—like love at the fire-side. There have always been two there, like that, since I remember, and I sit and watch them. What are they thinking of? Are they the shades of some old lovers long since dead, who sat by other shores afar, and heard perhaps the song of the Ægean when Agamemnon's fleet swung by to the rhythm of oars? Is it in Greek or Gaelic that their sea-dreams now speak to them? For there were once Diarmid and Grainne, and the lovers of Deirdre, and old sorrows that were nursed by the sea-wave now those thousand years.

There will be no moon to-night, and the old ghost-man in loose slippers will come up the gully when the tide is filling—'flip-flap, flip-flap' of the in-stealing wave before it, till I can almost picture what the creature must be like—with the drip of salt water at his chin and a string of tangle caught around his right foot!

In another hour I shall be in a sleep as dreamless on this rock as though I were drifting through the deep waters that are coming in with the tide all around. What a labour of Sisyphus it seems—this march and counter-march of all the seas. Is there a greater mystery? At the tug of the moon unseen

here it comes—with an innumerable host; and away over in the distance press the white-plumed riders of the deep. Our steeds stable in the stalls of Davy Jones, and ride the stormy waves when all besides keep close in stall.

Yesterday was calm as a whisper and people spoke to me, staying their oars for exchange of a passing word. But to-day—not a sail—not a boat—not a sign on the waters or the shores. We are absolutely alone on the rock except for the gulls—the wind, continual, like a sound inside one's ears—and the cry of the water, broken into an agony on the crags.

III.

Thoreau went into a wood, and got into touch with Nature, and called it solitude. But he was not far from the tracks of men. Had he gone right into the heart of the primeval forest, or up into a giant pine and built for himself a house of boards in the branches—seeing the stars swing with him as the wind swayed his dwelling-place, and the moon come quietly along on tiptoe, like an Eastern beauty peeping from her veil, seeking for him with her dark lantern, the clouds for shutters of it, or a little squirrel's keen eyes to glance at him round the bole of a mighty bough! But he just sat down quite near to men and made a solitude to himself by thinking.

There is no solitude like an island, and no solitude more filled with emulous comradeship. Why—the moon is my neighbour. The sea is my mate, and what a host of friends the tide brings with him out of the far-off limits of the main. There are waves that have touched America, and are below my window now. An African woman sang a song to that little bit of foam which is leaping yonder. And the stars—ladies and gentlemen are they in the gallery front seats—grand tier—what jewels are shining when they come forward, when the house of the world is darkened and the drama of Night begins. How small you feel, and what a poor programme you have, as you see these old autocrats waiting for you to do something.

There's a buoy on a sunken rock out there. He bows to everybody, like a doited dancing-master. He keeps his place of vigil like a forgotten sentry. A crowded day he has with the gulls, and the folk that sail by, and the high tides that lift him and the low tides that let him down. But his nights are lonely. I remember why they put him there. There is a rock just below, and one day from the tower I was watching a wind slowly driving the rain along and up the loch, as I have seen a policeman move on an unpleasant beggar out of a fair into another man's beat. By came a yacht gaily, ladies sitting on chairs chatting, and everybody looking like Lipton in the America

Cup Race, when over she swung as suddenly as an old woman swings a basin out before she empties it; and then as they all shrieked she dropped into the water straight again, only the next second to repeat the performance, for there are two peaks and a notch under water, and nobody who ever had a chart in his hand should get a keel there. We heard the shrieks, and she limped off, looking very uncomfortable. So, just in the way they stick up the Commandments when a fool goes wrong and makes the world a messy place, they set the buoy there, as much as to say—'No encores, please.'

There are no by-laws here—in fact, no laws at all. I can walk on the right or the left side, or in the middle, for I have nobody to meet or pass, or step aside for. If I shut my eyes I should fall into the sea or over a rock, but I could not run into anybody. There are no motors and no electric cars. The wind and I are the only passengers, and we do not apologise to one another when we meet hastily at a corner of the house, though he once snatched a basin from my hand and sent it spinning off seaward. I swear I thought he laughed as he did it—but he was the south-west wind and a frequenter of the place, and we understand each other. The income-tax man finds you out, however, as well as finds you in. And the poor you always have with you. It is amazing how those hands importunate outstretch. And even a stormy channel cannot shut you off from 'O.H.M.S. Official—paid.'

On an island your ears and eyes are kept wide awake. There was a drip in a cupboard last night when the midnight shower was drumming on the roof. It woke me. I must see to it. For winter hates a house on a rock in the sea which has defied its disintegrating onslaught for so long.

There is nobody except myself with whom to quarrel, and though we have certain lifelong feuds between us we lay them aside here. An island has that advantage, amongst many.

Here I am my own time-keeper. I am going off to bed now, though it is only six o'clock. I shall get up when I like. I go now, just to prove that mind is greater than matter.

That wind is either a true somnambulist or a wakeful necessity-driven slave, for while I sleep he goes on always. He and the tide are the constant toilers here, but they have no Mound meetings, and no Trafalgar Square orators. When they speak most they may be most at variance on great principles, but they do not stop their work to exercise their eloquence. They do not mind when they begin to labour, or whether they work overtime or no.

All day yesterday it was wild storm. In the early dark I understood some of the old legends of the voyages of saints and heroes into the unknown. For the phosphorescence in the

waters was phenomenally bright; and as the waves swept in foam around the island the breaking spume flashed into flame, so that my rocky home seemed girdled with actual fire. Even in still nights it is environed with twinkling spangles, as if queens and princesses of the sea-folk lingered about the skerries in the azure shadows.

But it was the stillness of midnight that awoke me, and I arose and looked forth. The sea lay

quiet as a babe. A flickering light quivered in the northern skies. Every inch of the heavens seemed in high festival, strewn with stars, as though God had tossed them in handfuls to celestial beggars, giving alms by worlds. And the great ones, all radiant, and as if with hands folded, seemed waiting till some king of glory should pass by. If I myself had seen Him, with the shining floor beneath His feet, I should not have wondered at all.

A GIPSY OF THE NORTH.

CHAPTER XX.—THE FOREST AFLAME.

IT was late in the afternoon when Billy, waking out of a refreshing sleep, asked a question. 'How long do yo' reckon we're goin' to stay here, Mista Carwyke?'

'Not an hour longer than necessary, Billy. I've talked it over with Norma, and if you think you could stand moving in and out of the canoe, I think we might start in a couple of days. We have no time to waste if we are to find our way out of the wilderness before winter.'

'Nope! Thet's a fact. I reckon we'll start when yo' want. I ain't going to be a hindrance.'

'Hindrance, Billy! But for you we shouldn't have been here at all.'

'An' but for yo', Mista Carwyke, Missy an' me 'ud hev been stuck at Unapik still—thet is, if Standifer had not potted me. . . . Queer thing ther way he was set on them matches, wasn't it?'

'Yes. But he'd probably been without fire for a week. That's how things work. I knew a man once who lived without sweet stuffs for a year, and for a month after he got in touch with a store he just stuffed himself with sugar and molasses. You can see the same thing in any of the mining camps when fresh vegetables and fruits happen to get in. I've seen a man with a big tomato in one hand and half a pineapple in the other, biting chunks first out of one and then out of the other as he walked down the street. It's the same principle. A man in the wilderness who has been without fire craves for matches, which will guarantee him a fire.'

'Yep!' answered Billy doubtfully. 'I reckon I got ther argument, but thet man's a devil, an' I guess ordinary human cravings don't account for much o' what he does.'

'But matches, Billy! What harm can he do with them?'

'I dunno, rightly. But I reckon he'd light all hell about us wi' them if he knew how.'

It was in the night, when he and Norma were keeping watch in turns, that Carwyke made the discovery that Standifer 'knew how.' Norma was sleeping, and Carwyke was

smoking by the fire, when suddenly Eskimo Billy called out, 'Mista Carwyke, do yo' hear anything?'

'A rising wind in the tree-tops, nothing more.'

'There's something else at the back o' thet. Listen!'

Carwyke listened. The southing of the wind was the only sound his ears could detect, and he said so.

'Maybe I'm dreamin' or goin' light-headed again, but I thought I heard a roaring noise—same as—same as—oh! I dunno.'

Carwyke laughed. 'It's weakness, Billy. Just shut your eyes and try to sleep.'

The sick man fell quiet, and Carwyke, thinking little of the matter, began to pack his pipe. The sound of the wind in the tree-tops grew more pronounced, but he took little notice of it, and presently, when Norma awoke to take her watch, he lay down, and in a very short time drifted into sleep.

A couple of hours later he was wakened by Norma shaking him. 'Roy! Roy!'

He sat up quickly. 'What is it?'

'Listen! There is something that—'

A moment later he was on his feet. From the direction of the main river there came a roaring sound, and though a strong wind was blowing, the air was hot and sultry. He lifted his head and looked upward. The sky was hidden in a thick haze. Without a word he walked to the bank of the river, and as he did so a rolling gust of smoke hid the lower reach of the river, and to him came the odour of burning spruce. When he returned to the camp his face was grave.

'What is it?' asked Eskimo Billy quickly.

'The forest is on fire, and the wind is blowing this way. We—'

'Them durned matches!' cried Billy. 'This is why he was so keen. If I had him here—'

'I'm afraid you're right, Billy,' answered Carwyke, a hard note in his voice. 'But who would have thought the scoundrel would have done it? It's despicable beyond words.'

'Damnable! But it's what Standifer would do naturally. Ought to hev shot him when he came out of ther wood. . . . I guess we're in a pretty nasty fix.'

'Oh, not so bad yet. We have the canoe, and can run before the fire if necessary. The trouble of that course is that we shall be driven out of our way. Maybe it will be sufficient if we just cross the creek, or it may be possible to run down to the main river.' He stood thoughtful for a moment, then he said, 'Do you mind being left alone for a few minutes, Billy?'

'Nope; yo' got somethin' in yo'r head, I guess, an' I know yo' won't leave me to—Lor'! what's thet?'

A great bull-moose, careless of everything except the terror behind, had broken from the wood, and, regardless of the human beings, had run right across the camping-place, almost treading on Billy as he did so.

The significance of its blindly hurried flight was not lost on Carwyke, who had seen forest-fires before. 'Quick, Norma! Help me with the canoe.—We're going a little way down the creek, Billy, to see what the chances are that way.'

'All right, Mista Carwyke.'

With Norma's help her lover launched the canoe, and they began to paddle down-stream, making a long course for the other side. They had scarcely reached it when a great, rolling cloud of smoke met them, making them cough, and at Carwyke's word the girl steered the canoe for the soft bank. They landed, lifted the canoe on the bank, and whilst Norma waited by it, the man moved a little way into the wood.

In a very few minutes he was back again. 'Both sides of the river are on fire. It must be a perfect inferno lower down. Standifer has done his work pretty thoroughly.'

'You really think that he—'

'Haven't a doubt of it! He really was too keen on those matches, as Billy noticed. He must have spent hours on this business, and fired the woods in a dozen places. We shall have to run before the fire, and we've no time to lose. Come, my dear.'

They re-launched the canoe and paddled back to the camp. Billy was sitting up in his blankets, a look of scared wonder on his face. 'It's ther queerest show I ever saw,' he said, as they moved towards him. 'Noah's ark has loosed out in the woods there. A bear an' a cub bundled by just now, and a wolf never turned a hair as it jumped over me. An' there's foxes an' ermines an' porcupines back there—look at 'em! Might be a Fourth of July procession. Methuselah! there's—'

Carwyke did not spare a moment to look. He had seen ere now the frenzied flight of the creatures of the wild before their most terrible

enemy, and he broke in on his friend's words. 'We've got to join the procession, Billy—only we go by water. I don't know that we'll do you any good to move you; but it's that or the fire. The woods on both banks of the creek are blazing, so it's up-stream we shall have to go. Heaven send paddling-water is my prayer.'

With Norma working her hardest to assist him, he loaded the stores, wrapped the sick man in a blanket, and carried him to the canoe; and as a great cloud of smoke, hot and suffocating and full of ash, rolled down on them they pushed off, working their hardest with the paddles. So great was the heat that in five minutes sweat was pouring from them. Now and again the pall of smoke with its ashen dust rolled on them, and thrice Carwyke's hands were blistered by flying sparks.

The roar of the fire behind them was like the sound of a great waterfall. The crackle of wood as it kindled was like a steady rifle-fire, and with it mingled the louder crash of trees as they fell before the destroyer. Now and again while he paddled Carwyke looked back over his shoulder. There was, however, little to be seen but the pall of smoke, though twice he saw great yellow tongues of flame leap out from the mirk, whilst the hot wind on his face told how near the peril was.

The smoke, the heat, and the fine ash with which the air was filled made it difficult to breathe, so that the exertion of paddling was doubled; but grimly they drove on, urged by the horror behind them. The heat dried the sweat upon their faces, and the ash settled there and left black stains. Norma's golden hair was dark with the dust, and Billy's blanket might have been a funeral pall.

How many miles they went, how long they paddled before they reached the place that promised sanctuary, they never knew. But when paddling had become more difficult by reason of the quickening current, round a wall of rock they came upon a short rapid which barred the way, and could only be tracked up, if that; but beyond it the forest widened out in a rough semicircle, and as he saw that Carwyke gave a shout of exultation.

'The bank!' he cried to Norma, and as they made it he leaped out, and a moment later had Billy in his arms, and, shouting directions to Norma, was hurrying up the incline to the head of the rapid. As he reached the crest of the climb his heart leaped with gladness, for before him opened a long lake, of which the creek was the outlet. Like the valley in which it lay it was of no great width, but it offered safety, since the fire must pass on each side of it; and it was of sufficient width to divide the flaming forces of destruction. Setting Billy down upon the turf he ran back, passing Norma laden with stores on the way. There were still some things left which the girl had lifted out of the

canoe, but with these, for the moment, he did not trouble. Lifting the canoe and settling it well upon his shoulders, so that a part was raised above his head like a hood, and the other part stuck out like some monstrous tail, he moved up the sloping trail to the brim of the lake once more. When he reached it Norma was returning for the rest of the stores; but he forbade her. 'No! Remain here, Norma, and look after Billy. I will fetch the rest. Put what you have brought into the canoe.'

He ran back towards the wall of smoke, which, in the time occupied by the portage, had advanced amazingly. The hot air blown in his face was like the heat of a furnace, and the black dust that came with it filled nostrils and mouth and eyes, troubling him much, making breathing difficult, and making his eyes smart so that tears ran down his face. But he secured the stores, and hurrying back stacked them in the canoe. Then he lifted Billy in, and a moment later they thrust out on the placid waters, paddling steadily towards its centre. By the time they reached it the pall of smoke already hid the head of the creek, and as they ceased to paddle and he looked back, a dead spruce on the right of the outfall suddenly fired, sending up yellow flames like so many great candles. Then with astonishing

rapidity the fire roared on, tree after tree crackling into flame. The dead willows on the lake-side were licked up in a flash, but the green bushes kindled less readily, and sent the smoke of their slow burning in clouds across the water. Up the hillside, sparing nothing, the fire climbed, and then under the flail of the wind swept on, and passed, leaving behind it a blackened and desolate land. The wind veered a little, and with its veering brought air that was fresh and cool, and to the smoke-dried lungs of the watchers was like draughts of red wine. They inhaled it gratefully, and dipping tin cups over the side, drank great mouthfuls of the cold water to quench the thirst induced by the intense heat.

The smoke drifted away, except for inconsiderable spirals that rose from still smouldering wood, and—a gaunt and bleak array, a very army of the dead—such trees as had not fallen stood mere blackened poles or smoking skeletons along the hillsides. Across miles of country had rolled the destructive force, let loose by one man's villainous desire for vengeance; but whilst the green things had been destroyed and hundreds of wild creatures must have perished, those whose destruction had been sought remained unharmed.

THE MOON.

By Professor GEORGE FORBES.

PART I.

I.

THERE is no object in the heavens that appeals to us more, as the source of beautiful thoughts, than the moon. The points of view from which she is regarded by the astronomer, the philosopher, the mathematician, the poet, the lover, the artist, and the practical man, all beautiful, are as diverse and varied as her own phases.

Re-born every month, she first appears as a delicate crescent, two days old, in the amber light of sunset, a reincarnation grasping in her arms the shade of her prior existence, the old moon in the new moon's arms. At the age of seven or eight days her face is a sharply cut half-circle of white. Then she takes on that curious form 'gibbous,' until at the age of fifteen days she dominates everything in heaven and on earth as the full moon, round, bright, and glorious. Her declining days have an air of dissipation and decadence when exposed to our gaze during the forenoon hours, until she is lost in a beautiful second childhood before the hour of sunrise, and dies at the age of thirty days, to be again re-born.

But it is not only in her changing phases that the moon is an object of interest. There is nothing else in Nature quite like the strong shadows cast upon our path by the moon. There is nothing quite like her reflections from the ripples of a lake, or from the waves of the sea during a long voyage.

On a night of full moon the spirit is uplifted, and many are they who repeat to themselves the thoughts of Lorenzo:

The moon shines bright; in such a night as this,
When the sweet wind did gently kiss the trees
And they did make no noise, in such a night

was the soul of many a hero stirred to start upon a historic adventure, which is now an epic poem. On such a night, in the lives of most of us, did some event occur that now recalls a thrilling incident of our youthful enthusiasms.

The moon is an inspirer of memories to every one. Furthermore, she is a true guide to the traveller, a lamp of hope to the wayworn and of safety to the seaman, an inspiration to the poet and the musician, and, marvellous gift, she is the one connecting bond with his own people

to the exile or prisoner in distant lands, the only visible object of common delight to him and them. I have known this to be true ever since, fifty years ago, I heard this plaintive utterance, on the shores of Lake Baikal, from the lips of a Scottish girl, herself an exile for life in the wilds of Siberia.

In another mood our thoughts about the moon turn to the tides, raised and driven by the moon's force of gravitation, with which our luminous attendant sweeps and scours the estuaries and ocean shores as a scavenger, safeguarding the health of millions.

And again, we are attracted by the intellectual problems about the moon's constitution, her motion round the earth, and the very origin of this cold round globe, illumined by the sun. Add to this the wonder and speculation aroused by seeing the moon through a telescope, displaying the extraordinary features that characterise her surface.

II.

Those people who examine the sky at night, not only with wonder or admiration, but also with intelligence, take note of many things worth remembering. If the moon to-night at a certain hour is in a certain part of the sky, then to-morrow it will be more to the left at that hour (for us in northern latitudes). And three-quarters of an hour will elapse before it reaches the same region as last night.

Again the intelligent spectator can note that this wandering of the moon is over a definite course among the stars, much the same as the sun's course; passing near the very bright stars of the ecliptic, Aldebaran, Regulus, Spica, and Antares. In fact, these stars are sometimes 'occulted' or eclipsed by the moon. During the year 1924 Aldebaran and Regulus are occulted by the moon, each six times. Astronomers take delight in watching these disappearances and reappearances even without a telescope.

The age of the moon regulates the hours during which we need no lantern to go home with in the country. A knowledge of the moon's age tells us when yachting at what hour it will be easy to make a landing. If you think of spending an evening with your telescope you avoid any night when the moon is near the full. It is often good to know when to expect spring tides—that is to say, when the moon is new or full. In fact there is no need to labour the point that even in peace-time, when there are no air-raids, we often want to know the age of the moon.

Fortunately, there is a rough and ready rule, easily remembered, by which the moon's age at any date can be foretold.

Here is the rule. There are three numbers that have to be added together to give the moon's age. If ever the sum exceeds 30, the

moon's greatest age, you subtract 30. The remainder is the moon's age at that date.

The three numbers are called the year number, the month number, and the day number.

1. *The day number* is simply the day of the month.

2. *The year number* in 1911 was 0. For each year after 1911 you add 11. When the number exceeds 30, you always subtract 30 or a multiple thereof.

For example, take the year 1924. That is 13 years since 1911; and 13 elevens is 143. This gives the year number after you have subtracted 30 four times, i.e. 120. There is left the year number for 1924, and it is 23. Once found, it serves you throughout the year.

3. *The month number* is best remembered thus: Write on one line the initial letter of each month, and below each month the following month numbers: 0, 2, 0, 2, 2, 4, 4, 6, 7, 8, 9, 10.

J. F. M. A. M. J. J. A. S. O. N. D.
0, 2, 0, 2, 2, 4, 4, 6, 7, 8, 9, 10.

After reading the row of numbers aloud several times *in pairs*, their sequence is easily remembered.

As an example, take the 17th July 1924.

Year number =	23
Month number =	4
Day number =	17
Sum =	44
Subtract	30
Moon's age	14 days.

This is one day short of full moon (15 days).

On testing this rule by the almanac, you will find it to be always right within a day.

In many other directions the ordinary observant person finds out things concerning the moon's motion. The full moon rises to a greater height in the sky during winter than in summer, just the opposite of what the sun does. It does not take long to realise the wonderful fact that the moon always presents to our view the same half of her spherical form. We can always recognise the same markings, the dark eyebrows of the man in the moon, and his smudged mouth, while the tip of his nose is always seen near the middle of the full moon. No person has ever seen the other side of the moon. This is one of the things that are difficult to explain; and the reason usually accepted is so far from being entirely satisfactory that we must at present make no attempt at explanation beyond saying that it is supposed to be due to tidal friction in a previous age when there were tides on the moon.

III.

A matter of far greater immediate interest is to examine the features of the moon's surface,

for there is no object in the heavens that offers more beauty and wonder to us than the moon in her different phases. And this is true whether we look at her through a small spy-glass or through one of the greatest telescopes in the world. A common field-glass reveals new and unexpected details; and every increase to the power of our telescope increases the wonders of this new world.

We might expect to see a close resemblance to the features of our earth, with its oceans and continents and vast mountain-ranges. These are all absent, and we feel that we are looking at a dead world in ruins.

In gazing through a telescope at the full moon it is easy to see that the general outlook is upon two types of scenery. Around the poles, especially at the southern pole, the surface is white as snow, but round a great circle on the moon, near to, but not actually on, its equator, the surface is black as the ice on a newly swept curling-pond, and an outlying branch extends northwards. There is, however, a further feature of the most extraordinary nature. In the southern snow cap, one of the largest of those white ring-shaped mountains, usually called 'craters,' is Tycho. Its position can easily be noted, because that point is the centre of a star-shaped set of wonderful streaks or cracks, reminding us of the star-shaped cracks on a frozen pond when a skater has fallen and cracked the ice. These 'Tycho streaks' extend to great distances, almost right across the whole surface of the moon. They are most distinct at time of full moon.

These are the three things that strike the eye in the first look through a telescope at the full moon—the great surfaces white as snow, the black belt like clean ice, and the streaks like ice-cracks.

The whole of the white regions are broken up and disturbed, and covered with lunar craters, whose shapes can best be examined when the moon is a good deal less than full.

The zone of black regions is one whose pole would come somewhere near to the crater Tycho, which is the centre of the streaks. The whole of this zone has the appearance of a succession of large, calm, level, and generally circular seas, separated from each other by white rough boundaries. A simple glance establishes the circular form of some of these—the sea of Crises, the sea of Nectar, the sea of Serenity, and the sea of Showers. They have been called seas, as the ring-mountains have been called craters, without good reason from terrestrial analogies.

The moon's temperature is far too low to permit the presence of liquid water. Nor is there any air; at least, Bessel proved that its density cannot exceed the nine hundredth part of our own atmosphere.

When we look with a telescope at the moon in the first quarter, or in any phases except full moon, our attention is engrossed with wonder at the forms of the lunar craters in the snow-white regions. In fact, it is probably true that to the amateur astronomer there is no more attractive object in the heavens than the weird shapes of those craters which lie near the boundary between the illuminated half of the moon and the half that is in shadow. It is then possible to judge from the shadows cast by the sun how high, steep, and rugged are the walls of these craters, in some cases miles high. The shadow of the crags on one side falls upon the floor of the crater. Often it happens that the sunlight reaches only the summits of the peaks inside the crater, and they then appear as bright spots on a dark, unseen background.

The most common features of these craters are the flat floor, level with the general surface of the moon, the ring of crags enclosing it, and a hill or cone rising out from the centre of the floor. But the variations from this type are innumerable. They vary much in diameter and in the heights both of the crags and of the central hill. Every stage of transition from the typical form can be traced until we find, in the whitest regions near Tycho, mere holes pierced in the surface, showing no floor, no central cone, no surrounding ridge.

In some regions near to Tycho and the south pole the craters are unusually abundant, and so close together that the enclosing ring of one may be either deflected or obliterated at one side by another encroaching crater.

Those who have not the opportunity of studying these marvels through a telescope can do almost as well by securing copies of the wonderful photographs from the great observatories of the world, in which every detail can be examined. But, best of all, they can look at the splendid atlas of the moon by the French astronomers Puiseux and Loewy, who have published copies of their beautiful negatives, enlarged so that the whole diameter of the moon is 6 feet across.

All the seas and craters and mountains on the moon have had names given to them. It is a pleasant occupation to take a lunar chart and a small telescope, and to identify these features.

When this occupation has familiarised us with the craters, and the Tycho streaks, and the seas and mountains, the question must arise, How have these formations been made? On our own earth, geologists refer us to denudation, glacier-action, and volcanoes, as being responsible for the mountains and valleys. On the moon the temperature is so terribly low that denudation by water is out of the question.

NEST ROBBERS.

A TALE OF THE ESKIMO.

By Captain H. T. MUNN.

I.

'SO you have been egg-gathering,' said old Ag-you to me one fine July evening, as I sat in the warm sun beside my trading store on the south side of Bylot Island, Baffin Bay. As he made the remark, the old man produced his pipe, and suggestively knocked out the ashes on the palm of his hand to show it was empty. I passed him my pouch, and he seated himself contentedly beside me.

It was a rare and wonderful Arctic summer evening, the air indescribably clear and still, warm and exhilarating.

Half-naked children romped and raced happily round the near-by *toupiks* (tents), the fat, stretched-out dogs too lazy to move out of their way. A few white and fleecy clouds hung like delicate skeins of wool in the intensely blue sky, and the brilliant sun, high in the west at this hour (as it would be in the north at midnight), gleamed on the white glaciers and snow-covered mountains of Northern Baffin Land across the inlet, and the yet frozen sea in the foreground.

On the ice, numerous black objects here and there denoted seals basking in the warm sunshine. From the rocky ledge behind the house snow-buntings rose on their short, lark-like flight, trilling a musical little song to their mate nesting under a boulder or in a cranny below.

The distant report of a rifle far out on the ice sent the keen-eyed children scampering to a vantage-point to see if it announced the return of a sled and hunter from the floe-edge five miles away. Soon a rosy-cheeked little lass, five or six years of age, appeared half-shyly round the corner of the house, wearing nothing but her knee-high native *kanicks* (footwear) and an engaging smile, and uttered in Eskimo the word 'telescope'—knowing I kept an old one for such uses—wrinkling her small nose (the negative sign) at her grandfather's joking cry of 'Shame, shame, little one!' as she accepted the loan. 'I am not afraid of the white man,' she called over her shoulder, as she ran back to the shouting group on the hill, for she knew she was by way of being a favourite of mine, children being the only favourites a wise trader in the Arctic will make to avoid jealousies.

It was the all too brief summer's day of the Arctic, the Eskimo's happiest time.

'Did you climb up to the nesting places?' asked Ag-you, with the air of expecting a negative reply.

I admitted I had been foolish enough to do

so, and added emphatically, 'Never again,' at which Ag-you chuckled.

'It is a bad place,' he said thoughtfully; 'once there was a man——' and he re-lit his pipe carefully. I knew a story was due.

In truth it *was* a very bad place to climb. Known on the chart as Cape Graham Moore, its native and (translated) whaler's name is Loom Head, and tens of thousands of these excellent sea-birds have their nesting-ground there. The bold headland rises from the water over a thousand feet to its summit, the last hundred feet being perpendicular rock. Approaching the headland over the ice or by water, one may climb it at one place by a difficult and dangerous route, the first six hundred feet of which necessitates a fly-like clinging to the rough rock face; a false step after the first hundred feet would mean certain and unpleasant death. At about six hundred feet up, after squeezing through a narrow cleft, a 'shoulder' of rocky ground less steep gives better foothold; some three hundred feet of this brings the climber to the perpendicular cliff. The shoulder, cut by a gully sheer to the water, is about a thousand feet long; here on every ledge and jutting rock a few inches wide, and flat enough to hold one, eggs lie in thousands. There are a few depressions along the shoulder where a man could lie down in safety, and one place where a little pool of melted snow-water, thoroughly fouled by the nesting birds around it, offers a most uninviting drink. The 'nesting' arrangements seem to be one bird one egg, the latter laid on the rock without any nest whatever, and how the birds know their own egg amongst the other thousands everywhere about is an ornithological mystery; perhaps they don't trouble, but are bird communists. The eggs are oval, mottled black and green, and as large as a duck's egg; both eggs and birds are excellent eating. When disturbed by the egg gatherer the birds leave the cliff with a noise like thunder, darkening the sun as they pass outwards; they—or others, for there always seem more birds than eggs—return in flocks of twenty to one hundred every few minutes, and settle on the ledges, sometimes within reach if the climber is quick enough.

'Let's have the story, Ag-you,' I said.

II.

'It was in my father's time, before there was much white man's stuff amongst the Innuits, such as rifles, whale-boats, or tobacco. The Innuits were camped at Kar-soon (a hunting spot about fifteen miles from Loom Head), and

they were egg hungry. The ice had left the coast very early that year, so the only way to get to the nesting rocks without a whale-boat or *oo-miak* (native boat) was from the top. There a strong man could let himself down on an *og-juke* line (a very strong seal line) to the shoulder, and another man at the top haul up the eggs in a sealskin bag. Ag-pah ("The Loom") was a famous climber from boyhood, and one fine day such as this is he and another young man named Issi-gaito left to gather eggs. If they were successful, other Innuits were to come the following day and help to bring back the loads to Kar-soon.

'Climbing to the hill-top Ag-pah slipped, and in falling said he had hurt his foot and could not go down over the cliff face on the *og-juke* line, so Issi-gaito, himself an active climber, took his place. I do not think Ag-pah really hurt himself when he fell; he had no wife, but Issi-gaito had a pretty little wife he had taken less than six months before. Without always meaning to, women sometimes cause many bad things to be done by men, especially when they are young and good to look at.

'Down the cliff went Issi-gaito on the *og-juke* line, using his feet to steady himself and keep off the rock face. He soon had a bag full of eggs, but when he climbed with it back to where the line hung, it was lying in a heap at the bottom of the cliff where he stood, and he found the top end had been frayed through with a sharp stone.

'He saw at once it was Ag-pah's work, for he had been very careful to lower himself easily and gently down, and a seal skin had been placed under the line where it touched the rock. Instantly Issi-gaito knew why Ag-pah had done this evil thing; it was to steal from him his little wife. He guessed the tale Ag-pah would take back to the camp; how, with the broken line as proof, he would say he had heard Issi-gaito's body fall, and then roll down into the deep gully you saw there and splash into the sea, for the landing-place from the hill-top—owing to a convenient rock to tie to—was at the head of the gully, and there was only standing room just there. No one would come near the place for perhaps a year or two, because they would be afraid Issi-gaito's spirit would be there and harm them.' Old Ag-you laughed quietly. 'It was a wicked and a clever way to get rid of a man,' he remarked; 'and Issi-gaito had guessed the truth.'

'Why didn't Ag-pah cut the line when Issi-gaito was half-way down and kill him at once?' I asked.

'That would have been murder,' replied Ag-you gravely, 'and Issi-gaito's spirit would have haunted him.'

Well! some of our theological sophistries are just as thin. I thought of the Spanish Inquisitors, and their requests that the heretics

should be killed 'without the shedding of blood,' to accomplish which they burned the unfortunates slowly at the stake.

III.

'Go on,' I said, after the pipe had been re-filled and the interlude of tobacco smoke over.

'Issi-gaito "took stock." Six hundred feet below him the ocean swell surged gently against the cliff, and he knew that for a mile on either side the water was a hundred feet deep to the sheer rock foot. It would be four months before the ice made again to permit escape by that road; four or perhaps five months, and by then the winter would be at its coldest time.' The old man shivered suggestively. 'I should have cut my wrist here' (he indicated the vein) 'and died, but Issi-gaito was a braver man.'

Knowing old Ag-you as I did, I doubted this.

'The first thing he did was to stretch the *og-juke* line taut and split it with a small knife; he then made nooses on each line, and started to snare the looms as they returned to the nesting rocks. One place he left undisturbed, and from here he made a store of fresh eggs daily, for the loom will lay many eggs if they are removed. In a few weeks Issi-gaito had hundreds of loom bodies carefully skinned and stored under some loose stones, and over them, to keep off the sun, he placed the strong, well-feathered skins. Others he split and sun-dried the meat, but it was the skins he needed most; three looms a day would keep him alive, but his greatest risk was freezing to death on those cold, exposed rocks. With a needle of bird bone and the strong leg sinew for thread he made two *koo-le-tang* (jumpers) with hoods, and two *kod-ling* (trousers), one of each to be worn with the feathers next the skin. He made stockings, mits, and three blankets. Other skins were taken off from the bodies without being split up, and were laid down as a sleeping place in a hollow in the rocks.'

'And for water?' I asked.

'You saw it,' replied Ag-you. 'It is still there, the little pool in the rocks. Yes, it was very dirty and smelt, but it was wet,' and he smiled at his simple joke.

'When the great autumn storms came Issi-gaito had hard work sometimes not to be blown away, and to keep his meat store and his bird skins. Long before this all the birds had flown, and he was the only living thing on that lonely cliff face. Then, at last, late in the dark month (December), the ice set at the cliff foot, and Issi-gaito was able to leave.

IV.

Do you remember the little cleft in the rock up which you went before reaching the nesting places?' I nodded.

'In Issi-gaito's time there was a large rock at the top of this little cleft. When you climbed up it was gone, and you put your

arms on each side of the cleft and raised yourself to the top. When the rock was there the climbers would pull themselves up by holding on to a niche on the under side. Issi-gaito moved this heavy rock a little nearer the edge, and put small stones under the hinder side, until it would easily come away if pulled from the niche.

'It was fifty miles for Issi-gaito to walk before he found any *igloos* of his people; they say even his own dogs attacked him when he arrived in his bird-skin clothes, so strange did he look.'

I waited while the old man re-lit his pipe, and after a reasonable pause asked, 'Was there a fight?'

'No; Issi-gaito went to Ag-pah's *igloo*, and greeted him, and all the Innuits came, and there was great rejoicing, and Issi-gaito learnt (as he had foreseen) how Ag-pah heard his body fall down into the water.

"It was a stone," he explained, "which I fell on to when the line broke."

"Why did not you shout?" asked some one. "My breath was all knocked out," lied Issi-gaito, "and I lay a long time before I could move." For many hours he told his adventure; how he caught the birds with a noose, how he made his clothing and blankets, and of the terror lest the great gales should blow him bodily into the seething waters dashing against the cliffs below—to die by drowning is the worst of all deaths to an Inuit. He spoke of the bitterly cold winter nights under his small bird-skin blankets, when the powdery snowdrift would find its way inside in spite of all he could do, and how he had no food except the half-rotten bird meat, and only the snow to eat for drink. An Inuit understands all these things as few white men can do.

'None of the listeners exclaimed more interestedly than Ag-pah, no one was more sympathetic, and when he gave his place beside the little wife to Issi-gaito, and moved to another *igloo*, the others thought he did so gladly—except Issi-gaito.

'Presently the Innuits left them, and when underneath the deerskin blanket I think Issi-gaito must have looked contentedly round the warm stone *igloo* hung with deer and seal skins, and watched his little wife as she deftly trimmed the *kood-lil* (stone lamp) with a small stick, till the flame was steady and clear and shone brightly on her soft, bare shoulders and ruddy cheeks. And the Loom cliff must have seemed a bad dream.

'He was told, with many nose-pressings and a few happy tears, how glad, how *very* glad, she was he had returned, and how she liked him much, much better than Ag-pah—all of which he, boy-like, believed, hearing it thus from her own red lips. And Issi-gaito laughed happily, and presently told the little wife—with more

nose-pressings—how he liked this warm nest, and the little mate now in his arms far, far better than the loom's nest away yonder where—and a lot more such foolishness, for he was very young and very fond of his little wife, and glad to be alive thus after all he had gone through.'

Ag-you sighed sentimentally; he was a born storyteller.

'And Ag-pah?' I asked presently; 'didn't Issi-gaito—'

'No,' replied Ag-you; 'Innuits are not like white men. Sometimes they will forgive a great wrong, sometimes they will only seem to do so, waiting chance; Issi-gaito was like this last. Ag-pah? Well, he had nowhere to go to, and I suppose he thought, poor fool, Issi-gaito had forgiven. Listen.'

V.

'Next spring Issi-gaito and Ag-pah and some more Innuits went on the ice to the nesting rocks at Loom Head. Issi-gaito was going to climb up for eggs, but the little wife suddenly began crying and clinging to him and begging him not to go up the cliff, and he laughed at her, but gave in to her at once. Then Ag-pah laughed contemptuously and said, "See me! No woman shall make me afraid to go up the egg rocks. I will go and gather them; let Issi-gaito stay below;" and he began to climb up.

'Issi-gaito took his little wife out a short distance on the ice, not seeming to mind Ag-pah's contemptuous words, and began to point out to her his old sleeping place far up on the cliff side, and she called the other people who were standing near the cliff to come and see; and Ag-pah climbed carefully and slowly on, shouting down to them how easy it was. And he put his hand in the niche under the big stone, and it came away, hitting him in the belly, and he cried out very badly, and fell down on to the ice far below, and died at once. And the big stone fell without hurting any one, for, as I told you, the little wife had called the others out onto the ice before it fell.'

'Issi-gaito must have told her?' I ventured.

'Yes. He was afraid Ag-pah would suspect if he was asked to go up, so Issi-gaito planned it she should make a fuss; and he knew Ag-pah would be afraid to climb up with him, lest an accident should happen, so he pretended to be afraid himself.

'I think the little wife must have really liked Issi-gaito the best, as she told him she did, or she would have warned Ag-pah, but you cannot tell; in these matters women are not to be trusted.'

I laughed at the old cynic, the story of his married life indicating one of the happiest matings I have ever known. 'You old humbug,' I said.

'*Oo-man, oo-man,*' came a shrill cry from the *toupiks*, and the old man rose. 'It is my old

wife,' he explained apologetically. 'Young women think of nothing but love-making at this season, and old women of nothing but food-making. Aie! Aie! and I am an old man now—ah well! It is you whom she will scold if I am keeping her waiting,' he added, as he pocketed the plug of tobacco I offered.

'Why not you?' I jeered.

Ag-you laughed softly. 'Have you ever heard her scold me?' he asked; 'or have you ever heard any Innuits tell you she has been scolding me?'

And when I thought it over, as I watched him depart, I found I never had.

THE AUSTRALIAN CROCODILE.

By 'YERRILEE.'

ONE often wonders why, in His wisdom, the Maker of the universe and everything belonging to it should have placed this creature on the earth. It requires a great stretch of imagination to find redeeming features in its favour—one compensation, perhaps, is that it sometimes acts as a scavenger in ridding fresh-water courses of dead animals which had got there by accident. Generally, however, its choice is to capture beasts, birds, or fish alive, and in doing this it is as cunning as any of the feline tribe. By a strange misnomer, this saurian is usually known in Australia as the alligator, although it is really the crocodile, its jaw action being the reverse of the alligator's.

In the early settlement of the eastern coast an odd specimen was located as far south as Moreton Bay, the port of Brisbane, but in all probability this was a female, and the reason is explained later on. Now it never occurs so far south, and it will be accurate enough to say that the Tropic of Capricorn is its southern boundary, if we include Keppel Bay and its immediate waters on the eastern coast. The watercourses emptying into this bay are simply infested with these brutes. Their habitat takes in the whole of the sea frontages of Australia north of the Tropic of Capricorn. The crocodile likes all deep tidal streams, because these swarm with fish, of which it is very fond, but it is equally at home in fresh water.

It has always taken a fairly heavy toll of mankind—to what extent is not exactly known. Many a travelling swagman walking along the coast, through ignorance, or carelessness caused by having escaped so often, has disappeared as if the earth had swallowed him, having become a tasty meal for saurians. These crocodiles have a great liking for children; another of their choice morsels is the dog, and they will stalk either, under the water the whole time, for hours if necessary. Should an opportunity occur, they come out like a flash of lightning and secure their victim, returning immediately. Their strong point of attack is to lie in wait under the water, and, as man and beast come to dip or drink the water, to strike with the claw like a cat, and then seize their victim with the mouth and disappear.

Along the banks of most watercourses thick

scrubs or jungles flourish in many places; these are the homes of marsupials, upon which the crocodile preys. In the large fresh-water lagoons where the wild-fowl swim the crocodile finds a nice selection, and shows great cunning in quietly clawing them under while swimming, so that their mates know nothing about it. In the good grazing country it is quite a common thing to see cattle and horses badly mutilated about their hind-quarters through having escaped from the claws of the crocodile as they turned to walk out of the water after drinking. This can scarcely be wondered at, considering that this scourge to man and beast grows to 15 feet in length, and weighs anything up to half a ton.

Sportsmen delight in shooting them with bullets (which are the only things that will penetrate their hides) when in the cold weather they lie basking in the sun on the sand at the water's edge. To succeed in this the crocodiles have to be stalked. In badly infested rivers a dead dog or cat, after being poisoned with strychnine, is tied to an overhanging limb just clear of the water, and such tempting baits make a good many of the crocodiles lose the number of their mess.

Owners of boats in these rivers will never sleep in them, or allow any one else to do so, because so many attempts at night-time have been made by crocodiles to pull the occupants out. Directly the sun goes down the crocodile becomes as lively as a cat, and prowls about on the land in the vicinity of its haunts. Sometimes it can be heard, in the stillness of the night, grunting like a pig. On these occasions it is always consoling to know that one is perfectly secure on a balcony, enjoying a smoke, or else rolled up snugly in bed inside a house. Under ordinary conditions on land it flies from man, but once in deep water it is the other way about.

The only redeeming feature in their existence is, that an all-wise Providence has so willed it that the adult male crocodile is the greatest enemy to its race, because he devours the young as quickly as he can catch them. To guard against this the female uses the greatest cunning, in that she travels many miles away from the haunts of the adult males, up fresh watercourses, to make her nest in a nice secluded spot, in

which she lays an average of sixty white eggs as large as those of a goose. This done, she covers them up with grass, leaves, and humus, and trusts to the sun to hatch them. As they come out of their shell the little ones by instinct toddle to the water, and the mother guards them. As they grow, they gradually work their way to deep water, where many are devoured, as already indicated. The crocodile is a long-lived creature; specimens shot indicated that they must have been a hundred years old.

When caught very young they can be reared with care, but captured adults are practically impossible to keep alive for any length of time—that is for show purposes, as they will not take food, and, after exhausting what vitality they have, die in a few months of starvation. Occasionally, show-people advertise for an adult, and there are young white Australians who have been reared in the north, and under the tuition of the aborigines have become expert in the habits of the crocodiles. These young fellows undertake to supply orders at £1 per foot in length—that is to say, if a crocodile 15 feet long is supplied, £15 has to be paid. The hunters place on a well-used track during the day a dead wallaby, which is invariably taken overnight by the crocodile. The same thing occurs next day—the bait again disappears. Then on the third day a dead wallaby is used as a bait inside a strong noose made of wire, chain, or rope. This gear is firmly fastened to a very strong young tree, which is bent down like a bow, the wallaby becoming the trigger. Directly the wallaby is grabbed, up goes the tree, and the lassoed crocodile is partly suspended. After this, it is placed in a long box and transported to the nearest boat or railway station. The food that it has already had enables it to exist for some months.

Rather an amusing scene happened at one of the leading hotels in the north, where among the pets in the back-yard was a young crocodile, about 3 feet long, which was imprisoned in a wire-netting yard. As is usual in the north, during hot weather the main back-door of the hotel was left open overnight, and by some means the crocodile got out of its yard during the night and quietly took possession of this entrance inside the passage. The housemaid was the first down the staircase in the morning, and was horrified to find this visitor in charge at the landing. Before anything serious happened her screams quickly brought assistance, and the crocodile met its doom.

The following reliable incidents will give an idea of this brute's habits. Twenty years ago the rivers and creeks on the eastern coast of Queensland had the highest floods known. Taking advantage of this, the hydraulic department of that State decided to correct their records, and parties were sent out at once to secure the data. The party who had to take

the new levels of the longest northern river comprised an engineer, the Crown Lands ranger, and a black boy, the last-mentioned to look after the horses and be generally useful. After following the Burdekin River up to where it broke through the mountains it was decided to camp, and a nice little clear spot, high up on a shelf away from the water, was selected. The ranger was satisfied it was safe from the crocodiles, supposing any ever travelled so far. Consequently the horses were unsaddled, a fire was lit, and everything made snug for supper, and then a sleep in the open on nice grass. The black boy hobbled the horses, and told the ranger that he saw 'alligator' tracks near the water when filling the 'billy-can,' but no importance was attached to this remark. After having tea and a smoke, each man rolled himself up in his rug and was very soon in the land of 'Nod,' allowing the camp-fire to burn out. About 2 A.M. the black boy aroused his masters, yelling 'alligator,' and the white men immediately struck matches, but nothing could be seen. The ranger told 'Joker' that he had been dreaming, but the black boy emphatically declared he heard 'that fella walk about,' refused to have any more sleep, and rekindled the fire. Both white men once more rolled in and slept the sleep of the tired. At dawn the black boy once more roused his master, saying, 'You been call me big fella fool last night. I'll show you.' The white men jumped up and followed 'Joker' a few steps through some grass. The black boy pointed to a good-sized mound, consisting of dead grass, brackens, and leaves, which were quite wet. 'What is it?' said the ranger. 'That fella alligator's nest,' was the reply; and 'Joker' straightway rooted out a large egg, finishing up by finding sixty-two. The crocodile had to pass quite close to the feet of the sleeping men to expectorate water over her nest so as to keep it at the proper temperature, and the aboriginal had heard the crackling grass as she slunk past when returning. Had the saurian wished, she could have taken any of the men, but her eggs were of more importance.

Another case was where two settlers, after a hot Saturday forenoon's work, decided to have a bath in shallow water a little above the knees; they had bathed there before. One of them took his seven-year-old boy in, and as they were all enjoying the splash the little fellow suddenly disappeared. He had been clawed and taken by a crocodile into the deep water close by. Some Chinese gardeners lower down the river saw the crocodile come to the surface carrying the boy's body in its jaws.

Another cruel experience happened to two young men, mates, who went for a stroll along a shallow stream, one taking his shot-gun and cartridge-belt. The stream soon afterwards spread out into a marsh with scores of little islets—familiarily known as 'devil-devil' land—

between which the water could be waded. The wild ducks were numerous, and some were quickly shot. The young fellow had just dropped a bird, and, gun in hand, waded to it. Without any warning he was seized by a crocodile, lost his gun, and was carried to one of the small islands, where amidst appeals for help to his chum the crocodile played with him, just as a cat would with a mouse. As no other human beings were within miles, his mate could not help him. He was soon devoured.

A rather amusing experience was when the railway department was building a bridge over a tidal creek, and hardwood piles had to be driven into the bed, after passing through twenty feet of water, as a central pier. These piles were to be sheathed with Muntz metal below the water-level to prevent the 'borers' penetrating them. The inspector responsible for passing the work decided to don a diving-suit, go below, and see if everything was right. After he had been lowered out of the punt by the tender, he received an unusual hard knock on the head, and, in Gaelic, did not bless his mate for acting the 'Angora' by dropping a piece of stone on him. After reaching the bottom it was some

seconds before he could see properly, but when his eyes became accustomed to the dim light he made a careful examination of the base, then, looking up the piles, was horrified to see an immense crocodile outside the temporary staging waiting for him. There was only one hope for him, and that was to give the urgent signal to the tender, which he did. He was rapidly pulled up in safety. After explaining why he gave the urgent signal, he remonstrated with his mate for his 'horse-play' during the descent. Thereupon he found out that the crocodile had dealt him the blow, and congratulated himself that the helmet had saved him.

That man is the crocodiles' deadly enemy can be understood; also it can be appreciated why some of our best rifle-shots in the north are women, who are intensely keen in using the bullet where a saurian is concerned. Apart from this, these 'Amazons' never spare themselves where they can teach those of the rising generation, male or female, to shoot. On one occasion I saw a woman with a class of boys and girls 'coaching' them with a sporting rifle, a target against a large tree being used. It was intensely practical, and made me think hard.

THE HIGHBINDERS.

PART II.

VII.

'PASADENA, Pasadena,' shouted the brakeman as the north-bound train from San Francisco drew up at the little, sun-smitten station on a vast scorched-up plain that glowed like a furnace. Pasadena was the nearest railway station to Santa Agata, which was fourteen miles away on the other side of the desert. The journey across that sweltering inferno was not an experience to be desired.

Two travellers alighted from the train, both Chinamen. Each carried a black bag and a white cotton umbrella. After a brief consultation with the station-master as to the direction to take for Santa Agata the two travellers turned their faces to the desert.

Under the shelter of their cotton umbrellas they plodded on, a cloud of white dust following in their wake. They were attired in the hideous garb, half Chinese, half European, worn by all Chinamen on the Pacific slope, which has a tendency to make them look all alike. In their case, however, it could not lessen the striking contrast in their physical appearance. One was a tall, lanky individual, a walking skeleton almost, with a wizened, shrivelled face like dried parchment, his almond-shaped eyes glazed and dreamy, his shoulders drooping, his long, scraggy neck bare and sunburnt. He was strangely suggestive of an animated scarecrow.

His companion was a short, stout, pot-bellied man, with a bull-like neck and a bullet head. He waddled along like an apoplectic duck, his long pig-tail swinging from side to side pendulum fashion. In other respects there was nothing to single out these meek and humble travellers from other Chinamen so frequently met with tramping the dusty roads under the broiling sun in southern California tramping from place to place in search of employment. In spite of their grotesque physical difference they were commonplace and harmless looking enough.

One or two mounted cowboys flung a curse at them as they passed; while a Yankee pedlar in a mule-drawn buggy smiled contemptuously, and advised them to go back to their country and wash themselves. But neither curses nor contempt could ruffle the serenity of the fat man or the stony impassiveness of the skeleton. A big rattlesnake wriggled lazily across their path a few yards in front of them, but though they must have seen the deadly reptile neither swerved an inch. Little did the cowboys and the Yankee pedlar think that this ridiculous couple of Mongolian tramps were the emissaries of the Highbinders, a secret society as powerful, occult, and omniscient as the 'Holy Inquisition' of the Middle Ages, or the infamous Westphalian Vehme. The Black Hand and the Camorra were at a disadvantage when compared with the Asiatic Association of Highbinders.

Those two Chinamen, as impassive as the Sphinx, who wearily plodded along over the hot sand under the blistering sun, were 'judges' of the Association, which watched with argus eyes the welfare, and enforced the discipline, of the Chinese colonies throughout the States. Had the black bags they carried been searched they would have revealed little to the eyes of Westerners, but would have had a deadly significance for a Chinaman.

VIII.

Mr Sefton Skindle was reclining in a large deck-chair on his veranda enjoying a siesta. The heat of the day was lessening as slight puffs of a cooling breeze swept down from the Sierra Gorda Peaks, as was usually the case at that season in the late afternoon. He had returned from San Francisco a week ago, and now as he lolled in a semi-somnolent state he was suddenly aroused by a servant coming to him and announcing that two Chinamen wished to see him. 'I am sorry to disturb you, sir,' added the man apologetically, 'as I fancy they are only two tramps looking for work. But they said they had a letter which they must deliver to you personally.'

Mr Skindle sprang up with a bound, and the man drew back, fearing a drubbing for disturbing the boss; but Mr Skindle said quietly, 'Show them into my office. I will see them at once.'

He knocked the ashes from the pipe he had been smoking, finished his iced drink, and went to his office, where the skeleton and the fat Chinaman awaited him. They rose as he entered, bowed very low, and shook hands with themselves in accordance with the custom of their country. Then, when they had reseated themselves at Mr Skindle's bidding, the fat man placed a letter before him. It was an official document, signed by the chief secretary of the Association, and informed Mr Skindle that the bearers were the accredited agents of the Association, and had been sent to *make inquiries*.

Having received the manager's assurance that there was no fear of their being overheard, they stipulated that all work of the coolies should be suspended for three hours the following morning, that the coolies should be confined to their houses during the time, and that under no circumstances should any of the white men be allowed in the Chinese quarter during the 'investigation.' They also inquired very tenderly about the health of the foreman and his assistant, and being informed that they had quite recovered from their injuries, the emissaries expressed their satisfaction, as the 'two unfortunate men' would have to be present during the inquiry.

At first Mr Skindle demurred, and innocently inquired what the nature of the investigations would be. The two visitors smiled blandly, and said they were not in a position at that stage to give any information until they had heard

the evidence, and that unless their stipulations were adhered to, they would be compelled reluctantly to return at once. Skindle was still dubious, but on reflection came to the conclusion that, having committed himself so far, he would only make himself ridiculous if he backed down now. And he recalled the hint given him by the man from Chicago that the methods of the Asiatics were not the ways of the Westerners. He had no idea what methods these representatives of the Association intended to pursue; that they would be drastic he hadn't a doubt, but the unavoidable conclusion was that the Chinese themselves were better able to deal with their own countrymen than the law courts were. So perforce he yielded. The emissaries smiled blandly again, and the fat one, who constituted himself the spokesman, thanked him, and said he had every reason to think the stolen money would be recovered, and—'All would be made welly proper, welly soon.'

'But if you do discover the thieves, how about punishing them?' the manager queried.

The yellow faces of his visitors beamed with what was almost a seraphic smile, and the little fat man replied, 'Oh, as to that, me no thinksee any punishment will be wanted after we have discovered them.'

He then requested that he and his companion might be shown to the workmen's quarters, as they would like to have a wash and a rest. It was a long and hot walk from Pasadefia. An offer of refreshment and a room in the manager's house was politely declined. The two mysterious visitors then took their departure, guided by a Chinese servant by orders of the boss.

Mr Skindle returned to the veranda and re-lit his pipe. The purple twilight had given an ethereal beauty to the landscape, and a sweet calm reigned, as work on the estate had ceased for the day. 'Well, it gets me,' mused the manager, 'why those two beauties should have come here alone to sift a matter that has baffled the police and the Chicago man alike. Seems to me ridiculous; but very likely the Chicago chap knew what he was talking about. All the same, I'm dead-licked to know how those two guys are going to solve the mystery.'

IX.

The following morning, instead of the usual bustle and activity when the labourers were preparing to go to their respective duties, silence and solitude reigned. The doors and windows of the large wooden shanty occupied by the coolies were closed, while blankets and sheets screened the windows inside. The manager had given strict orders that no one was to approach or loiter near the place on pain of dismissal.

The shanty and an annexe where all the cooking and washing were done stood isolated in the midst of an extensive kitchen-garden. The only dwelling near was a cottage occupied

by the head cooper of the estate and his wife. It was a comfortable house with a flat roof. The cooper was a German, who had learnt his business in the Rhenish vineyards of his beloved fatherland, and had been in the service of the estate company about five years. The order to cease work for three hours had mystified him. Like all his countrymen he was exceedingly curious, and liked to know the why and the wherefore of everything. His house commanded a full view of the Chinese quarters, and, as he stood at the door of his cottage, he noticed that all the windows of the buildings were screened. It was such an unusual thing that his curiosity became so great that it nearly overpowered his discretion, and he was tempted to sally forth and investigate. But, on second thoughts, the fear of dismissal restrained him, and the only conclusion he could come to was that his neighbours were going to mark some national event in connection with their country by 'unholy rites,' and there would be much burning of joss-stick and other 'devilry,' which shocked his Teuton mind. He yearned to have a peep behind those screened windows and see what was going on; but, as that was out of the question, he furnished himself with a pair of opera-glasses, and mounted to the flat roof of his cottage, in the hope that he might learn something, though it appeared rather a forlorn hope.

All the Chinamen were apparently assembled in the large room of the barracks, which was used as the common dining-room. Occasionally he heard the subdued clamour of voices, followed at intervals by an ominous, death-like silence. Presently the main door of the building was opened, giving egress to two coolies, who went stealthily, glancing about to make sure they were not observed, to the kitchen of the cook-house. In a few minutes they reappeared, one carrying a brazier of live coals, the other a large frying-pan and a bucket of charcoal. They re-entered the house, and the door was closed again. About ten minutes later a muffled cry of pain reached the German's ears, and confirmed him in his belief that some barbarous religious rites were being observed. The cry was repeated again and again at intervals, and the German could scarcely control himself. Once more he was tempted to go out and endeavour to peer through one of the curtained windows, but before he could decide the door was opened again and the two coolies emerged.

One made his way to the tool-shed, returning with two pulleys, a small coil of wire, and some rope. The other man, who had been to the kitchen, carried an oil-can. The mystification of the watcher increased. Presently his nostrils were assailed by an odour like that of burnt meat, and he thought it came from his own kitchen, where his frau was busy preparing his breakfast. He was about to descend from his

post of observation when he saw one of the windows of the barrack partially open and smoke and vapour issuing, whilst the odour increased until it became almost overpowering. In a few minutes the window was closed again, and after another interval of silence there was a subdued murmur, the door was flung open, and a number of men came out and arranged themselves on each side of the steps.

They were followed by two men carrying a chair, upon which was seated a man whom the German recognised at once as the foreman, Lie Ling. He reclined limp and inanimate, his head rolling from side to side at each step of the bearers. His legs dangled helpless from the seat, his feet being enveloped in canvas tied with rope. He was evidently in agony. He was followed by two other bearers carrying a shutter on which a man was stretched, evidently in as sad a plight as the foreman. The second man was his assistant. Then came the two officials, the little fat man fanning himself vigorously, while the tall lanky one was complacently smoking a water-pipe. The rest of the coolies lined up and followed silently. They directed their steps towards an orange orchard about two hundred yards away, and disappeared amongst the trees.

(Continued on page 468.)

ST MARGARET'S WELL.

(‘Supposed to have been the Rood Well . . . placed over a limpid perennial stream that issues from the interior of Salisbury Crags.’)

If you're passing round by Holyrood
Upon a summer day,
Just carry on a hundred yards,
Then step across the way;
And beneath the ruined chapel
Where the pious monks did dwell
You'll find the quaint stone basin
Of old St Margaret's Well.

Many a wanderer sought it
In days of long ago
As he fled the bitter vengeance
Of an unrelenting foe:
Ere he passed to peace and refuge
In lonely cave or cell,
He blessed the cooling waters
Of old St Margaret's Well.

Then never let us cavil
Though its charity be cold;
Like the waters of the Jordan
It is free to young and old.
It flows for rich and poor alike,
And ancient legends tell
There is healing in the waters
Of old St Margaret's well.

It knows the laugh of children,
Who love to splash and play,
Or tightly cup their little hands
To catch the dancing spray;
But early in the morning
Is the time to feel the spell,
When the robin and the blackbird meet
At old St Margaret's well.

Chambers's Journal

SEVENTH SERIES

GIPSY OCCUPATIONS.

By HUBERT N. B. RICHARDSON, B.A.

I.

THE popular idea of a gipsy's method of earning his living may be represented by the picturesque vision of a gaudily painted caravan—laden with cheap household utensils and drawn by a lean horse, with sometimes a donkey hitched to the shafts—crawling along a country lane; a swarthy-faced man with keen, dark eyes and wiry, athletic figure strolling alongside the horse; the lithe and supple form of a woman of Eastern visage, with straight black hair and eyes full of mystery, lolling in easy negligence on the front of the van; and several half-naked, dusky children, with shrill voices, playing along the roadside, a scraggy lurcher padding in the rear. But this picture portrays merely one out of endless ways by which the Romany people endeavour to eke out an existence. Charles Godfrey Leland once remarked that 'there are few trades that gipsies have not somewhere or at some time turned their hands to,' and it would indeed be difficult to put this comprehensive yet truthful assertion in a more concise form.

By far the most ancient of their many callings is that of working in metals. The Hungarian coppersmiths and the bell-founders and goldsmiths of eastern Galicia are perhaps among the earliest known gipsy craftsmen; and many prominent students of the subject maintain that the *komodromoi* (vagrant coppersmiths) of the seventh century, mentioned by Byzantine writers, were gipsies. Another ancient employment, one much favoured by the early British gipsies, is that of 'horning'—making spoons from the horns of animals—and in Scotland such was the interest that the gipsy took in his craft that one clan would know the spoons made by another by the workmanship.

Universally attractive to the race as the working in metal and horn may be, however, horse-dealing and, among the women, fortune-telling are essentially gipsy callings. The Romany is proverbially fond of animals, but his preference for the horse is readily admitted both by himself and by those who have studied him. There appears to be some natural affinity between gipsies and horses that is almost unaccountable; at any rate, the fact remains that the Romany

has a mysterious power over these animals that is quite peculiar to his race. For expert knowledge and the management of horses in general the gipsy has scarcely an equal; and it was no trivial suggestion when Theodore Watts-Dunton said: 'These nomads have an instinctive knowledge of horseflesh—will tell the amount of "blood" in any horse by a lightning glance at his quarters.' It follows, therefore, that gipsies are the most astute horse-dealers in the world, and many of them have made fairly large incomes in this particular trade. That their business methods will bear close scrutiny, or that their transactions are free from guile, is, however, quite another matter. There is not a trick or a device in the nature of 'faking' or 'doctoring' a horse that is not known to the 'sons of Little Egypt.' They will hesitate at nothing to ensure a good bargain. By the administration of certain preparations, which they are exceedingly careful not to divulge, they can impart to a jaded, worn-out old 'screw' the temporary appearance of soundness. On the other hand, if they are desirous of purchasing a horse, they are able by other secret preparations to induce a kind of languor in a sound animal which tends to reduce its value. Again, these crafty wanderers will cause a horse to sicken by surreptitiously introducing into its mouth a drug called the 'drao' or 'drab,' in order that they may be employed to cure it of the illness thus brought about. The opinion of a gipsy as to the value of a horse is seldom far wrong, though it would be somewhat risky to take his advice upon such a question, owing to his innate love of 'having' a *gorgio*. But let us be just and acknowledge that honest dealers are not altogether unknown among the gipsies; and let us admit that owing to their exceptional knowledge of horses, and the ignorance they so frequently encounter, the temptation to drive a crooked bargain must be very strong indeed to people who have such a slender conception of honour.

In the early part of last century horse-stealing was carried on as a regular trade, more especially in the Scottish border country, where many celebrated gipsies have earned their living by the sale of stolen horses, which were used by the cavalry and as hunters. These horses were

stolen in Ireland and disposed of in Scotland, while the opposite course was also followed of stealing horses in Scotland and selling them in Ireland; and a similar trade existed between Scotland and England. Many amusing stories have been told of cases in which the stolen animal has been so successfully disguised—by docking the tail, 'hogging' the mane, and sometimes by even dyeing the coat of light-coloured horses—that the rightful owner has failed to recognise his own horse; and in more than one instance the appearance of the animal has been so effectually altered that the owner has actually been induced to purchase his own horse which had previously been stolen from him.

II.

The gipsies in Spain, besides dealing in mules and asses, have made the trade of clipping or shearing these animals peculiarly their own. They are called *esquiladores* (shearers), and Davillier tells us, 'There is hardly in Spain a horse, a mule, or a donkey which does not once a year pass under the hands of an *esquilador*, or gipsy shearer.' In this industry they use scissors, termed *cachas*, which they carry in their belts. These scissors are sometimes two feet long, and are also used as weapons when occasion arises. The gipsy grasps them open in his bare hand at the point of intersection, and very formidable weapons they make, the most terrible wounds being inflicted by their use.

In the same country many of the innkeepers are of the Romany race; and most of the women employed in cigar and cigarette factories are gipsies, which calls to mind Prosper Mérimée's tragic story of *Carmen*, used so successfully by Georges Bizet for his opera of the same name; while the gipsy dancing-girl of sunny Spain is known in every capital in Europe. It may not, however, be so generally known what an intimate connection the gipsies have with the national sport, and that many of them have become noted *toreros* in the bull-ring. The bulls employed in this savage sport are reared and fed in vast prairies, far from human habitations, and many of the herdsmen who tend them are gipsy youths, who thus early in their careers become associated with bull-fighting. Towards the age of four years the bulls are rounded up by the herdsmen and driven to town to take part in the *corrida*. The task of guarding a herd of the fiercest bulls along scorching, dusty roads, and often through rough mountain passes, is by no means free from danger, even though the herd is accompanied by large tame oxen as leaders, and it is probable that it is the excitement aroused on this journey that first gives the gipsy a desire to take an active part in the arena itself. Some years ago the part of the *matador*, as well as that of the *torero*, of the bull-ring was nearly always taken by a *Gitano* (Spanish gipsy); and we are told by Dr Bright that this class of gipsy

formed a very similar type to that of the Roman gladiator or the English prize-fighter of bygone days. He describes these particular gipsies as 'dissipated villains, accustomed from their infancy to scenes of brutality, receiving large sums for the casual exercise of their skill, and then passing long intervals in absolute idleness; their mode of life gives ample room for the pursuit of vice, strengthened every day by the examples of their parents and associates.'

Employed as blacksmiths, many gipsies dwell in caves on the hillside of the Sacro-Monte—a miserable suburb of Granada. At one time these gipsy workers in iron were put down by the Spanish law, but owing to the irrepressible nature of the race the trade was allowed to crop up again, and it has now been vigorously carried on for generations. Another method of earning a living among the gipsies of Spain is to cart down snow from the mountains to the towns, where it is used for making cooling drinks.

There are some occupations which are not only specially followed by the gipsies in certain countries, but are actually monopolised by them. For instance, the gipsies in Montenegro have a monopoly of iron-working. The blacksmith in that country is no smith in our sense at all. He is supplied with horseshoes of various sizes by the gipsies who make them, and only hammers them on. A monopoly in the working of metals generally is largely enjoyed by the gipsies in south-eastern Europe and in Asia Minor; and, according to Grellmann, gold-washing in Wallachia and Transylvania has been practised from time immemorial, and in his day was carried on almost entirely by gipsies. It was their principal summer occupation, though not all of them were allowed to become gold-washers, permission having to be obtained from the proper authority, which carried certain restrictions with it. Only the better-class gipsies were granted this privilege. The gold-washers were obliged to pay tribute in gold dust; the remainder of the dust had to be sold to a government official at a fixed price, and this was sold again at a much higher price for the official's personal benefit. It appears to be somewhat doubtful whether this occupation was profitable to the gipsies or not, for some writers say one thing and some another; but it is hardly likely that these cunning nomads would seek an employment that did not pay them, though it may possibly have afforded indirect advantages which we do not hear about. In fact, one of the writers tells us that working at any trade or employment seemed to be 'merely a disguise, in order the better to enable them to carry on their thieving practices.' The following account of gold-washing in the Banat may be of interest: 'The operation consists in first providing a board of lime-wood, about one fathom long, and half a fathom broad, being hollowed at the upper end in the form of a

dish, from which are cut ten or twelve channels in an oblique direction. This board is fixed in an inclined position so as to form an angle of forty-five degrees with the horizon. The sand containing the gold being laid in the hollow at the top of the board, a quantity of water is then poured upon it, which carries off the lighter parts; such as are more heavy they shove down by hand; what remains in the channels, or furrows, is discharged into an oblong tray, carried to the straining-trough, and the gold which remains picked clean out.' This is another instance in which writers differ, some saying the work was performed in so careless a manner that a considerable amount of pure gold was lost, while others tell us that so expert did the gipsies become by daily practice the loss of gold was almost negligible.

In Hungary and Transylvania the duties of hangmen and executioners used to be performed regularly by gipsies; and in Egypt the art of snake-charming was wholly monopolised by the race. But perhaps a more striking instance of monopoly occurred several years ago at Cadiz. The butchers' trade in that town happened to be entirely in the hands of the gipsies, and they were prepared to go to any length in crime—not even excepting murder—in order to secure this lucrative business to themselves. An Irishman named O'Reilly was governor of Cadiz at the time, and being desirous of improving the state of the public markets, he established a number of Irish butchers. But this praiseworthy attempt on the part of the governor to bring down the price of meat was the very last thing that the *Gitdnos* desired, many of them being wealthy men through their impositions. In a short time not one of the Irish butchers survived, while the trade returned into the hands of the gipsies.

Many and various are the occupations of the gipsies of Persia. We find them passing their time—for the Romany seldom works hard at anything except sport and games—as blacksmiths, tanners of brass and iron vessels, tinkers, and cattle-doctors; while many of them, in more approved gipsy fashion, support themselves as fortune-tellers, vendors of charms and philtres, conjurers, dancers, and mountebanks; and sometimes they practise the arts of gold and silver-smiths.

III.

The English and Scottish gipsies of to-day seem to employ themselves very much in the same manner as they did at the beginning of the sixteenth century, when they first made their appearance in these countries, although not so many of them are minstrels or pipers as formerly. They are still known as 'tinkers,' 'horners,' and 'muggers'; that is, they mend kettles, pans, and cans; make spoons of horn; and repair broken china and pot articles. The

making of baskets, skewers, and clothes-pegs is also a common employment with them. The women assist in the upkeep of the family by hawking these goods from door to door, along with other small articles for household use; nor do they ever waste an opportunity for telling fortunes during these hawking expeditions. Until quite recently a large number of gipsies were employed in hop-picking in the southern counties of England, and their gains during this harvest helped them in staving off hunger during the winter months. But of late years the large increase in the importation of hops from America and Germany has rendered it unprofitable to grow hops in this country, hence the serious loss of employment to these unfortunate nomads. Many of the English gipsies make a speciality of rat-catching. They 'draw' the rats by the use of oil of rhodium, aniseed, and caraway oil, while sometimes the heads of dried herrings are used as bait. A gipsy who is well-practised in the art will almost tame the rats as he catches them.

In the sixteenth century gipsies often worked as bell and cannon-founders in Scotland, and at the present day the same trade is carried on by a few of them in the south-east of Europe. Many of the town-pipers of olden times, especially in Scotland and the north of England, were gipsies.

To show the diversity in their proclivities, a few of them are known as professional story-tellers, while others travel the country as bear-leaders; nor is it without precedent for a cab-driver in London to acknowledge the Romany tongue. Gipsy pedlars and knife-grinders may be met with at almost any time in our large towns; and through their love of horses it is not surprising that many have become jockeys. Even prize-fighting has not lacked its quota of devotees; Jem Mace was not the only gipsy who attained the championship.

As musicians they are known the world over. The music at most of the fashionable cafés in Petrograd—pardon! Leningrad—is supplied by gipsy orchestras, and some few of their women have won fame as opera-singers. But it is rather as instrumentalists that the gipsies have gained renown, quite a large number having become celebrated violinists. Among these may be mentioned the beautiful Czinka Panka, who achieved many successes at various continental cities, notably Vienna, and who is the more interesting inasmuch as she compiled a volume of gipsy songs. Another instance of a famous instrumentalist is John Roberts, who was one of the greatest harpists that Wales ever produced. In connection with musicians it may be of interest to recall the story of the gipsy boy, Josy—in whose case a wonderful opportunity to become famous was carelessly thrown away. When eleven years old Josy was taken from his parents by Count Sandor Teleky, who handed

him over to Franz Liszt as a present. The great composer quickly discovered the boy's exceptional gift for music, and placed him under the best masters in Paris. But Josy could not be induced to give serious attention to his violin, spending his time rhapsodising; for, in the words of Mr R. A. Scott Macfie, 'to him (Josy) civilised music was ugly and insipid, and he caricatured it with wit and skill which were almost uncanny.' The gay city afforded too many temptations to this wild youth. He early showed the Romany fondness for gaudy apparel and finery, squandering his patron's money on jewels, ties, and waistcoats. Again, to quote Macfie, 'he spent hours with his hairdresser, and raged with fury and disappointment when he found that all the oils and cosmetics of France could not bleach his dark skin.' The story ends with the boy's request to see his relations again. Liszt

acceded to his wish, and took him to Vienna, where they happened to be staying at that time. Mad with joy, Josy threw himself into the arms of his people, and returned to the only life which was possible to him.

Among the gipsies' less reputable callings may be mentioned smuggling, coining counterfeit money, illicit distilling of whisky, acting as spies in war, and even slave-dealing was practised by them in Brazil as recently as the middle of last century. But most of these villainies have disappeared with the wild days of the past, and year by year the occupations of the gipsies become less different from those of other people. It may be regarded as a general rule that gipsies, whenever possible, choose an occupation which requires few and inexpensive tools, and one for which the materials are easy to procure

THE HIGHBINDERS.

PART III.

X.

THE cooper was aghast, but he began to realise now the nature of the 'unholy rites' that had been carried out behind the screened windows. The two strange Chinks who had arrived the previous evening were evidently the 'High Priests,' in other words the inquisitors. Of course he knew all about the robbery, and how the police had spent days in searching, probing, and examining; and that a detective from the north had followed them with no better results. He himself had had a *mauvais quart d'heure* with the man from Chicago, who had pumped and cross-examined him until the cooper felt inclined to punch his head. The Chinks' methods were evidently more drastic.

Determined now, despite all risks, to see what was taking place in the orchard, the cooper left his post of observation, ran down the stairs, slipped out of the cottage, and crouching low, crept behind a cactus hedge which bordered the orchard, where he could see without being seen. From this coign of vantage he witnessed the proceedings with ever-increasing amazement.

The procession halted beneath one of the biggest trees, which was laden with fruit, several of the heavily-weighted branches being supported by crutch props to prevent their breaking down under their burden. To avoid chafing and lesion of the bark a pad of wadding was placed between the limb and the bifurcated end of the prop.

The long, lanky man, still smoking his water-pipe, was bending over the prostrate form of Lie Ling. Evidently he had some difficulty

in catching the sounds of the sufferer's voice, and the poor, agonised wretch pointed a trembling finger at a certain branch of the great tree. Then Lanky said something to Fatty, who had the prop removed. It came down with a thud, and among the pads were two of the bags of stolen money, which had been so cleverly concealed that not even the lynx eyes of the Californian police would have discovered them. The police dug and probed in that orchard, but never thought of looking up.

The bags were taken by the fat man, and the mob returned, but no longer silent; they jabbered in low tones, and gesticulated, and seemed joyous and gratified, the culprits excepted.

At nine o'clock, when the stipulated three hours had ended, the hooter sounded, and the coolies resumed their labours as if nothing unusual had happened.

XI.

During the investigations Mr Skindle had been very anxious and restless. He knew nothing of what had taken place, as he had honourably kept his compact not to interfere in any way. Having finished his breakfast, he went to his office and was busy with his correspondence, when a message was brought that the two emissaries were waiting to see him.

When they came into his presence they were smiling blandly, and shook hands with themselves vigorously. The ceremony over, the fat man placed the two bags on the table. The manager gasped with astonishment, and recalled all that the Chicago man had told him. The money was counted and found to be only half of the amount stolen, but the fat gentleman inti-

mated that he was sure the balance would be in the hands of his Association shortly, and it would be remitted by special messenger. The whole affair, he explained sweetly, had been due to a misunderstanding, and the money had been inadvertently mislaid. No, he was not authorised to explain or give any details, as every member of the Association was under an oath of secrecy. He and his colleague were very glad they had been able to carry out their duties so successfully and expeditiously, and it further gratified them to know that the pleasant relations between employer and employed that had existed so long would be restored under the benign influences of the new moon.

It had unfortunately happened, the fat man further explained, that in the course of the investigation Lie Ling and his clerk had met with a little accident, which would incapacitate them for a short time. It was not serious, but would necessitate medical treatment, which they would receive at the hands of a Chinese doctor in 'Frisco. 'Melican doctors, all same, were welley clever,' but the patients in this instance preferred their own physicians. Mr Skindle would confer a great favour if he would provide a conveyance of some sort to transport the two men to the railway station, as they were scarcely equal to the fatigues of a tramp across the desert. The emissaries themselves, the fat man explained, would follow on foot. He concluded by again expressing the gratification of himself and colleague in having been instrumental in bringing the little incident to a successful conclusion without any fuss or bother. The owners of the estate could feel assured that they would have no further trouble with their work-people. The costs which had been incurred, which 'would be trifling,' would be deducted from the balance of the money when it was remitted from headquarters.

Shaking their own hands and bowing profoundly, they departed. As the manager stood on the veranda and watched the two amazing Chinks disappear he felt bewildered, and also shocked as he realised that the Chicago man had been quite correct in suspecting Lie Ling and his clerk. He was shocked because he had had such faith in Lie Ling. However much he might object to the Chinese methods of crime detection, he could do nothing, and for obvious reasons it was important to observe a discreet silence in the matter. He experienced a sense of relief now that the executioners had gone. Their presence had filled him with loathing, and he had been half-tempted to kick them out, though he knew that would have been an indiscretion that would have led to trouble, for between East and West there was a broad line of demarcation, and the two could never blend. In this instance East had scored over West, though it was by methods that were revolting to Western ideas.

For three weeks Mr Skindle heard nothing further about the matter, and came to the conclusion that 'The Chinese Discipline and Welfare Association' had been only partially successful, when one day a special messenger arrived from 'Frisco, and handed' to him a parcel containing more money and three dirty and mud-stained canvas bags bearing the stencilled inscription of the Los Angeles bank. These were the bags in which the money had been secured when it was given into the custody of Lie Ling. A letter explained that one bag was still missing, but the Association hoped to trace it. The bag, however, was never restored by the Association.

XII.

A few months later an old and well-known prospector, named Bill Slater, came down from the mountains to Santa Agata as he was in the habit of doing periodically, and being a friend of Mr Skindle's, he was generally a guest of the manager for a few days. As the two men sat on the veranda one evening after a good square meal, Bill related a strange story to his friend.

During his last trip to the mountains Slater was one day traversing a very lonely gulch, known to miners as 'Hell Valley,' which had formerly been worked by Chinese, but subsequently deserted as the gold had panned out, when he came across the skeleton of a Chinaman lying by a disused water-chute, with a hatchet buried in his skull. It was close to the ruins of a miner's cabin. It was Bill's opinion that the Highbinders had paid a visit to that 'God-forsaken spot' to execute a decree of their order. He was confirmed in that opinion by the station-master at Pasadefia, to whom he told the story. The station-master remembered that a Chink pedlar, as he seemed, but who, he thought, was wonderfully like a man he had formerly known as one Lie Ling in the employment of the Estate Company, arrived by train from 'Frisco. He looked ill, and walked with a decided limp, as if his feet had been injured. He inquired if he could obtain a guide and pack mule to take him over the Sierras to Pine Creek Cañon. As neither guide nor mule was obtainable the pedlar shouldered his heavy pack and set off alone. If the skeleton Bill saw was that of the pedlar he must have avoided Pine Creek, which was full of miners, and made his way by an unused route to the other side of the Divide in order to reach the deserted Hell Valley, his object presumably being to cover up his track, because if he had desired to go to Pine Creek, and was really a pedlar, he could have done a roaring trade there.

Two or three weeks later two other Chinks, a tall, lantern-jawed fellow, and a short, fat one, arrived at Pasadefia and struck out for the mountains. They returned a month later, looking travel-worn and tired. The station-master

recognised them. While they were boarding the 'Frisco train, the fat man inadvertently dropped a black bag, which rolled from the platform on to the line under one of the cars, and one of the railway men had to recover it; he said it was heavy and chinked with money. Bill further informed his friend that he had searched the deserted cabin in the gulch and found an empty canvas money-bag. As it

bore the mark of the Estate Company and the stencilling of the Los Angeles Bank, he had brought the bag back with him, and would place it in Mr Skindle's possession.

Bill Slater thought it was curious that one of the Estate Company's bags should have been in that old cabin in the lonely gulch. So did Mr Sefton Skindle, but he offered no explanation.

THE END.

A P E N A N C E.

By C. M. M. PATERSON.

I.

FROM beginning to end the whole plan had worked without a hitch. No fears of discovery assailed Agnes Warren, convinced, as she was, that in the hands of the wily Pathan the secret was as safe as in her own keeping. Even if detected, the penalty of the law would probably fall less heavily on the otherwise blameless wife of a British officer than on the head of a well-known native rogue, and the legal punishment, as every one knows, was not one which even a hardened old sinner would be eager to incur.

Sixteen years before Armageddon, most of those who then resided in northern or north-west India will remember old 'One Eye.' He was a familiar figure on all verandas which, behind their shimmering door 'chics,' boasted the presence of a 'mem-sahib'; and even on the outer floors of less lucky (or otherwise) bachelor establishments the sound of his slimy voice was not uncommon. A huge and fat Pathan was old One Eye, deeply versed in the guile of the East, possessing, moreover, which is unusual with an Asiatic, an uncanny insight into the workings of the Western mind, especially of the female intricacies of that possession.

'Allah,' with that kindly love which he bestows on all true believers, had in old One Eye's youth stricken him with smallpox, and the optic which that unpleasant disease had rendered useless and hideous, together with the deep pits with which it had scarred his flabby, unhealthy face, made him as pleasantly repulsive an object as may be met in the East.

But Allah is great! If Allah takes away, does he not also give a hundredfold? The one eye, which in his wonderful bounty the Holy Prophet had seen fit to leave intact to this huge Pathan, was worth what many eyes would be to the rest of the unblest. Nothing escaped it! An impending decision on the mem-sahib's countenance, as the bargain drew to a close—the as yet distant, though gathering, scowl of disapproval which began to be born behind the eyes of his honour, her husband, were all as an open book to this prince of Pathan merchants.

It was this notorious gentleman's daily boast that he possessed the finest collection of merchandise in Hindustan.

'Adul Aziz,' he would remark, 'came here yesterday, mem-sahib, to sell you bad embroideries, and Mahomet Ali the day before, and you not buy. You wise, mem-sahib—only old One Eye got things worthy of the many rupees you want to spend.' And he would proceed to spread out his wares in front of the smiling mem-sahib with the cunning and dexterity of an artist, choosing patches of sunlight for such goods as needed it to enhance their glory, gloomy corners for the more tawdry colourings. Strong-minded indeed the officer's wife who could chase him from her bungalow before some of the husband's hard-earned pay had changed hands, for this merchant was the Tempter himself, and the goods which he displayed were, as he stated, unsurpassed by those of any other trader. Rich Chinese embroideries, as old as Time, which his clever fingers had managed to extract from the loot of the 'Boxer' rising; beautiful silk prayer-rugs from Turkestan, pictures in themselves, worthy of a space on any ancestral wall; shawls of exquisite patterns from Kashmir, weird designs from Bokhara, and curious trophies from Tibet—the sight was sufficient to make any mem-sahib consider bankruptcy worth their purchase! This curious old character disappeared in the year 1906, and the verandas of northern India knew him no more. Whether he retired outside the limits of the 'sirkar' or to Paradise of the Blest I was never able to discover. It is difficult to imagine that one optic which was so disarming in this life shining in glory now, but the ways of Allah are, of course, unfathomable.

With this short description of the man who aided Agnes Warren in her transgression, it is necessary to state that he did not share the secret of a hardened criminal. On the contrary, this officer's wife was an extraordinarily loving and lovable woman, with the charm of a pretty face, and delightfully considerate manners, and the sin which she committed was paid for in full in this life, which is more than the fate of most sinners.

One of the causes which moved Agnes Warren to perpetrate the tragedy of her existence is a common one with women—the want of ready cash, combined with an adoration for pretty clothes, and for all those other appurtenances dear to the feminine heart. The other incentive was not so ordinary—it was passionate devotion to her husband! To keep his love unsullied by petty monetary squabbles; to save him from the worry of a bank overdraft, with which there was no hope of catching up; to hold on by fair means or foul to the wonderful beauty which had come to these two, shedding its lustre over the days and nights of their life together—this chiefly was the motive for her crime. It was not altogether an ignoble one, though for the vanity and extravagance which paved the road and made such an incentive necessary there is no excuse.

II.

Unfortunately, when Agnes Warren found herself in difficulties there was no rich relation to whom she could turn for help. Her father was a struggling country parson, often denying himself the necessities of life that he might send a few pounds to his children—assistance from that quarter was out of the question. The husband was a captain in the Scinde Rifles, doing his best to live on his pay and a private income of £105 a year. Agnes's long attack of enteric the previous autumn had been a severe drain on their resources. The regimental doctor's capabilities had not been considered equal to the occasion, and because, to Charlie Warren, this woman was the orb of existence, he had, during that desperate illness, telegraphed recklessly for the most renowned consultants, and had 'damned the consequences'; and though, like a desert mirage, had vanished the small savings assiduously collected for the next leave, he had insisted, as soon as Agnes was convalescent, on a trip home. 'Never mind,' he had said, 'if it puts me in debt for the rest of my life, home you go!'

Macgrigor and Co. were instructed to place to her credit, while she was in England, all of his pay except the few rupees necessary every month to meet mess expenses, and during her absence, all through the hot weather, Charlie Warren drank soda water, and conquered altogether his passion for cigarettes.

Judging by cases reported in the law courts, Agnes was not a wildly extravagant woman, but in London, which, in an inexpensive little club, she made her headquarters, she swam out of her depth. Old Simla acquaintances hailed her with joy. They introduced her to their friends. In the Cavalry Club, a middle-aged and entirely respectable married man was heard to remark that Agnes Warren that season was the most fascinating woman in London. That was lavish praise, for London boasts of possessing the most

charming women in the world. Many declared her lovely; all apparently found her attractive. What Agnes herself was unable to find was the adequacy of her husband's pay, doled out monthly by Macgrigor and Co., to keep pace with her wants.

A fortnight before she sailed back to Charlie she was sitting miserably in her tiny room at the club, engaged in adding up the sum-total of the formidable pile of bills which lay on her knee. In those good old days shops were much more generous as regards credit than they are to-day. As an officer's wife and a member of a highly respectable club Agnes, in this matter, had found no difficulties. When, on this afternoon, she had finished her calculation, she lay back in her chair—appalled. After paying the passage-money, and drawing up to the last penny in the bank, there remained a total debt of two hundred and thirty pounds. Carefully, every chance of raising such a sum was mentally scrutinised. Her father, as we have said before, was out of the question—to mention such a monstrous debt to the beloved husband even more impossible. There remained, of course, plenty of friends, men who had taken her to Ascot and Henley, several of them well endowed with this world's goods. But Agnes, though young, perhaps vain, and, as most will agree, foolish, was no babe in mundane matters. She realised that on this planet a woman has to repay in cash—or otherwise—for any loans from stray male friends. That notion of raising the wind was at once repudiated—to place herself in such an invidious position was totally foreign to her nature.

Outside, in the street, a miserable autumn drizzle added to her gloom. Slipping on a mackintosh, Agnes went out into the rain, to try to walk away from her worry.

III.

Turning out of Dover Street, she crossed St James's Park, and was loitering down Buckingham Gate, when a small crowd at the door of one of the houses there attracted her attention. On the iron railings which guard those houses was a large placard announcing an auction sale, then in progress. 'By order of Executors,' she read. 'Furniture, fire-arms, India curios, &c.'; and because she had nothing better to do, and ugly thoughts needed dispersal, she turned in to have a look at the Indian curios.

It was in the smoking-room of that Buckingham Gate house that the inspiration came to Agnes Warren which carried her away.

The late lamented, whose assets executors were busy liquidating, must have been a considerable sportsman, for the back room in this house was a small armoury. Every conceivable weapon needed for the slaughter of both big and little game was there. One case of rifles

caught Agnes's eye, and held it. Within the glass doors of a fine mahogany case were six perfect little .256 Mannlichers. Engraved on tiny silver plates, let into the stocks of each, were the initials G. J. B.

Agnes Warren stood in front of that case for fully ten minutes, her eyes glistening, her face paling. In those ten minutes the decision was made which was to bring fifteen years of bitter remorse.

Joining the small crowd in an adjoining room, she listened to the bidding. Everything seemed to be going for an old song, as indeed in those far-off days, at auction sales, they often did, and for the sum of three pounds ten shillings each, with five hundred cartridges thrown in, Agnes eventually became the possessor of the six Mannlicher rifles.

There was generally, in those years, a four-wheeler, with an old gray mare, and a still more ancient white-bearded jehu, standing on the Buckingham Gate rank. Very shortly the taxi was to send the aged quadruped and her master to oblivion, but that particular day they both dozed in their accustomed place. Struggling under the weight of the rifles, Agnes hailed the driver, and returned to her club.

At the bottom of a vast Noah's ark trunk, which had been dug out of the parsonage attic for her trousseau when she had first gone out to India, carefully she packed the rifles. Laboriously, one by one, each cartridge was wrapped in paper, and stowed tightly in between and around the Mannlichers. Then Agnes procured a large sheet of cardboard, cut it exactly the size of the trunk, and covered it with the faded linen lining, which she had removed from the bottom of the ark. On the top of this were placed all her heavy boots and shoes, the long riding-habit, and marching brogues. The club porters staggered under its weight on the day she sailed, but the 'Customs' in Bombay passed it without the slightest suspicion.

IV.

'Salaam, mem-sahib,' said old One Eye, a broad grin on his pock-marked face.

'Salaam-gi,' replied Agnes, sitting idly on her veranda.

'Me have much nice things to show you, mem-sahib. Me keep all good things till mem-sahib come back!' He signalled to his coolies, squatting at the compound gate, and they came, depositing several fat bundles on the floor. Then they retired again to the shade of the entrance pillars, and putting their hookah on the ground, prepared to pass the pleasant hours it usually took their master to complete a bargain at this establishment.

Old One Eye unfastened his bundles, and one after another held up enticing pieces of embroidery, all being, according to him, 'Ver cheap.' Yet he failed to interest the mem-sahib,

who wore an air of abstraction. Old One Eye redoubled his efforts—still she sat listlessly in her chair, apparently uninterested. Finally Agnes rose, and moving first to one door and then to the other of the two rooms which opened on to the veranda, she peeped through the 'chics.' The rooms were empty. The servants had all gone to the midday *kana*. She and One Eye were alone!

Coming back to the Pathan, she stooped towards him. 'One Eye,' she said quietly, 'to-day I do not wish to buy. I want to sell you something instead. Come this way.'

She led the way into her bedroom, where stood the Noah's ark. Then, with a furtive glance round, she locked the door which behind gave exit to the servants' quarters, and the one opening to the veranda. 'One Eye,' she said, 'I have rifles to sell!'

The Asiatic's emotions are never written on his face for all the world to see. This man's evilly-marked face showed no astonishment whatever as with trembling fingers Agnes Warren unlocked the old-fashioned trunk. Only when, from its depths, she produced a perfect little rifle and laid it in the Pathan's hands did old One Eye's remaining optic glisten slightly, as if a tear-drop had come and gone in it. 'Mem-sahib,' he said huskily, 'you know the penalty!'

Agnes nodded. 'I am prepared,' she answered, 'to take the risk. There are six of these Mannlichers, and I want two hundred and forty pounds for them. Give me the money, One Eye—no one will ever be the wiser—and over the frontier you can get sixty pounds apiece for them—you know you can!'

'But, mem-sahib,' he bargained, 'these rifles no good! No ammunition! Ammunition we steal from soldiers no fit this kind. Not easy to pinch this sort from sahib-logs.'

'I know,' said Agnes; 'but there are also five hundred Mannlicher cartridges—for nothing. Don't waste time, One Eye!'

The Pathan opened the bedroom door and disappeared. In a few moments, however, he returned with a roll of Kashmir *durries*, and one by one each *durrie* became a fatter roll than it had been when he brought it into the room. For once in his life old One Eye did not bargain—expediency was important.

Agnes knelt still, with a strained white face, by the side of the Noah's ark. Squatting beside her, the Pathan removed his turban. From its depths he produced a roll of notes; then, replacing his headgear on his oily locks, and fumbling in his voluminous garments, he produced yet more money; and presently, after much licking of fingers, two hundred and forty pounds passed from his possession to Agnes Warren's trembling hands.

'The penalty,' he whispered, 'for me, mem-sahib, is death or deportation. For you, I know not!'

'The reward, One Eye,' said Agnes, smiling wanly, 'is worth the risk.'

Within the next few seconds the Pathan was back squatting on the veranda, rolling up his merchandise, just as Charlie Warren cantered in at the compound gate.

'Salaam, mem-sahib,' said old One Eye. 'Another day, perhaps, we do bizniz.—Salaam, sahib,' he added, as Charlie Warren, within hearing of the last remark, threw himself off at the door. 'Mem-sahib say she got no rupees to-day. Another day, perhaps, old One Eye got better luck.'

'Get out,' said the mem-sahib's husband.

'Your honour,' replied the Pathan, 'I go, and I shall ever pray for your honour's welfare. May the great god, a gentleman your honour much resembles, bequeath you good luck!'

Signalling to his coolies, and salaaming again gravely, old One Eye walked off with his bundles.

Exactly ten days later, over the border, where the king's writ does not run, a group of Mahsuds sat round a camp fire handling affectionately the six Mannlicher rifles from the house in Buckingham Gate—and old One Eye's smile as he squatted on various verandas was more evilly genial than ever.

v.

'Sorry, old man,' said the colonel, 'but I am afraid you are for it! I know you were contemplating leave in Kashmir. This order distinctly says my "senior captain." You occupy that enviable position, and, anyhow, there is no one else available at the moment.'

Charlie Warren looked crestfallen. The trip to Kashmir had been looked forward to for months, and now, instead of floating about in ecstatic matrimonial happiness in a house-boat on the lily-swept waters of the Wolav Lake, he was ordered to go and grill all through the hot weather in some God-forsaken outpost beyond Dera.

'Kismet,' he remarked, smiling grimly. 'But why can't those sanguinary Mahsuds kick over the traces in the autumn instead of always at the beginning of the hot weather, just when one wants to go on leave?'

'Heaven knows!' said the colonel; 'they are an infernal nuisance, and I am very sorry, old chap.'

So, instead of fishing for 'mashir' off the banks of iris-clad rivers, Charlie Warren, one steaming May morning, marched out of Dera Ismail Khan, and Agnes settled herself into Pelite's Hotel in Simla for the hot weather.

It was not until late in August that one Saturday afternoon, returning from a gymkhana at Annandale, Agnes Warren was met on the hotel doorstep by one of the chief's A.D.C.'s. She was a favourite of this gallant old man,

who, with his usual consideration, had sent a kindly note, as well as the telegram which the aide-de-camp handed to her.

The telegram was terse and simple: 'Patrol surprised while mending telephone wire. Regret to report death from wounds of Captain Charles Warren, Scinde Rifles, in charge of patrol.'

A few days later came a letter from the officer commanding that particular portion of our outposts.

'Dear Mrs Warren,' he wrote, 'to-day I have had the sad task of packing and despatching to you your husband's personal belongings. Charlie Warren was one in a thousand; in the ranks of *men* his loss will make a big blank. Yet I cannot blame myself for the awful catastrophe—every precaution was taken.'

'On the 4th instant the telephone line between Posts 7 and 8 ceased to operate. None of the Mahsuds had been seen for many days, but, taking no risks, I sent thirty men with Captain Warren to ascertain the cause of the breakdown.'

'About five miles to the west of Post 7 the wire was found cut. While the sappers were repairing damages, a single shot was fired from some rocks on a hill to the north. Poor Warren received it in his throat. The patrol replied with a volley towards the spot whence the sound came; then, leaving the captain with two resaldars, they charged up the hill to the rocks. Behind one of them, hit apparently by a ricochet shot from the volley fired, they found a wounded hillman. Needless to tell you, he died speedily. The mystifying thing about the affair is that this Mahsud was in possession of a perfectly new type of Mannlicher rifle, let into the stock of which was a tiny silver plate, on which were engraved the initials "G. J. B." How these fellows get hold of such good material is a conundrum, and where the ammunition for these rifles comes from, even more mysterious.'

'We have, alas! a little cemetery here, the graves of which are handed over to the care of each succeeding C.O., and are beautifully kept. Charlie Warren lies there, and his grave is already planted with flowers. Believe me, Your sorrowing and sympathetic friend,

'W. L. (Col.).'

vi.

Midnight had struck, and in the long wards of the base hospital the green-shaded electric lights cast weird shadows on the faces of suffering and dying humanity.

Here and there in the dim light flitted the form of a nurse. Even on the lips of those who were shortly to start on the great adventure there was a faint smile as Sister Agnes bent over them, for this worn, gray-haired woman with the sad eyes had retained in middle age the charm which had been so remarkable in her youth. It was simple to see that in this hospital she was greatly loved, though of her

beauty no trace remained. Fifteen years of remorse and two of seeing hell are not beauty restoratives.

Outside except for the boom of distant guns, all was silent. No newcomers disturbed the night's repose, for the offensive of previous days had filled this hospital to overflowing, and the stream of mangled men which had poured in during the past forty-eight hours had been diverted elsewhere. Suddenly a sound, which was certainly not that of a distant gun, broke the outside silence. Nurse Agnes moved quietly to the curtained window and looked out. Again the same noise shook the earth—this time nearer. Another woman, who had been busy in the adjacent medicine-room, joined Sister Agnes, and together their tired faces strained out into the dark.

'What is it?' asked the newcomer.

'Bombs,' answered Sister Agnes, whose ear, after two years in the heart of war, had been tuned to every variation of music; 'and not a man fit to move! But I order you to the dug-out, Cecily.'

'I can't leave,' began Cecily, but Nurse Agnes put her hand over her mouth.

'I order,' she said simply. 'Go!'

Drawing the curtain hurriedly, she whisked off the electric light, and, as Cecily moved to the door, gave her hand a sympathetic squeeze.

The next explosion rocked the hospital.

In a bed, next the window where Sister Agnes stood, a small fair boy was lying. A few hours previously the P.M.O. had ventured to bet that this lad would now pull through. Only that day, too, in a period of consciousness, this sub. had babbled to Sister Agnes of his home. An only child, he had told her. 'And what a stew,' he had said, 'will the poor old folk be in over me.' Again, now, he was unconscious.

Quietly Agnes Warren laid her slim form on his bed; and then, very gently, so that the weight of even her worn frame could do no further damage to his wounds, she covered the unconscious boy's body with her own. And so she waited. . . .

When they cleared up the mess and the corpses next morning, they found the fair boy still unconscious, but with a pulse going strong, and the piece of shell which had broken the vertebrae of the spine still deeply embedded in the neck of the dead woman who lay on the top of him.

In that book, where in our youthful days we were told are recorded all our deeds, both good and evil, which side, we wonder, for Agnes Warren, will hold the balance? Who are we that we can judge?

THE PLANTAIN TREE AND FRUIT.

By F. J. L. MURE.

THE plantain is a distinct species from the banana, although there is a particular type of banana which is sold in fruiterers' shops in the United Kingdom under the misnomer of plantain.

The plantain tree is a tropical plant, originating, it is reputed, from the East, but at the present day it is widely cultivated in all parts of the tropical world. There are many varieties of plantains, the greater number of which can be put down as being of merely academic interest.

From an industrial and commercial viewpoint there are two varieties which are most worthy of attention; one yields a coarse and large grade of fruit, measuring from 15 to 16 inches, which, from its size, is sometimes called the 'horse plantain'; and the other yields a smaller but finer grade of fruit, measuring usually from 7 to 8 inches.

Plantain is only fit for human consumption after it has been cooked—the ripe as well as the unripe fruit being used.

The ripe fruit or 'yellow plantain,' as it is sometimes called, is very nutritious and appetising, and has a sweet, buttery taste, containing, as it does, over 15·0 per cent. of sucrose and 9·0 per cent. of invert sugar, also 0·2 per cent.

fat; whilst the unripe fruit or 'green plantain,' though equally nutritious, is less digestible and appetising. It contains only mere traces of sucrose and invert sugar, but has a high starch content.

To assist in overcoming the indigestible nature of the unripe fruit it is the custom in certain parts of Africa, South America, and the West Indies, after cooking the plantain, to pound it with a pestle in a wooden mortar until it forms a mass (like glazier's putty and with a similar consistency) which is called 'foo-foo.' In this condition it is more easily digested than otherwise, forming then an excellent and sustaining vegetable side-dish.

Plantain flour or meal is made from the pulp of the unripe fruit, which is rich in starch, by first slicing, then eliminating the moisture content by thoroughly sun-drying, after which the slices are pounded to a powder before being sifted. A special coarse grade of meal peculiar to the West Indies and British Guiana, and known locally under the curious cognomen of 'Conquintay,' is made by first grating the raw pulp, which is afterwards sun-dried, the resulting dry meal being utilised as a thickening for soups and also as a porridge. It is reputed

to be highly nutritious, especially for children, but is an acquired taste.

From the fresh pulp of the fruit 40 per cent. of flour is obtainable, and the fruit from an acre will give 2500 lb. and over of this flour.

The plantain tree flourishes on soil containing a high percentage of humus, but will also grow on any soil except desert sand, providing proper attention is paid to its cultivation with efficient drainage, and the correction of irregularities in the physical condition of the soil by proper and intelligent agricultural practice.

Propagation is carried on from root cuttings (commonly called 'suckers') of old stools, and these are transplanted into square holes about 18 inches deep, which are prepared beforehand by ploughing sufficiently to ensure aeration, and, when necessary, also applying humus and pen manure.

Suckers should be planted about 12 feet apart on loamy soil, 10 feet apart on clay soil, and 15 feet apart on peat soil. The rainy season is the best time for transplanting of suckers.

It takes a full twelve-month from the date of planting for the plantain tree to bear and mature fruit, and to obtain best bearing results the usual practice is, so soon as the bunch is set, to cut off the hanging extremity known as the 'navel,' thus allowing the maximum of nourishment to go to the fruit.

The parent stool should not be allowed to have any more than three suckers at its base—preferably only two should be allowed to remain. All extra suckers above this number *must* be removed and planted elsewhere. This procedure limits the period of ratooning, as it were, up to the third year from the original plant stool.

When the bunch of plantains on the growing

tree has matured to the point commonly known as 'full,' it should be harvested and the tree cut down to within less than a foot of the base, and the most advanced of the two or three suckers of the stool takes its place in succession.

The utilisation of the fibre from the plantain tree for the purpose of making string, and also as a substitute for a slightly inferior grade of Manila hemp, offers remunerative possibilities on a large scale; besides which it is only logical to conclude that the residual portions could, along with the husks of the fruit, which has a fibre content of 10 per cent., be profitably utilised for paper-making.

In countries round about the equatorial belt the natives, during the hot season—that is, the dry (there are only two seasons, the wet or rainy and the hot or dry)—often use plantain leaves to minimise the possibility of sunstroke by poking some into their headgear, and this custom suggests to the writer the probable use of this material in the hat-making trade as padding for the make-up of pith helmets and other tropical headwear.

The plantain tree and fruit have also their value from a medicinal point of view—the unripe fruit is cooling and astringent, and in cases of diarrhoea and dysentery is often used by the natives in the tropics with beneficial results when roasted and eaten; the young leaves are good and soothing as a covering for burns and blisters; and the root and stem are valuable in scurvy and blood diseases, including venereal diseases, being tonic and antiscorbutic.

The analysis of flour made from unripe plantains gives the following percentage composition: water, 8·2; proteids, 6·7; carbohydrates, 82·6; mineral salts, 1·8; oil or fat, 0·7.

THE MOON.

PART II.

IV.

At present there is no theory for the moon that has gained general acceptance. The old idea was that the ring-shaped craters are really volcanic craters like those on our own earth. Now, however, those who are best acquainted with our own volcanoes find that, in essential features, there is a total dissimilarity, and that theory has been generally abandoned.

Other people have suggested that the craters were formed by aerolites falling from the sky and digging themselves into the level surface, throwing up the excavated material in a ring. The shell-holes in France, during the Great War, suggested this explanation, but in many points it fails entirely.

The shape of these ring formations, with a

central cone, recalls to the minds of many people the instantaneous photographs which have been taken, with great skill and ingenuity, of a drop of water falling into a bowl of water. The ring is formed momentarily, and also the central cone.

These thoughts have led some people to experiment with splashes, as by throwing a ball of clay on the floor. This certainly does often give the required shapes. But it cannot yet be called a theory of the lunar craters.

Most theorists have dealt only with the craters. And yet, surely the white streaks that radiate from Tycho across the moon must hold the key of the problem, at least in part. They stretch across the globe straight on, like a Roman road, regardless of hill and dale, unmoved by the presence of countless craters on

the way. These are ruthlessly broken through by the terrific forces that must have been at work to produce these cracks. We are compelled to look for some great cataclysm.

There is one other theory of the moon that has often been brought forward. It has certainly not been generally accepted. But, seeing that there is as yet no accepted theory, we may devote a short time to the ice-and-snow theory.

More than once has the speculation been advanced that the moon is a ball of ice and snow. The pure whiteness of snow, the blackness of smooth ice, and the white starry cracks radiating from Tycho, are certainly suggestive. And travellers in India who have seen the full moon rising over the snow-clad Himalaya ranges have said that the equality of whiteness left them in doubt for a moment whether the moon were not a part of the snow-mountain range.

A theoretical argument has lately been put forward. The moon is supposed to have been broken away from the mass of the earth when molten. Both cooled down, but the smaller moon cooled the quicker. So now, while the earth has a moderate temperature, that of the moon must be as low as the temperature of liquid air. If it once had lakes or oceans they must now be all frozen hard and solid.

Again, we have every reason to suppose that the moon is made of the same materials as our own planet, including some water—though it is now frozen. And sound reasons have been put forward for believing that the moon had a greater percentage of water in its constitution than the earth.

The mass of the earth is composed partly of rock and metals, which are heavy, and partly of water, which is light. Now, the mean density of the moon is only half of that of the earth. Therefore, in the moon, the proportion of water must be much greater. In fact, it is easy to calculate that, if this be the sole cause of the moon's lightness, the depth of her oceans, before they froze, must have been nearly 400 miles, all over her surface.

It would seem then that, before the moon had cooled so much, the whole of its solid nucleus was immersed in water. These are some of the considerations that led to a snow-and-ice theory as a vague suggestion. It is described by Puiseux and Loewy in the volume accompanying their lunar atlas.

These writers, when describing the snow-white surfaces surrounding the poles of the moon, add these words: 'But it is also favourable to the opinion of those who consider that the poles of the moon are actually covered with ice. This opinion can be pushed even further by arguments that are plausible enough. It responds, in part, to the conditions actually realised on the earth and probably on Mars.' They go on to say that the absence of any boundary between the polar caps and the rest of the surface has led some people

to the conclusion that the north and south ice-caps are joined so as to envelop the whole globe in ice.

There is an obvious criticism of such a theory when we realise that, while during one fortnight any place on the moon is subjected to an incredibly intense cold, yet during the next fortnight it is exposed to the blazing direct heat of the sun. We ask whether this heat would not raise the temperature of the ice to melting-point, and transform the whole appearance of the moon.

There are many reasons why we could hardly expect to perceive any such changes in the lunar configurations. In a rare atmosphere (as on the Himalayas) snow does not melt into water, but evaporates in vapour, as camphor does. Then, this must be re-deposited on the mountains of the moon, as it is on the snow-peaks of the Alps. But, most important, the disappearance of any mass could not be detected by our vision unless the mass that was melted had a diameter of many miles, so that centuries might elapse before any change could be seen.

The time has now come to give vitality to this rather vague theory by describing an experiment for reproducing the appearance of lunar craters.

V.

One winter morning in the Highlands, at an altitude of 700 feet, with nearly twenty degrees of frost, a thin coating of snow, a quarter of an inch deep, was seen to cover a flat board that lay on the lawn. A snowball was made and thrown down with great force upon the board. What was the result? The snowball broke up, and scattered radially over the board, sweeping the snow outwards to form a rampart, a ring-shaped steep ridge of irregular height. The floor was swept clean, and the remnants of the snowball were piled into a cone in the middle. The resemblance to a normal lunar crater was perfect.

The experiment was repeated under different conditions. By breathing on the snowball during its making it was made as hard as ice. Then it could be thrown obliquely. Again, the thickness of snow lying on the board could be varied. These variations in the experiment produced new effects, and it was soon apparent that almost every type of lunar crater could be reproduced in this manner. If the snow were thick we reached the final phase where there was no scattering, only a hole in the snow, as we see on the moon in some regions near Tycho.

The experiment was interesting enough, but seemed to have no bearing upon the constitution of the moon. For how could we conceive that such mountainous snowballs could ever have fallen upon the lunar surface? Then, unexpectedly, a wonderful connection seemed to be possible between the lunar craters and the white streaks or cracks radiating from Tycho.

If the ice-theory deserves any attention, then

surely these radiating cracks must indicate some catastrophe by which the ice-crust of the moon was fractured in the star-figure always assumed by cracked ice.

The explanation arose from considering the physical conditions following increasing cold upon the moon, a solid nucleus enclosed and submerged in an ocean hundreds of miles in depth.

When the temperature fell, the whole surface would become covered with a shell of ice. This shell would gradually thicken to a depth of 10, 20, or 100 miles, or more, by the freezing of additional layers of ice on the inside of the shell.

Now, we all know that water expands in freezing. If, then, inside the shell, a new layer of ice is added by freezing, it expands. This must either burst the shell or compress the remaining water. In the earlier stages the shell would give way at the thinner regions near the hotter equator, and it is possible that these overflows might spread into large round seas before being again congealed. It is not impossible that the black regions of the moon were thus formed of smooth ice.

After the shell has thickened perhaps to a depth of 100 miles or more, it may be able to resist the enormous hydrostatic pressure that is exerted inside of it.

Finally, however, the accumulating water-pressure becomes insupportable. Then comes the cataclysm. The ice-cover gives way at its weakest point. This happened to be where now we have the crater Tycho.

The overwhelming pressure bursts the shell at that point, and cracks the whole shell in star-shaped streaks, extending over half the globe. A large part of the contained water, oceans of it, are shot up, it may be thousands of miles, to the sky. Released from the pressure, it all freezes instantaneously in masses that vary from the size of a raindrop to the size of a mountain; and they fall back on the ice-surface of the moon. Nearly half the globe is by that time covered with a snow layer, thick near Tycho, thinner farther away. And upon this coating of snow fall mounds and hills and mountains of frozen water, gigantic snowballs, falling upon the snow-covered, smooth surface, and repeating upon a gigantic scale the snow-splash of the experiment already described, producing all the various shapes of lunar craters.

As a result we see in a powerful telescope, or in the best lunar photographs, that the crater formations over half of the visible hemisphere, most numerous near Tycho, encroach on each other, and blot out those that had been first formed. And again near Tycho, where the snow is thickest, some of these great snowballs have simply buried themselves in the snow, leaving visible nothing but deep holes.

Meanwhile the water which was left inside,

having been relieved from the great pressure, instantaneously freezes; and our moon remains permanently as a solid globe of ice containing a rocky nucleus; covered with snow over a great part; dotted all over with craters, with pit-holes in the snow, and with great black seas of virgin ice; and, through it all, the star-shaped cracks radiating from Tycho, filled up almost to the edges with white ice, upon which, at full moon, the sun shines, and reveals to us those white streaks that have been a puzzle.

The records of Arctic travellers, and of Himalayan explorers in a rare atmosphere, concerning the surprising phenomena displayed by ice-formations on a large scale, give an assurance that there is probably no lunar feature that is not reproducible in an ice-world. Most certainly the curious 'rills' seen near the centre of the moon beside the crater Triesnecker are reproduced by the expansions and contractions of ice during great fluctuations of temperature on large frozen lakes in the north.

VI.

It seemed desirable, in view of this novel speculation, to make a test on a small scale, to see whether a globe of water frozen from the surface inwards would give rise to an explosion like that at Tycho.

With the kind help of the late Sir James Dewar an india-rubber balloon was filled with water and immersed in the intense cold of a bath of liquid air. This gave the required condition of freezing from the outside. The result was that, after three minutes, there was an audible 'pop,' as if the shell had burst. The india-rubber covering prevented any jet of frozen water from issuing. On removing the now solid ball, and breaking it up, it was found to be completely frozen to the centre. The experiment seemed to support the argument that an explosion like that at Tycho was inevitable.

James Nasmyth, of steam-hammer fame, produced somewhat similar appearances on a glass globe by filling it with cold water, closing it up, and plunging it into warm water. This causes the enclosed cold water to expand very slowly, and the globe eventually bursts, its weakest point giving way and forming a centre of radiating cracks similar to the fissures in the moon—Tycho's streaks.

And now the dream is over. We have allowed ourselves the pleasure of a speculative romance. Let no reader suppose that we have proved our case. A case has been stated for consideration of judge and jury, that is all. But the evidence must be sifted and examined far more minutely before it can be said that the ice-and-snow theory of the moon ought to be accepted.

Such speculations and guesses serve a useful purpose if they increase the interest with which you and I examine the remarkable features of the lunar surface. Still, after what has been

said, a serious examination of De la Rue's most beautiful stereoscopic picture of the moon, as supplied by Messrs Beck of Cornhill, will be a new pleasure. For the impression becomes almost irresistible that, suspended in front of

you, is a ball of ice, sprinkled with snow over some areas, with others left uncovered, dark, and that it has been cracked by a blow or otherwise at the point where Tycho lies.

THE END.

A GIPSY OF THE NORTH.

CHAPTER XX.—*continued.*

AS they paddled towards the blackened shore the wind veered still more, and when they landed was blowing from a different quarter, carrying away with it the odour of still smouldering timber and grass. There was nothing to fear now. Not until Nature's recuperative power had reclothed this blackened land would fire be able to march across it afresh. And with the first rain the recuperative forces would become active. Living shoots of green would start out of the blackness. Next spring the fireweed would flame, and other flowers would splash their colour on the blackened land. Seeds dormant in the earth would quicken to life. Winds and wandering birds would bring other seeds, and young trees would spring among the gaunt blackened relics that now made the sides of the valley so stark. Rabbits would flourish in the young green herbage, and, multiplying exceedingly, would attract the lynxes and the foxes, and so life would increase where black destruction now prevailed—but twenty, thirty, forty years would not replace the timber that one man's puny hand had destroyed in the hours of a single day and night.

All this flashed in Carwyke's mind as he stamped out the smouldering grass and once more made a camp, of which there was great need, for the excitement and the rough handling he had suffered had tried Eskimo Billy sorely, and brought with it a slight recrudescence of fever, which made his friends anxious on his behalf.

Having made him as comfortable as was possible, the lovers walked a little way up the still smoking hillside to get a better view of the desolation wrought, and suddenly the girl spoke. 'That man's hate must be dreadful to do a thing like this.'

'Pretty ruthless, for sure! But I imagine this is the last stroke, a desperate one enough, since it must have been aimed at our lives.'

'You think so, Roy?'

'What else but a sheer desire to destroy us will account for it?'

'He may have wanted just to drive us from the camp, and have waited for us down-river.'

Her lover nodded thoughtfully. 'That is possible. Maybe he had prepared some precious ambush in which he hoped to trap us if we drove hastily down the river, though what he could do I can't guess. It is not as if he had a rifle.'

'I wonder where he is now?'

'I don't know. If he stayed anywhere at the back of the fire he'll be in a tight corner presently, for this change of wind will probably drive the smouldering fire into the untouched woods, whilst if he's given us up, and is travelling southward on the raft, he may be caught in his own fire-trap. Look there!' They had reached a height on the hill which gave them a view of the country to the south. Everywhere stood the fire-blackened sticks, and some miles away the view was curtailed by a great pall of smoke. 'That means the fire is travelling south along the main river. There's no saying where it will end. The fire runs among the roots and the dead stuff on the ground. It will smoulder there for weeks almost invisibly, and under the fan of the wind break into open flame and destroy miles of timber. Standifer didn't quite understand the game he was playing. He may be roasting now, as he deserves.'

Norma said nothing in reply, and after a moment Carwyke spoke again. 'We will stay here a couple of days or three, and let Billy recover from the shock of this hurried removal; then we will start again for the south.'

'Yes,' acquiesced the girl, 'and, waiting, we shall lose that dreadful man altogether, perhaps.'

Carwyke laughed harshly. 'I'm not sure I want to if he's still alive. I should like to meet him just once more.'

The girl did not inquire why. There was a grimness in his tones that told of a stern purpose behind them, and in her heart she prayed that such a meeting might never be. But things were fated otherwise.

On the morning of the third day, their departure having been postponed until the fourth, Carwyke went over the hill in the hope of finding game. The valley beyond was green and untouched by fire, which, roaring across the land, will sometimes cut a clean swathe, leaving the timber on each side unscathed. He had been absent perhaps a couple of hours, and had bagged nothing but a couple of brace of ptarmigan, when some unreasoning idea that all was not well at the camp turned his feet that way.

He laughed at the foreboding, but nevertheless hurried, and had just reached the crest of the hill with the farther end of the lake coming into view, when he was unutterably startled by

the crack of a rifle. At the point where he was it sounded thin and far away, but he knew that it must come from the camp, which still lay outside his view.

His unreasoning fear became a distinct apprehensiveness, and as a despairing cry reached him he began to run madly. The camp lifted to view, and what he saw there drove him to distraction. On the edge of the camp, struggling with a man, was Norma. Apparently the thing for which they struggled was a rifle, for whilst he ran, Carwyke saw that weapon twisted from the girl's hands. A second later the attacker struck her with the butt, and she fell and lay still. The aggressor, whom he could not recognise, but who, he knew, must be Standifer, stooped, appeared to examine the girl, and then, flinging her over his shoulder, began to walk towards the outfall of the lake. Looking more closely, Carwyke saw that the canoe was no longer on the shore by the camp, and instantly divined that the raider must have taken it to the foot of the cataract, in the direction of which he was now carrying the girl.

He altered his course so as to intercept him. Standifer must have been very sure that he was safe from interference, for he made no hurry; and Carwyke, running silently across the burned land, and half hidden among the black gauntness of the stark trunks, steadily gained on him. He had less than two hundred yards to go when his foot caught a burned stump, and as he shot forward the rifle in his hand was discharged, awaking the echoes. Instantly the raider swung round, caught sight of his pursuer as he picked himself up, and then, with the girl over his shoulder, began to run. Carwyke did not wait to recover his rifle, but, a blackened figure of vengeance, ran on, making for the point where the waters of the lake ran free in the cataract, for there was the canoe as well as Norma to think of. He was still a score of yards from that point, when Standifer, realising that he had lost the race, dropped the girl, and with a shout fell on one knee, with the rifle at his shoulder. A second later the shot rang out and Carwyke heard the bullet whine by him two yards away. Still he ran on, conscious that Standifer was struggling with the ejector. He heard the click of the bolt as the fresh shell shot into the chamber, and quick as lightning, as once more Standifer sighted, he threw himself upon the blackened turf. The bullet sang over him, and whilst he still heard its drone, he leaped to his feet and ran forward. Standifer straightened himself, and with a snarl struck with the clubbed rifle as the other leaped. The blow caught Carwyke on the shoulder, but it did not stop his rush, and a second later the two were locked in the embrace that for one of them meant death.

Standifer's smoke-blackened face was twisted in maniacal fury. His eyes were the eyes of a madman, and he snarled like a vicious dog as

his hands sought the other's throat. Carwyke fought grimly, soundlessly, and with a definite purpose in his mind drove the other back towards the lip of the outfall. For a minute they wrestled, without Standifer divining the other's purpose, but with the near crash of the falling water in his ears realisation must have come to him. Forgetting his own objective, he now strove to break his antagonist's hold, but could not. He tore with his nails at the hands that held him, and the next moment banged the lowered head of the other in the endeavour to release himself. Then, quite suddenly, he was lifted from his feet and flung backward. As he went a scream broke from him, but was cut short by the engulfing waters.

Carwyke, for perhaps three seconds, stared at the cataract, saw an arm lifted, the outline of a dark body as it rolled in the broken waters, and finally, gasping and almost spent, staggered down the declivity to the foot of the cataract. Keeping his eyes upon the waters he almost stumbled over the canoe, beached on the dry sand ready for launching, and, as he did so, knew how near to success his enemy had been. At the foot of the cataract something dark swirled in the whirlpool made by the descending waters. He watched it like a man hypnotised for a minute, saw it thrown out of the whirl and begin to drift down the creek, then slowly sink out of sight. He waited. It did not reappear, and, after five minutes had gone, he turned and began to ascend to the level of the lake, assured that Standifer would trouble neither Norma nor himself any more.

When he reached the top of the incline Norma had raised herself on her hands and was staring wildly round. A little cry of fear escaped her as her eyes fell on his ash-blackened form, but a second after she recognised him, and next moment was sobbing and quivering in his arms. He soothed her as best he knew how, and when she was quieter, asked abruptly, 'How did it happen?'

'I don't know; I can't tell exactly. When you had gone a flock of geese settled on the lake a mile away. Billy was sleeping, so I took the rifle and went after them, thinking I might get one. I lay for quite a long time in the hollow made by a stream that comes down from the hill, hoping they would come near enough for a safe shot. Something disturbed them and they flew away, and I walked slowly back to the camp. When I reached it I missed the canoe, and looked round towards Billy, meaning to ask him what had happened; but just as I did so Standifer rose up from behind that tangle of burned trees behind the camp. His face was all blackened, but I knew him instantly. "Good morning, Norma," he said. "This is a pleasant meeting." I was dumb, and shaken by sudden fear; then I remembered the rifle, and threw back the safety-catch. He must have

guessed that I was desperate, for he leaped before I could raise the rifle properly, and as he seized it I must have pulled the trigger. I cried out to Billy, and we struggled for the rifle. He wrenched it from me, and hit me——'

'I saw him. I know the rest!'

'W-where is he?' asked Norma, looking back.

'Dead! At the bottom of the river, where he deserves to be.'

The girl offered no comment, and together they moved towards the camp, fears for their friend hastening their steps. When they reached the place where the sick man lay they saw that his head was covered with a blanket, and that he was quite still. Sick with apprehension, Carwyke stooped and snatched the blanket away. Billy's eyes were closed, and there was a large bruise over one temple where a heavy blow had manifestly been dealt. Carwyke dropped on his knees, tore open the unconscious man's tunic, placed a hand over his heart, and then gave a shout of gladness.

'He lives?' asked the girl tremulously.

'Yes, and will! I know Billy by this. It would take more than a knock on the head to put him off the pay-roll, as he would say. Get me some water. Quick, dear!'

Half-an-hour later Billy, propped up on a sack of beans, declared that he knew nothing of what had happened. 'I mus' hev been sound asleep,' he averred.

'A good thing too,' commented Carwyke. 'That blackguard would surely have killed you if he had found you awake.'

'But how did he come here?'

'He must have waited for us, and then as we didn't appear have worked backward to the camp on the creek, perhaps expecting to find our bones. When he didn't find them it would be an easy guess that we had run in front of the fire up-river, and I suppose he must have tramped after us, and have been watching for the opportunity which came to him when I left the camp.'

'Yep. I guess that's ther story. An' now he's done for?'

'Yes.'

'An' all his devilry ended?'

'I suppose so.'

'A good thing too. He was a bad citizen—thet one.'

'If I only knew what had led him into all this devilry as you call it, I should be more satisfied in my mind, Billy.'

Billy moved impulsively as if he were going to say something, then he laughed, and after a moment said, 'I wouldn't worry about thet just now. Mebbe yo'll find out one o' these days.'

'I haven't much hope!'

'No! Well, what's it matter, Mista Carwyke? We've got Missy safe, an' ther road south is clear before us.'

'Yes, thank God!'

CHAPTER XXI.—A WEDDING GIFT.

IT was fully two months later when the knowledge that Carwyke had desired about Standifer's motive was granted to him, and it was given in the crowning hour of his life. Trail-worn and weary, having paddled hundreds of miles and made two difficult traverses, they at last reached the Altana River, where Carwyke was in waters that he knew. Down this they made their way to the Koyukuk and to the native village above which in those days the gilded cross of the mission of St John-in-the-Wilderness lifted itself. There they rested before resuming the trail down the Koyukuk itself, and on the second day a great hooting on the river hurried them quickly to the bank, where they saw a gasolene launch making for the landing.

'Who comes here?' asked Carwyke of the trader who had made them welcome.

'I guess it's the Mission parson who wanders round these parts. If you an' your gal want to get hitched, he's the man who'll do it for the pleasure of doin' it. He's sure great on weddin's, he is. The way he insists on the Kobuks an' the Koyukuks being hitched accordin' to gospel-rites is fair amazing, an' if he ain't tied up a white couple in this location yet, it's jest because none ain't givin' him the chance. I'll bet a dollar he'd fair jump with joy if——'

Carwyke looked at Norma. Her face was rosy, but laughter danced in her eyes, and behind him he heard Billy's chuckling accents.

'Say when, Mista Carwyke. Here's the happy day knockin' at ther door, an' I'm fair wore out with being a chappyrone. I ain't cut out for ther part. Besides, I've a weddin' present in me pouch thet's wearin' out faster than I like.'

Carwyke laughed and looked at Norma. 'Shall we?' he whispered.

Her flush and the light in her eyes answered him. And so it came about that the athletic missionary, whose archdeaconry runs the length of the Great Yukon and its tributaries, married them with all proper ceremony, with a crowd of Kobuks and Allakekets for spectators and the trader and Billy for witnesses.

When the ceremony had ended, and the missionary was busy christening the babies born since his last visit, Norma turned to the ex-whaler. 'And now, Billy, that wedding-present.'

Billy thrust a hand into his Eskimo breeches and drew forth a piece of newspaper, tattered at the edges and worn at the foldings.

'What's the joke?' asked Carwyke, looking with puzzled eyes from one smilingly excited face to the other.

'No joke,' said Eskimo Billy, with a chuckle. 'Better open it out an' read. Mebbe thet's ther quickest way, boy.'

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THIS is London's year. With the exhibition at Wembley for a special enticement, added to the older and mellow abundance, the greatest and finest city of the present civilisation is calling, insistently calling, and the world is coming. He will hardly be supposed to be living, to be making a success of himself, and to be doing the plain and proper thing who, if his means and circumstances permit, does not pack up and come to London in her prideful year. While people from Iceland and Ecuador, from Alaska high north and Patagonia low down south, from Japan that earthquakes do not daunt, and even from queer places in the Sahara desert, all in their diversity answer to the call of London, there are ponderous sections of the human race bearing towards this capital of empire from parts that feel for it an intimacy. Thus we are assured that, in excess of the normal number of visitors from Australia, there will be forty thousand beating all that long journey up the globe; while America feels that this is in some measure a celebration for herself, and, acting accordingly, despatches by arrangement some three hundred thousand of her people to our chief city. Never have so many Americans come to London before, and it is pleasant to reflect that they arrive just when the spending capacity and disposition of the children of freedom are at their best. Observers of conditions and tendencies suggest that after this year the Americans will hold their pockets more tightly when abroad; and some of us might have thought that the new order of discrimination and carefulness had already been given an informal and hesitating start, because not only in London but in several parts of Europe during the last year we have observed a disposition of the American not so much to count the cost—for, whatever it may be, that matters nothing to him now—but to consider the exactness of the charges levied against him, and their fairness, and to offer some criticisms and even refusals. He suspects, not without reason, and not without provocation against him, that in some foreign places an advantage has been taken of him, and, with natural pride for his famous acuteness in business affairs, he endeavours to practise a new parsimony. We have found him

haggling over trifles, even complaining of hotel charges that were no more than half of what America exacts from foreign visitors, and he seems not like his better self when he makes a show of this skinflint's part. London, who, for the country, has paid him what she owes as no other has, and can look him very squarely in the face, is also juster than any foreign city. Here is value for him, and it is in an honest way of business that we anticipate with pleasure the spending in Britain this year of between forty and fifty million pounds by these American visitors, which is quoted to us as the sum they have brought for the purpose. Each American, it is said, will drop an average of £175 into the sagging pockets of the British people. The mart is elegant enough for such prodigality. Not for ten years, long and thin as they have been, has London looked fairer than she seemeth now. Her streets are freshly garnished, and in some of them new and splendid buildings have arisen which, if they somewhat lessen that rare mellowness of old and simple fashion which has been one of the peculiar charms of London, yet make it plain that if there must be a new world of smart progress, the old town will make her bid. Smart is the word, and while one may care little for the attitude in general, London decidedly is smarter than ever before. Nervier, too; she begins to jig and jump. The Americans will award approval, against which an old Londoner might inwardly dissent, to the amazing medley of electric sky signs presented by night in Piccadilly Circus and its purlieus. Broadway itself was never more whimsically smart in this manner than is the west end of London now, with its electric rockets spouting coloured stars, the bull-pup wagging its tail in enjoyment of the cigarettes it smokes, its railway trains whose wheels revolve with increasing speed when the signal falls, the flying motor-cars, the baby crying for milk, the mixing of the cocktail, the full news of day and night passing in a lettered procession over one of the topmost roofs, and many other strange devices that call us at every glance away from talk or contemplation to the advertisement that quickens commerce.

* * *

In material things and enterprise London in these days is very smart. So may be her ladies,

too; but, in the human way, London regrets that her men do not present themselves more smartly in their dress to these guests of theirs, who, considering careful dressing as an affair of efficiency and business, are decidedly the smartest people in all the world. A keen memory concerning American men in their own country, in the big cities like New York, Chicago, and Boston, is of the trim and ironed neatness, the flat and polished squareness, and the taste and goodness too, of the American business man's attire when he turns himself out for work or play; and, if desirable, he renews the polish at intervals during the day. In New York one may step from the side-walk into an establishment where, with a thin dressing-gown for cooling and covering, one may read the paper while the suit of present wearing is being pressed. In some unaccountable way London men have not properly recovered from the negligence in dress that, with such good excuse, they practised in the war-time. They scarcely match their smartening town. From nearly every other habit and custom of the hard four years there has been a firm reaction, but not from this. The excuse of reduced means, plausible as it may be, is not enough; nice clothes, worn at their best, as everybody knows, make a man feel better, and urge him on. Only one of peculiar temperament and strength can live, act, and think higher than his clothes when he is out in the world and amid the crowd in daytime. There is a physical and mental value in male dress conventions that no other social forms promote in like degree. An Englishman, owing nothing to any man, can look straight at the world with a bolder air, and an active optimism along with it, when wearing good clothes, well kept and applied, than at any other time. But a large proportion of London men seem to cling beyond all reason to shabby garments. They have made a stupid fashion of it. One may see a personage stalking unashamed through St James's in things his butler would not thank him for. A man used to be particular how he showed himself at his club among his friends; now he scarcely cares, but resorts for his conscience to the pale excuse that all know how really good he is. There is not only shabbiness but defiance, for a young and foolish man will sometimes go to dinner in his golfing clothes. This is good neither for London nor for the empire. What matters is the general attitude that is thus betrayed. The explorer, Sir Harry Johnston, once said that when in the savage depths of Central Africa, far, far from all sign of civilisation, he insisted that every man of his expedition should present himself in full evening-dress at the dinner-table, having faith that obedience in such circumstances to the old convention would serve as a moral tonic, would keep the standard of manners high, and would act as a preventive of a general carelessness

of ways that might hinder the common efficiency. Now London, being so smart, needs smart men to present themselves to these Americans with their hundred and seventy-five pounds apiece to spend. Ten years ago the most slovenly business man in Europe was the German, and he was hated by nice people for it. 'Tis said that in spite of his poorness he is mending his ways in this matter. London should not fall into a place vacated by Berlin. This matter becomes important because, it appears, the Londoner is being noticed and talked about. There is no fine and influential beau to give a lead in fashion in these times. King Edward, not a beau truly, but a man of taste and dominance, to be followed by a multitude, was the last. He had character and ideas in dress, and a way of impressing them. In hats and ties, the cut of jackets, and other matters he made signs which were accepted in Paris and New York. Brown boots, as one remembers, were banned for a time except under the most definite restrictions. Extravagances were disallowed. But the new London young man, if we should argue from all that is said of him, and something even which is seen, likes the limit whenever he can attain it. The standard example is what is called the 'plus four' vogue in knickers, adopted, as it may seem, because of the incapacity, proved and patent, of the wearer to approach in golf to within many strokes of what plus four means. Used to mean, we should say, perhaps, because one notes with agreement that the Royal and Ancient club, dispenser of laws and convener of conclaves, makes no official recognition of anything like plus four since it took to handicapping; so the stylish party have it to themselves, and the little meaning it ever owned is lost. For the rest, we are assured that the smart fellows, having exploited various ideas, supposed to have been borrowed from Egyptian kings, as patterns for their waistcoats and jerseys, are now devoting themselves to bright colours, and the brighter the better say some, believing strangely that it is for London's good.

* * *

From women we naturally, and properly, expect constant displays of fashion. We like them, and men will go farther now and state deliberately, will depone that they like them now better than ever, for, despite all the strange whirligigs and hysterics of London life in these days and nights, and without reference to such things as bishops and others are condemning, they seem to associate a curious dignity with their brilliance. Having from the War onwards, as never before, been gradually educated in feet and ankle possibilities, and no surprises being feasible in this department, the public attention is now drawn to the heads of ladies, where bobbing of hair is accompanied by what is described as shingling. This having become

a Court question, and decisions having been reached that *débutantes* at the Palace may bob or shingle, the feathers being left to take their chance, all should know what shingling is, but all do not. One school of young feminine fashion in coiffures, a school mainly of vigorous young girls who stand up straight and hold their heads back a little boldly, rather defiantly, in the manner of maidens who have made up their minds to deal with the Future, stalks the street hatless and with the shortened hair promoted to a loose, upright, and fluffy sort of arrangement in which there appears to be no cutting, parting, twirling, or shaping. If we describe it as fuzzy-wuzzy, we feel we approach as nearly as possible to conveying the idea and description. It is a semi-savage kind of arrangement that demands a manner. The girl must not only convey the impression of having appropriated the Future, and of being fiercely independent, with a temperamental strength that might have suited Cleopatra, Boadicea, and Queen Elizabeth, but must toss her head at times and must walk quickly. There is a great combined manner. A few of these fine creatures may be seen gliding through main thoroughfares during this brilliant season. At least we like the look of them better than that of the shabby men or the others who are cultivating colours. The ignorant have not unreasonably supposed this fuzzy-wuzziness to be that which is called shingling, but are told that it is not so, and many are left in doubt. It may be as well, however, that they should not come to know too much and develop opinions and prejudices accordingly, for there may be trouble ahead in this affair of hair. The ghosts of our grandmothers, who, for all that modern young ladies may say, hold firmly in our standards as the most charming women of all time, delightful in their sweet and gentle femininity, and enormous in their good influence, are wreathing themselves amid the social movements still. Those splendid grandmothers, so sweet and tender, do well in the stern unyielding persistence with which their spirits exert their influence yet. The memory of these dear people is still a mark and a safeguard in English life. And so those who gratefully and fondly remember such good women in their own family line, who still strive on in love and influence through their everlasting spirit, smile with satisfaction on hearing that the daughter of a Socialist Prime Minister has for herself, in such a matter as this and others, presented herself as the most adamant Conservative. The Court and the shingled hair were being considered, and some one asked Miss Ishbel MacDonald if she proposed to follow the prevailing fashion of society women. She replied, with great emphasis, 'No, I do not!' Then she was asked, 'Is it possible that you will have your hair even bobbed?'

and she responded firmly, 'No, it is not!' And the questioner asked a third time, 'Is it that you do not care for the shingling and bobbed hair styles—at least, for yourself?' and she answered, 'I do not.' Miss Ishbel MacDonald had a good mother.

* * *

London constantly amazes us with its unfailing resource, springing from its strength and its tranquillity. It does not become excited like other cities, and when strange things happen, such as unexpected strikes, the dropping of German bombs and what not, they do not seem to make any considerable emotional difference after a preliminary grumble. London always keeps its head, is steady, and in this respect it is, for its example alone, an asset of great value to the empire. The tranquillity comes from self-confidence, and experience proves that the resource of London never fails. This feature of the town helps us to withstand a fear which would otherwise be great indeed, for on bad nights one may dream of a London without movement, suffering from one great permanent block of people and traffic. A crisis will have been rapidly approached until only by careful arrangement of other units might one of them move slowly from one place to another, as is done with the little cubes in the framework of a figure puzzle. One cube is out, and so the others can have their positions interchanged; put the odd cube back, and the mass is complete, compact, immovable. The traffic of London thickens daily; we can really see the mass becoming less fluid, more solid, and on those bad nights the period of our dreams is placed only a few weeks ahead, and we see London streets crowded up until there is only room for one more person or vehicle in them, and this, when added, must have the effect of stopping the movement of all the rest. From somewhere will come this fateful unwanted man or car; the last place will be filled, and London will stop still. Even in such a predicament it will not become excited, any more than do my friends when, having now but ten minutes for a journey by taxi-cab to Euston station to catch a train, they are held up for four of them at a Piccadilly point to witness a long and mixed procession, brewers' drays participating, file at right angles past. But London would then need to realise that with the failure of movement the game was done, and the only apparent chance of relief would be by bombs from the sky in the way they were dumped in war-time. If this fancy is a stupid exaggeration, it is neither so stupid nor so much exaggerated as might be supposed. The London traffic problem is one of the most serious questions in the empire to-day, for the efficiency of the capital is being seriously threatened. A few expedients are being tried and some fanciful ideas suggested, such as wonderful bridges at the big crossings, but it begins to seem the truth, as a great authority flatly declared the other day,

that 'the London traffic problem is insoluble.' Then, if it is insoluble, the motionless mass of our bad nights must come, and no man without an aeroplane may even catch a train again. This matter now comes to mind because it seems that in this, London's great year, when they are filling up from everywhere, all those Americans and Australians and others, the problem must become even more seriously acute, perhaps grotesque. If the American cannot freely circulate, he may not have the power to spend his hundred and seventy-five pounds, or might even refuse to spend them. There is here a new economic aspect of the problem which is not a mere matter of comfort and convenience. Most of our visitors will be able to explain exactly how the trouble might have been avoided, and how it may be remedied. The Parisian may mention that his people move more quickly, and that his taxi-cabs, for example, do not care how fast or dangerously they dash, being specially skilful at rounding corners on two wheels. The man from New York, with his delightful self-assurance, will point to the advantages of a system of traffic above the surface, on the surface, and below the surface. I suppose that a Venetian might even make a mock of us by murmuring of canals, and that would send our thoughts to the Thames, where there is far more space than anywhere. Lately I have been reading in the story of the life—a wonderful story of a wonderful life—of Sir Harry Poland, who is ninety-five on the ninth of this present July, that though in his young days there was a railway running from Blackwall to Fenchurch Street, and the trains were hauled backwards and forwards by a rope attached to a stationary engine at each end, upon which ingenious idea we have advanced, we are not better served for locomotion on the Thames than Londoners were then, possessing three steamboats plying between Hungerford Bridge and London Bridge, at a half-penny fare each way. The *Ant*, the *Bee*, and the *Cricket* were the names of these vessels, and one of their peculiarities was that they never turned about, for they had detachable rudders which were changed over at the end of each journey. The engineer of the *Cricket* once found himself being tried at the Old Bailey on a charge of manslaughter, through having by some negligence allowed the boiler to explode and kill some passengers.

* * *

Such remembrances of old London and the older Thames lead to a sympathetic thought upon a melancholy case. Londoners possess the most beautiful bridge in the world, but only fully and generally recognise the proud circumstance upon the moment of their losing it. Waterloo Bridge is this best bridge, and now it is condemned for its creakiness, the uncertainty of its old foundations, and its increasing unsafety. So it is to be reconstructed

at a cost of a million pounds. There are lamentations in the town, the praises of the bridge, so grand in its lines, are sung, and it is called a poem. This was the masterpiece of James Rennie. It was a comfortable belief that it would last as long as London, and Rennie, at least, is not to blame for its present failing. Now we know how noble is this nine-arched bridge, that Canova, the great Italian sculptor, was enraptured by it, declaring that it was indeed the noblest bridge in all the world, and worth a visit from the remotest corners of the earth; while Baron François Dupin, a famous French engineer, said it was a colossal monument worthy of Sesostris and the Cæsars. We may visit Paris, Florence, Rome, Cologne, and other places, and return with grandiose tales of bridges, but we have not been in the habit of recommending the view of Waterloo Bridge to our friends and guests, and but a few of them have seen it—from the bend of the Embankment, which, after all, is the world's finest riverside walk. The truth is that London, which has made a special sight for one season, so abounds in peerless wonders that most are left in varying measures of neglect. When the King and Queen went to the Zoo the other day His Majesty warmly declared, 'It is the finest show in London, and worth all the money that has been spent on it,' and, as usual, His Majesty was right. The children—some of them—indeed go to the Zoo, but millions of their elders missed last winter a sight in lions that Africa could never yield to explorers and adventurers—five baby lions, to be seen day by day growing up, and, with their enormously big and strong front legs and the piercing acuteness of their constant watch, revealing the deep truth of Nature's provision, and passing the story of creation and evolution on from the primeval forest to London—and to Wembley. Only now, this year, at its centenary, does all London fully awake to the great glory of the National Gallery. Cockney tourists pass to the Continent, and on their first morning are poking themselves in front of pictures, but only now are considering and comparing the priceless merits of their own collection of four thousand works, are deciding that Michael Angelo's 'Entombment' is the finest of the lot, and trying to understand why Mr Dulac would burn the Rokeby 'Venus' if he had to burn one at all. It comes to this, that this city is too full, too fast. Lately, in the last cold days of one of the harshest winters, there was a strike of omnibuses, and the streets of London were nearly empty of the wheeled juggernauts. The people grumbled, but London's old resource and tranquillity remained; and what compensation was there for the true friends of the town! The din was softened, the streets and scenes were opened out again, and for this brief spell we saw and felt once more, just once and last, the old and lovely London that has gone.

THE COMFORTER.

By ROBERT SMILLIE, M.P.

I.

IT is wonderful the different effect which the influence of different people may have on one; how the cheery tone of one person may put spirit into you when you are sad, while the very presence of another person might make you feel that life was not worth living, even when you had no real cause to complain. This is shown to some extent in the following story.

Willie Gibson was a working collier, who had spent his whole life in an old-fashioned town in Lanarkshire, and who was well known locally as a quiet, intelligent man. He had married early in life, and his young wife and he set up housekeeping in a little top-storey garret of an old tenement house in the centre of the town, where there was very little room or convenience for bringing up a family, but which was the only place available at the time.

Willie and Mary were mates in the real sense of the term, and though times were bad and living conditions very hard, they enjoyed a great amount of real happiness. There was only one child of the marriage, and the coming of it nearly cost Mary her life. The baby died shortly after its birth, and this brought sadness into their lives for a time. Joy returned again, however, and life in their little home was like summer sunshine.

Willie worked hard and steady, and spent most of his spare time in reading; and a lot of this reading was done aloud, in order that Mary might also get the benefit of it, as she sat at her knitting or sewing, during the long winter nights. Willie gathered together a decent little collection of books, with the contents of which he was fairly familiar. Burns, Scott, and Dickens were his favourite authors, and 'Rabbie' had always first place. As time went on Gibson became recognised amongst those who knew him as a well-informed man, and his opinions were often asked for on knotty points which came up for discussion from time to time. He never posed as an authority, nor did he at any time thrust his views or opinions upon others, though he was always willing to help where he could be of any service.

Mary never fully recovered her strength after the birth and death of her little one, but she was of a cheery disposition, and seldom complained. She not only kept her own house spick-and-span, but she gave a helping hand to any of her neighbours who stood in need of assistance—and in this small working-class community there were always occasions for one universally loved, as Mary was, to give assistance. Mary was especially anxious to

assist Maggie M'Farlane, one of her friends who lived on the flat below, for Maggie had more than enough to do in bringing up a numerous family of boys and girls, who arrived with remarkable regularity, in the little room and kitchen house.

The life of Willie and Mary Gibson was a remarkably happy one, but at the age of fifty Mary passed away, leaving Willie to face life alone, at the time, probably, when he most required the companionship of his helpmate. He bore up bravely against this heavy blow, and resigned himself to the fact that he would have to go on alone.

On the day of Mary's funeral, when all was over, Maggie M'Farlane came to him and expressed her deep sympathy. 'Willie Gibson,' she said, 'you have lost one of the best wives that ever lived, and I have lost my best friend. If you make up your mind to bide on where ye are, I will dae ma best tae keep things tidy for ye. Mony a guid turn Mary and you hae din for me. Naething bit time can heal the sair heart, but we'll a' dae oor best for ye.'

Willie decided to remain in the little garret and to go on as best he could.

II.

Soon after the death of Mary Gibson, Willie and his bosom crony, Thomas Simpson, or 'Lang Tam,' as he was usually styled, joined 'The Ancients,' as they called themselves, or 'The Toddlers,' as they were dubbed by the younger generation. This was a body of elderly men—some colliers, some weavers, and others retired business men—who made it a practice to meet together just after tea on summer nights, and to take a walk, or 'dauner,' as they termed it, at their leisure, for some miles along one or other of the country roads leading out of the town, talking and debating on many different topics. They did not agree, by any means, on most of the matters which were discussed from time to time, but they went along slowly, in a fairly close group, so that all could hear what went on, and usually the best of good-humour prevailed. Generally speaking, the main part of every controversy fell upon two or three of the best-informed members of the company, and the discussions were undoubtedly informative and instructive. On some occasions the group was augmented by the presence of one or more of the local schoolmasters, and the parish church minister, a broad-minded man, had been known to grace the company by his presence.

The 'Ancients' did not welcome any of the 'Young Yins,' as they called the men under sixty years of age, but they welcomed Willie

Gibson, who was generally respected, and they reluctantly allowed Tam Simpson to join their walks, chiefly out of respect for Willie Gibson. Willie and Tam were very regular attendants with the 'Ancients' for some years on their 'Toddles,' and it could be truly said that Gibson imparted as well as received a lot of useful information during the course of the discussions on various subjects. Simpson rarely spoke unless the subject turned on football or funerals, and he had to be heard on those matters, as he was an authority on both.

The parish church minister met Willie Gibson on several of those walks, and though at first he regarded him with very grave suspicion as a 'Perverter,' he came to take a deep interest in him, and evidently formed a very high opinion of his character, if we can judge from a conversation which he was reported to have had with one of his elders, a man of somewhat doubtful report. This person, a retired business man, was seemingly dissatisfied that his spiritual adviser should keep company with such a person as Gibson, whose religious views were at least doubtful, and he was foolish enough to mention the matter to the minister during a conversation in which he expressed doubts as to Willie's character. The minister heard him through with evident impatience, and then replied, 'Well, Mr Shoddy, I am really glad that you have revealed your mind on this matter, which I would have thought was one entirely for myself, but as the question is raised I am bound to express my opinion, and it is this. I had probably formed a false opinion about Mr Gibson, without having sufficient knowledge of him to justify me in coming to a conclusion. I now know him, and though he may not hold orthodox views, I look upon him as a thoroughly upright man, and I should be pleased to have amongst my elders and managers a number of men with half his character, courage, intelligence, and honesty of purpose.' This answer cost the minister an elder—and he did not regret it.

III.

Willie Gibson and Tam Simpson had been boys together, and they had formed a close bond of friendship for each other in those early days. This companionship had continued when they went to work in the coal-pits as mere lads, and they became working partners at the coal face in early manhood.

They were a strange pair to be close companions. Their appearance, their character, even their methods of working were different, and yet they were lifelong friends, and there had seldom been a rupture between them.

Willie Gibson, as we have seen, was a persistent reader all through life, and became a well-informed man. Tam Simpson seldom read anything but the newspapers, and not by any means the most useful parts of those. The

football news, the death columns, and the sensational murder cases were the items which he devoured most greedily, and relished, and his memory for the details of those things was remarkable. Tam was tall and lanky; Willie was of medium height and well-built. Tam was irritable and of a rather morbid turn of mind, while Willie was always cheery and bright, never troubling outsiders with his own trials. Tam seldom formed any definite opinions and was easily moved, while Willie never came to a conclusion until he had done his best to ascertain the facts of the case. Tam's simplicity—some people called it stupidity—strengthened Willie's regard for him. He recognised that Tam, with all his failings, was earnest and true, and he knew that he had a rare courage, which showed itself more than once when they were boys, and Tam, who was bigger and stronger than his friend, had stood up for him and fought for him when bullies sought to take advantage of him. Tam's admiration for Willie knew no bounds. He multiplied Willie's knowledge and skill far beyond their true measure, and usually, when he expressed any opinion to companions in Willie's absence, he began by saying, 'I heard Willie Gibson saying the ither day—'

Generally speaking, Simpson was looked upon by his ordinary companions as a 'wee bittie saft,' but he was recognised as a highly skilled hard-working miner, and he was the greatest authority in the district on football. Though not a player himself, he could rattle off the names and state the chief qualifications of all the local and national players, dates of all the big matches, cup-ties, &c., and he seldom missed a big local game if he could possibly attend.

After football, his great hobby was funerals, and on the question of local interments he was an undoubted authority. He had scarcely missed a local funeral for many years, and he could give you the exact date of each burial that had taken place in the district for years, the names of the ministers who officiated, and the position of the grave in the cemetery. He strongly questioned the right of people to have private funerals, as it interfered with the rights of other people who desired to be present, and incidentally injured his own record. Tam's whole appearance fitted in with this hobby of his, and he would have been taken by a stranger as the chief mourner at every funeral which he attended.

It was said that when Tam was called upon to decide between a big football match and a funeral which unfortunately fell upon the same day, and at the same time, it was his practice to toss up a penny, 'heads,' football match, 'tails,' funeral, and that whichever side was uppermost caused him regret. Tam Simpson's other great outstanding features were his doubts of ministers, and his freely expressed hate of

doctors. The former he designated 'queer kin' o' folk,' and the latter 'deevils.'

IV

Tam's feelings towards the medical profession were said to have arisen from a strange incident which, if true, revealed one of the chief weaknesses of his character.

Some of the most mischievous and daring young men of the town, knowing Simpson's nature fairly well, hatched a plot to try to put Tam in his bed for a time, and it was said that the betting was odds on the success of the scheme.

It was arranged that on a day when Tam was sure to walk from his home to a central part of the town he was to be waylaid and held in conversation, at various parts, by different men, care being taken not to arouse his suspicions that they were acting in common. Four or five men were chosen who were on friendly terms with Tam, and who could be trusted to control themselves. On the day appointed, Tam left his home, looking wonderfully bright for him. He had not proceeded far, when a friend met him and said, 'Hello, Tam! Hoo are ye feelin' the day?'

'Fine, man, fine,' said Tam. 'Hoo's yersel?'

'Oh! I'm fine,' said Tam's friend; 'but, man, I got a fricht wi ye when I saw ye. Ye're looking awfu' no' weel. I houp ye're no' takin' the new trouble that's gaun aboot.'

'Whit trouble?' said Tam.

'It's some new seekness that I wis jist hearin' aboot twa meenits ago. They say that it jist comes on ye like a shot o' a gun, an' tak's aff the biggest and strongest men in twa or three days. Ye're lookin' gey bad, Tam, bit it's meebly no' it that's wrang wi' ye. Guid-mornin', Tam!'

The man walked on, and Tam continued his course. He had not proceeded far when he met another collier whom he knew.

'Guid Lord! Tam, whit's the maitter wi' ye?' said the newcomer. 'Ye're as white as a funeral shirt, an' yer een's kin' o' watterin' like. They say that's yin o' the signs o't comin' on. Weel, I've never seen ye sae knocked-up like afore, Tam, and ye seem tae hiv' it sure.'

'Hae whit?' said Tam.

'Oh, that d——d new disease that's gaun aboot. They're deen' in thousands some places, and it's maistly men that it's takin'. I noticed ye tak' a bit shiver the noo, Tam, and that's yin o' the signs o't, bit ye may be able tae get rid o't yet if ye gang straight tae yer bed. I'm no feelin' very weel mysel', bit I'm gaun richt hame tae sen' for the doctor.'

This man left in a hurry, and Tam stood for a moment, uncertain what course to take. He finally went on, however, but he had not proceeded more than a hundred yards when he was accosted by a third man, who exclaimed,

'Heavens! Simpson, bit ye do look bad. Talk aboot a walkin' corpse! I hae never seen a man sae poorly like as ye are gaun aboot on his ain legs.'

'Indeed,' said Tam, 'I dinna feel jist sae weel as I thocht I was when I cam' oot. I'm feart that I've got a touch o' the new trouble.'

'New trouble or auld trouble,' said the man, 'ye've got it a'richt, and I wadna like tae be in your shoon this day, and though I'm heart-sorry for ye, I maun hurry awa';' and Tam was left alone once more.

He went on a little farther up the street, and he passed two men whom he knew. They were in close conversation, but, as he was passing, one of the men looked up, and he seemed to start back with surprise as he nodded to Tam. As Tam moved forward, and before he was out of hearing, he overheard the man who had nodded to him say to his friend in a low voice, 'Good heavens! puir Tam has got it richt enough. I wadna be surprised to see him drap doon on the street.'

This put the finishing touches on Tam. He crossed the street, and retraced his steps in the direction of his home, feeling, no doubt, that he was really ill. He went right off to bed, and greatly alarmed his wife by the serious symptoms of his sudden illness. The doctor was called in, and continued to attend Tam for three weeks, protesting all the time to Simpson and his wife that he could not find any trace of disease about his patient. Tam maintained that he had come through the plague which had killed thousands, and that the d——d doctor had failed to grip the nature of his sickness. It was years afterwards before the plotters dared let the truth be known, as they were really afraid that they would be blamed for bringing about Tam's illness. In addition to this, they knew that Tam Simpson was a rather difficult customer to deal with when he was roused.

V.

Tam Simpson had been away on the Ayrshire coast for a fortnight's holidays, and on the day of his return he was informed by one of his friends that Willie Gibson was very ill. Tam felt genuinely sorry about this, and made all sorts of inquiries as to the nature of the illness, and what the views of the doctor were. He was told that Willie had taken ill shortly after he (Tam) had gone off on his jaunt, and the doctor had not yet stated the nature of the disease, but had expressed the view that Willie might go off at any time. 'Just like yer pit-lamp gaun oot, when ye drap it into a pail o' watter,' as his informant put it.

'Ach, whit dae doctors ken aboot a body when there's oucht wrang wi' them?' said Tam. 'It's my opinion that the haill gang o' them kill mair folk than they cure. Hoosomever, I'll gang awa' up the toon an' see him an' cheer

him up a bit. The sight o' a cheery face works wonders whiles, even when the doctors gie folk up.'

The man did not like to express any opinion about Tam's face at such a time, but he told the story to another man a few minutes afterwards, and added, 'A face like yon is enough tae kill a body that's weel, let alane a seek yin.'

Tam started away at once in the direction of the tenement in which Willie lived. When he came to the entry into the building, it dawned upon him that it would not look very well for him to go right up into the sick man's room without first finding out how matters stood. He knew old Mrs M'Farlane, and this knowledge helped to fix his course. He would go up to her house on the second floor and ask for Willie, and allow events to shape themselves afterwards.

He reached Mrs M'Farlane's door and knocked. She came to the door herself, and Tam thought that she looked more than usually glum and fierce. He asked how Willie was keeping. Maggie M'Farlane did not like Tam, and she answered him shortly, 'I hae jist cam' doon,' she said, 'an' though he's gey bad, he's as weel as we can expect him tae be.' Maggie seemed to think that this was to be the end of the conversation, for she turned to go into the house again.

'Can I no' gang up an' see him, an' cheer him up a bit?' said Tam.

Mrs M'Farlane turned upon him, her old eyes wide open in amazement. 'Gang up an' cheer him up a bit,' she said. 'Why, guid God, man, if ye tak' that funeral face o' yours up there it wad be as muckle as the man's life is worth! Na, na, guidman, gang awa' and tell Jean tae pit on a clean collar for ye—ye're no' oot the need o' yin.' With this she went in and shut the door.

Tam had turned away while she was talking, but he was only a few steps down the stairs when he heard the door shutting-to. He made up his mind in a few seconds that he must see Willie, so he turned and slipped up the stair as quiet as a mouse. Opening the door of Willie's garret, he walked in without a sound.

VI.

Willie was lying in bed, in a kind of stupor, and did not notice Tam at first.

'Hoo are ye, Willie?' said Tam, in a low, broken voice.

Then the light of recognition came into Willie's eyes, and he said, 'Why, it's you, Tam!'

Tam could scarcely hear the words, but he knew what was meant. 'Ay, Willie, it's me,' he said. 'I'm jist hame fra' Ayrshire, an' I heard ye were awfu' bad, an' I cam' doon tae cheer ye up a bit.'

Tam then rattled on with his talk, while Willie listened in a dazed kind of way. Tam drew in a chair and became quite confidential in his tone. He got hold of Willie's hand, and looking into his face, said, 'Man, Willie, they tell me that ye were bad, but I had nae idea that ye were sae far gane. I've seen mony a deeing man, but ye are worse-like than any o' them. Ye are mair like a corp' than a leevin' man. It's a pity I gaed awa', as it has had an awfu' effect on ye, an' I doot I've come ower late tae save ye.'

As Tam rambled on in his cheering process Willie's eyes became brighter, the humour of the thing seemed to get hold of him, and the old look of intelligence came back into his face. He tried to speak once or twice, but Tam was wound up, and seemed anxious to do all the comforting he could in the shortest possible time. At last he managed to get an opening, and said, 'Man, Tam, it's maybe no' sae bad as ye think. The doctor was in a wee while sin', and he says that there is a bare chance o' my pulling through if I'm no disturbed in any way.'

'Doctors!' said Tam. 'Doctors!' he said again. 'Man, ye canna believe a word they say. Dinna lay ony stress on that, Willie. Ye're a gone corbie, or my name's no' Tam Simpson. But, man, there's wan thing that should gie ye comfort. Ye'll hae the biggest funeral that we've had for mony a day. Whaur dae ye bury, Willie? Wait a bit, it's cam' into my min' noo, tho' I had nearly forgotten. Man, I'm at sae mony funerals that there's whiles that some o' the facts gang oot o' my min'.' And then Tam began a long rigmarole of funerals which he had attended, and the facts regarding deceased persons. For the last thirty years, he said, he had missed only one funeral, apart from those that he had lost through a fibb' match—and this one was lost because he was lying in bed himself ill, and the doctor refused to let him rise to attend the funeral. He would have gone in spite of the doctor, he said, had it not been that Jean had hidden his funeral clothes, and that 'pit the shutter on.' 'Nearly a' ma auld freen's are awa' noo,' went on Tam, 'and you amang the last o' them are gaun tae gang the same road, and I'll sune no' hae a leevin' sowl left. Hoosomever, Willie,' he said resignedly, 'we maun bear the heavy burden that is laid upon us and welcome the hand that smites us.'

VII.

Willie, with a show of the old twinkle in his eye, remarked, 'Man, Tam, yer face is gey serious like. Hae ye no' something cheery tae tell us about Ayrshire. Yin wad think that it was you that was gaun tae dee, an' no' me at a'.'

'Though I'm trying to cheer ye up a bit,

Willie,' said Tam, 'I fin' that it's nae easy task. This is nae time for merrymaking, or saying pleasant things. It maun be an awfu' thing, Willie,' continued Tam, 'tae be screwed doon in a big black box, where a body canna get room tae steer, or tae get a breath. And then tae be put into a hole in the grun' an' covered in. Then tae hae the worms rampaging up an' doon through ye, an' the maggots fechtin' for which o' them is tae get the best bit o' yer brains for their dinner. Man, it must be awfu'.'

With great patience Willie heard to an end this cheery description of what he was to expect, and then he said, 'Man, Tam, I've been thinking, while ye were talking, that the maggots will hae a gey hard job tae get much o' a dinner aff some o' oor brains—an' then, ye ken, they maun leeve, puir things; aye, an' dee tae.'

Tam did not take up the thread of this discourse, but looking round him carefully, he observed, 'Man, Willie, noo that ye're gaun tae leave us, hae ye made up yer min' what ye're gaun tae dae wi' yer bits o' things that ye hae roon' ye? They're worth a guid wee bit o' siller.'

Willie, for the first time, showed some resentment when this statement was made, but Tam did not give him time to reply. He rose from his seat and cast his eye from the head of the bed to the foot. He then went to the door and opened it cautiously, and looked down the stairs. Willie thought that Tam might be looking for Mrs M'Farlane, whom he expected up at any moment, but this was not Tam's quest. He came back to the side of the bed and stretched his two great arms over Willie's body, as if he was going to pronounce the Benediction, and then he went back to the door again, and did some measuring. Coming back once more to the bed, he said, 'Man, Willie, that will be a deevil o' a place tae get a coffin doon. I'm dooting that we'll hae tae sling ye on a rape. Bit dinna fash yersel' aboot that. It'll be a pleasure tae me tae help tae get ye doon, however much trouble it may gie.'

Tam said this with such a self-satisfied air that it seemed to get on Willie's nerves. By a supreme effort he raised himself onto his elbow, while the old strong look came back into his face again. 'Tam,' said he, 'come over here till I speak tae ye.' Tam moved over a bit, expecting that he was perhaps going to learn some secret news. 'Tam Simpson,' spoke out Willie again, 'I'm no' a sweering man, as ye know, but I canna help telling ye hoo I feel about you as a comforter. I'd see ye in hell, Tam, before I'd dee jist tae gie ye the pleasure o' helpin tae lower me doon the stair in ma coffin wi' a rape. Awa' ye gang hame tae Jean as quick as ye can, an' tell her hoo ye hae comforted an' cheered me up the nicht. Tell her that, thanks tae you, I'm no gaun tae dee jist yet, an' that I'll be doon tae get a cup o'

tea wi' her an' you within a fortnight. Gang noo, at ance, before I get up an' lay haun's on ye.'

Tam went without a word, and in two minutes Willie had fallen into a sound sleep, which was not disturbed by Mrs M'Farlane, who came in shortly after the comforter went out. Willie did not awake until well on next day, and when Maggie, who had been watching him carefully, offered him a little soup when he awoke, she said, 'Eh, man, whit a change has cam' over ye a' in wan nicht.'

'Ay, woman,' said Willie, with a smile, 'this is a' Tam Simpson's doings. He came up here aboot seven o'clock last night, an' he cheered me up wonderfully, wi' his bricht face an' his cheery chat; I feel ever sae muckle the better of his visit.'

'Guid Lord,' says Mrs M'Farlane, 'the man spoke tae me last nicht, and speered efter ye. He telt me he wanted to gang up tae see ye, but I was as impident as I could be wi' him, and ordered him doon the stair, and jist tae think that if I had got ma wey ye micht hae been deed this mornin'! I never liked Tam,' said Mrs M'Farlane, 'but I'll never say a wrang word tae him, nor aboot him, in my life again.'

Willie mended every day, and within a fortnight he kept his word and went down to have a cup of tea with Tam and Jean. But the question of the cheering up never was mentioned, though Tam took the credit, to the day of his death, of saving Willie Gibson's life.

Willie attended Tam's funeral within twelve months of his own escape, and lived ten years longer than the doctor and Tam Simpson had portioned out to him.

FOR THE LAST TIME.

In youth these simple words may strike
A ringing note of gladness,
But later, as we journey on,
They breathe a strain of sadness.

In every change there lurks a sense
Of parting tinged with sorrow:
We know to-day, but cannot say
What may befall to-morrow.

To take a farewell look around
The home we've dearly cherished,
Where one by one the links that bound
Have snapped, and loved ones perished;

To sail for some far-distant land
Where right or glory leads us,
And feel we ne'er shall clasp again
The aged hand that speeds us;

To look our last on some loved form
When cements enfold it,
And know that ne'er this side the grave
Shall we again behold it;

At times like these, when hearts are torn
And life is very dreary,
Take heart o' grace, and bravely trust
The promise to the weary.

JAMES T. JOHNSTON.

SIR WALTER'S SON.

By R. F. HEALY.

I.

THERE hangs over the mantelpiece in the library at Abbotsford the portrait of an officer of Hussars. No need, perhaps, to give the exact position, for it is the only canvas in the room. We are told it is the second and last baronet, the elder son of the great Sir Walter, and that is all.

It is not easy to trace the career of this sometime master of Abbotsford. Of the first Sir Walter much has been written, but of Lieut.-Colonel Sir Walter Scott there appears to be but scant record. We get a glimpse of him now and then in the family letters, and from these and other sources we may learn something of his short but not uneventful life. William Allan's picture should tell us something. A tall, slim young man with strongly marked features, wearing the fantastic uniform peculiar to Hussar corps of the period of the long peace; Cossack trousers or overalls tightly strapped and shaped-out over the foot, braided jacket, fur-trimmed hanging pelisse, and a furry busby worn very much on one side; a stirrup-hilted sabre, and long, straight spurs screwed into the heels of the boots. Sitings were given in Edinburgh in 1822, when the subject of the portrait was one-and-twenty and a lieutenant on half-pay in the 15th Hussars.

II.

Walter Scott, the soldier, was born in Edinburgh on 28th October 1801, and received his early education at the High School there. He would then be not more than eight years of age, and it was his childish admiration for Johnnie Armstrong which earned for him the nickname of the Laird of Gilnockie, or, more generally, the Laird. The ruined tower of his early hero is still to be seen at Gilnockie on the Esk.

His father wished him to adopt the law, but he would be a soldier, and from a letter of his sister Charlotte's we read, 'You will have the supreme felicity of seeing your elegant pupil Walter in his Yeomanry dress, which, I can assure you, he is not a little vain of. Papa asked him lately what his brilliant genius inclined him to, and he declared that he would be nothing but a soldier; so a soldier he is to be.' The recipient of this epistle was their governess, and no doubt she was pleased with the appearance of Cornet Walter Scott of the Selkirkshire Yeomanry Cavalry. So both father and son were yeomen, for the great novelist had been quartermaster in a Fencible Cavalry corps in his younger days. Having determined to be a soldier, and having seen something of the life with his

troop of Yeomanry, young Walter was promised a commission by his father, and there was apparently some talk of his entering the Guards, 'because,' as his sister writes, 'they do not go to the East or West Indies.' But it was not to be the Household Brigade, just as surely as it was to be his Kismet to lose his life through service in an Eastern station. Another letter refers to Walter's commission as a cornet in the 18th Light Dragoons, and reference to official lists shows his appointment as a cornet in the corps popularly known as the Drogheda Light Horse on 10th June 1819. His uniform and equipment cost some £360, and no doubt Walter Scott was pleased with it, for the Eighteenth wore a very attractive dress at this time, which included a dark-blue Hussar jacket and pelisse, with white collars and cuffs, and richly laced with silver. The pantaloons were light blue; so too were the sabretache and shabrack. The busby and the trimming of the pelisse were of light-brown sable, and the busby-bag was blue, with a tall scarlet-and-white plume. And so, with an allowance of £200 a year, the promise of money to purchase chargers, and much good advice, the young cornet sailed for the Emerald Isle, joining his regiment at Cork in July.

The Eighteenth, then one of the four Hussar corps in the Service, had a great reputation, and had a few years before covered itself with glory under Wellington in the Peninsula and at Waterloo. When Scott joined there must have been a good many wearing the Waterloo medal, and with tales to tell of Sahagún, Benavente, Corunna, and their encounters with Napoleon's Cuirassiers at Quatre Bras. His father's letters about this time are full of good advice, which embraces the servant question, horse-dealing, wine and expenditure generally; but whether Master Walter supplied himself with the 'little book with ruled lines for pounds, shillings, and pence,' there is no evidence available. Later, he marches with his regiment to Dublin, and in 1821 finds himself disbanded, for the gallant Eighteenth, with other corps, had become a victim of economy. He was appointed a lieutenant in the 15th Hussars on 24th October 1821, and was placed on half-pay soon after, probably being one of those affected by the Order of August 1821, by which his new regiment was reduced by 5 officers and 60 other ranks. A letter from his sister in the summer of 1823 mentions his being at Sandhurst, and in June he is reappointed a lieutenant in the King's Hussars, with whom he again did duty in Ireland, under the watchful eye of that best of commanding officers—Colonel Joseph Thackwell.

III.

Matrimony now comes into his life, and his engagement is announced in January 1825. The lady of his choice was Miss Jobson of Lochore, with a fortune of £60,000, and the wedding took place on 3rd February. Sir Walter settled the estate of Abbotsford on his son, and lodged the sum of £3500 with the army agents—the necessary purchase-money for a troop in the regiment—and on 16th June of the following year Walter Scott was gazetted a captain. Marriage settlements appear to have brought home the fact that soldiering in a cavalry regiment a hundred years ago was an expensive way of earning a living, as may be seen from a letter of *Waverley's* creator. 'Every one grumbles,' he writes, 'at his own profession, but here is the devil of a calling for you, where a man pays £3000 for an annuity of £400 a year and less—renounces his free will in almost every respect—must rise at five every morning to see horses curried—dare not sleep out of a particular town without the leave of a cross colonel, who is often disposed to refuse it merely because he has the power to do so; and last of all may be sent to the most unhealthy climates to die of the rot, or to be shot like a blackcock.' The zealous quartermaster of Volunteer Light Horse no doubt compared his own experiences of amateur soldiering with life in the regular army, and not to the advantage of the latter.

Sir Walter Scott was with his son and daughter-in-law during his visit to Ireland in the summer of 1825. That was when the Fifteenth were at Portobello Barracks, Dublin, and in the following year, according to the records of the regiment, Captain Scott's troop was on out-station duty at Athlone. He obtained a majority in February 1828, and we next hear of him as having been granted leave to accompany

his father on that last sad voyage, which was to prove in vain. When the *Barham* frigate left Portsmouth on 29th October 1831, father and son were together.

Reference again to the letters shows Major Scott on leave in London, and being suddenly recalled to take command of his regiment in Ireland 'upon Lord ——'s dismissal.' The statement, if not quite accurate, is interesting, as it gives an insight into the attitude adopted by the outside world towards one of the principal figures in a court-martial which disturbed the usual tranquillity of the family life of the King's Hussars. Lord —— was the Earl of Cardigan of Balaklava story, and at that time Lord Brudenell, commanding the 15th Hussars. He was not 'dismissed,' but was ordered to revert to half-pay on account of the disclosures made on the court-martial of Captain Wathen in March 1834. Scott, as senior major and second-in-command, took over the regiment pending the arrival of its new lieutenant-colonel.

After service in England and Scotland the regiment is ordered to India, and Scott, now its second lieutenant-colonel, takes command of the third division, which sailed in the *Malabar* from Gravesend, landing at Bombay on 9th November 1839. Then Colonel Sir Walter Scott settles down to make the best of his first Indian station—Bangalore. His experiences of Indian soldiering lasted nearly eight years, and he was in command of the regiment during his commanding-officer's temporary absence as a brigadier. He said farewell to the Shiny Land in 1847; but he never saw Scotland again, as he died at sea off the Cape on 8th February 1847.

Sir Walter the soldier is overshadowed by the Sir Walter whom we all know, yet these few notes on the career of the son may be of some interest, and take their place with the story which has grown up around the life and times of the great man.

A GIPSY OF THE NORTH.

CHAPTER XXI.—continued.

WONDERINGLY Carwyke opened out the half sheet of newspaper, which was so worn that it almost fell to pieces during the operation. Hurriedly he glanced over it, and as he did so the staring headlines, in which American newspapers revel, caught his eyes:

THE MANNERING MILLIONS!

WHO GETS THEM?

ROMANCE OF LOST HEIRESS.

HOW KIT STANDIFER LOST THE DOLLARS.

\$10,000 REWARD.

Having read so far, he looked at Billy, a sharp question in his eyes.

'Yep!' answered Billy, with affected nonchalance. 'Thet's ther dope!'

Carwyke read what followed hurriedly. The account set forth in its own flamboyant way that seven million dollars, being the amount left by the late Christopher G. Mannering, the well-known Wall Street financier, was waiting for a girl to come and claim them, the money having been willed to her by her grandfather, whose sole heir she was. No one knew exactly where this girl was; but it was thought that, if alive, she was somewhere up on the Alaskan coast, with her father, the late lamented magnate's son—Christopher G. Mannering Junr.

What the newspaper described as a romantic story lay behind this willing of so large an amount to the deceased man's granddaughter, of whom none of the millionaire's friends had ever heard until the will was proved. The junior Mannering, whose mother was the daughter of a Moravian missionary, had from boyhood shown a strong religious disposition, and on leaving Harvard had desired to enter the church; but under pressure from the magnate had gone into the Wall Street office. There he had laboured for five years, and at the end of that time had communicated to his father his double intention of marrying a mission-worker in the New York slums, and of departing forthwith to serve as a missionary among the Eskimos after the example of his maternal grandfather. Mannering Senr., according to the account, had stormed and raved, roundly denounced his son for a fool of fools, and had threatened to cut the young man out of his will if he persisted in his resolves. But Mannering Junr. had something of the self-will of the irate millionaire himself, and, notwithstanding the threat, had gone his own way, marrying the mission-worker and departing for the north within a month. From that time New York knew him no more; but nearly three years afterwards Mannering Senr. received a marked copy of the *New York Herald*, announcing the birth of a daughter to Christopher Garfield Mannering and Norma his wife at Unapik in Alaska. And each year afterwards, until three years ago, when there had been a sudden cessation, a photograph of his grandchild, in Eskimo dress, had reached Mannering Senr. on his birthday. After the third the millionaire had purchased an expensive portfolio, in which the photographs, fifteen of them in all, had been mounted, and the portfolio was now in the possession of his lawyers, who hoped that it would prove valuable in helping them to find the missing heiress, for information of whose whereabouts a reward of ten thousand dollars was offered.

The reference to Standifer was almost scurrilous. The son of the millionaire's dead daughter, after the quixotic departure of Mannering Junr., had been taken into the magnate's office, and had so acquitted himself that he was looked upon as his grandfather's successor and heir, as he might well have become but for a radical crookedness of character which found expression in questionable pleasures, and in an extravagance which brought its own Nemesis, for it had led in the end to the embezzlement of considerable sums. This fact, being discovered, had resulted in his prompt dismissal from his grandfather's service, and to the making of a fresh will on the part of the magnate, in which Standifer's name was omitted. Where Standifer was at the present time no one knew, but he was known to have made money in a

saloon on the Klondyke, and no doubt, like the bad egg that he was, would show up to fight this will, which directed that, in the event of Norma Mannering not being found or being dead, the whole of the money should go to the founding of a great educational institution in New York, the income meanwhile being devoted to certain charities which were named.

When he had read the article through, Carwyke looked up, a rather bleak expression on his face. Norma was smiling with joyous anticipation; whilst Billy, shyly watching Carwyke from the corner of his eyes, was whistling with a wholly assumed carelessness. He stopped suddenly as the other inquired almost harshly, 'Where did you get this, Billy?'

'Up at Little 'Ell. Yo' remember ther Russian reading a paper when he couldn't eat, jest before he picked me up an' threw me at yo', Mista Carwyke?'

'Yes! Yes!'

'Thet paper is part of it. I reckoned there was somethin' blamed queer in it that mebbe explained what yo' may call his general attitooode on thet occasion, an' when we quit I brought it away with me, an' forgot it till after yo'd gone off to get Missy—or Missis, as I should say—away from Standifer. Then when I read it I tumbled to ther whole thing—Standifer's game as well as Goliath's.'

'Standifer must have known,' said Carwyke to himself.

'You bet he did.'

'But you didn't tell me!' exclaimed Carwyke sharply.

'Wasn't such a durned fool! I reckon I know ther kind of proud feller yo' are, Mista Carwyke, an' I wasn't goin' to hev Missy's happiness ruined for a five-cent pride thet, however commendable, ain't no sort o' sense—so there yo' get it in yo'r hat.'

Carwyke turned to Norma. 'You knew of this?'

She nodded smilingly. 'Yes! Billy talked one night when he was delirious, and I made him tell me the truth.'

'And you hid it from me? Why?'

'Norma's face flushed rosily. 'Because . . . because—oh! what were millions beside—beside—'

'Don't need no more words, Mista Carwyke! Look at Missy's face.'

Carwyke looked, and the hard light in his eyes softened. 'It was hardly fair to me—' he began, and broke off at the look in Norma's eyes. Then suddenly he laughed a little vexedly. 'Anyway, I didn't know, and my hands are clean, whatever New York says.'

'What does it matter what New York says?' asked Norma softly. 'We know—and, besides, we are not going to live in New York.'

'Then where—'

Norma began to hum his own song of dreams.
 'Here shall I build my cedar house——'

'Norma!' he whispered.

The girl looked at him with eyes that were alight with love. 'Yes!'

'You mean it?'

'Yes, Roy! We'll build the city with gates—and most of all the cedar house.'

'Not forgettin' a log shack for an' old whaler-man what——'

Then Carwyke laughed whole-heartedly.
 'You deserve man-handling, Billy; but we'll build you a palace instead, won't we, Norma?'

He took his wife's arm and led her towards the woods, and as they walked the song was on his lips:

Here shall I build my cedar house,
 A city with gates, a road to the sea—
 For I'm Lord of the Earth!
 Hew! Hew!

And Eskimo Billy, looking after them, broke off his whistle and murmured aloud, 'I know'd 'twas ther card to play, but I guess 'twas ther queen thet took ther trick after all!'

THE END.

THE MONTH: SCIENCE AND ARTS.

GUIDING SHIPS INTO PORT BY SOUND.

THE entrance to almost every harbour demands careful navigation by those in charge of ships, even in broad daylight. At night, the procedure is still more difficult; while in fogs it becomes impossible except by the aid of what is known as a leader cable laid along the bottom in the middle of the channel. A description of this device, which was used during the War, will be found in our issue for April 1921. Electric signals transmitted to the cable from the shore are picked up by instruments in the ship, and by means of these the pilot can tell whether he is over the cable and therefore in the centre of the channel. A much simpler contrivance has been invented recently by Mr H. M. Fellows, a well-known shipbuilder of Great Yarmouth. The device is based upon the fact that if two fog-horns are sounded at exactly the same moment the nearer one will be heard before the other. To make clear the method of guiding a vessel by horns sounded simultaneously we will assume a straight coast-line with a channel at right angles to it leading to a harbour entrance. In such a case one fog-horn would be located on the shore at a definite distance from the middle of the harbour entrance, the other being fixed at an equal distance on the opposite side of the channel, a straight line connecting these horns being exactly at right angles to the channel along which ships must pass to enter the harbour. One cannot always be certain of the direction from which sound comes in a fog. To avoid this possibility of error one horn has a high note and the other a low note. If the approaching ship is in the middle of the channel those on board will hear both horns at the same time. If one is heard before the other the vessel will be steered towards that heard last until both are heard together. The horns are sounded by compressed air under the control of a wireless circuit which is worked by a clock. As described, this device can only be applied

to a straight channel, but it is claimed by the inventor that pairs of horns placed in suitable positions would render a curved channel navigable in a fog, the pairs being sounded in a definite sequence and at predetermined intervals. At present the device is in the experimental stage, the apparatus having been installed on some flat land near Egham, where very promising results have been achieved. The main advantage of the device is that no instruments are required on the approaching ships, or skilled operators to pick up the signals, as is the case with leader cables.

A FIRM TUMBLER-HOLDER.

When a new and obviously useful device is invented, one often wonders why nobody has thought of it before. This feeling will be engendered in most people on seeing for the first time a holder for tumblers, bottles, and other objects, for use in trains, cars, aeroplanes, and yachts. So firmly is a tumbler or a bottle gripped by this holder that it can be turned upside down without the slightest risk of the object falling out. Yet a light lifting action, combined with a twist, effects an immediate release. The actual gripping device consists of a rubber ring of which the inside diameter is considerably less than the outside diameter of the object to be held. This ring is clamped to a metal bracket by a metal ring. The bracket is hinged to a metal plate attached to a wall, the door-post of a car, a bulkhead in a yacht, or the side of a railway carriage. While out of use the bracket can be turned up, when it projects only half an inch. For card-tables or pianos a different form of bracket is used, which swivels on a screw, and, when out of use, turns in under the table or the piano. Alternatively, the rubber rings may be screwed over holes in wooden shelves, such as glass and bottle racks in yachts, aeroplanes, and railway carriages. Another modification of the device especially suited to yachts and aeroplanes takes the form of a brass disc with four legs, which

cling to a tablecloth, and prevent the holder slipping even with the table at an angle of 45 degrees. Strangely enough, a similar result is obtained on a smooth table-top, although the legs are not sharp enough to scratch it. The metal parts of the holder are made of brass, polished or nickel-plated; or of steel with an oxidised finish. With the card-table or piano model a tipping ash-tray can be supplied if desired.

A MOVING PICTURE CAMERA FOR AMATEURS.

Every amateur photographer must have wanted on many occasions to take moving pictures. A small motion-picture camera of French make has recently been introduced into this country. Small enough to be carried in a big pocket, this camera is 6 inches in length, 5 inches in width, and 4 inches in depth, and weighs less than 4 lb. With its aid any one can take moving pictures as easily as still ones. All the operator has to do is to press a button. The camera uses standard films in lengths of 17 feet, which give 250 pictures. At any place on a film the camera can be used for moving pictures, snap-shots, or time exposures. The film is moved by clockwork for taking motion-pictures, this arrangement avoiding any possibility of turning a handle at an incorrect speed. The camera has both a direct and a reflecting finder, for holding to the eye or supporting at the waist respectively. Two sides of the camera open up, exposing the 'gate,' which also opens, and the film reels. The loading of the camera with a new length of film can be carried out in daylight, and the operations involved are easy and simple. The only operation which has to be carried out in a dark room is the loading of the film reels. Once loaded, however, they can be inserted in daylight with impunity. Of metal throughout, these cameras are accurately made and well finished, while the instructions are so precise and clear that there is little excuse for spoiled films.

AN INSTRUMENT FOR FINDING METALS AND BURIED TREASURE.

Boring into the ground to find water or valuable minerals is generally a more or less speculative venture. At one time persons known as water-finders would walk over the ground holding in their hands a hazel twig, which was said to give a slight movement when over water. Of late years an instrument has been devised which has proved so successful for finding supplies of water and oil that the makers undertake borings on the sites indicated, on the principle of 'no full supply, no pay.' A recent and more astounding development consists of apparatus which indicates the exact shape and position occupied in the earth by metalliferous deposits. Buried treasure is still more easily found by these devices, because it

is in the form of solid metal, whereas ores containing metal, precious or otherwise, hold only a small percentage. Two devices are required for indicating the presence of metal in the earth. One is a simple electrical device which sends a curious musical note through the ground; the other is a sounding rod in combination with a head telephone, with which the musical note is heard through the rod when it touches the ground. As a matter of fact, a second sounding rod is carried by a boy, but both are connected to the one head 'phone. Wherever the note is clearly heard, the ground is sterile; but should the sounding rod make contact over metal or metal ores, the note is greatly diminished or ceases entirely, varying according to the richness of the underlying deposit. The operators are therefore able to step on to and off from the area over the deposit, and, by means of pegs, to indicate its precise shape. Very simple calculations enable the operator to estimate the exact depth. The apparatus can be used in mines where lodes have been lost, to find out whether they will be struck at different levels, or if they have altogether disappeared. For treasure-hunting these devices are invaluable. One party which contemplates an attempt to discover pirate treasure on the Spanish Main has witnessed a long series of demonstrations, with the result that an instrument has been taken aboard.

A NEW VACUUM PRESERVING JAR SYSTEM.

That the vacuum preserving system for foods has come to stay is abundantly evidenced from the number of makers who specialise in the jars and vacuum pumps. Two different types of vacuum jar apparatus have been described in these pages comparatively recently. Another which has been brought out of late has the advantage of being exceedingly simple. The jars are of glass, and each has a glass lid with a small glass disc in the middle of it. Each lid is made tight by a rubber ring. The bottom end of the air-pump fits over the smaller central disc, and is simply pressed down by the operator on to a rubber ring. The pump is then worked, and quickly exhausts the air through the hole under the small disc, the disc rising slightly at each up-stroke. The outstanding features of this make are simplicity and low prices.

A ROAD-TESTING MACHINE.

Among the many functions of the National Physical Laboratory at Teddington is that of testing road materials for the authorities who are responsible for the upkeep of the roads of this country. Materials are tested for resistance to attrition, abrasion, impact, and crushing, while their ability to absorb water is determined, and the value of fine material as a binder is assessed. But the most interesting test which is carried out on road materials is one in which a

miniature road is constructed and wheels are run over it to give the closest possible approximation to road traffic. This test is carried out on a circular path 34 feet in diameter and 2 feet in width. The road material to be tested is laid down on a concrete foundation. A circular framework over the track is supported by eight wheels, each 39 inches in diameter and having a tire 3 inches wide. In order to imitate as nearly as possible the driving-wheels of a motor-lorry, each of these eight wheels is driven by its own electric motor. In most cases the weight per inch-width of tire is 470 lb., but during the consolidation stage this is sometimes increased to 750 lb. The machine is run over the surface to be tested with a gradually increasing load, until about 6000 lb. per yard of width has been rolled over it. This is called the consolidation period, during which the surface is kept dry. For the test proper the machine is run at a load of 470 lb. per inch of width and at a rate of about 2200 tons per yard of width per hour, the track being kept wet all the time. Plaster casts are taken to record the shape and condition of the road surface, and during the test longitudinal and transverse sections are taken of the surface by means of special apparatus.

A NEW FIRE-ESCAPE WORKED BY HYDRAULIC POWER.

In cases of fire in which human lives are in danger the rapid placing of the fire-escape and its extension are of the utmost importance. Fire-escapes which will reach to the upper storeys of the high buildings now so common are essential, and the extension of the heavy ladders by hand is a slow operation. To expedite this process a fire-escape worked by hydraulic cylinders has been designed and patented by Chief Officer G. Lee Tuppen of the Rangoon Fire Department. This escape, which has been made in London, was recently tested, and proved entirely satisfactory. The ladder is in four sections, and is mounted on a turn-table. Not only is hydraulic power used for extending the ladders, but also for raising them from the horizontal position, and for revolving them on the turn-table. The escape is carried on a 65-horse-power motor chassis. When the firemen are about to proceed to or return from a fire, the ladders are closed the one over the other and lowered to a horizontal position. The ladders are extended by wire ropes running round pulleys, the principle being similar to that by which in smaller pieces of apparatus sectional ladders are pulled up by cords; but, of course, the principle is here applied on a much bigger scale. The hydraulic ram for extending the ladders carries a six-wire pulley system in duplicate, so that its length of stroke is multiplied six times. Another hydraulic ram is used for raising the ladders

to the necessary angle, while a hydraulic rotary motor revolves the ladders on the turn-table as desired. On arrival at a fire all these operations can be put in motion at the same time. The ladders can be raised and extended in less than one minute, and the upper one reaches a height of 80 feet when extended at an angle of about 60°. This means a considerable overhang beyond the chassis, which is required for some exceptionally wide pavements in Rangoon. These hydraulic rams are forced out by oil under a pressure of 600 lb. per square inch. The oil is compressed by a three-throw pump at the rear of the chassis, which is driven by the engine through worm reduction gear. If any part of the hydraulic system fails, all the necessary operations can be carried out by hand, but, of course, much more slowly. Every possible safety device is embodied—for example, the interlocking of the control-levers, so that they cannot be mismanaged, and the provision of pawls for engaging with the rungs of the ladders, to take the weight when the necessary height has been reached. Other safety devices prevent the ladders from closing up accidentally or falling to the horizontal position.

RECLAIMING THE ZUIDER ZEE.

The gigantic scheme referred to in our issue for October 1918 for the reclamation of this wide-spreading but shallow arm of the sea is now in process of realisation. The scheme contemplated, in the first place, the building of a broad dam westward from the island of Wieringen to the opposite coast of North Holland. This is now in course of construction, and when completed, will not only prevent the further flow of water, but will provide a carriage way between the island and North Holland. With the completion of this portion of the work the second and larger part will be begun. This will consist of the building of a vast dam, some fifteen miles in length, from the north-eastern point of Wieringen eastward to the coast of Friesland. The whole scheme is now estimated to cost some £24,000,000, and it is computed that its successful completion will add nearly half a million fertile acres to the extent of the Netherlands, the produce of which will amply repay the cost involved. In addition, it will bring the northern part of the country into much closer communication with the capital.

A NEW FOUNTAIN PEN.

One of the disadvantages connected with the employment of the now almost indispensable fountain pen is the necessity for refilling it when it is empty. The trouble and the 'messiness' involved are greatly reduced by the use of the 'self-filler' type of pen; and there has now been put on the market a form of fountain pen in which the 'messiness' connected with refilling is entirely eliminated. The ink

is contained in a sealed metal cartridge fitting inside the pen. When this cartridge is slipped into position and given a slight turn the end is pierced, thus ensuring a steady flow of ink from the cartridge to the nib. When the cartridge is exhausted, it can be removed and a new one inserted in its place in a few moments, when the pen is once more ready for duty. It is claimed that one cartridge is sufficient for the writing of some 22,000 words.

AN EFFICIENT TICKET-WRITING MACHINE.

A recent development in the printing world is the invention and perfecting of a machine by means of which even the most inexperienced operator can quickly produce embossed show-cards or tickets beautifully printed in one, two, or more colours. The method of working this new form of hand-press is very simple. Gummed paper of the necessary colour (or variety of colours) is laid upon the cardboard to be printed upon, and the type, which is of gun-metal and has a sharp cutting edge, is placed on the paper. The card is then put in the machine, and heavy pressure is applied, the machine being so adjusted that a girl can effect a pressure of fourteen tons. On the card being withdrawn from the machine the type is lifted off, and a slight rub removes the superfluous paper, leaving the letters printed in the chosen colour or colours, and presenting an outstanding or embossed appearance. The device should prove very serviceable in shops, warehouses, and other places where individual show-cards or price-tickets are frequently needed in a hurry, for it is as cheap to print one card as many, and the card is ready for use the moment it is printed. The machine is no larger than an ordinary typewriter in size, and is therefore quite portable; the type, being neatly laid out in trays, occupies little space.

FATALITIES FROM THE USE OF LOCAL ANÆSTHETICS.

A committee of the American Medical Association, which has been making investigations into fatalities resulting from the use of local anæsthetics, has recently issued a report which strikes a note of warning, and contains recommendations which will doubtless prove distinctly helpful. Of 43 deaths attributable to this cause, 26 were due to cocaine; apothecin and butyn were each responsible for 4; novocain for 1, and perhaps 2. The committee regard the last-named drug as the safest yet discovered, and it is therefore satisfactory to note that it is the one in most general use. The investigators suggest that 'cocaine applications to the throat or nose should be restricted to 15 minims of a 10 per cent. solution, and that as a rule no more than 1.5 grains should be given when the drug is applied to a mucous membrane,' while the special danger arising from urethral injections

of this drug is wisely insisted upon. The committee recommend that the new drug butyn, the properties and full effect of which are still matter of experiment, should not be injected, but suggest that it may be applied in a 2 per cent. solution. It may be added that the British Medical Research Council has recently decided to inquire into the effects of the use of nitrous oxide, or 'laughing gas,' and its report will form a useful companion to that of the American Medical Association.

PAMPHLETS ON RURAL INDUSTRIES.

In our issue for March reference was made to the first ten of a series of Pamphlets on Rural Industries published by the Rural Industries Intelligence Bureau with the object of providing useful information in a handy form for those interested in the initiation and revival of industries in country districts. Two additions to the series have now been made. Leaflet No. 11 deals with 'The Importance and Value of Poultry Feathers,' showing how the feathers should be treated, how they may be disposed of, and the price that may be expected. Leaflet No. 12, which is illustrated, is concerned with 'Bundled Firewood Manufacture,' and deals with the subject in a thoroughly practical manner. Copies of these leaflets, and additional information on matters arising out of them, may be obtained on application to The Secretary, 258/262 Westminster Bridge Road, London, S.E.1.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

MISERY IS MYSTERY.

(From the Greek.)

MISERY his heart hath broken—
Misery is mystery!
Let the sad one lonely be:
As the Ancients slumped the token
Of a lightning-blasted tree.

Breathe no word, his doom is spoken—
Misery is mystery!
By its scathing lightning fated,
Human hearts are consecrated
For a higher destiny.

CHAN-TOON.

*. TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

THE GARUDA.

By 'AL KHANZIR,' Author of *Kharma*.

CHAPTER I.

I.

MY journey was at an end at last. Two years of soldiering in Waziristan stretched in monotonous perspective behind me, and for five long days I had been travelling—successively by Ford van, toy railway, and broad gauge. But the balance of ninety days' leave was to come, and here was my destination. Scarcely a destination to grow ecstatic about, you may think: only a little wayside station a few miles from the Ganges Khader. Yes, but the Khader of old Mother Gunga, where she flows, silent and muddy, in her league-wide bed of grass and tamarisk jungle alive with game—what memories its name recalls to all who have had the luck to know and love it! And my leave was to begin with a ten days' Christmas-shoot in my former haunts, unvisited since the War. Emphatically, the good wine had not been kept unto the last.

My host of the Christmas-camp was an old friend whom we shall call Geoghegan, a local 'heaven-born.'* As the train drew up at the platform a red-coated *chaprassi* appeared at the carriage door with a note of welcome. Leaving the *chaprassi* and my bearer to see to the luggage, I strolled off to find the waiting elephant which was to take me to camp. For many moons I had been a stranger in a strange land; and amazingly good it felt to mix once more with the homely peasant-folk as they fussed and hustled to board the local train—anxious fathers shouldering the family cooking-pots done up in bulky bundles, beringed and ankleted mothers sketchily draped in warm shades of red and brown, young hopefuls manfully sucking at gargantuan stalks of sugar-cane. To-day, even 'them spicy garlic smells' struck a note of friendly memory.

Yes, but was my brotherly love reciprocated? Soon I began to have serious doubts. If you have not wholly forgotten your *Ingoldsby Legends*, you must surely remember ill-fated Nellie Cook, whose way it was to 'look askew' at those of whom she disapproved? The crowd

adopted Nellie's attitude to a nicety. I sensed a new and subtle atmosphere: an atmosphere of mingled curiosity and aversion, of the sort which surrounds one fatally sick of some contagious disease. *Autres temps, autres mœurs*: the crowds of former years had behaved very differently. But then, thought I sadly, that's part of the price we pay for nursing serpents in our concorporate bosom.

But as my eye ran idly over the crowd all at once a familiar figure hove in sight, to bear down upon me with a grin of unequivocal welcome. One-armed Dulloo was an old henchman of the days when I was stationed in these parts, and—after the manner of old henchmen in India—had obviously received timely warning of my return through unofficial channels. And he at least was pleased to see me. Now Dulloo, you must know, was nothing better than an outcast Kanjar, a member, that is, of a tribe which the police unkindly term 'criminal.' But the law has no regard for a born hunter. And as my elephant shuffled out across the fields to head for camp, Dulloo fell in at my stirrup, as it were, to chat as we went of half-forgotten days—days spent together after boar and panther, antelope and duck. Very pleasing they are, talks of that kind, and soothing to the vanity; for your veteran Indian retainer knows the trick of graciously conveying to you that your successors with gun and spear are but sorry wights compared with you. So Dulloo beguiled the miles for me till camp was reached.

II.

It was early afternoon when at last we came to camp, pitched in the shade of a big mangrove. But at that hour it was deserted. After my journey a bath and a change were clearly the first essentials, so I made my way straight to my tent. Then, having bathed with due deliberation, I wandered over to the anteroom tent for a cup of tea.

Perhaps it was only the genial aftermath of a hot tub; or perhaps it was the long-unfamiliar sight of the green parrots flashing in the sunlight, and of the little mud-village across the fields where the women were drawing water

* Indian civilian.

from the well and the children herding the cattle—all with a disregard of military precaution little short of scandalous to one fresh from the excursions of the Border. However that may be, as I settled down in an easy-chair the conviction grew on me that the world was, after all, a better place than it had seemed for many a day. And then I heard some one open the flap-door behind me, and looked round to find that the newcomer was 'Judy' Elkington. His appearance was the one thing wanting to complete my happiness; for Judy and I had not met for three years, and if I might choose my company from all mankind, the chances are that he would be my first selection.

Metaphorically I took him to my bosom like a long-lost brother. Then, when he had dragged up another chair beside me, we settled down to that best of all conversation—the communion of kindred spirits met after long separation. About Judy's work, however, I was careful to ask no questions. That he was in 'Intelligence' at Army Headquarters I already knew, and it is never tactful to inquire too closely how the 'hush-hush' folk earn their daily bread. But as our first flow of talk began to run dry it was brought home to me that Judy was strangely preoccupied. And finally he himself broached the subject, in a most unexpected fashion too.

'Look here, old boy,' he suddenly began after a short silence, 'I want to talk "shop" to you now if you don't mind. You know my present job, don't you? Well, I may tell you that I'm down here on business combined with pleasure. And, what's more, I need your help; that's partly why I waylaid you this afternoon. But before you make any rash promise I must tell you, too, that there may be some risk—considerable risk, in fact. And you've earned a cushy time after those strenuous days in Waziristan, so you can refuse me with a clear conscience. Now, are you on to help, or would you rather spend your time shooting with the rest?—which, after all, is what you came for.'

'Help? Of course I'll help,' I said; 'always on the understanding that there are no night-operations; I've had enough of them to last me my natural life. But what's your game? I was just thinking how perfectly peaceful this part of the world appeared. Tell me more—or else I shall conclude that you're trying to make my flesh creep.'

'Right-o,' said Judy; 'I'll tell you.'

III.

'You said that everything looks peaceful,' he went on thoughtfully; 'and so it may. But, then, India's never wholly peaceful, is it? With three hundred millions involved, somebody's always up to mischief: the seditionist takes care of that. And for the past few months we've known that there was something unusually rotten in the state of Denmark. The

same old symptoms, you understand, only more so: tenants refusing to pay their rents; boycotts of English goods; refusals to find supplies for touring officials. And, what's more, every indication points to this very district as the seat of trouble. That's why I took advantage of Geoghegan's standing invitation to run down here—more or less incognito—to look into things for myself. And I've found out something, though not much.

'You know the great jhils* in the Khader here,' he went on again after a pause, 'where we used to have our big duck-shoots: tens of square miles of water and reeds set in quaking bog, with a geography which alters completely every year in the rains! Once you get among those reeds nobody on earth can get you out but the local marsh-men. They're Sindis, of course, these marsh-men—a regular colony apart with a language of their own. The story goes that they were imported by the Moguls all the way from the Sind marshes to supply fresh fish and water-fowl to the Delhi court every day. And, of course, you remember Murrawalla jhil, too? It's the largest marsh of the lot, where you and I had that big day's fighting the year before the War. Well, there's a queer taboo in force these days: the wealth of Golconda wouldn't tempt the boldest Sindi of them all to venture onto Murrawalla now.'

'That is queer,' I admitted. 'You'd as soon expect Brer Rabbit to shun his briar-patch. And how do you account for this taboo of yours?'

'That's just the question I can't answer,' Judy replied; 'for when your Indian gets hysterical, he ceases to be a reasoning being. But this much is quite definite: three perfectly good fishermen who were last seen starting for Murrawalla on their lawful occasions have severally been murdered, and one boy has disappeared. Nothing very extraordinary in that perhaps, except that the bodies of the murdered men when found were miles away from the jhil. In fact, according to the police theory, the fishermen were scuppered in everyday feuds over women or other debatable property—nothing whatever to do with Murrawalla. But that's not the popular idea. The people won't say much, but they're obviously convinced that to venture on Murrawalla is sudden death. And another thing, too, is as clear as daylight: though you'll hardly believe it, they're equally convinced that Murrawalla is "possessed." But whom by?—that's the question. The countryside's humming with old wives' tales. Pir Baksh, for instance, that old boatman of ours, swore to me that late one evening he had seen with his own eyes a monstrous shape hovering above the jhil, and had recognised the dreadful form of one Ratan Haji, a saint of great local repute, renowned

* Marshes.

for the miraculous javelin with which he extirpates unbelievers. But that's only one of the tales, for the popular version seems to favour a new *Atatāra** of Vishnu. Rumour has it that he's come to earth again as saviour of his people, riding on his winged charger Garuda, who, by the way, is king of the birds, as you'll doubtless remember, and devourer of evil-doers. Complete and utter rubbish, of course; but then the whole point is, the people believe it. And it's astonishingly bad for their nerves.'

IV.

'Who's at the bottom of it all?' Judy went on in answer to my question. 'There again you have me. Though, of course, their motive's perfectly plain. Just cast your mind back to the history of the Mutiny, and you'll remember how the moving spirits prepared the popular mind for the outbreak by spreading the wildest tales, and finished up by circulating those mysterious *chapattis* from village to village—a sort of vernacular edition of the Fiery Cross. The bulk of the people hadn't the faintest notion of the meaning of the sign. But rumour bred of boundless imagination supplied a thousand meanings; the whole country waited, breathless and ready, for something—anything—to happen. Well, that's precisely what I'm up against now. Again there's talk of signs and portents. Again rumour's busy; and the tension's increasing. With one's finger on the public pulse, as it were, one feels the excitement rising to fever-pitch. I promise you there are all the makings of a thoroughly bad show.'

'What have we done about it? Of course we're in touch with the regular leaders of the "enemy"; they're marked men. But their behaviour tells us nothing. There's literally nothing to go on—nothing, that is, but a parcel of ridiculous tales. Make no mistake about it, this journey we're dealing with artists quite outside the ordinary run. And I'm completely in the dark—I frankly confess it. Which, you know, is about the gravest confession I could make; for, though your intelligence merchant may tell you the worst with perfect *sang froid*, a confession of doubt is the unforgivable sin. Can you wonder, then,' he concluded earnestly, 'if I'm just about the end of my tether?' The mask had dropped for a moment, and that fleeting glimpse of over-wrought nerves—in Judy of all people—did more to convince me than all the arguments he could have produced.

'I take it, then,' I asked, as soon as I had recovered from my surprise, 'that if we don't clear up this mystery of Murrawalla, and quickly, there's going to be hell to pay?'

'Precisely,' Judy answered, with a return of his ordinary manner; 'and that's where you come in. You've hunted and shot round here

for years, and know the country better than most, so if you'll come with me it will be an enormous help.'

'I'll come all right,' I said; 'but I'm no use on Murrawalla, you know. There isn't a landmark in the whole place; without a local guide we're bound to be lost.'

'I've thought of that,' said Judy. 'You haven't forgotten all your classical education, have you? What about one Theseus, who shikarred the Minotaur in the Cretan labyrinth? I seem to remember that he found his way out by means of a ball of twine supplied by his doting Ariadne. Well, we'll take that same twine with us in our dugout to-morrow, so we sha'n't need to worry about our line of retreat. And I've reconnoitred a way to the edge of the marsh. To-morrow Geoghegan and the others are shooting near camp, but I told him that you and I would like to spend the day farther afield—you see, I took it for granted you'd join me. We'll have the day to ourselves, and before night we'll get that secret out of Murrawalla, or my name's mud.'

After some further talk a sudden idea struck me. 'Look here,' I said, 'we've still got an hour's daylight left; and if I remember right, from the cliffs only about a quarter of a mile from camp we can see Murrawalla and the whole Khader spread out below us. What about strolling over to spy out the land?'

Judy agreed; and as we left the mango-grove together, an unexpected reinforcement emerged from the direction of the elephant-lines to fall in behind us. I had forgotten Dulloo.

CHAPTER II.

I.

OF course Dulloo was the man for the job; if any one could solve a mystery connected with the Khader, that man was Dulloo. As I have previously hinted, he was not one of my most reputable friends; in fact, I have a suspicion that had Dulloo figured in *Who's Who*, we should have read against his name an entry something to the following effect:

Profession . . . Dacoity.*

Recreations . . . Cattle-stealing and poaching.

But, for all that, his was a friendship which I valued highly, for I knew that Dulloo would never let me down. And you must not judge Dulloo by a Western code of morals; in India to this day one follows the calling to which one is born.

Our first meeting is still very clear in my memory, though it is a good many years ago now. To compass the death of a gray Khader wolf happened at that time to be my pet

* Incarnation.

* Robbery under arms by five or more persons is technically dacoity.

ambition. But a wolf can be a peculiarly elusive beast. Thus it came about that one day I was seated disconsolately on a sand-dune overhanging the Khader. Next day I had to return to civilisation, and the wolf was not yet in the bag. And then I looked up, to find a slim, jaunty little man standing before me and salaaming. It was Dulloo.

Some lucky folk, male and female, have the knack of looking distinguished no matter how they may be dressed. Dulloo had that knack. His outfit then, as always, consisted of a twist of dingy cotton round his close-cropped crown, a discarded 'Tommy's' frock of khaki drill, and a scanty cotton *dhoti*, whence his brown shanks emerged bare from the knee. But the poise of his lithe body seemed to have caught something of the easy grace of a wild thing, and he looked you in the face with a pair of the keenest brown eyes you have ever seen. There he stood in his rags, with his faintly ironical smile showing just a glint of gleaming teeth beneath his little jet-black moustache; a rogue and a thief, no doubt, but a *beau sabreur* to his finger-tips. I have always believed that Dulloo had a lot of good Rajput blood in him. In the olden days, you see, these wandering tribes were often given protection by some *grand seigneur*—just so long as husbands were complacent—with the result that much of the best blood in the land flows in their veins.

He had heard that I wanted to shoot a wolf, he said. Well, then, if I would come to the spot in the Khader where that date-palm in the distance showed up straight as a ramrod growing out through the branches of the big peepul-tree—and he waved his hand towards the landmark—he would promise me a wolf that very evening. Needless to say I agreed; and an hour before sunset you might have seen a party of three, consisting of Dulloo and his young son of fifteen and myself, seated in the light grass near the tree. Then followed the weirdest performance I have ever witnessed. Dulloo and his son set themselves to howling; loud and shrill the blood-curdling wolf-call floated over the Khader. It was the triumphant pæan of the wolf who has killed. And soon like an echo faint from the ravines there came an answer—an answer that approached nearer as fast as a hungry wolf can gallop. But the supreme display of woodcraft was yet to follow. When the answering call sounded close beside us, all at once my companions ceased their howlings, and, throwing themselves on their hands and knees, fell to worrying Dulloo's stout bamboo stick which lay on the ground close by. They mouthed and bit and snarled over that stick till I could have sworn that two wolves were gnawing a bone beside me. And the stranger came to the same conclusion. He arrived—at a gallop—a great dog-wolf with hackles raised, and was within ten feet of us

before he realised his mistake. We were both surprised, but I had an unfair advantage. The wolf died.

In this manner my friendship with Dulloo started. And it waxed through many vicissitudes, for together we must have worked destruction of every kind of furred and feathered game in the countryside—by fair means and by foul. Together we have netted the duck by night on a jhil—and a plaguy dark, cold business it was, too. And, low be it spoken, we once netted a crusty old boar. Though *not* in hunting-country, believe me. And before you lightly dub us cold-blooded assassins, try to net a boar yourself. When 250 lb. of bone and gristle arrive—very peevish—in your quite inadequate net, then, if you would avoid the fate of the late lamented Adonis, you had best be nippy with your spear.

But, when all's said and done, hunting—or poaching, if you prefer it—was nothing more than Dulloo's relaxation. About his serious business in life he was discreetly silent. And who am I to inquire too searchingly into my friends' affairs?

The event which sealed our friendship was this. One baking day in May news reached me that Dulloo was sick unto death. And by five o'clock that afternoon a borrowed Ford had borne me twenty-five rough miles to his village, where I was met by an emaciated ghost of Dulloo, who crept out with his right arm strapped to a board across his chest. That arm was an unpleasant sight. From the hand to a point about three inches below the shoulder it was a bloated, shapeless, bladder of pus: at that point it narrowed in a bottle-neck to a wasted stick. There and then I packed him into the car, and that very night his arm was amputated. His recovery was marvellous. He swelled visibly, and within a month was hale and hearty again. He explained that the trouble all arose from a poisonous thorn. Perhaps, but the doctor certainly extracted a buck-shot from the amputated arm. At any rate Dulloo was thereafter ridiculously grateful to me for an act which, after all, was nothing more than one of common decency.

I have described Dulloo at some length to you, for he is perhaps the most important character in this tale.

(Continued on page 520.)

THE FAIRIES.

For they passed at dusk, an hour ago,
And the song they sang I do not know;
I seemed to hear faint bells aringing,
And then they went by singing—singing.

There were elfin men with painted wings,
And a girl with hair in golden rings;
One look she gave me, sideways glancing,
And in the gloaming vanished—dancing.

P. G. N. CHAMBERS.

HONEY.

By CANNING WILLIAMS.

'The bee is little among such as fly; but her fruit is the chief of sweet things.'—*Ecclesiasticus* xi. 3.

I.

ACCORDING to the Mohammedan faith, the honey-bee will be one of the ten 'dumb animals' which will be gathered into heaven. 'The bee alone,' says the Koran (the Mohammedan Scriptures), 'has the honour of providing with its pleasant scent a substance created to be used in honour of devotion, and which lights the hour of prayer for all religions. Do not tapers burn in honour of prophets, of saints, and of the dead who have gone before into another world? This is why the insect is sacred.'

This being so, it is not surprising that supernatural powers were claimed for the bee's principal product—honey. It dissolved gold and other metals; infants fed upon it developed in later years wonderful powers of eloquence; it restored vigour to old age; dissipated melancholy, anger, and 'corrupted blood'; and—perhaps most wonderful of all—it induced luxurious crops of hair to grow on shiny crowns!

The Greeks (in whose mythology the bee has a place) thought that honey was the best diet for old persons, and, according to Pliny, there was a certain man named Raemilis Pollio who attributed his health and vitality at the age of a hundred to the fact that he was a confirmed eater of honey, and had been long addicted to the habit of rubbing his body with olive-oil. I have known of centenarians who explained their longevity on less reasonable grounds.

In Burma, to this day, honey in which the embalmed body of a Buddhist priest has lain for a considerable time is sold in the markets, and consumed by the faithful in order that they may 'gain merit.' It is called 'potted hpoongyi'—a sort of extract or essence of priest. Honey was employed in Egypt as an embalming material, and it is probable that some was so used when our good old friend Tutankhamen was prepared for posterity.

In olden days the theory was held that honey, like manna, fell from the skies. Virgil, the poet of the bee (who appears to have been an apiarist, and therefore should have known better), opens his Fourth Georgic with the words: 'Next will I discourse of Heaven's gift, the honey from the skies.' In an essay 'Upon the Nature of Honey,' which was contributed early in the eighteenth century to the Proceedings of the Royal Academy of Sciences in Paris, it is said: 'We no longer believe, like the ancients, that honey is formed of the dew which falls upon flowers; nor is it any longer taken for a

production of the air, or a present from Heaven.' But, from the remarks which follow, it is clear that the essayist's own notions as to the derivation of honey were extremely hazy.

II.

It cannot be said with accuracy that bees 'make' honey, in the sense, for example, that cows make milk; nor is it correct to state that they gather it. The substance they collect with such literally consuming energy is nectar, which is no more like ripe honey than grape-juice is like an old, full-bodied port.

Nectar is a thin sugary juice which is secreted by the nectaries of various flowers. Some of it is required by the flower itself, but the greater part is employed by Nature as a bait to attract insect visitors, which, unknown to themselves, act as important aids in her scheme of plant-fertilisation by conveying pollen, the fertilising dust, or male element, from one flower to another. The chief agent in this respect is the honey-bee. Indeed, the true work of the bee is that of a fertiliser of seed. She wings her humming way in the summer sun in search of food for the countless children of the hive. This is the obvious purpose of her labour. But the real purpose is hidden from her (as the chief ends of life so often are), and is infinitely more important: it is to add to the beauty, the fragrance, and the fruitfulness of the earth—to contribute to the glory of June and to the splendour of September.

Pollen—'the love-ferment of every flower of spring,' to quote Maeterlinck—forms an important part of the food of bees, especially when they are in the grub or larval stage of their existence, and large quantities of it are brought into the hive in the 'pollen-baskets' with which the hind-legs are provided. It was known to the old bee-masters by the expressive name 'bee-bread.'

When a bee burrows into a flower for nectar, or pollen, or both, granules of the fertilising dust adhere to the minute hairs with which its body is covered, and these are borne to another flower of the same species, with the result that some of them are brushed off and effect the pollination or fertilisation of the seed.

The value of bees as pollinators is appreciated by progressive fruit-growers. I received last year from a large English jam-producing concern a circular offering bees for sale. They said: 'It is well known that we keep bees on a very extensive scale. The original object of this was the fertilisation of our orchard-trees, but the actual production of honey, to the extent of several tons a year, is also of great importance.'

The owner of an 800-acre fruit-farm at Gloucester, N.J., stated: 'I could not do without bees. I never take a pound of their honey. All I want them to do is to pollinate the blossoms.' And a Nebraska fruit-grower, writing in the *Independent Farmer*, gives this remarkable testimony: 'We had 300 bearing cherry-trees close to our apiary. During the blooming season there were two days during which our bees worked on these cherry-blossoms profusely. As a result we harvested 300 bushels of cherries when our neighbours two or three miles away, who had no bees, and whose trees bloomed as profusely as did ours, were compelled to come to our orchard for cherries.'

The nectar is sucked up by the bee by means of a long, flexible organ, popularly called the 'tongue,' and passes down the gullet into the honey-sac or honey-stomach, which is capable of considerable distension. Below this receptacle is the mouth of the food-stomach, which is opened or closed at will—opened when the insect requires nourishment, and closed when the liquid is to be retained.

On returning to the hive the bee brings the muscles of the honey-sac into play, and the fluid is forced out of the mouth and deposited in the cells. On my explaining to my seven-year-old son how the bees get rid of their loads, a look of unutterable disgust came into his face, and when next he was asked to have some honey he replied, with a shudder, 'No; I don't want any of the nasty stuff. It comes from bees' stomachs!' In vain I pointed out that bees' stomachs were very clean little things.

III.

Nectar may be described roundly as a mixture of cane-sugar (*sucrose*) and water. By some process, which does not even yet seem to be fully understood, the bees change the *sucrose* into invert-sugar, or honey. It is held by some that a chemical change takes place in the nectar while it is in the sac of the bee; others are of opinion that the change is effected after it has been deposited in the cells. This question was referred to by James Bonner, bee-master, who in 1795 published his interesting *New Plan for speedily increasing the Number of Bee-hives in Scotland*. He says: 'Some writers believe that when the liquor which the bees collect has been for some time in their stomachs it comes from thence changed into true honey, the liquor having been there properly digested and rendered thicker than when it entered. Others are of opinion that the bee makes no alteration in the honey, but collects this delicious syrup just as Nature produces it, and first fills her bag, and then discharges it into the magazine; which appears to me to be the most probable opinion.' A few pages further on he gives his imagination full wing: 'A conjecture may naturally arise here

that, seeing bees do not *make* honey, but only collect it, if we could by any device fall upon a plan to extract it from flowers, or, in other words, to pour 10,000 of Nature's vessels full of honey into one of our artificial ones, it would be astonishing what a prodigious quantity might be produced throughout the island. Scotland alone, I will venture to affirm, would in such a case produce more honey and wax in one good season than would load one of His Majesty's first-rate men-of-war.'

The secretion of nectar varies greatly with the state of the atmosphere. 'During the prevalence of dry easterly winds the fields present to the bees nothing but barrenness; . . . but when the weather is moist and sultry, and the air charged with electricity, the circulation of this vegetable fluid is considerably accelerated.' All apiarists have observed the marked increase in the activity of their bees when there is 'thunder about'; and also how they hurry home in a panic of alarm, and crowd and jostle one another on the alighting-board, if the storm is about to burst. The instinct of self-preservation has developed in the fragile bee a fine weather-sense.

From analyses made by a Swiss chemist (Dr A. de Planta), it was found that the quantity of water in the nectars he examined varied from 50 to 93 per cent.; whereas in ripe honey there is only about 20 per cent. Dr de Planta concluded that a good deal of the water is thrown off by the bees while the nectar is in the honey-sac. My own view is that the nectar is usually in the sac for too short a time for any appreciable evaporation to take place. Be this as it may, the greater part of the excess moisture passes away after the nectar has been stored in the cells, and this process, except when the atmosphere is very damp, is by no means a lengthy one in the high temperature of the hive during the summer. The woollen coverings which are placed over the combs—'quilts,' to use the technical word—absorb some of the moisture, and some of it is driven out of the entrance by a clever ventilating device known as 'fanning.' Two squads of bees stand at the entrance, one squad facing inwards and the other outwards, and all vibrating their wings with such rapidity that they do not appear to move at all. This draws in a current of fresh air on the one side and expels the moist air on the other. If on a warm evening, when a large number of fanners are at work, a lighted candle be held close to the entrance, the force of the outward-moving air will extinguish the light.

In order to expedite the evaporation of moisture, the bees adopt another plan which is graphically described in an American book, the *A B C and X Y Z of Bee Culture*. 'After the day's work is about over, almost the whole colony spreads out over all available surface,

and nearly every bee has her sac full of honey. All the bees hang vertically with head up. . . . Then each bee opens her mandibles and mouth and forces up a drop of nectar. This drop fills the mouth and extends up over the upper lip and fills the space between the mandibles. . . . Next, the bee begins a chewing motion with the lower "jaw," and this causes the drop to pulsate. . . . For about ten minutes this operation is continued; then the drop is swallowed, and after a few moments' pause another drop appears and the process is renewed. This is continued by the colony until about 11 P.M., or sometimes later, and then work stops and all hands go to sleep.'

As soon as the honey becomes of the right consistency—the point, that is, at which it will not ferment—the bees seal it over with a delicate capping of white wax, and there is produced that truly beautiful thing—honeycomb. Native British bees—which are becoming rare owing to the importation of foreign queens and the consequent mixture of races—produce comb with the whitest and neatest cappings.

The most valuable flowers from a bee-keeper's point of view, arranged somewhat in the order of their appearance, are the crocus, dandelion, gorse, wallflower, fruit-blossom, hawthorn, white clover, sanfoin, lime, and heather. Of these, white clover, sanfoin, lime, and heather are the chief nectar-yielders.

Honey-bees would obtain large supplies of nectar from red clover if their tongues could be lengthened by about a third. Attempts have been unsuccessfully made to produce a strain of bees with longer tongues, and, until this improvement (?) is effected, or the bees have learnt the trick, practised by a short-tongued species of humble-bee, of piercing the tubes of the clover at their base, this flower will, in the main, be the preserve of the humble-bees. I say 'in the main,' because the second crop of red clover has shorter tubes, and so the honey-bee is able to 'make boot' upon it.

IV.

A honey-bee weighs $\frac{1}{300}$ th of an ounce; its 'load' of nectar is, therefore, extremely small. An American scientist ascertained that the average load weighs about $\frac{1}{1250}$ th of an ounce—a quarter of the bee's weight. This means that 20,000 journeys (reckoning the outward and inward trip as one) are necessary for the gathering of a pound of nectar; but, as flower-juice loses at least one-half of its bulk before it becomes honey, it follows that the production of a pound of honey involves on this reckoning a minimum of 40,000 journeys. If we assume that the average trip out and home measures half a mile (a low estimate), the immense distance of 20,000 miles must be covered in gathering the raw material for a pound of honey. This is equal to 1250 miles per ounce.

Is there any wonder that bees in the summer work themselves to death in six or eight weeks, and that it is the delicate wings that are usually the first to give out?

But what the bees lack in size and strength they make up in numbers, industry, and unity; and it is surprising what a large harvest of honey a strong colony will yield when the conditions are favourable. In order to note the daily increase in the weight of one of his hives a Californian apiarist placed it upon a scale, and kept a record extending from the 16th of April to the 30th of June. The increase varied from nil to twenty pounds per day, the average for the seventy-six days working out at seven pounds. A British patriarch of the craft (Mr T. W. Cowan) also records that one of his hives gained twenty pounds in a single day, and that from each of seven hives he obtained in one season an average of 194 pounds. An even greater 'take' was that of a Dutch stock—439 pounds.

These extraordinary results are obtained from colonies with huge populations—100,000 or more—which are not, as a rule, the progeny of a single queen. Combs containing brood are taken from other hives and given to the one which it is desired to strengthen, additional boxes to accommodate the combs being placed over the original brood-chamber until the hive may stand as high as a man. Four or five pounds of increase per day per colony of average size during the nectar-flow is excellent work, and this is not to be obtained unless district, weather, and management are good. Any one, however, who embarks upon what has been appropriately and alliteratively styled the 'perfect pastime of peaceful people' should not reckon, taking good and bad seasons together, on securing more than from twenty to thirty pounds per hive. It is necessary that this cold fact should be stated in view of the assertions of interested persons. But your true apiarist does not keep bees for the harvest alone.

By far the greater part of the honey placed upon the market is 'run' or 'extracted' honey. The cappings of the honey-combs are sliced off by means of an uncapping-knife, and the combs are then placed in a wire cage which, in turn, is put in the extractor, a tin cylinder in which the cage is made to revolve at considerable speed. The honey is thrown out of the cells, and, striking the side of the extractor, drains to the bottom, whence it is drawn off and strained. The combs, very little damaged, are then returned to the hive, when the bees repair and clean them, and, if the 'flow' is still on, fill them again. I have combs which have been in use for more than ten years, and they are as good to-day as they ever were. Heather-honey is too thick to be extracted in this way; it is therefore either pressed out or sold in the comb.

v.

There is not, I think, as much honey produced in these islands at the present day as there was twenty years ago. This falling off is due to the Isle of Wight disease (now known as Acarine disease), which has killed thousands of colonies, and disheartened all but the most enthusiastic apiarists. Thrice has my own apiary been all but exterminated by this dread scourge. The cause of the disease was unknown until a year or two ago, when Dr Rennie and his associates, of Aberdeen University, traced it to the presence of a parasitic mite in the air-tubes of the bee. Experiments are being made to discover some means of killing or expelling the parasites without injuring their hosts. The general opinion is that the disease is becoming less virulent—to know the cause is a big step towards a cure—and there is strong reason for thinking that its days are numbered.

TABLE SHOWING THE QUANTITY AND VALUE OF HONEY IMPORTED INTO THE UNITED KINGDOM DURING THE TEN YEARS 1913-22.

Year.	Quantity in Cwt.	Value.	
		Total.	Average per Cwt.
		£	£ s. d.
1913	31,815	50,673	1 11 10
1914	23,372	37,666	1 12 3
1915	53,601	93,603	1 14 11
1916	91,839	187,272	2 0 9
1917	209,439	825,737	3 18 10
1918	320,004	2,702,734	8 8 11
1919	173,228	892,988	5 3 1
1920	53,021	224,201	4 4 7
1921	24,894	81,909	3 5 10
1922	53,373	166,267	2 17 0
Totals...	1,039,636	5,263,050	5 1 3

The quantity of honey consumed in the United Kingdom is considerably in excess of

that produced therein, as is indicated by the above table, which I have compiled from figures supplied to me by the Department of Overseas Trade. Note the large increase both in quantity and price in the years 1917-18-19—due mainly to the fact that, while there was a shortage of sugar (which was rationed) during this period, there were no restrictions on the sale of honey.

The United States of America supplied the largest quantity during the ten years (368,721 cwt.), the remainder coming from British West Indies (187,761), Chile (127,811), Australia (93,553), Cuba (88,049), France and other foreign countries (116,632), and New Zealand and other British Possessions (57,109 cwt.).

Strange as it may seem, honey is exported from the United Kingdom. In normal years the quantity is not great, but in 1919-20-21 it amounted to 49,497, 30,143, and 26,722 cwt. respectively. In 1921 the exports actually exceeded the imports by 1828 cwt., 11,072 cwt. going to the Netherlands, and 6176 to Germany. In 1920 the largest customer was the United States—the principal honey-producing country in the world!

Honey possesses great food-value, as it is the purest and most easily digested sweet in the world, and, not having undergone the heating and other processes necessary for the manufacture of sugar, the vitamins are not destroyed. For children it is the ideal sweet. It is also excellent for inflamed conditions of the throat; and I know of no finer drink for persons suffering from cough than one composed of lemon-juice, honey, and hot water.

'My son, eat thou honey, because it is good.' But do not eat too much at a time, or the result may be as stated in Proverbs xxv. 16.

Of all the meals you can buy for money,
Give me a meal of bread and honey.

So sings Richard le Gallienne, who, if he had had the chance, would certainly have joined the queen in the parlour rather than the king in the counting-house.

A PRINCE OF RIFLEMEN.

THE 'MAD MINUTE' AND THE 'OLD CONTEMPTIBLES.'

By Lieutenant-Colonel J. L. SLEEMAN, C.M.G.

UNQUESTIONABLY the Germans failed to gain a victory in the Great War owing to their initial blunders of 1914. Chief among these was their ignorance regarding the power-value of the modern rifle when used by our highly experienced long-service soldiers. Time after time in 1914-15 the mighty hordes of the German Army were stemmed by an insignificant number of 'Old Contemptibles,' compelled by

circumstance to rely almost entirely upon the rifle for their defence. So excellently were their rifles used that the Germans thought their set-back due to large numbers of machine-guns, whereas the infantry battalions of the British Army—owing to the apathetic folly of some who should have known better—possessed two machine-guns only. When, therefore, we praise the work of the Navy, the Army, and the Air Force for having won the Great War, history should record the fact that, but for the 303

rifle wielded by brave, well-trained, and disciplined soldiers trained to the 'mad minute' (fifteen well-aimed rounds in one minute), the Germans must have triumphed in their initial march on Paris in 1914.

It will, then, be of interest to place on record the work of one whose name throughout the 'Old Contemptibles' was associated with the highest degree of musketry efficiency ever attained, one, moreover, who was largely responsible for the high standard of musketry efficiency attained by the soldier of the 'Old Army' prior to 1914—Wallingford, the Prince of Riflemen!

It was my good fortune to meet Staff-sergeant-major Wallingford when, as a subaltern, I attended my first course of musketry at Hythe some twenty-three years ago. Already his fame had spread throughout the army, and I remember the intense interest with which we young officers looked forward to the demonstration of rifle-fire given by Wallingford to each party of officers attending a Hythe course.

The first impression of Wallingford was one of respect for his complete control of himself. Most of us have our 'off-days,' when we are unable to perform satisfactory work. Wallingford, however, appeared to have no 'off-days'; during a number of years he was expected to show the highest form on all occasions, and he always succeeded in fulfilling those expectations. Tall, wiry, cool, and determined, Wallingford was the *beau-ideal* of a soldier, while he possessed those clear, steel-blue eyes so curiously typical of good rifle-shots.

On one occasion he gave us a demonstration of shooting on the 1000 yard range. The conditions were extremely bad, for a strong gusty wind was blowing from a flank and light rain driving across the butts. Before a body of critical young officers the ordeal must have been a difficult one to a lesser expert; but Wallingford appeared totally unconcerned, and, after adjusting his sights, fired his first round. The hit was recorded as being at the extreme top right-hand corner of the target. This appeared to be all the guide that Wallingford wanted, as he followed this shot with thirteen bulls' eyes in succession, to the great astonishment of us subalterns, most of whom had missed the target altogether prior to this exhibition. Subsequently, he gave us many similar exhibitions of his amazing prowess with his beloved arm. Until then we had not appreciated what a '303 rifle could do, and we returned to our regiments with a very considerably increased respect for the British rifle.

After leaving Hythe I soldiered for some years in Africa and India, and was there to learn the immense respect in which Wallingford's name was held by the private soldier. Any man in my regiment who particularly distinguished himself in rifle-shooting was always nicknamed 'Wallingford,' the sincerest form of flattery that can be offered by the British soldier.

I was not destined to meet Wallingford again until the Great War—fourteen years later, when I had the honour of serving with him. He had by then transferred to the New Zealand Army, and attained the rank of major, and had taken part in the first operations on Gallipoli with immense credit to himself. It is not too much to say that at one period of those trying days on the peninsula it was Wallingford's efficient handling of his machine-guns that stopped a Turkish counter-attack which might well have proved disastrous to our army. Unfortunately for the Turk the New Zealand machine-guns were commanded by unquestionably the greatest expert in the world, Wallingford, and line upon line of brave Turkish soldiers advanced to certain death into the path of machine-gun bullets.

As Director of Military Training to the New Zealand Forces from 1916 to 1921 I was later afforded the opportunity of speaking to hundreds of officers and men who served with the Australian and New Zealand Forces on Gallipoli, and I was immensely impressed with the absolute unanimity with which they expressed their admiration for Wallingford's wonderful handling of the rifle and machine-guns, and his utter disregard for his life during those critical days. For the Colonial soldier is ever a severe critic, and seldom gives credit unless it is absolutely deserved.

Apparently in the early days on Gallipoli, when a particularly obnoxious Turkish sniper manifested himself, who proved too difficult for the ordinary shot to locate or dislodge, it was the custom to send for Wallingford. He would arrive in the trench nearest to the sniper, as cool and unconcerned as if in Bond Street, and, after receiving all particulars regarding the supposed position of the Turkish sniper, would expose himself over the parapet in order to obtain 'first-hand' information as to the exact position.

His amazing knowledge, gained in many years of musketry experience, enabled him almost invariably to judge the position of the sniper, once he had been fired at, by a well-nigh 'Sherlock Holmes' power of deduction. Once the sniper's position had been ascertained, Wallingford would charge his magazine and engage in a rapid-fire duel with the sniper, which always ended in Wallingford's success. In most cases I was assured that Wallingford was able to fire at least three shots to a sniper's one. So much for the value of musketry training during times of peace.

II.

Wallingford may well be said to have been born with a rifle in his hand, for he first saw the light of day in the Rifle Brigade, and enlisted in the brigade when fourteen years of age.

There was then a system by which a soldier could go to the rifle range instead of attending early morning parades, provided that he paid for his own ammunition.

Wallingford's love of musketry was such that he then often went without supper in order to be able to pay for his ammunition. Those were the days when the army messing was not so good as it is to-day. His sacrifice to the goddess of musketry was to be rewarded, as Wallingford's shooting record will show.

In 1890 he won the Southern District Recruit Championship, and was the best shot in his regiment. In 1892 he again won the Recruit Championship, and the Southern District 'Old Soldiers' Championship. In 1893 he won *The Daily Telegraph* Cup at Bisley, and the Prince of Wales' Prize in 1898 and 1910. In 1894 Wallingford went to the School of Musketry and obtained the best shot certificate; following his course, he returned to Hythe as an instructor, and, two months later, in 1894, he became the best shot in the army for the first time. He also shot in the Army team. In 1896 he was the best shot in the army for the second time, and in both 1894 and 1895 he won the Aldershot Championship. 1898 saw Wallingford the best shot in the army for the third time. In 1899 he was selected to proceed to The Hague as one of the British team. There he won the prize for the best shot in Europe for prone shooting, gaining ten points more than the record. This performance established the fact that the British Lee-Enfield rifle was equal to any in Europe, because Wallingford shot with a rifle issued to him for drill purposes and with ordinary rifle ammunition. The team score at The Hague was not so satisfactory—in fact the British team were at the bottom of the list; Wallingford always held the theory that, owing to this, the Boers came to the conclusion that the British shooting was inferior, and, accordingly, declared war four months later. The Boers were certainly not far wrong, for shooting, except by a few men in each regiment, was remarkably poor.

A fortnight after winning this European Championship Wallingford became the best shot in the army for the fourth time. Like many other things the South African War proved the turning-point of the army's shooting, and, in 1901, with Colonel Pennington as commandant and Colonel Munro as chief instructor, a new system of musketry training was introduced, which included rapid fire, free drill, the personal touch, the Colonial style of handling men, snap-shooting, natural targets, and fire action applied to active service conditions. This may be described as the birth of a system which reached its majority during the retreat from Mons. It was the Renaissance period of British army musketry.

In 1903 Wallingford was made warrant-officer for experiments, under Colonel Munro as commandant, with Colonel Bird of the 'Queen's' as chief instructor.

From this time forward Wallingford and his

staff-sergeants were continually called upon to give demonstrations of rapid fire, moving fire, machine-guns, and any automatic rifles that were brought to the notice of the Army Council.

In 1904 the Rexer gun was experimented with, and gave remarkable results. Staff-sergeant Churcher fired ninety-two rounds in a minute with single shots at 800 yards, making sixty-two bulls and inners. Wallingford could never understand why this gun was not adopted. I believe it afterwards became known as the 'Madsen' gun, concerning which there was so much discussion in 1918, when championed by Lord Charles Beresford.

In 1903 Wallingford won the Army Championship for the fifth time, gaining his sixth win in 1907—a very remarkable record. To be Army Champion once is a great record; to gain this high distinction on six occasions within nine years is truly wonderful.

III.

In 1903 the great importance of rapid fire became obvious, and Wallingford was continually called upon to give demonstrations of this character. So proficient did he become that he could always be relied upon to fire from thirty-three to thirty-five rounds in a minute, at 200 yards range, and to place all his shots on the target. There are many, like myself, who know with what difficulty one fires the fifteen rounds a minute required by the regulations who will appreciate the amazing efficiency called upon to more than double this number of rounds. Although Wallingford was required to maintain this rate of fire on hundreds of occasions, and for many years, he practically never failed when a good performance was needed. It was, however, recognised that this rate of fire was quite abnormal, and the necessity for ascertaining the number of rounds which an ordinary soldier could be expected to fire in one minute became obvious. Wallingford, therefore, trained four School of Musketry workmen for a month to see what standard of rapid musketry they could attain. These were old soldiers; yet, on the day of their trial, he marched the men several miles in full marching order, and they then fired twenty-five rounds per minute. This conclusively proved that, with expert tuition, the ordinary soldier could be expected to fire from twenty to twenty-five rounds a minute without difficulty. It was therefore decided that the soldier trained by the ordinary regimental N.C.O. could reasonably be expected to fire fifteen well-aimed rounds in a minute, and this was accordingly the standard laid down in the Musketry Regulations, a standard which proved its value at Mons.

In 1899 Wallingford established at Aldershot a possible at all distances—200, 500, 600, and 800 yards. In 1907, when winning the championship of the army for the sixth time, he made a

possible through the three ranges, without a 'sighter,' and with the open bar sight; on that day, for his three performances, he got 101, 102, and 105. In 1906 Wallingford was sent to France to show the French School of Musketry the Halle Automatic Rifle, and on his return to Bisley he put in five shots with this rifle in one run of the deer—all in or near the heart, repeating this performance in the following year.

In 1906 there was a match for one automatic against two Lee-Enfield Rifles. The conditions were three seconds up and three seconds down at a target which made four appearances for three intervals. Wallingford made twenty-three hits with a rifle which carried five shots only in the magazine and one in the chamber. This meant that he had to fire six shots in three seconds and then get the chamber and magazine loaded in the next three seconds, and so on.

In 1910, with a Winchester repeating rifle, Wallingford fired ninety-two rounds in one minute at 200 yards. This rifle holds ten rounds, and, by means of spare loading tubes, he managed to fire this number. In all these tests Wallingford, ever modest, regarded his success as attributable to constant drill. Some of Wallingford's best scores have been in team matches. In the Palma Trophy in 1902 he was top. In the Empire Trophy of 1910 he was again top. In 1903 Wallingford won the Martins Cup at Bisley.

Wallingford represented the army in 1907 in the rifle team that went to Canada and Australia under the command of that famous rifle-shot, Colonel Hopton, and Colonel Sir Phillips Richardson as the shooting captain.

In 1911 Wallingford transferred from the British Army to the New Zealand Forces, and proceeded with the Anzacs to Gallipoli as Infantry Brigade Machine-Gun Officer in 1915. It was there that he was able to see that the arguments used by the staff at the School of Musketry, following the South African War, were based on sound conclusions. These arguments were that officers without war service should not be allowed to draw up rules governing the fighting instruction of the soldier, and that those in charge of musketry training should remember that the personal factor must always be taken into consideration. Wallingford never forgot that on one occasion, when the new rifle was under discussion, the artillery members of the committee appointed made him shoot a charge of fifty-one grains of cordite, in the lying position, at his greatest rapidity, overlooking that a rifleman was not made of steel like the guns they were accustomed to deal with.

Wallingford's wonderful shooting record was not due to extraordinary physical strength or abnormal qualities. Ever a sparely-built man, he owed his success almost entirely to concentration, self-control, and an amazingly strong power of determination. Surrounded, as he was at

Hythe, by the best rifle-shots of the British Army—which is equivalent to saying the world—Wallingford succeeded, year after year, in maintaining his position as the greatest musketry expert of all. To succeed in doing this for one year is creditable; to maintain this reputation for seventeen years is wonderful. As I can testify, by a knowledge of Wallingford's Spartan habits, this was not achieved without denying himself most of the 'pleasures of life,' which sap the self-control and nerve of lesser men.

It should be placed on record that, on the day Wallingford won the Prince of Wales' Prize in 1898, his son was born. Twelve years later, in 1910, on his birthday, this son had the pleasure of seeing his father win this prize again. A remarkable coincidence, and proof of no deterioration. Wallingford's motto has always been, 'Never give in until the last shot has been fired.'

Such is the history of Major J. A. Wallingford, M.C., and I feel sure that those who read this article will agree that he has a remarkable record, and that the great part he played in teaching the army to shoot should be remembered by the nation he has so worthily represented. Let us always remember this when we recall the stemming of the German rush to Paris in 1914.

THE ENIGMA.

Do you not know?—

That the sky is blue,
And the fields are green,
And the scent of the flowers,
From the roseate bowers,
The fresh air dowers.

But why it is so

No one can tell;
I yield to the spell.

Do you not know?—

That the ocean is broad,
And the world is wide,
And deep are the springs
Of the life that brings
The beauty of things.

But why it is so

You will not find
In the logical mind.

Do you not know?—

That your lips are sweet,
And your voice is a song,
And your ears are shells,
And your eyes are wells
With their liquid spells.

But why it is so

I will not ask—
'Twere a fruitless task.

Do you not know?—

That my love is deep,
And my faith is strong,
And my life is found
In your keeping bound,
With your beauty crowned.

But why it is so

Is a secret, I trow,
That God only can know.

W. KINGSLAND.

THE LARGER VISION.

By D. E. STEVENSON, Author of *Peter West*.

I.

JANET LOGAN stood at the door of her little greengrocer's shop gazing down the steep street with unseeing eyes. The sun shone brightly, casting the long shadows of afternoon upon the cobble-stones. A soft breeze, laden with the scent of the sea and with the familiar smell of fish and tarred ropes, crept up from the harbour, and stirred the strings of onions which hung on each side of the door. In the dim background of the interior glass jars of gaily-coloured sweets and tins of canned fruit winked a faint challenge to the winter sun.

Janet stood in the same attitude for a long time without moving—it was the stillness of body which goes so often with a patient and contemplative mind. Her eyes turned to a yellow shield which was affixed to the house opposite, telling the inhabitants of Port Andrew the exact distance to Carlisle, London, and John o' Groats. Janet had never been out of the little village in which she had been born, but to her simple mind the yellow shield had brought the romance of travel; and life had not seemed so deeply grooved, so narrow and confined, since the day on which the sign had been put in place.

A crutch of yellow wood, whose crudity had been mellowed by the usage of time, supported the thin figure—for Janet had been crippled from childhood by the loss of a leg, and years of suffering had drawn lines of endurance and patience chiefly about her large and tender mouth. Her hair was prematurely streaked with white, and her pale-blue eyes were faded and tired, like the eyes of an old woman weary of life; yet for all her suffering and the daily solitary struggle to make ends meet, Janet's courageous spirit was neither bent nor broken.

On this particular day Janet's smooth and placid brows were creased with worry, and the romance of the yellow shield failed for once to bring her the solace of a larger vision. Her eyes strayed in a puzzled manner to a barrel of apples—round sweet Newton Pippins with shining skins, which stood beside the door. A week ago it had been a full barrel delivered at the shop from the railway company's cart, and to-day—although nobody had bought any—the number had visibly decreased.

It was a most amazing and unprecedented thing to happen in his little fishing village, for your Lowland Scot has a wholesome horror of pilfering—whether it be because he is by nature honest, or from an ingrained fear of the long arm of the law, it is difficult to say. There is an old rhyme which avers that—

He wha tak's what isn't hisn,
If he's cotched must gang tae prison.

This rather points to the latter explanation; but in either case the result is identical, and, though he may swindle you if he can, and bargain with you for the semmit off your back down to the last bawbee, your Lowland Scot does not steal.

Janet Logan would have left out her barrel of apples—or, indeed, anything else that she possessed—in the street all night with perfect confidence that she would find it intact when she came down in the morning. She would as soon have suspected her own hands of pilfering as have suspected any of her neighbours. Yet, there it was, beyond all manner of doubt, for the barrel had been full to the brim, and it was not full any longer. Somebody—somebody in Port Andrew—was a thief.

II.

The thought struck deep down into Janet's inward consciousness, and rankled there like a poison-growth. The apples were nothing, though she could ill spare the loss, compared with the terrible feeling that there was a thief abroad. Who could it be? She was drawn, despite a struggle with herself, to suspect her neighbours, individually, of stealing in its most despicable form.

Several more days passed, and the apples still decreased steadily at the rate of two a day. Janet was counting them now, with a sort of desperate hope that she might have been wrong, might have been mistaken in her suspicion. It never crossed her mind to move the barrel from its tempting position near the door; it was the moral and not the material aspect of the depredations which caused the lines of worry upon her smooth brow.

For another week the diminution of the apples continued, and then one day Janet saw the thief. She was later than usual in going upstairs to her solitary dinner. A consignment of tinned fruit had arrived, and she was busy unpacking it in the back shop. A slight sound made her raise her head, and she saw a small hand, begrimed with dirt, dive into the depleted barrel and reappear with its ill-gotten gains—two large and shiny-skinned Newton Pippins, whose price in these hard and unprofitable times was approximately threepence each.

The back shop was dark and shadowy, so that, although Janet had a clear view of the small boy stealing her apples, the young pilferer, whose eyes were dazzled by the sunlit street, had no idea that his action had been observed.

Janet drew a long breath of dismay; she reached for her crutch, but before she found it and hobbled to the door, the boy was away down the street and beyond recall.

III.

The next day was wet—a soft drizzle fell steadily all the forenoon—the windows of the shop were clouded with moisture. There was little business doing, and by twelve o'clock the shop was deserted. Janet went to the door and stood there with the rain blowing softly on her face. Below her and eastward stretched the sea, an impalpable blur of gray merging imperceptibly into the blue-gray of the winter sky. But Janet was for once oblivious to the beauties of Nature. She was waiting for the children to come out of school, waiting to bring home the sense of wrong-doing to her apple-thief.

She had not long to wait, for soon the happy voices could be heard approaching, and the children streamed past the door on the way home to their dinners. They were a sturdy crew, glowing and round of cheek as Janet's apples, crisp and wholesome as pippins. Some of them called a blithe 'good-day' to her as they passed, and the crippled woman smiled her sweet, sad smile, and waved to them in return.

The stream of radiant childhood had thinned

to a few stragglers before Janet saw the disturber of her peace. She called to him and beckoned.

'Jem, come here.'

The child started at the sound of the soft voice, and a guilty red flush suffused his face; but Janet's eyes were friendly, and—how could she know? He drew near half defiantly, half sheepishly; and then, suddenly, he saw two apples in Janet's hand—two large, round, golden-cheeked apples—and he drew back with an access of shame and horror.

'Tak' them, Jem,' said a kind voice. 'They're for ye; I'm meaning it,' added Janet, as the lad hung back.

'Naw, naw!' he cried; 'Ah canna tak' them.'

It was a cry of guilt and shame and penitence all in one. Janet recognised it as such, and rejoiced in her gentle heart, schooled by suffering to a wise understanding of her fellows.

'Aw, laddie!' she said—her eyes misty with more than the rain—'Aw, laddie, Ah dinna grudge ye the apples! Ah'll gie ye twa ilka day till the barr'l's din.'

'Naw, naw!' he cried; 'Ah canna bear it,' as he turned and fled.

And Janet watched him go with a thankful heart, for she knew that she had cured her thief.

A FAMOUS WILTSHIRE HIGHWAYMAN.

By A. G. BRADLEY, Author of *Round about Wiltshire*.

I.

A FEW men still living have talked with those who knew Boulter, the famous Wiltshire highwayman, and with some who had been robbed by him. He was a native of Poulshot, a sequestered village two miles from Devizes, lying at the foot of the Marlborough Downs, which, with Salisbury Plain just to the southward, comprise many hundred square miles of the best galloping ground, threaded, till the recent years of military occupation, by some of the loneliest highways in England. If the inspiration of local atmosphere played any part in the making of a highwayman, Thomas Boulter was fitly cradled. As a matter of fact, however, he seems only to have elevated to the more romantic sphere of a knight of the road a hereditary fancy for other people's property. His father, who was long remembered in the neighbourhood as a buckskin-breeched, red-waistcoated miller, made his final exit from Wiltshire and England as a felon transported for horse-stealing. His mother had been publicly whipped at the market cross in Devizes for similar tendencies. His brother, Isaac Blagden, of Market Lavington, on the edge of Salisbury Plain, had been shot and crippled for life in

an attempt to rob Colonel Hanger as he was returning from hunting. The last half of the eighteenth century was, in truth, a strange time. Men of substance went abroad armed; others in humble walks of life pursued ordinary avocations in a kind of quasi-respectability, but under continual suspicion, till one fine day they were swung off the fatal ladder outside the county jail, or disappeared like the miller Boulter to the penal settlements.

Young Boulter, born in 1748, was respectably educated, and, till his twenty-sixth year, helped his father in the mill at Poulshot without attracting any notice whatever. Just before the miller was transported his son, sick either of grinding corn or of his father's company, joined his sister, who had opened a milliner's shop at Newport, in the Isle of Wight, and started as a grocer under the same roof. So far Thomas Boulter figures as a quite respectable young man, with ambitions far removed from pistols, thoroughbreds, and wild gallops for life. One might almost imagine him disapproving of the old man's moral tone, which obviously was low, and dreaming virtuous dreams of aldermanic laurels. But young Boulter was made of sterner if less reputable stuff. Tying up tea and scoop- ing out sugar were not for him, and within the

year he had decided to become a highwayman, and had set to work with the cool deliberation that indicated an inherent genius for the road. He purchased his pistols in Portsmouth, and, while still behind his Newport counter, took much thought for his future sphere of action. The island was at once rejected as too dangerously limited; so, somewhat vague as yet, he crossed to the mainland on pretence of a visit to his mother, just deprived by the law of her husband. He had got rid of his business, which had only brought him in debt, but had enough money to hire a good horse at the Vine Inn, in Southampton, and, thus equipped, launched out on his new career.

It was on the Great Western road between Stockbridge and Sutton that Boulter made the first plunge. He describes in his memoirs how he rode several times past the Salisbury diligence in a tremor of suspense before he could bring himself to the point of 'stand and deliver.' When at last he acquired the requisite confidence the driver behaved so nicely, and the passengers handed over their purses so readily, that the tyro was able to assume the airs of a true highway knight, and take leave of his victims with a flourish of the hat and a wish for their pleasant journey. Boulter had no more qualms. Taking the lonely road across Salisbury Plain, he robbed three separate horsemen, besides a pedestrian or two; and when he received the maternal embrace at Poulshot, had several watches and £40 in cash on his person. On his way back to Southampton, between Devizes and Andover, he robbed a post-chaise and several farmers on horseback, baited his horse at the Swan at Andover, took the Winchester road, lightened another chaise of its valuables, and reached Southampton without further adventure. Here he returned his hired horse, crossed over to Newport, and assumed the outward rôle of a retired and innocent family grocer.

II.

But Boulter was now planning something bigger. He substituted for his old pistols new ones of the finest make, and in place of his modest clothes donned fine attire suitable to the part. For a man of his trade and talent to throw good money away in the purchase of a horse would have been absurd, so, hiring one from his old friend the Southampton landlord, he set out to steal another for himself. Boulter was obviously a born horse judge, as he was horse-thief and horseman. He ranged the outskirts of the New Forest for days before he could suit himself, till at last the right thing appeared in a paddock near Ringwood. Dining there at the White Hart, he rode out before it was quite dark, caught the horse, and led it through the night across the forest to Southampton Common, where he turned it out for a few days.

The ex-grocer was now finely set up, and decided on Devonshire for his opening campaign, intending to behave himself till he got there. But he could not resist the temptation of a mounted traveller encountered between Salisbury and Blandford, from whom he extracted a gold watch and several guineas. Passing rapidly through Blandford, he committed various robberies on the Dorchester road; and then, to avoid pursuit, rode at a great pace across country to Calne, where he lay low for a few days. On resuming business upon the Bridport road a stroke of luck fell to him; for a garrulous farmer, flushed with good trade, and doubtless with good cheer, courted his company, and, bragging of the high prices he always got for his cattle, confided to the well-dressed and well-mounted stranger that he had just made an exceptionally good sale in Salisbury market. Boulter expressed regret that so little of such fortune had as yet fallen to his own share, but that the next best thing was to run across somebody who had been thus blessed; whereupon, pulling out his pistol, he intimated that he was prepared to share in the other's benefits. The astonished grazier suggested that his companion was trying to hoax him. 'Not at all,' said Boulter, clapping his pistol to his breast, a proceeding which produced £90, the rest being bills of exchange, of no use to a highwayman. The watch he politely returned, and galloped away to further operations between Exeter and Weymouth, where he adventured with success.

When winter came on Boulter retired to his mother's house at Poulshot with about £500 in cash and valuables. Those were curious times. The close of the Seven Years' War a decade previously had turned loose an immense number of unemployed persons, soldiers and otherwise, and now the pinch of the American War was being felt, and the policing of England was altogether most inefficient. Boulter spent a jovial winter around Devizes, and scattered his money freely, so much so that in the spring of 1776 a depleted exchequer as much as re-kindled ardour sent him out on the road again. He had his eye now on a new horse, a rare piece of blood then stabled at Erle Stoke, Mr Watson Taylor's beautiful place six miles from Poulshot. His sister Nelly was in service there, which facilitated the theft, and in May Boulter found himself speeding to London with a mare beneath him that was to win fame both for him and herself under the name of Sunshine. He now waited about Staines to try his luck upon the early morning coaches out of London. They carried too much artillery, however; so after relieving a private carriage of £7, Boulter turned away towards Windsor, encountering a single traveller in a post-chaise, who refused to stop when challenged, and galloped on, levelling his pistols at our hero, and finally firing and missing

him, till the latter, shooting at the post-boy, compelled him to stop. Boulter then relieved the traveller of £43 and his jewellery.

Towards Maidstone, with supreme audacity, he stopped three post-chaises within sight of each other, taking £50 and considerable jewellery, and in sheer bravado rode in front of them to the town, and baited his horse at an inn while they drove past. The hue and cry was now raised with a vengeance, and Boulter took the Oxford road at full speed for four miles, and then swerved off by Oakingham to Hartley Row. Here he gave his mare a large hunk of toast soaked in port wine, and, outdistancing his pursuers, made for Whitchurch and thence to Everley, on Salisbury Plain, at each place doctoring his mare in the same fashion. He reached Poulshot by nightfall, having ridden a circuitous route from Staines of over ninety miles, and the last seventy-five of them at an average of ten miles an hour! The newspapers of the time, through the pens of the various squires, farmers, and clergymen he robbed, describe Boulter as a fresh-faced, light-haired, heavy man of 5 feet 9 inches, with a hat flapped except behind, and a snuff-coloured coat. After this ride he lay low for a couple of months.

III.

It is impossible to follow Boulter through his numerous adventures, to describe his whimsical attitude towards some of his victims, and his narrow escapes.

During 1777 Boulter went north, and, after operating through Yorkshire with some success, got caught in this wise. Near Ripon he attacked a gentleman well mounted and, as he thought, alone. The man gave up his purse, and Boulter rode on carelessly, when he suddenly found himself pursued by his victim and a servant, both armed. After a two-mile race his mare went lame, and he was run down, and, with a pistol on each side of him, surrendered. He was then carried to York Castle, tried at the assizes, and, of course, condemned to death. His Majesty, however, was woefully short just then of soldiers, and, to Boulter's delight, he was given a reprieve the night before his appointed exit from the world on condition of donning a red coat in the line regiment quartered at York. He served the king just four days, escaping before he had exchanged his civilian clothes for his uniform, and making his way to Bristol by all sorts of shifts. Here he fell in with an innkeeper named Caldwell, who befriended him, and showed such a pretty talent for dark and devious ways that a partnership was formed for fresh enterprises in the west. With some difficulty, and the inn in Milk Street as a refuge, they managed to steal one horse, on which Boulter rode off to Poulshot, with characteristic audacity stopping the Bath diligence and a private post-chaise close to Devizes,

at a profit of £30. After a short breathing-space he then traversed South Wilts and East Hants, stopped the Exeter diligence at the lonely Winterslow 'Hut' near Salisbury, famous as the resort of Hazlitt, robbed a gentleman of Salisbury near Andover, returning him twopence to go home with, and finally collected £100 on the Basingstoke road. After this he swept back through Wiltshire to Bristol, cleaning out the Bath coach at Stapleford near that city. Caldwell in the meantime had picked up one of the finest mares in the country at Brislington, and had her in great condition. The two now hunted the west, sometimes singly and sometimes together. Caldwell, though lacking Boulter's good presence and address, and being a bit too bloodthirsty, proved in other respects an efficient partner. After many successful adventures they left Cirencester for Gloucester one night a little heady with wine. After two successful robberies Boulter rode after a post-chaise, but when level with the window the occupant fired full in his face, the ball skinning his forehead and lodging in his hat. Caldwell, riding up, found his friend blinded with blood and half-stunned, but, tying a handkerchief round the wounded head, the two galloped on, breathing vengeance, caught the chaise, and, with no light hand, stripped the occupant of £30. The partners now returned to Bristol, where Boulter lay for a time recovering from his wound; but his face was conspicuously scarred, a serious matter to a highwayman. In the cellar floor of Caldwell's inn, The Ship, the two had dug a pit, and in this deposited all the jewellery and valuables that were gathered by their far-extended exploits.

Starting out again, and choosing Leicestershire as their field, Boulter had a bad scare. While he and Caldwell were feeding their horses in an inn yard at Leicester they ran right into the sergeant of the company from which Boulter deserted, who recognised him instantly. They all went into a room together, and did not get out of it till the highwaymen had emptied their pockets for the sergeant's benefit to the extent of £31. Even then there was no security from pursuit, and they passed rapidly into Cheshire and Shropshire, Caldwell stealing a fresh horse on the way, and so to Bristol, where they added valuables they had picked up to their subterranean store. Boulter admits that he occasionally stooped to the pilfering of hotel plate. Dressed like a gentleman, and shown into the best rooms, he always took care that his horse was fed before he dined. Then, standing at the door of the room when the waiter brought the bill, he kept him outside interested in the expected tip till he was ready to mount with the spoons in his pocket.

IV.

Every highwayman is credited with some virtue. Boulter's seems to have been an affec-

tion for his mother, and he used to visit her at considerable risk to his safety. On the last occasion before he was caught he struck across from Poulshot for Hampshire, and soon after he had mounted Salisbury Plain an exuberant country squire came galloping after him, filled with admiration of his mare and in purchasing mood. After inquiring her price, he asked to see her paces. Upon this Boulter clapped his pistol to the breast of the astonished sportsman and demanded his portable goods. The Squire having succumbed to the inevitable, the other thanked him, and remarked that having paid for the privilege he should now see the mare's paces, and went off over the plain at a gallop. In the days when all men rode on horseback almost every one had an eye for a horse, and the stolen nags of the highwaymen were occasionally recognised two or three counties away, and caused awkward moments.

Large money rewards emanating from Salisbury had been offered for Boulter's capture for the last two years, but not a single official had yet been able to catch him. He was now, however, secured in a strange way. The partners, wishing to dispose of their hoard, carried part of it to Birmingham. Exercising every caution there, Boulter opened negotiations with a Jew, who made an appointment for the same afternoon; but Boulter had not been long in his shop when the prison officials were introduced, who promptly seized him. Boulter's powder-blackened eye had betrayed him to the sharp Jew, who recognised him at once from the descriptions advertised abroad. Caldwell was taken immediately afterwards, and the two were conveyed to London and imprisoned, Boulter at Clerkenwell and Caldwell in Tothill Fields. Sir John Fielding, then Bow Street magistrate, wrote at once to Salisbury that 'the noted highwayman so long the terror of your county has been taken.'

But while the law was collecting the necessary evidence from all parts of the country, the astounding news reached the courts that the bird had flown. Boulter had been put in the strongest room in the new prison, in company with several others. But his fertility of resource showed itself at once; for, espying a piece of bond-timber in the wall, he foresaw that the bricks beyond could most likely be easily removed. He had, of course, no tools, and was, moreover, heavily ironed, and the co-operation of his fellow-prisoners was necessary. This was readily gained; so was the assistance of one of the women who visited the prison. The necessary tools were introduced, and by methods which would take too long to describe here, the aperture was successfully made, Boulter's irons at the same time were sawn through, and with two companions he dropped safely into the street. The others were captured, but Boulter coolly remained in a house two doors away from the prison for a

couple of days till he had procured another suit of clothes, for he either had with him or acquired some ready money. He now took the public diligence to Leicester, where he was not well known, stole a horse in the neighbourhood, and rode for Dover, meaning to get out of the country. Here, to his dismay, he found that in view of the approaching war with France all the ports were closed, and he tried in vain even to get taken over in a rowing-boat. Riding along the coast, he next tried Portsmouth with equal futility. As a last resource he made for Bristol, but could find no means whatever for getting to sea. Boulter's notoriety and blackened eye together seemed to have impressed even so audacious a man with a sense of extreme danger. So now he betook him to the Isle of Portland as the most secluded region known to him.

His habitual carelessness, however, never quite forsook him. Putting up at an inn at Bridport, he dined at the ordinary, where a guest at once recognised him and, calling the landlord out of the room, made the fact known. Mine host, however, taking Boulter privately aside, told him of his danger, at the same time remarking that he had no feeling against him, and that he might pay his reckoning and ride away. The highwayman's foot was hardly in the stirrup when the crafty landlord, with a party of his guests, rushed upon him before he could mount, and seized him. Boulter admitted his identity, and was taken on 4th July 1778 to Winchester jail, whither Caldwell had already been removed. Needless to say, the evidence was overwhelming, and the death sentence was passed as a matter of course.

The interest, however, excited by Boulter's career of three years was so tremendous that several gentlemen of the district procured a respite of three weeks that the famous highwayman might relate the details of it, which he did simply and unaffectedly. These were taken down, and with many notices concerning him in the contemporary press form the substance of what has been set down here. He died penitent at the hangman's hand on 19th August 1778. No woman, as in many such cases, entered into the romance of Thomas Boulter's career, whose family name, it may be said, is still a common one in the villages along the northern edge of Salisbury Plain. Sixty years ago his name was well remembered in Wiltshire. 'Ask any old man about Devizes,' wrote a well-known Wiltshireman at that time, 'who was the booted and spurred hobgoblin which the servant-maids of a past generation threatened to call out of the dark wood to silence the nursery, or what name was always coupled with tales of terror around the Christmas hearth, and whose the phantom steed that dashed across the village green, and it was always Boulter on his famous mare Sunshine.'

Chambers's Journal

SEVENTH SERIES

WHERE THERE'S A WILL THERE'S A WAY.

A STORY FOR GOLFERS AND OTHERS.

By WILLIAM GARRETT.

PART I.

I.

HIS friends had known that Sir John Merriam was eccentric during his life; at his death his eccentricity was published to all the world, a nine days' wonder.

A successful merchant, he retired from business and settled at Wellwood, some fifty miles from London. Always a sportsman, he succumbed in his late fifties to the attractions of golf, a game he had hitherto despised, and, like many elderly converts, having come to scoff he remained to worship. His devotion was almost an obsession. From the moment he became a devotee of the royal and ancient game the local golf-course, till then insignificant, rose with startling rapidity to the first rank of inland greens. The Wellwood Golf Club undoubtedly owed its magnificent club-house, its well-made artificial hazards, and its Scottish professional to the energy, enthusiasm, and purse of Sir John Merriam of Wellwood House. And a tournament with prizes of princely magnitude—also at Sir John's expense—brought it prominently to the eye of the golfing public.

Let it be confessed at once that Sir John was a bad player. He was even worse than he thought he was, but that only increased his enthusiasm. Still, try as he would, achievement, save by a fluke, was beyond him. As was natural, advancing years put success farther from his grasp, but they failed to quench his ardour, and to the end he struggled like a hero, faint yet pursuing. He delighted in a sort of vicarious success, however, through the instrumentality of his two nephews, Harold and Vincent, sons of a long dead brother, who were well known in the golfing world. In their victories he won tournaments and broke records by deputy.

When Sir John Merriam succumbed to a heart attack, brought on, as was generally believed, by undue exertion in the rough, his will created a sensation that extended far beyond the confines of the Wellwood Club. It was a simple document, drawn up by his own hand and couched in grimly humorous terms. After leaving legacies

to the club and to M'Allister, the professional, he provided that the whole residue of his estate, amounting to eighty thousand pounds, should go to whichever of his two nephews should be the winner of a golf-match of thirty-six holes to be played over Wellwood course on an appointed day.

The terms of this astonishing testament were sufficient in themselves to attract the attention of the press and the public. But the brothers Merriam were so well known in the sporting world that the prospective contest was awaited with more interest than a championship.

In appearance, as in temperament, they formed a curious contrast. Harold was tall, fair, and broad-shouldered, the typical athlete. His greatness as a golfer lay as much in his grit and doggedness as in his excellent execution. Whether winning or losing, he played his match to the end, steady and unmoved; and he was always a terror to finish. These were qualities which had won him that year's Amateur Championship after being three down and six to play in the final against a celebrated American.

Vincent was the direct antithesis of his brother. Slender and dark, obviously more intellectual, he played golf with a scientific precision and understanding that Harold could never have attained. But he was cursed by a curious temperament. It was not a case of 'nerves' in the ordinary sense. It was a strange, almost logical perversity of mind that drove him to do the most stupid and unreasonable things, just because their stupidity was obvious. And nowhere did this most unfortunate failing manifest itself so strongly as on the golf-course. When in the right mood nothing daunted him; when in the wrong one he would for a succession of holes make just those mistakes that he ought clearly to avoid at all costs. To onlookers both execution and judgment seemed to desert him in a moment.

After the terms of the will became known Vincent rather avoided his brother. They were very good friends, but he was disappointed that his uncle, who had treated them both with

impartial affection, should have indulged in such a freakish arrangement. It was not that he would have admitted, even to himself, that Harold had the better chance of success. He knew himself to be really the better player; in ordinary friendly matches he more often won from Harold than lost to him. But he had come to distrust himself profoundly. In the back of his mind there lurked a horrible fear. Would he crack this time? Would his temperament again betray him?

The great match was fixed to take place upon the 24th of August. One evening, about a week before, Vincent came into the club-house at Wellwood with three friends. He and Hay, the captain of the club (a modest twelve handicap), had played a four-ball match as partners against Ratcliffe and Manderson, two of the club's back-markers. Vincent and Hay had won both the afternoon and evening rounds easily.

Dusk was falling, and the big smoking-room was deserted. The four men settled round a table, and, after ordering drinks, fell to discussing the play.

'Well, Vincent,' said young Ratcliffe, 'if you can put up some of that golf you showed us to-day you'll easily flatten out Harold next week.'

Vincent shook his head gloomily. 'It seems such rot playing one's brother for a stake like that,' he said.

'Rubbish, Vincent,' protested Ratcliffe. 'Hang it, I'm laying three to one on your winning. You're not thinking of backing out?'

'You ought to know me well enough, Ratcliffe. I'll go through with it, but—'

'I quite see Vincent's point,' Hay put in. 'It would be more natural for brothers to call quits and divide. But the will made no provision for that. Besides, we should miss the greatest sporting event of the century. Harold will take some beating, but I'm certain you can do it, Vincent. Why, you practically beat those two lads off your own bat to-day. I contributed precious little but moral support.'

Vincent was filling his pipe with nervous, restless fingers. 'Yes, I know I was delivering the goods all right this time,' he said, 'but golf's a queer game.' He paused to light his pipe. 'Harold's a terror on his day, you know,' he went on, 'and I—I don't always function when I want to.'

Manderson gulped at his whisky and soda. 'Nonsense, my boy,' he said, putting down his glass; 'you mean all that rubbish about your not having a temperament for the game. That's all rot; you know yourself it is.'

Vincent looked round the empty room, and then at his companions. All were intimate friends. 'Look here, you fellows,' he said, 'I've got a confession to make. Perhaps it'll do me good to get it off my chest. I wonder if you'll understand. . . . About as far back

as I can remember I've suffered from a curious obsession. If I know I shouldn't do a thing, I often have an uncontrollable impulse to do it. It's difficult to explain. People do foolish and stupid things because they're careless or don't know any better; but with me, I do the stupid thing just because I *know* it's stupid. The more clearly I see its stupidity the more it fascinates me. . . . And I—I usually end by doing it.'

'Liver,' pronounced Ratcliffe. 'Try a pill, Vincent. There are many well-advertised brands.'

Vincent flushed slightly. 'Of course, if you're going to treat it as a joke——' he began, and stopped, sucking nervously at his pipe.

Hay, the oldest of the party, looked at Vincent thoughtfully. 'Go on,' he said quietly. 'I think I understand.'

'It isn't a question of physical health,' Vincent continued. 'I never felt better in my life. It's a sort of moral quality. It worries me most when I'm playing golf, probably because I'm so keen to do the right thing in the right way. When the fit is on me—often at the critical moment of a round—there suddenly flashes into my mind what I ought not to do—what might happen. I fight it sometimes, or play with it for a bit, and then—well, it happens. I wonder if you understand now? You fellows know quite well how often I crook up in the most incredible way during an important game. You call it nerves, or say, "He hasn't the right temperament." But it isn't that—it isn't that at all.'

He stopped suddenly, looking at his companions with an expression of intense appeal on his pale face. There could be no doubt of his earnestness, of the reality of his suffering. Hay thought of an unhappy child trying to explain something it didn't quite understand—trying to justify itself for some inexplicable action.

Manderson and Ratcliffe, too, were impressed, and the feeble jest died on Ratcliffe's lips. Hay broke the sudden silence. 'I think I understand, old chap,' he said. 'It seems to me this may be a medical matter. Nerves are probably behind it. Oughtn't you to see a doctor. I'll go to Harold and get the match postponed for a bit. He's far too good a sportsman not to agree.'

'Certainly not; not on any account,' said Vincent, flushing angrily. 'This is my job. I'm going to beat this devil of mine. And I will, too—probably when I'm too old for first-class golf,' he added bitterly.

Hay glanced at his watch. 'Good Lord! I'd no idea it was so late,' he said. 'I must get home to feed.' He threw away the stump of his cigar and rose. 'Are you fellows coming?'

Ratcliffe and Manderson finished their drinks and rose to accompany him, but Vincent remained seated.

'I'll smoke for a bit yet,' said Vincent; 'I

want to think this thing out. Making a confession to you chaps has helped me a lot.'

Hay put a steady hand on his shoulder. 'You know we'd do all we could to help you, Vincent,' he said. 'Meantime, don't brood too much over this thing. I've immense faith in your golf. Good luck to you next week.'

II.

They were gone, leaving Vincent alone in the smoking-room, to which the dimness of the twilight lent a hint of mystery. He filled a fresh pipe and sat thinking over the conversation. Had he been right to tell them? He was not sure. His natural wish had been to keep his secret buried, but the impulse of the moment had rushed him into disclosure. Anyhow they were all three good friends of his, and no one else would know. Hay might understand; the others almost certainly would not, but they would not talk about it.

He rose to go, when he was startled to hear a voice say, 'Excuse me, but I think I could help you.'

Vincent turned sharply round. He had not been aware that there was any one else in the room. He saw a stranger coming across from a big chair by the window.

'I hope you do not think me interfering,' said the stranger. 'I was sleeping in that chair when you and the others came in. I was just going to move and draw attention to myself when you began what you called your confession. Your story interested me so profoundly that I forbore to interrupt.'

Vincent looked at the eavesdropper with some distaste. He was a slight, clean-shaven individual with long, untidy hair and a swarthy complexion that suggested foreign blood. He spoke with a trace of foreign accent. His eyes were remarkable. There was something strange, yet fascinating, about his gaze. Vincent knew himself in the presence of a compelling personality.

'I should explain,' the stranger went on. 'I call myself Foster. By birth I am a Hungarian, one of your late enemies. A man of science has no country, but prejudices die hard. A friend brought me down here for the afternoon. He has gone off to make a business call, and is to come for me later.'

Vincent felt a curious thrill. Just for the moment he could not say whether he was attracted or repelled. He hated to think that his carefully-hidden secret was in the possession of this complete stranger. And yet the stranger was obviously sympathetic. 'I'm afraid I should not have discussed my affairs so openly,' he said a little coldly.

'I repeat that I can help you,' said Foster. 'Have you ever heard of psycho-therapeutics?'

'Why, yes,' Vincent answered. 'I've heard the family doctor discuss it. He has no use for

the so-called science—thinks it is a dangerous thing to trifle with.'

'How insular,' said Foster, with a slight sneer. 'Why, the whole future of medicine lies there. What are doctors now? If they are surgeons, they are more or less successful butchers. If they are physicians, their cures are either accidental or due to the patient's faith. By my method I *compel* the faith in every case. I cannot cure a broken neck, but where the body can be made to heal itself I make the mind compel the body. Your case is even simpler. It is purely a matter of healing the mind. If you will allow me to take charge of your mind I will make you forget your troubles.'

While he listened, Vincent felt the fascinating intensity of the other's gaze full upon him. Little by little he felt himself surrendering to a stronger personality. With an effort he pulled himself together. 'What do you mean?' he asked.

Foster smiled. 'I mean what I say. I can compel you to win this golf-match. You will require to place yourself unreservedly in my hands. For years I have studied psycho-therapeutics and hypnotic suggestion. I am only an amateur, but—he shrugged his shoulders expressively—'I am profoundly interested.'

Vincent's inclination was to bid the stranger good-night and go. But the other's gaze held him. 'What is your suggestion exactly?' he asked.

'A few words will explain,' Foster replied. 'You remember Edgar Allan Poe's tale of the Imp of the Perverse? Your case is something like that. You suffer from a perversity of temperament that forces you to make the supreme blunder because its obvious consequences fascinate you. Physically, you are one of the best golfers living. For this match I want you to surrender your will to me. You know how to play the game. Play it, and I will exorcise this perverse imp of yours which prevents you from doing yourself justice. If I am close to you it should be an easy matter. You felt my power a moment ago. It will be a great experiment.'

Vincent had a fleeting vision of himself as the subject of some scientific experiment at the hands of this mysterious stranger. Then he thought of the possibilities. Would it perhaps work? Was it playing fair to Harold? After all, was golf not a struggle of character as well as of muscle? Still, why should he not get the full value of his own powers? He knew he was a better player than Harold if only he could avoid his curious weakness. Never mind the money; he could fix that up with Harold afterwards—he could share it. He would win, and by beating Harold he would at last justify himself. 'What do you want me to do?' he asked.

'Nothing, my friend,' said Foster, with a quiet smile; 'nothing, except that you should con-

sciously allow me to dominate you on the day of the match. I shall be there amongst the spectators, always close beside you. You will do the playing; I shall do the willing, and I shall cast out your devil. It is a great experiment. We shall succeed, and success is the

scientist's greatest reward. For you there will be the glory of victory, for me the knowledge of success.'

Vincent held out his hand. 'I am willing to try,' he said.

THE ADDER IN ARGYLLSHIRE.

By DUGALD MACINTYRE.

I.

ADDERS are plentiful on the wide moorlands of Argyll. The wilder districts are naturally most prolific in adders, for few people can pass an adder without making an attempt to kill it. The reptile loves thick heather or bracken for cover, and it is fond of water. The banks of moorland streams or lochs are favourite haunts, and the adder returns, like other creatures, to certain favourite places year after year. I know some of those breeding-places of the adder in a particular district of Argyll, and, indeed, have known them for quite thirty years. One has only to go to those known spots in early spring to find a pair of mated adders in the identical place where one killed a pair last year or the year before—or twenty—or thirty years ago, for that matter.

One such hereditary nesting-place of the adder is beside a large flat rock on the bank of a lake. The adders hibernates under this rock, and there must be a large population attached to the place, for no sooner is one pair of adders killed at it, than another takes its place. The adders at this typical adders' haunt resemble each other in colour and markings, and it seems likely that they are blood-relations with a common ancestry.

Adders are numerous in certain parts of Kintyre. I have known a shepherd who made a speciality of hunting adders kill sixteen in his Sunday morning walk. Shepherds do not like adders, because they sometimes bite sheep or cattle. The *Oban Times* reported two cases of milk-cows dying from adder-bite in 1922. Those animals were each bitten on the udder; cattle or sheep bitten about the feet or legs generally—so far as I have noted, invariably—recover.

The island of Mull is famous for the number and size of its adders. Some years ago a large acreage of heather was burned in one portion near the Misnish lochs above Tobermory. The road along the banks of the lakes stopped the fire on one side, and between this road and the water there was a narrow strip of unburned ground. The adders which had existed on the huge burned area naturally had to emigrate after the fire, and they gathered in great numbers in the unburned area by the water. To get there they had to cross the road, and a great many were killed by the road surfacemen and others. Some

idea of the number of adders daily crossing this road may be had if I state that I have seen a dozen freshly killed adders lying on the highway.

One day, when I was fishing from the bank of one of the Misnish lochs, I landed a nice trout, and bent down to examine it where it lay among the heather. Just as I put down my hand to grasp the fish I became aware of some rapidly-moving minute object near it. My eye focused on this new object, and with a shock I recognised it as the black forked tongue of an adder. The adder was coiled within a couple of inches of the trout, and but for its tell-tale tongue I should most probably have been bitten. I measured a good many of the largest Mull adders I saw, but the longest did not equal in length one I killed in Kintyre, which measured twenty-eight inches.

I know of only two cases in which the bite or 'strike' of an adder caused the death of a human being. One of these is recorded in one of the works of Captain Francis Buckland. Buckland, who was noted for his love of strange pets, carried a live adder in his pocket while journeying to London. The pocket containing the adder was picked by a professional thief at the station, and the adder bit the thief, who, despite prompt medical aid, died. Captain Buckland found that the man's blood-stream was in a very bad state, hence his demise. Buckland had himself been often bitten by adders and suffered little inconvenience. The other case of fatal adder-bite known to me occurred years ago at Gruline, Mull. The victim in this case was a little girl of four or five years, and she was bitten in a sensitive spot.

Two boys of thirteen and fourteen bitten on the bare ankles recovered, after a dangerous illness in each case. The legs of both those boys swelled up to a great size, and were much discoloured. An Irishman engaged in hill-draining was bitten by an adder on the back of his hand near a vein, so that the blood spouted from the wound. His friends advised him to go home and go to bed, while a messenger went for the doctor. Pat refused to go home, and went on with his work, merely remarking, 'No fear of me! Sure, St Patrick blessed the soil.' I can certify that no evil results followed this bite—whether owing to the blessing of St

Patrick, or simply because the spouting blood carried away the venom, readers may be left to judge for themselves.

Sporting dogs are sometimes bitten by adders, but I personally know of only one fatal case. The dog in this case was bitten in a peculiarly vital place, so that recovery seemed improbable from the start. Dogs bitten about the head generally swell up very much, and are very sick for a day or two. When the swelling subsides they quickly recover their health. I have known dogs which had been bitten by adders and recovered from the bite to be extremely nervous about them ever afterwards. A coil of old fencing wire or a twisted heather root would give a once-bitten dog a fright while ranging, and the dog would leap high in the air, afterwards coming to heel. One dog I had could not bear the sight of my dog-whip coiled in the grass. It evidently made him think of adders, and he retreated growling. Another dog, a little terrier, made a practice of killing all adders seen. She—for this terrier was a lady—often got bitten, and suffered a good deal from the bites, but this never deterred her from attacking the next adder she saw.

II.

Early in February, should the weather be fine, adders may be found basking in the sun near the hole in which they have lain dormant during winter. At this time they are rather slow in their movements, and seem to lack the strength to get out of the way even when they see you. In the month of April a great many shed skins or 'sloughs' of adders may be seen on the moors. Sometimes these sloughs are fixed in long heather, showing that the adder used the stems of the heather as a purchase in ridding itself of its old dress. Adders become extremely active and vigorous in May and June.

Few people probably have seen an adder hunting for its prey—mice and young birds for the most part. I have been quite thirty years among adders on the moors, and, so far as I recollect, have seen an adder actually on the hunt on only two occasions. On the first of these an adder was seen passing from one heap of fitted peats to another, exactly as a weasel does, and nearly as quickly. It then raised itself to a semi-erect position on the heap of peats, looked all round as a weasel does, and passed on to another heap. It passed thus from heap to heap, rising to a semi-erect position on each, and covered a considerable portion of ground in so doing. At last it came quite close to where my companion and I were watching. The said companion, an old peat-cutter, suddenly uttered a Gaelic ejaculation, literally 'Daughter of the Evil One,' and ran to kill the adder with his peat-spade—a thin steel implement. The man, on coming up with the snake, placed his spade's edge on the middle of its body, thereby detain-

ing without injuring it. The adder instantly struck the spade with such force as to make it ring, and this it did again and again. I examined the spade after the old man had killed the adder, and found on the bright steel some greenish-yellow marks, like pollen—no doubt the venom expended by the snake in its efforts. I found by experiment that the spade could be made to ring only by a rather sharp punch with the forefinger. That a small creature like an adder should be able to make a peat-spade ring argues the possession of extraordinary muscular power.

The second occasion on which I saw an adder hunt was when I was seated on an old turf dyke—a favourite haunt of adders. Sundry squeaking noises in the thick heather clothing the dyke drew my attention, and advancing quietly, I saw a fat old field-mouse creep out into the open. Its attitude reminded me of that of a rabbit when a stoat is on its track, and it seemed to lack the power to run away. Then the adder appeared, swift and alert in its motions. The mouse moved a little, and the adder instantly coiled round it, thus preventing its escape. I killed the adder at this stage of the proceedings, and the mouse fell a victim to the same blow.

Adders take a long time to swallow large prey, such as a field-mouse. I have watched a large adder gorging a mouse for quite thirty minutes, and during that time the outside portion of the mouse did not appreciably diminish. I have seen a young weasel taken from the stomach of an adder, two grouse chicks from another, and five young of the black-cap warbler from still another, the corpulent condition of which, prior to death at my hands, invited dissection.

Adders have quite a strong scent. Young pointers and setters often point them. Once, in the month of July, on coming to a point made by a young dog, I saw quite a collection of adders close together on a sunny bank in front of him. I fired two shots 'in the brown,' other two at single specimens as they crept off. From an examination of the remains of adders strewn about, I should judge I had killed at least six, and as many escaped.

I fancy that adders collect together prior to seeking some hole in which to hibernate. In point of fact they must either do so or join each other below ground. Sometimes workmen pulling down an old turf wall in winter find a ball of adders twined together underground.

On the question as to whether adders do or do not swallow their young, my observation does not qualify me to speak. On one occasion only have I seen young adders near where I had killed a pair of old ones; at other times when I saw young adders, no old ones were in sight. I have measured unborn adders, and found them quite six inches in length. I have also measured some young ones found at large on the hill, and

found them only four and a half inches long. How does that come about? A possible explanation is, that the embryo adder becomes shorter through the consolidation, and consequent contraction, of the backbone after birth.

One reads sometimes of a person being 'rooted to the spot' by the sight at close quarters of an adder or other snake. The mouse, or other small prey of the adder, loses its ordinary power of locomotion at the sight of the 'cold, glittering eye' of its hereditary enemy. Mice, as I have already noted, do lose the power to run when the adder is after them, but it is not the power of the reptile's eye which holds them—the adder may be out of sight of its victim at the time the terrified mouse is rendered incapable of further flight. The stoat has precisely the same power over a rabbit that the adder has over a mouse, and I have more than once seen a rabbit or a hare sit down and begin to scream when the pursuing stoat was not in sight.

The conditions for successful fascination are, as in mesmerism, dependent on the will-power of the victim, or, rather, on the lack of it. Some rabbits, probably old experienced ones, do not submit to the stoat's power of fascination: they run strongly away. It is an essential condition of successful mesmerism that the victim's will-power should first be broken down. The adder is said to have the power to draw birds from the air to its jaws. I should doubt this very much; 'fascination,' as I have seen it, simply renders the 'subject' dazed. The nearest approach to that of an adder 'drawing' a bird to it that I have ever seen was once when I noted a meadow-pipit hovering in an unusual manner in close proximity to the heather. I made a quiet approach, and found that there was a large adder coiled in the pipit's nest. The adder was in a coiled semi-erect position, and its black, forked tongue was in rapid motion. The adder's rapidly moving tongue seemed to be the centre of the pipit's attraction. I killed the adder, and found the pipit's young in its inside. Little wonder, therefore, that the pipit was hovering near the adder.

Adders are sometimes found in the nests of grouse and other large birds. They have been said to lie on the eggs to get the benefit of the warmth, but I know from personal experience that they can, and do, break quite large eggs and eat the contents. I once reserved a nest of the merlin-hawk, with a view to taking the young later for training purposes. One day when I visited the nest to see if the young had hatched, the old hen merlin did not fly off as usual, and I examined the nest. There was an adder coiled in it, and only one of the four eggs it had contained was left. I killed the adder, and found the contents of the three missing eggs (minus shell) in its stomach. A round bruise on the solitary whole egg remain-

ing in the nest served to show how the snake had managed to get at the contents of the eggs—namely, by violent 'prodding' with its mouth closed. I never saw the old pair of merlins belonging to this nest again, so I think it probable that both were bitten by the adder.

Many kinds of birds seem to recognise the adder as an enemy, and 'mob' it as they do an owl in daylight. I once saw a flock of starlings harassing an adder which was making its way across a ploughed field. The starlings formed two long ranks through which the snake had to pass, and as their enemy progressed, the screaming, chattering starlings formed fresh ranks in front of it. The snake went steadily on its course, and the starlings' hostile efforts seemed confined to making a noise.

The forward motion of the snake, which puzzled Solomon, is no longer a puzzle owing to the explanations of the anatomist, but I have often wondered at the behaviour of *part* of an adder at which I had shot. The reptile was moving at a rapid rate towards a glen. The charge from my gun cut it in halves, and the head half of the adder flew across the glen to a considerable distance. The adder was progressing at an angle to the course of the shot-charge, and the tension of its body when going at high speed explains why the head part flew off. But why did not the tail half of the adder shoot off in the other direction?

III.

The adder is by no means the malignant enemy of mankind which history, and more particularly religious history, teaches. The adder hides itself as much as possible, but it really does not lie about in the hope that it may get a bite at its hereditary enemy. If one touches a retreating adder with a stick it quickly coils, but it does not bite unless further provoked. Tease it, after you have rendered it doubtful of your intentions and it has already given warning by coiling, and it will bite—and quite right, too.

I saw a retriever, a playful, high-spirited, young animal, tease an adder for quite a long time. Each time the adder tried to escape the dog made a playful bound at it, when the adder coiled and hissed a warning. The dog's nose was often within striking distance for the adder, but it was evident from the snake's demeanour that it had no intention of provoking combat. I had no fear for the dog in this case, because his superior intelligence enabled him to anticipate and avoid the adder's offensive.

A curious incident occurred in this district some years ago, the actors being a retriever and an adder. The dog's owner had beheaded an adder with his spade, and the dog went to smell the decapitated head, which retained sufficient intelligence and vitality to bite him

on the lip. The retriever, a large, strong animal, nearly died in consequence of this bite on the lip.

It is impossible to dogmatise from the harmlessness or otherwise of individual adder-bites on the general effect of adder-venom; so much depends on the situation of the wound, the health of the victim, and the strength of the viper. The tongue of the serpent is really a harmless thing, so much so that naturalists are in doubt whether it serves any useful purpose in the reptile's present stage of evolutionary progress. I think the forked tongue of the adder is still useful to it in a variety of ways. Birds are strongly attracted to the rapid-moving black tongue of the adder, and that attraction, which seems merely curiosity, may lead them sometimes into the fatal jaws. The adder's tongue is most certainly not forked for nothing, and there is every probability that it is useful as a 'fork' when it is swallowing prey. The tongue is the organ most useful in speech and in distributing saliva to all creatures, and there seems no reason to doubt that the adder finds its tongue useful for those ordinary functions. (The adder's attempted speech is 'hissing,' of course.)

When we were children our parents were wont to admonish us for putting out our tongues in token of derision. This was said by them to be a 'Bad Man's trick.' The 'Bad Man' was the polite name for the Devil in our nursery days. The Author of Evil, as every one knows, once took the form of a serpent for the purpose of bringing about man's fall. Even a temporary visit from such a potent power for evil in the serpent's guise has left that unfortunate serpent's descendants with a number of bad habits, of which putting out the tongue is one.

The adder has a reputation for intelligence which seems hardly merited. 'The wisdom of the serpent' refers, of course, to the 'Old Serpent,' but our ancestors were simple-minded folk, and confused the one with the other—the natural with the spiritual.

One is surprised at times to see rudimentary traces of intelligence in individual adders. I once threw an adder into a loch, just to see how it could swim. It swam well and strongly towards the bank of the lake, and I prevented it from landing, when it swam out into the open loch. Some way down the lake it tried to land again, and I again met it and prevented its landing. This time it swam right across the loch, and I went round to see it land, but kept well back from the water. When the adder neared the end of its lengthy journey it raised itself half out of the water, and had a long look at the shore; and, seeing nothing to alarm it, crept quickly over the gravel of the beach and hid in the heather.

As I have already noted in this article, I once found a pair of mated adders in early spring near the hole in which they had passed the winter.

Careful search at the spot disclosed the presence of young adders. Those young adders, which were not six inches in length, and no thicker than a slate-pencil, coiled and attempted to bite as to the manner born. Close inspection showed them to possess the familiar marking of the adult adder, but the tracing lacked colour; at a little distance they resembled 'elvers' (young eels) rather than what they were. The adder has from six to a dozen or more young at a birth, but the balance of nature is in operation with adders as with all other creatures, and only a small proportion of the young come to maturity.

Man is by no means the adder's chief and only enemy. Cattle, sheep, and goats (and, I think, deer) have been seen trampling adders to death. Swine use them as an article of diet, and have been said to be 'immune' from adder-bite. I do not like the word 'immune' in relation to adder-bite. 'Impervious' better describes the matter in the case of the pig, which has a thick hide and a layer of fat under it. Should a breeding sow chance to be bitten on the udder, I should not give more for her chance of recovery than for a cow in similar circumstances. The adder's fangs are very fragile as well as very sharp, and the reptile is powerless to bite through the leather of a boot or a pig-skin 'legging.' Experiments made on fish are unreliable, for the same causes which give so-called immunity to the pig. The scales of the fish present an impenetrable glassy surface to the adder's fangs, which break off instead of penetrating. Remove the hide of a pig or the scales of a fish, and its supposed 'immunity' to adder-bite may quickly disappear.

To return to the enemies (other than man) of the adder, the common buzzard sometimes takes an adder to feed its young, and I have seen the female hen-harrier do the same. Both buzzard and hen-harrier know quite well that the adder is dangerous prey; for they, in the few instances when I have seen a bird of either species with an adder in its talons, were carrying the reptile by its tail. I have seen the greater black gull kill an adder and swallow it in a whole condition in a series of gulps. The gull carried its quarry to a great height, and let it drop three or four times. Then it hammered the head of its dangerous prey with its powerful beak, and finally swallowed it.

Many young adders are swept away in the sudden summer spates common in the Highlands. I have often found young adders (fairly large ones, too) in the stomachs of lusty trout intended for breakfast. Last year, when on a fishing holiday in Mull, I was advised not to fish in a particular loch, because the trout there fed only on adders and 'asps' (that is, lizards). I have not the slightest doubt but that a young adder would be a taking bait for big trout in certain Mull lochs.

THE GARUDA.

CHAPTER II.—*continued.*

II.

NOW, as we walked towards the cliffs, I told Dulloo of our plans for the morning. He was naturally of a sceptical turn of mind; except in the matter of omens the supernatural had few terrors for him. He had already heard all about Murrawalla's uncanny reputation. But he was not impressed. 'Children's talk, sahib,' was his only comment. 'There's a gang of dacoits sheltering there, or else perhaps coiners.'

'Anyway, Dulloo, we'll soon find out. But we'll have to go well armed.'

When we reached the end of the fields where they dropped down to the Khader we seated ourselves on a bluff to review the scene. Away to the eastward, across the sea of grass and tamarisk, we could just distinguish the course of the Ganges. And nearer—like a vast black smudge in the failing light—lay the great Murrawalla jhil. As we looked, a dark cloud appeared, rising and falling, over the centre of the jhil.

'*Nil sir*' (mallard), Dulloo remarked laconically; 'night-feeding duck fighting half-an-hour before their time. That means that there are men about on Murrawalla now.'

Gradually the shadow of the cliff lengthened towards the jhil, and night settled on the Khader. Now the Khader to me is normally an open, smiling land of happy memories. But to-night there was something very sinister about that empty landscape, where the only signs of life were the startled duck wheeling over the great dark marsh. What, I asked myself, was the unhallowed secret which the marsh concealed?

From our O. P. Judy pointed out to us the path which he had already reconnoitred to a spot at the edge of the jhil where were several disused dugouts of the marsh-men lying in a channel in the reeds. We agreed that Dulloo should precede us next morning to select a seaworthy craft, and that we should join him at the jhil soon after dawn. Then the waning light warned us that it was time to return to camp.

But as we rose to go an incident occurred which I was afterwards to have good cause to remember. About a mile to the north of us, and tucked away beneath the cliff, I noticed for the first time a large barrack-like building dimly visible in the gathering darkness. That it was a factory of some kind was evident from its two tall chimneys outlined against the evening sky.

'What in all the world is that place there?' I asked Judy.

'That?' he replied. 'Oh, that's the sugar-factory which has just been started; of course it's new since you were here last. It's a good show, with all the latest plant for crushing and refining. And, Heaven knows, there was room for improvement on the bullock-driven crushers and antediluvian boilers they've used up to date.'

'Who put up the money?' I asked casually. 'Money's pretty tight these days.'

'A refreshing instance of local enterprise,' said Judy. 'The owner's an Indian, by name Essar Dass. It seems he made a pile in the States somewhere—San Francisco, I believe. And he's a good fellow, Geoghegan says—all for encouraging home industry. Anyway, he asked us all over to tea yesterday, and took us round his factory afterwards. A plump little person, but remarkably shrewd; at least that's how it struck me.'

Whereafter we dismissed Essar Dass and his factory both to the limbo of unimportant things. Which was, perhaps, the first really grave mistake we made.

III.

During our absence the rest of the party had returned to camp. Gathered in the anteroom tent we found on our return Geoghegan and his wife with half-a-dozen other guns, soldiers and civilians from the neighbouring cantonments. It was, in fact, a typical Christmas shooting-party, completed by the presence of two very charming American spinsters on a visit to India for the cold weather.

After dinner Geoghegan unfolded to us his plans for the following day, with many and bitter regrets that the usual big duck-shoots were impossible. For, thanks to the taboo on the jhils, there were no boats or boatmen to be had: a state of affairs by no means uncommon in these degenerate days. Still, there were plenty of snipe and partridges to be shot, so the party was told off to its respective beats. And, as previously arranged, Judy and I were given a roving commission.

Next morning we were up betimes, and started for Murrawalla as the first level rays of the sun were lighting up the Khader. At the appointed spot we espied Dulloo waiting for us. Now, on the soft Khader soil one moves as quietly as a cat, so we rounded a clump of high grass and were upon him before he noticed us. We found him seated on his hunkers, very busy with an old cigarette-tin, which he handled as one handles a dice-box. And his face was as solemn as a judge's. He finished his throw as our long morning shadow warned him of

our presence. Past experience told me what he was about.

'Hulloa, Dulloo!' I hailed him; 'and how are things this morning?'

'I've thrown eleven,' he replied doubtfully, gathering up from the ground as he spoke a number of small black objects that resembled melon-pips, 'and eleven *should* be a lucky number. But then I threw eleven the night before I lost my arm.'

'What on earth's he playing at?' asked Judy.

'Only consulting the omens,' I answered. 'Every good Kanjar does that, you know, before he starts out on a sticky job. But they usually throw with sandal-seed: he's not using the orthodox dice this morning.—Oh, Dulloo,' I called, 'what's that you've got there in your tin?'

'Datura-pips, sahib,' he answered, just a trifle sheepishly.

'Datura?' Judy queried. 'That's the broad-leaved plant you see everywhere, with white flowers and prickly green fruit, isn't it? Thorn-apple,* they call it.'

'Precisely,' said I. 'And you might have added, the stock-in-trade of the modern thug, for it's about the most potent alkaloid poison known. No more strangulation or nastiness of that sort; just a smear over the victim's cooking-pots or food—that puts him to sleep for the next day or two.—Dulloo,' I added reproachfully, 'I never knew you were a thug.'

'Nay, sahib,' he assured me earnestly, 'there are no more thugs; the sirkar† caught them all. But the datura can be a good friend—you never know.' Which remark, events were to prove, was a remarkably true prophecy.

IV.

Dulloo had already selected a dugout for us, and we lost no time in launching her in the shallow water. And then we set forth on our Odyssey along the narrow twisting channel, soon to be swallowed up in the reeds, which rose a good six feet above our heads on either hand. In the bow sat Judy with a compass, for our object was to work inwards on a bearing towards the centre of the jhil. Judy was also in charge of our battery, a 12-bore and a Mannlicher, which we had deposited in the bows. Mine was a thoroughly unpleasant job: I found myself balanced precariously amidships, and wielding a pole wherewith to hold the course which Judy ordered. *Experto crede*; the art of poling a dugout is not acquired in a day. As for Dulloo, he sat at his ease in the stern and paid out the clue of Ariadne with his one and only hand.

In truth, it was a fascinating world in which we found ourselves; a fairyland apart, shut in by whispering reeds where the kingfisher hung

poised, a living amethyst against the green, and the little fishes glinted silver in the gin-clear water. Even the very coots who spluttered fussily into the *ewigkeit* at our approach had donned a resplendent livery of metallic blue. And once we surprised a cunning old boar who had been wallowing in the shallows. As he cantered to cover, scattering the spray in rainbow clouds behind him, the truculent cock of his ears did one's heart good—a gallant old boar who would have tired one's horse out and then died fighting. And yet there are people who will leave India without once having felt her spell.

Working on our bearing, we chose as far as possible the channels which led in the required direction. Hour after hour we progressed in this peaceful fashion, while gradually the sun grew in strength and the marsh noises around us ceased. Often we found ourselves in a blind alley in the reeds, obliged to retrace our course and to try another channel; but always our clue guided us back safely. And all this time there was not a trace of the enemy. Surprise, we know, is the most potent factor in war.

Perhaps we had grown careless. The occasional mugger whom we disturbed from his siesta on a mud-bank, and the bevvies of pochard feeding peacefully in the more open reaches, all seemed to argue an entire absence of the unusual. And my back had begun to ache abominably. Privately I had long since consigned Vishnu and Garuda, both, to the celestial regions where they properly belong. So it came about that—after midday, it must have been—when we were poling down a particularly narrow channel, and Judy had just remarked that we must be near the centre of the jhil, all at once the dugout went down at the bows with a jerk, and I awoke to the fact that Dulloo had slid over the stern silently as an otter. There was barely time to visualise the ring in the water where he had disappeared, and the string of bubbles which marked his course to the reeds, before the trap closed on us. The surprise was complete.

'Where are you going to, my pretty maids?'

It was a harmless enough remark, spoken in a perfectly friendly tone. Almost playful it was; the voice of a man entirely sure of himself and of his mastery of the situation. But such is the moral effect of surprise that we could scarcely have been more thoroughly upset by the roar of a bull of Bashan. Judy and I spun round of one accord towards the speaker—to the imminent jeopardy of the dugout—to find ourselves contemplating the muzzle of an automatic at about five yards' rise. The owner of the pistol remained partly screened from view in the reeds, but from the very first I was in no doubt as to his nationality. There is this about a Yank—even to those who, like myself, are wholly uninitiate in the American tongue—his speech bewrayeth him.

* *Datura stramonium*.

† Government.

CHAPTER III.

I.

AS the dugout righted herself I saw Judy stoop to grab one of the guns lying in the bows.

'Hands up!' The words came like the crack of a whip, and brought Judy up short before his fingers had reached the butt.

'That's better,' the voice went on in its original quiet drawl. 'I just hate to be melodramatic, but if there's any damned nonsense I shoot. And you haven't a hope.'

So there we were, both with hands raised to heaven, swaying to the motions of that infernal dugout. The position was peculiarly undignified. Then there came a crashing and crackling from the reeds in front of us and the nose of a dugout emerged, followed in due course by the complete article. In it were seated two figures. Amidships was he of the pistol. And he was a remarkable-looking man. About thirty-five, I should say, though he may have been a few years older, for he had obviously worn well. He was hatless, and his hair was fair—too fair to be golden—that strong, wavy hair which is rooted for a lifetime. But his eyes were his most striking feature. They were amazingly blue, of the vivid shade of cobalt-blue that Celtic eyes sometimes are, the eyes of a seer or a fanatic. Altogether it was a strong, handsome face. Yet its expression was repellent. A mouth that closed too deliberately, and lips a shade too thin—one felt instinctively that here was a stranger to all those little human weaknesses which endear us to our fellow-men. As

you may imagine, I took good stock of the man; for in such surroundings the sainted Ratan Haji himself would have been an apparition hardly more astonishing than a Yankee gun-man.

The other member of the crew was one of the local marsh-men—a mere child. From the stern, where he crouched clutching his paddle, he scowled his unqualified disapproval of us and all our works. As I met his glare of stony hate it struck me as distinctly odd that he should be there at all—at a time when his elders and betters would venture nowhere near the jhil.

As the dugout came alongside the white man went on, 'We'll relieve you of these guns of yours as a start, so as you can sit down and be comfortable.' Then, turning to the boy, 'Ali Haider,' he said, in execrable Hindustani, 'get hold of these guns there, will you? *jeldi* now.'

The boy Ali Haider boarded us, grinning like a mischievous ape. And after transferring the guns to the other boat he proceeded to search us thoroughly, while the white man—seated at a respectful distance—kept us carefully covered. When the search could be prolonged no farther, Ali Haider was ordered to hitch a rope and take us in tow.

'Now,' said the white man, 'you can take your hands down and enjoy life. We shall lead; but I guess you'll have to pole after us, for our engine-power's low.'

'Had for mugs, we are,' Judy whispered to me. 'Do as he tells you, but watch your chance. He may slip up presently.'

(Continued on page 531.)

THE PLANET MARS.

By Professor GEORGE FORBES.

I.

DURING the month of August in 1924 many people will ask the question, 'What is that fiery star low down near the southern horizon?' It is the planet Mars, that revolves round the sun in an orbit outside of the earth's orbit, nearer to the earth than the orbits of Jupiter and Saturn. It is seen in August, 1924, to rise at 9 P.M., and to set at 3 A.M. At midnight in the south it is no higher in the sky than a December sun at noon.

The earth travels quicker than Mars in its course round the sun, and overtakes it every two years and seven weeks. At the time when Mars is being overtaken, he must be in line with the earth and the sun. He is then nearer to the earth than at any other time. So he looks far brighter than usual, and this is why people notice the planet when it is in 'opposition' to the sun. His red colour is generally

attributed to the colour of his soil, like red sandstone.

It is interesting to make a little sketch of the stars near to Mars in opposition, and to mark his varying position among the stars from week to week. His general course is found to be from west to east, or from right to left in our latitudes. But, at the time of opposition, Mars and the earth are travelling in parallel courses. And the fact that the earth travels quicker and Mars lags behind makes the planet seem to be travelling backwards, from left to right, among the stars.

On the 26th July 1924, in its ordinary course from right to left, it reaches a notable group of small stars to the left of the constellation Aquarius, the Water-bearer. Here, for a day or two, it remains stationary, so far as we can see. Then it flies rapidly to the right through 30°, right across that constellation, and there becomes again stationary on the 24th September.

Again reversing its direction, it presently acquires its steady rate of motion from right to left. On the 23rd of August it is in opposition, nearest to the earth and at its brightest. This retrograde motion, at times of opposition, was a great puzzle to the ancient astronomers. If they looked on the earth as being fixed in space, with the sun and Mars going round it, they would clearly have to give to Mars a very funny route, sometimes going backwards.

Pythagoras, however, and his school of followers, including the great Plato, seem to have pointed out what has been stated above, that the apparently retrograde motion can easily be explained if the earth goes round the sun in a circular orbit, and Mars in a larger circular orbit, more slowly than the earth.

These philosophers thought that this simple circular motion was far more likely to be the true one than the queer forward and backward motion of Mars, on the theory of the earth being at rest.

But the ancients generally could not believe that the earth moved. So at last the Greek mathematician, Apollonius, showed how two circular motions, such as were favoured by the great Plato, could, if ascribed to Mars, give the appearance of retrograde motion with the earth fixed in space. He gave to Mars a double circular motion like a waltzer in a ballroom, who describes one circle round his partner and another round the room. Any one in the middle of the room would see the waltzer moving round the room, on the whole from right to left, but with occasional stationary points, and retrograde motions from left to right.

This theory of Apollonius was adopted by Hipparchus, Ptolemy, Aristotle, and all philosophers for over sixteen centuries, until Copernicus directed attention to the greater simplicity of the Pythagorean theory of a moving earth. Finally Kepler discovered, from the accurate observations made by Tycho Brahe on Mars during eighteen years, the exact shapes of the nearly circular planetary orbits.

II.

Mars is, in many ways, the most interesting of the planets. It is much nearer to us than Jupiter or Saturn, so we have a closer view of its features. Venus sometimes comes still closer to us, but at such times its illumination by the sun leaves most of it dark, and only a thin crescent is visible, for Venus then lies nearly between us and the sun.

Certainly we can map out the topography of Mars better than that of any other planet. With a good telescope we can see dark and light areas, like continents and oceans. Also, we can see that the arctic and antarctic regions are covered with ice and snow. By watching with a telescope the movements of some dark area, the rotation of Mars, like that of the

earth, is established, and it is found to take about twenty-four hours, just as in the case of the earth. Moreover, the inclination of Mars's axis of rotation to the ecliptic is about the same as in the case of our earth. Since the character of our seasons depends upon that inclination, it follows that the seasons on Mars must resemble our own seasons. In fact, a telescopic examination of Mars shows a great resemblance to terrestrial conditions, except that the year is nearly twice as long, and being so much farther from the sun it gets less heat from it. Mars offers more conditions suitable for the life of human beings than any other planet. But it is doubtful if we shall ever be able to find out whether it is inhabited or not.

There was one thing that used to surprise astronomers. The Earth, Jupiter, Saturn, Uranus, and Neptune all have moons or satellites. Mars showed none. Venus and Mercury might perhaps have moons that are invisible owing to the blazing light of the planet itself.

In 1877 a splendid 26-inch refractor telescope had been set up at Washington, U.S.A.; and when the director, Asaph Hall, turned it upon Mars during opposition he discovered two minute moons, each a few miles only in diameter. But these moons differed from all satellites that were then known in being so near to the surface of the planet that they only take, the one seven and a half, the other thirty and a quarter, hours to revolve round the planet Mars, whose daily rotation is completed in twenty-four hours.

This unique phenomenon would enable an inhabitant of Mars to see the inner moon Phobos revolving every night from west to east; sometimes showing three full moons in one night, with all the phases, waxing and waning, completed in the intervals, exhibiting within a few hours the gibbous and crescent forms and the first and last quarters.

In connection with this discovery, mention must now be made of the most extraordinary fulfilment of a flight of human imagination that has ever been developed in the world's history.

Swift wrote the imaginary travels of Gulliver in the year 1726. He then spoke of the astronomers in the island of Laputa as being furnished with telescopes so wonderful that they discovered not only one but two moons revolving round Mars, very close to the planet, one completing a revolution round Mars in ten hours, the other in twenty-one and a half hours.

It is surprising that he should have said there were *two* moons, which is true. But it is simply astounding that he should have attributed to them periods of revolution so small as to be utterly at variance with any facts known about the solar system. And it seems actually miraculous that he should have,

so nearly to the truth, stated the periods of revolution of these two moons of Mars, which were never even seen till a century and a half later.

III.

The new astronomy owes more to photography and the spectroscope than it does to any new development of instruments, great as these have been in the lives of many of us.

Photography has been of service to astronomy in three different directions: (1) delineation, (2) position, (3) discovery. It was first used for the delineation of the moon's features by Warren de la Rue, Bond, Rutherford, and others. De la Rue then applied it to the sun to delineate the solar spots and faculæ, and also the phenomena of solar eclipses, and transits of Venus. The successful extension of this art to planets is more recent, and was largely due to the study of the planet Mars, as will now be told.

After photography had proved its superiority to the human eye in portraying accurately the markings upon the sun and moon, it seemed reasonable to expect a like success in the portrayal of markings upon the planets. The first attempts, however, dispelled that expectation, and the reason is very obvious to any one who has, with a telescope, sought to make a drawing of the fainter markings on any planet such as Mars, Jupiter, or Saturn.

The markings upon a planet's surface, beyond the broad outlines of continents, perhaps, or of belts of cloud, are often extremely feeble, and difficult to observe. The transparency of our atmosphere is not steady, but varies from moment to moment. So does the stillness of the air, which is essential for clear definition. Any movements of the atmosphere tend to blur and confuse the feebler markings on the planet.

On looking through a telescope at Mars or Jupiter, after a long wait, a momentary flash of exceptionally clear vision may disclose the existence of a spot, or a line, or mere dots, that had up to that moment been invisible. And the observer must then mark upon his drawing these glimpses, while he goes on looking, in hopes of confirming or correcting his first impression. Thus his picture may be filled in with details which are not seen by him all at once, but only 'glimpsed' occasionally.

Now, a planet differs from the sun, or even the moon, by the feebleness of its light. It requires a much longer exposure to produce a photograph, a duration of time generally much longer than the duration of any one of those exceptionally clear moments of vision. Details become obliterated by atmospheric fluctuations during the time required for exposure.

Thus it happened that disappointment was met with in all early attempts at delineation of the surface of a planet by photography. This arose from the absence in the photograph

of those glimpses that can be caught visually. But every one looked forward with hope, and we still do so, to a time when photographs of the planets will be as clear and superior to visual drawings as are those of the moon or of nebulæ.

One of the greatest charms to many of us in the history of astronomy lies not so much in the wonderful discoveries that have been made as in the dogged perseverance, patience, and skill of the astronomer in his continuous and unremitting search for truth. And the partial success that has been attained by the effort to photograph the finer details of the planet Mars is one of the best examples of this spirit.

Its history is worth recording here as a pleasing tribute to the untiring perseverance of the late Percival Lowell at the Flagstaff Observatory in Arizona, U.S.A., in his prolonged study of the planet Mars.

IV.

Up to the year 1877 the features depicted in drawings of Mars were permanent markings, perfectly clear and definite. In that year, when his moons were discovered, Mars and the earth came unusually close to each other, and Schiaparelli, for the first time, detected certain straight lines forming a kind of network over parts of the planet. The straightness of these lines did not look natural, and the suggestion was made that they were artificial canals made by human beings. At a later opposition of Mars the same astronomer declared that many of the canals were double.

Some people of imagination have looked upon the canals as means of transport between industrial towns situated at their points of intersection. The duplication of canals might have become necessary on account of the increasing traffic; one for the up trains, the other for the down trains, of canal boats.

On the other hand, some have looked upon the canals as a huge artificial system of water-supply for irrigation. If the red colour of Mars is due to the soil being a sandy desert, then the absence of water in these desert regions may have led to the construction of canals to bring water from the polar regions when the ice melts in summer time. For we do find that the ice-caps covering the north and south poles of Mars, as on our own planet, are seen to grow in the winter of Mars, and to be melted and shrink during its summer, alternately in the two hemispheres of the planet.

A great number of maps of the planets were drawn by those astronomers who were fortunate enough to detect these canal-like appearances. Among these, no one was more diligent, or more successful, than the late Percival Lowell, whose acquaintance I first made at the observatory of Harvard College over thirty years ago. He set up a magnificent

24-inch telescope, in the clear atmosphere of the high altitudes of Arizona, at the Flagstaff, or Lowell, Observatory.

While Lowell was thus confirming the observations of Schiaparelli, many other astronomers could not see the canals even with larger telescopes than his. They doubted the reality of the network of canals; and they suggested that the pictures by Lowell and others were the result of imagination, and that he unconsciously joined any spots or marks there might be into straight lines extending over great distances. Lowell, on the other hand, attributed his own positive results, where others failed, partly to superior qualities in his telescope, and partly to the climate.

Lowell continued, at successive oppositions of the planet, to confirm his original discoveries. Still the doubters insisted that the canals were an illusion. In answer to this he invited sceptics to his observatory. Again and again these independent observers, when favoured by moments of unusually clear vision at Flagstaff, confirmed his results. Still, many sceptics were not convinced.

Thereupon Lowell realised that the only way for convincing all astronomers of the existence of these canals was to secure an actual photograph independent of human hand, eye, or imagination. This would involve a new departure in the use of photography by the application of new processes, for, down to that date, photographs of planets had not been a success. All his efforts were concentrated on taking numerous pictures of Mars so instantaneously that in some of them he might chance to catch the favourable glimpses, under momentarily good conditions, which had hitherto been vouchsafed to direct vision.

He used the most rapid plates. He stained them with a dye that rendered them more sensitive to the red colour of the planet. He also interposed faintly-coloured films to accentuate the contrast between the chemical action of light coming from the canals and from the background of the picture.

At every step, though with many failures, his hopes became brighter. After years of laborious trials he was able to get a clear picture with an almost instantaneous exposure. Then he proceeded to take on each plate a great number of exposures in rapid succession on different parts of the photographic plate. Eventually he succeeded in occasionally finding perfect definition in some of the images.

In this way Lowell was ultimately able to circulate among astronomers photographs which, although they did not exhibit every detail which he had glimpsed in his eye-observations, did certainly prove to the world the existence of these lines which he considered to be artificial canals.

He did not assert that the great breadth

of the lines was all canal. He claimed that the lines indicated not only the canals, but also the belt of vegetation that would inevitably spring up to some distance on each side of the banks of the canals, as can be seen on the banks of the Nile.

Since the death of Lowell, his chief assistant and successor, Mr Slipher, has continued the good work with great perseverance. He tells us that the number of photographs of Mars already taken at the Lowell Observatory considerably exceeds 100,000.

Quite recently, by the application of these new processes, he has produced marvellous photographs of Jupiter, which have been the admiration of all who have seen them. Ten years ago such pictures would have been impossible.

V.

Every time that a line from the sun to the earth overtakes Mars that planet is in opposition, and at that time it is nearer to the earth than at any other time during that revolution. But at some oppositions the planet is much nearer than at others. It comes nearest to us when the opposition occurs in September, and in August of this year, 1924, it is only 35,000,000 miles away.

It is easy to understand the reason for this. The earth's orbit, though elliptical, is very nearly a circle, with the sun at its centre. In other words, the distance of the earth from the sun does not vary greatly in the course of the year.

But in the case of Mars the elliptical orbit differs much from a circle. It is an oval, with the sun not at the centre but nearer one end of the oval. Hence the planet is nearest to the sun and to the earth if the opposition occurs when the planet is at that end of its elliptical orbit. The earth is always in that line during September, and this is the reason why we get our closest view of Mars when the opposition takes place in September.

Every fifteen years we have an opposition at or near that favourable position. At those times there is the best chance to detect faint details upon the surface, as Schiaparelli found in 1877.

Moreover, the closer the planet is to us, the more accurately can its distance from us be measured. For this reason, in September 1877, that great Scottish astronomer, David Gill, carried out to Ascension Island, in the Southern Atlantic, the instruments required for the purpose. He then settled to the satisfaction of astronomers a perplexing problem as to the true distances, in miles, of all the planets and the sun.

The result reached by Sir David Gill in 1877 remained the best known until, ten years later, as Her Majesty's Astronomer at the Cape of Good Hope, with more powerful appliances, and

with all the experience gained in the interval, he measured the sun's distance still more exactly, and in doing so performed a feat of accurate observation which stands out even to-day as one of the greatest triumphs of British astronomy.

Those of us who look out for the fiery-red planet in the south after 9 p.m. during this month of August will perhaps have an increased interest when bearing in mind what has been told in this article. Unfortunately this opposition of Mars occurs, like all the best

ones, when it is in a part of the ecliptic which never reaches a great height above the horizon in our latitudes.

We are not likely ever to receive messages from Mars. But to most people there is a perennial interest in discussing what at present is a question with no immediate prospect of solution, the habitability of the planet Mars. All that can be said with certainty is this: If human beings can exist on any planet, Mars is the one on which they would have the best conditions for their existence.

BUTTERFLIES AND COLUMBINES.

By MORRIS MARPLES.

I.

IT was evening when I arrived at Zweimatten. I had walked all day, with rucksack and butterfly-net, and I had not hurried. It was too hot at first; even the butterflies were glad to drink at every wayside pool, and dance their flickering dances where the sunshine blazed less fiercely. And when no longer the sun struck into the valley, I had been content to dawdle on the cool upward road through the pine-trees.

I was happy. Did not my collecting-case contain two specimens of *Podalirius*, that lovely swallow-tail of the Swiss water-meadows, beside my other captures? A very little thing can make an entomologist happy. Singing to myself, I made my way among the familiar chalets. The tang of wood smoke reached me, the tinkling of mule-bells, the music of running water. It was like a home-coming. Indeed, I regarded Zweimatten as a home in a foreign land; and more especially the Pension Minerva, where good Frau Abplanalp had mothered me every summer these ten years.

I turned the corner, and, behold, the hospitable white front, the green shutters, the creeper-covered veranda, and on the veranda Frau Abplanalp herself.

Her homely face brightened as she recognised me. 'Well, here you are, Herr Partridge,' she said in her deliberate English. 'I was waiting you long time. How are you then?' We shook hands, and she led me inside.

When I had answered all her questions, she herself conducted me to my old room, facing the Geissthorn and the rising sun.

II.

Half-an-hour later I came down, and found dinner had already started. The long *table d'hôte* was so full that I could hardly find a seat. There were the usual school-teachers, just arrived like myself, and very talkative; a parson and his wife; a couple of family parties; one or two sun-blistered climbers. So much I took in at

first glance. Cheerful English voices filled the room.

At last I managed to insinuate myself between the parson's wife and a little elderly gentleman, who seemed to be alone. One glance at the High Church lady was sufficient; she carried a lorgnette, crocheted between courses, and sniffed. I turned to my other neighbour.

He had mild blue eyes, and a smooth, oval, red face; his head was absolutely and entirely bald, like an egg. His mouth turned down rather mournfully at the corners; indeed his whole aspect was rather lugubrious. 'Humpty Dumpty,' I dubbed him mentally.

'Have you been out here long?' I ventured conventionally.

He wiped his mouth with his napkin, and pivoting, as it were, from the hips, 'Yes,' he replied, very deliberately, 'I have been here three weeks. This is a charming place, is it not?'

'I'm glad you like it. It's an old haunt of mine.'

'Ah, yes.'

'I've been here every summer for years now. This your first visit? I don't remember ever having seen you here before.'

'No. Not my first visit,' he articulated. 'Twenty-five years ago I was here. I was here for my honeymoon.'

'Really? It must have been delightful in those days.'

'It has changed very little. Everything seems exactly the same. It strikes me very forcibly. I have changed so much, and things here have changed so little.' He blinked his blue eyes and drooped his mouth.

'The people must have changed.'

'I suppose they have. Most of them.' He sighed.

III.

My curiosity was now thoroughly provoked, not only by his demeanour but by his whole appearance. I could not satisfy myself as to

what he was, or why he was at Zweimatten. As I looked at his well-starched collar, his neat blue suit (they don't dress at the Minerva), his gold watch-chain, I associated him rather with Torquay, or perhaps Harrogate. I pictured him strolling on promenades, occupying hammock chairs, wearing a panama and rubber-soled shoes. He seemed to me distinctly out of place at Zweimatten, and alone at that. And yet he had been here three weeks. 'Are you staying long?' I asked.

'Perhaps for a month,' he replied, 'or perhaps less. It depends really upon the weather.'

'Well, you are pretty safe at this time of the year.'

'No, it's not that.' He hesitated a moment. 'The hotter it is, the sooner I shall be able to go.'

I wondered what he meant. 'You speak as if you were here under compulsion,' I said, smiling. 'Surely that can't be so.'

'Well——' Again he hesitated, toying with his dessert. 'As a matter of fact, I'm waiting for some one.'

He had the air of imparting a secret, rather against his better judgment.

'Your wife, perhaps,' I dared.

'Yes. My wife.'

Perhaps I should have pressed him no further, so uncommunicative did he seem. But curiosity overcame me. 'She's coming out to join you?'

'No. She's—she's out here now. She's been out here for the last twenty-five years.'

He seemed to fling the statement at me.

As we rose from table I realised I had stumbled upon a domestic tragedy. His wife had been in Switzerland since their honeymoon; he had been in England. Building upon these facts, and upon his reticence and general behaviour, I solved the problem quite simply. There had been a honeymoon quarrel, and a reconciliation was about to take place. Why, else should he meet his wife?

I strolled onto the veranda with my cigar, my companion having left me. The Alpine glow was on the mountains, and the goats were tinkling homewards uncondemned. I stretched myself in a basket-chair. 'Queer about Humpty Dumpty,' I thought vaguely. 'Pathetic little man. What on earth did he mean when he said it depended on the weather—the heat?'

But before long I had forgotten him. My mind slipped back to butterflies, as it always does. The night was cool and fragrant; the rosy hills were fading. It was indeed good to be alive.

When it was quite dark I went to my room, pinned out my swallow-tails, and so to bed.

IV.

When I came down to breakfast Humpty Dumpty was already there. I sat down beside him, and he seemed quite pleased to see me.

'Good-morning,' he said, very cheerfully, without turning down the corners of his mouth.

'Good-morning,' I answered, rather at a loss what further to say.

But this time he took the initiative. 'Are you remaining here?' he asked.

'Yes. For a week at least. I'm an entomologist, and this is a very good place.'

'Indeed? I have observed multitudes of butterflies—particularly along the glacier path. You know it?'

'Oh, quite well. I'm going there to-day, I expect.'

For a second he regarded me, pivoting in my direction. 'Er, would you—would it embarrass you in any way if I were to accompany you? It is my daily habit to stroll that way——' He left off questioning, and a little anxiously.

'By all means do,' I hastened to assure him. 'Let's go together, by all means. I shall be awfully glad of company.'

'Yes? I have always gone alone, for so seldom do I meet any with whom I care to associate, or who are at all in sympathy with me. But you——'

'Yes, yes. Quite,' I interposed hurriedly, and was immediately sorry, for he looked so crushed. 'It must be a bit dull by yourself,' I went on. 'You'll be glad of some one to talk to.'

'I'll go and get ready,' he said, and went out.

I finished my breakfast, and, having packed my rucksack, I took my net, and found Humpty Dumpty waiting for me with the sandwiches. Sure enough, as I had imagined he ought to, he wore rubber-soled shoes and a panama!

We started along the glacier path through the fir-trees. The sun blazed pitilessly from a turquoise sky. The flowers, in the little alps we passed, splashed their colours abroad like butterflies on stalks. And the butterflies danced above them like winged flowers. Sometimes my skilled eye would detect one more desirable than its fellows, and I would leave the path for a brief, but exhausting, pursuit with the net.

Slowly we climbed the gentle gradient. Our talk was of the mountains, the flowers, our fellow-guests, anything and everything, such as two strangers in Switzerland might chance to discuss. But my companion seemed always a little detached, as if his thoughts were other than his words. I knew there was something on his mind.

V.

Not far short of the glacier we sat down to lunch in the shade of a great rock, and there, at last, he broached the subject I had long been expecting.

'I expect to be able to take my wife away in another fortnight if this heat lasts,' he said abruptly.

'Er—she objects to the heat?'

'Oh no. Not that. But she will be released sooner if it continues,' he replied mysteriously, and set me thinking of the sun-cure for consumption for want of anything more plausible.

'Yes. I suppose the heat does make a lot of difference,' I said, without meaning anything in particular.

He glanced at me. 'Yes,' he said, and was silent.

No suitable reply occurred to me; and I fell to examining a great blue columbine which grew beside me, like some fantastic tropical insect, on its slender stalk, so it seemed to me with my butterfly-ridden mind. The wood around and above was full of them, glowing blue in the shadows. Humpty Dumpty saw what I was looking at.

'The columbines are lovely, are they not?' he said softly. 'My wife loved columbines!' He rose and gathered one or two. 'Twenty-five years ago, in this very wood, we gathered columbines together.' His mouth drooped. 'I think she would like a few to-day.'

'To-day?' I repeated a little startled. 'You will see her to-day?'

'I see her every day.' My theories collapsed. 'I hope to see her very shortly. Would you care to?'

'I should be delighted,' I managed to say, though my mind was filled with confusion.

'Shall we go on then?'

We resumed the path. Humpty Dumpty carried his little bunch of nodding columbines carefully in front of him.

'Your wife is in Zweimatten?' I asked, after a minute's silence.

'No, no. She is waiting there.' He pointed in the direction we were going.

'On this path?'

'No, no,' a little impatiently.

Completely mystified, I began to suspect a touch of the sun. We were approaching the smooth lip of the glacier, and the stream which flowed from it was clamorous beside us. I could see the glorious cold green-blue of the ice. I said nothing. Humpty Dumpty led the way up to its very face.

'That is the most beautiful colour in the world,' he said, touching the ice with his finger-tips; 'the most beautiful colour in the world.'

For a moment he stood, apparently absorbed in thought. Then he roused himself with a jerk, and we began to scramble around the foot of the ice-wall over jagged rocks.

'Shall we go in here?' he said, and led the way into a cave in the ice. He took off his hat, and his bald head shone blue-green in front of

me. Over his shoulder I could see, just within the tunnel, what looked like a rough barricade, or partition of wood, obstructing further view. He slipped behind it. I followed, and stood amazed.

Through the blue, bubbled ice shone a beautiful pale face, a calm young face. Her golden hair lay loose and tangled about her head, shining with a strange greenish brilliance through the ice. On her side she lay, quite peacefully, and one white hand drooped across her bosom.

VI.

I gazed in silence, awed and wonderstruck. Before that still face, like an angel's, I forgot for the moment everything. I was startled when Humpty Dumpty's voice came, low and reverent at my ear. 'I can tell you now,' he said. 'I have tried before, but . . . There are some words I dread. . . . You understand?'

I nodded, without taking my eyes from his wife's lovely face.

'Oh, it has been difficult, this waiting. I have wanted sympathy, some one to confide in. . . . Twenty-five years ago. . . . It was on our honeymoon—Mary and I—we were on the glacier with a guide. She had wanted to go so much. . . . But a crevasse; she slipped through the snow. The rope broke at both sides across the sharp edge. She was in the middle, of course. Look!'

I looked, and saw the rope knotted about her and the cut ends.

'They tried to find her, but it was no good. She had gone too far, slipped right into the heart of the glacier. . . . I suppose the cold killed her. She would sleep first. . . . They told me twenty or thirty years. I went back to England. We'd only been married a fortnight. I was thirty. I sat down to wait. It was terrible at first. But I lived through it. I got used to it, I suppose. . . . Then they sent word. I came, and saw her again. . . . When they wanted to dig her out, I said "No. This is her tomb. She shall not be disturbed. I have waited for years. I will wait a little longer." You see, it is almost—almost as if she were alive—asleep. . . . I like to see her. I come here every day. No one comes but me. A few know she is here, but they do not come, naturally, for I have made it a shrine. I worship here. I worship my beautiful Mary, as she was all those years ago, and still is, though I have changed.'

He went down upon his knees on the ice, placed the columbines gently at the foot of the blue-green wall, and bowed his head. I knelt beside him. A minute passed, silent, save for murmurously trickling water.

Humpty Dumpty rose. 'Come,' he said; 'let us go.'

We passed out into the burning sunlight.

Chambers's Journal

SEVENTH SERIES

MAKE BELIEVE.

By SYBIL GRANT.

HAVE you ever considered the possible value of a trained official diagnostician, where lending libraries are concerned?

This applies to England—not Scotland—where 'the worst vice is advice.'

In fashionable bookshops, salesmen will be found ready for the assumption of such a rôle; as interested parties, however, they are disqualified from the start.

To press best sellers upon bad buyers; to counter feeble demands for a book out of stock with works of which the firm holds an unwelcome surplus; to hurry wavering custom past 'the Morgue' (that dim slab where poetry is laid out) towards seven-and-sixpenny fiction—such is the business, indeed the duty, of salesmen.

With regard to lending libraries the position is different.

The present writer, no bookworm, reading either when ill, or when life offers no better alternative, is therefore entitled to speak for two-thirds of the great British public.

If you ever prowled about the countryside you will know certain little local shops where books are lent at a penny each, and 'a good read' is not only desired but expected. Subscribers demanding that neither time nor penny should be wasted, the young lady in charge is supposed to read and remember every book upon the shelves. Surprise and rebuke ensue should she fall short of this expectation. 'What is she there for?' Well, as a matter of fact, she is there sometimes to sell reels of cotton and sweets, often postage stamps, and nearly always newspapers.

Still the young lady does her best, patting one book and saying, 'full of society;' another, 'bit tragic—if you follow me,' leaving you to choose. And that is the catastrophe—the blighting process of making up what is called the mind, which takes the fun out of life, complicating railway travel, marriage, restaurant menu, and so on.

Sometimes, realising this, the young lady adds with primitive psychology, 'any'ow, ends up right all round—if you take my meaning;' guessing that we, who all hope so strenuously for happy endings where our desires lie, will be sure of falling to the lure.

It is the same in all libraries. From the humblest to the highest—in all of them the young lady lacks expert training in diagnosis; the difference between the chemist and the consulting physician.

The O.D. (for full name see above) would glance up at your entrance, and remark with professional interest (but not out loud) 'a clear case of——' and provide accordingly.

The task, delicate and difficult, demands natural aptitude, allied to thorough training.

Popular writers should prove useful at first. It cannot have escaped your notice that an author making 'good'—or at all events 'money'—in a certain line of work, is apt to patrol that line for life; and a loyal public follow him faithfully to and fro upon his 'beat.'

Once, having endured the unpleasant spectacle of a German singer (*sic*) waddling and wheezing through several hours of Siegfried, the present writer's grumble was met with: 'But only think! His golden wig is made from the hair of his grandchildren!' In the same way, once an author becomes an established favourite, he may waddle and wheeze complacently through edition after edition; or rather 'issue' after 'issue' (since universal interest in the birth-rate—controlled or otherwise—often leads publishers to prefer the language of Scripture and Burke). This fact provides another argument in favour of the O.D. Such fidelity upon the reader's part arises from a very general anxiety to avoid the strenuous process of thought, for with 'So-and-So' you know exactly what you are going to get.

Now the O.D. is there to prevent any such arduous process. She thinks for you. Not only does she provide you with 'So-and-So' after that first professional glance, but she enlarges your literary horizon—introducing you to hundreds of others exactly like him, each busy upon his own little beat.

Of course this essay would prove much more readable if names could be used; but the high cost of living and the low rate of literary remuneration* combine to make the writer shrink from giving personal advertisements—whether gratis, or in the more expensive form

* It depends.—EDITOR.

of law suits. Therefore must our illustrations be drawn with the blunted, prudent pencil of anonymity.

For instance, the O.D. would recognise at once those symptoms requiring 'a black draught' poured from that epitome of local drear—the work of a noted 'To-and-fro writer' excelling in details of dingy towns and dingy people owning more cash than comedy. Or others demanding a strong sedative compounded from the output of that leisurely stylist who keeps his followers upon the same tip-toe poise as his own considered language, waiting—for nothing to happen! One can almost see this writer weighing his sentences with the same intent leisure as the country grocers their sweeties to the school children—only the sentence (alas!) is less gaily coloured than the sweetie.

Yet again, completely reverse the process according to the symptoms of prospective readers, and a brisk tonic may be administered, such as this (quoted at random from an old ballad book), where the reader jumps into action on both feet:

She laid her cloke upon the earth
And then to little twins gave birth.

This last example shows a distinct advance in the career of our O.D., for she must not depend too much upon the convenient author belonging to the 'To-and-fro' category.

Such a practice savouring of 'cribbing,' she must learn to prescribe literature suitable for either bed, bath, or train; to read upon the hills, or by the sea; during political meetings, or public banquets. (For such occasions must pocket editions at popular prices have been invented—to hold concealed in the palm or the table napkin.)

Where bookworms are concerned there exists a book—if you can find it—to deal with every conceivable situation. From the neurasthenia subsequent to the discovery of unlawful trifling by secretaries of local slate or goose clubs—with either slate or goose (as the case may be), to the lesser emotion when your wife runs away—or, indeed, when she may have neglected to do so.

Indeed, this raises a new and alarming subject for speculation. Bookworms would become gratefully submissive to one saving them so successfully both time and trouble. Now the right book, administered at the right time, in the right dose, to the wrong person could produce almost any effect. How easy, under such conditions, to induce, rather than suit, a mood!

A pudding can become deadly as a bullet: it all depends upon the cook. Supposing, among the sheep, there should lurk a goat?

Supposing mischievous ambition should turn one O.D. into a purveyor of munitions of war, instead of mental nourishment?

An unscrupulous O.D. could abuse the gentle faith of a bookworm browsing placidly among

such luxuriant vegetation as the facile output of Miss Unôhoom, leading him to stronger meat than that pleasant parsley. Surely you foresee possible, and terrible, contingencies? Broken engagements, murder, inattention to the telephone or personal appearance—ruin.

The village plumber, after an intensive course of unsuitable reading amid the professional atmosphere of H.C. and gas—seeks the same kind of thing at Westminster. Meanwhile the village, left behind, bursts its pipes from chagrin; and ceases to exist. Or the O.D. (Lucrecia Borgia re-incarnate)—anxious to extend the practice of her lover, the village doctor or undertaker (either, or perhaps both)—presses the medical dictionary, complete with coloured illustrations and diagrams, upon nervous and imaginative subscribers. Result: plague, pestilence, and famine.

Among a dozen empty shell-cases once lent to the present writer for exhibition purposes, faint smoke revealed the chance presence of what is sometimes called a 'stinker.' Just bad luck.

Thus, among hundreds of invaluable O.D.'s might lurk a Lucrecia Borgia or a Bloody Mary; but surely the game is worth the candle?

You may answer 'No'; sticking to your farthing dip—the young lady with the happy endings. So might the present writer—if happy endings were, in truth, so readily obtained. As it is—why not the sporting risk?

If a parliamentary candidate could be found prepared to urge the establishment of yet another official, this humble pen might record a vote—at last!

The candidate will not be a fellow-countryman of mine (for you could no more advise Scotland what to read than what to think). Probably Rough and Rich. Candidates often are.

Something like this: 'Ladies and gentlemen. It is the juty of every citizen to assist in the improvement and develûpment of his native town, village, and so forth.

'I myself am a self-made man' (recipe given here for process of self-manufacture), 'proud of my sauce (*sic*), proud of my wife, proud of my children; and—last, but far from least—proud of myself. I . . . ' Asterisks here; not impropriety, merely autobiography. 'Why do I want your vote? To make £400 a year? I mock at the suggestion' (mocks). '*Me*—making per week . . . ' Financial autobiography involving army of asterisks. 'But when, with your vote in me hand, after a long day in the House of Commons boosting Boodles'—the constituency whose chief manufactures are hosiery, nonconformists, and teetotallers—'I go home for a gl— pipe, I am ready for a good read.

'Personally I'm not ashamed to confess that the Bible and *Hosier's Herald* (loud cheers) would be my choice. But should I say "no" to a book; a good book, mind you, that would

int'ruct and amuse? Offered by a nice smart gal that knoo her job.' Frown from wife, the speaker accelerates, changing, with a rasp, into 'top.' 'They sy Scotland's not with us 'ere; orl I say is, Scotland can sty outside. We 'ave

Wales, that great centre of fiction. And Ireland, that great centre of friction.

'Wot-I-mean-ter-sy is——' and so on. But I feel sure that you brought out your pocket edition long ago.

THE GARUDA.

CHAPTER III.—*continued.*

II.

SO, with Ali Haider paddling ahead of us, the procession started. Meanwhile the stranger surveyed us from the stern. He seemed to be in a talkative mood.

'There's no call for me to ask which of you two is Major Elkington,' he remarked, addressing Judy. 'From the word-picture supplied by our mutual friend Essar Dass I'd take my oath to you anywhere.'

Judy said nothing, but the stranger went on quite unabashed. 'A remarkable man, Essar Dass, believe me. In my particular line, now, I can only recollect two others in his class: R——, he's president of the Red International of Labour Unions, and X——, who got into your parliament last election for some Scottish constituency. But Essar Dass has 'em both beat. I may say right here that he's a big noise in the provisional government for India which we shall shortly introduce. That man'll make history. He's the brains of this stunt. I just do as I'm bid.'

'And who the devil are you?' Judy inquired pleasantly.

'Well, now, that's better,' said the stranger; 'for I want a talk. Six months with nobody but those Indians: it's been fierce! Somehow I can't hit it with them—not even with Essar Dass. But you and I now, we can understand each other. I don't mind telling you who I am; or what I'm here for, either. For why? Because you're out of the game. O-U-T, out. Now, don't you think of getting fresh, for it's no earthly. There are nine more of my boys around who'll come quick enough if they're wanted. That guy of yours who slid from the boat—oh, yes, I saw him—I reckon they have him by this time. Not that it matters at all, for the swamp or the alligators'll get him anyway long before he can hit dry land.'

'But to return to your question. I'm American—name of O'Gorman. So you'll perhaps guess where my folks came from. And I've been engineering all my life—airplanes latterly. During the war you may have heard talk of an engine of mine? No! Well, you can take it from me that it was a darned sight better proposition than that dud "Liberty." I guess that was why the agents of the Irish Republic came to me to build them something good for their war with you. Money was no object, they said.

'Well, now, I figured it out like this. Obviously a machine to be of any use to them had to be a night-bomber—sabotage, you'd call it. Likewise, there could be no question of airdromes—they kind of catch the eye. Likewise, the engine must be silent. So I sat down to work it out. And I done it. Yes, I delivered the goods. Helicopters!' His enthusiasm had been growing visibly as he talked, and now he almost shouted the word. 'I tell you, my bus'll land in a gale in one and a half times her length and take off plumb vertical. Furthermore, I can hover, without which you'll never get accurate bombing. And a silencer on the exhaust. My engine's quieter than a Rolls limousine, and the loss of efficiency's negligible.' By this time he had half-risen from his seat, and was flourishing his automatic to emphasise his every word.

'But,' he continued, 'by the time I'd built my bus you'd given Ireland best, so there was no market. That's how I come to be in this benighted country.' And he relapsed into his seat again, the wild light dying out of his eyes.

'You British make me tired,' he went on thoughtfully. 'You don't begin to know what you're up against, for you can see nothing but Bolshevik Russia. But we're everywhere: from Yokohama to Glasgow, from the Rand to Java and 'Frisco. Nationalism, republicanism, Swaraj, Pan-Islam—we use 'em all for one object: to crash the British Empire, as a first step to the rule of the proletariat. And mind you, it's got to come.'

'Take my case now. When they heard my bus was in the market, the "Freedom of India League" it was that got in touch with me in the States. I was to pack my bus and ship it as sugar-refining plant consigned to Essar Dass. And I was to ship myself to Calcutta: they'd do the rest. Well, they paid good money, and it was all for the cause, so I didn't kick.'

'That man Essar Dass is a live wire. He isn't one of your no-good non-co-operators: he's in your Legislative Assembly. And he had his sugar-factory all laid on for us. Why, your Governor himself opened the factory last fall. "A laudable and public-spirited enterprise which will bring capital into the Province," he called it. Essar Dass reckons to be made a Rai Bahadur in the next Honours List. And his staff are picked men: they know as much Communism as Karl Marx, and then some. Also, they can

rig an airplane. I've a dozen of them out here now: engineering students from the universities, and boys who've got sacked for making trouble in Tata's works and the railway shops. You'll see 'em in a while.

'So here I am with my bus rigged, ready for the word go. And likewise, here we are at my island.'

III

We had, in fact, at that moment emerged on to an unsuspected lagoon in the reeds, roughly circular in shape and perhaps six hundred yards across. Its surface was studded with a number of low, insignificant mud-banks of varying sizes, and it was towards the largest of these that we now directed our course—a narrow, hog-backed islet some three hundred yards in length, covered throughout with rushes and rank grass.

At first sight it showed not a sign of human habitation, but as the leading dug-out grounded, eight or ten figures seemed to materialise from the earth, to come running towards us. Each of them was armed with some sort of firearm. And if you had ever seen the National Volunteers, who until recently were wont to parade all over India, you would have had no difficulty in recognising the type—undisciplined, semi-educated, and disgruntled, with no respect for God or man, and ready to commit any excess from political murder to peaceful picketing.

'I don't figure to make your stay with us more unpleasant than need be,' said O'Gorman, turning to us, 'so you can land, and I'll leave you loose for a while. But behave yourselves, mind, for the boys are fair itching to shoot.'

'I guess you reckon to know all about camouflage?' he went on, as we reached the bank. 'Well, just you come along with me then.'

The bystanders were fingering their triggers lovingly, so we meekly complied and followed towards the farther end of the island, which in that quarter rose in a distinct hummock perhaps twenty feet above the rest. But it was not till we had actually reached the rise that we realised that the hill-top was a fake. Then we saw that it was a cunningly constructed roof of grass mounted on wire-netting frames, the whole exactly coinciding with the contours of the slopes. As we peered through the interstices of the grass, bit by bit we pieced together the outline of a vast shape housed within—great horizontal vanes of polished metal like the blades of a gigantic fan, and a maze of struts and tie-rods emerging from a dark, intermediate mass below.

'Some mountain, you'll allow,' remarked O'Gorman with conscious pride; 'and it's here we keep my very own "Garuda"—my bus, you understand. Over there, again, we've got the bomb-store—enough to blow up quite a few railway-depots and barracks, believe me. And away at the far end of the island are the boys' huts, all camouflaged; so, supposing any guy comes rubber-necking around, he'll sure miss them.'

'The "Garuda"?' said Judy. 'What made you choose that name?'

'Why? Essar Dass, he done it. I told you the whole plan was his, didn't I? Now, the Garuda, so he tells me, is the fancy bird of the god they call Vishnu; he used to joy-ride on the Garuda, as I understand. Consequently, my machine was billed for the part of the Garuda right away from the start; for Essar Dass reckoned when Vishnu and his fabulous fowl were seen flying around at night it would cause some stir. And after he had spread the glad tidings that on some big day—say Vishnu's birthday, now—that bird would make the British smell hell, why, then my Garuda had only to perform as advertised for the whole blamed populace to join in the good work. Simple, isn't it?'

'So Essar Dass selected this salubrious spot, for it's quiet-like here—once we'd frightened the marsh-men. And one dark night last rains we ferried the bus over, dismantled in her packing-cases. You can get a barge across then, you know, by the old river-bed from the factory. We caught a marsh-man for a guide. Subsequently we had to dispose of that marsh-man. When the bus was rigged we took him up at night, and dropped him away inland. We had to do the same thing twice more, and after that the marsh got kind of unpopular. But that boy, Ali Haider, he was my idea. We wanted a guide we could trust, you see, and the best communists are all caught young. Furthermore, he's too young to suffer from carnal desires, so he don't feel homesick.'

'Now we're about ready to begin. There's been plenty of talk—just the vague sort of dope we wanted—and everybody knows that next Tuesday is the day: "the ninth day of the new moon of *Magh*," Essar Dass calls it. It seems that's some big day or other. Gee! and they'll get their show. We've a sweet little programme laid on for that night—near a ton of bombs to be dropped with the season's greetings. Programme to be repeated nightly. After a performance or two, Essar Dass reckons anything may occur. His propaganda's been good. It only wants us to start things moving.'

'Well, friends, you see what you've butted into,' O'Gorman continued. 'Mind you, I've no nasty feelings towards you personally. None whatever. But you've sure got to be eliminated. See?'

Something in the altered tone of O'Gorman's closing words warned us to look out for squalls, but subsequent events left us no time to act. The storm-signal was a staccato order from O'Gorman, commendably brief and to the point. 'Now, boys,' he cried, '*pakkro!*' (seize them). And physical obliteration followed.

I found myself collared from the rear and hurled to the ground—the centre of absorbing interest to a very evil-smelling rugger scrum.

Of course, it was entirely futile to struggle, but at least there was one fleeting moment of triumph as my knee met a communist full in the face. Then they had us—bruised and panting—pinned helplessly to the ground.

O'Gorman next proceeded to rope us, and he did it most scientifically. When he had tested every knot to his satisfaction, we were bundled to the farther end of the island, and dumped unceremoniously into one of the camouflaged huts.

CHAPTER IV.

I.

We lay in silence for an indefinite time; and then at last Judy muttered, 'It's no good. I've done my darndest to get these ropes loose, but that fellow knows how to tie a knot. How about you?'

I made a similar report, and Judy went on, half to himself, 'Life's full of surprises. I ask you, who'd have thought of Essar Dass? And that tame Yankee of his, too! We've found out something, anyhow—not that it's going to do us any good; for, as far as I can see, we're for it. It's a black business. I'm d—d sorry, old chap, for I let you in for this.'

'Don't worry your head about that,' I said. 'After all, I came in with my eyes open. And we're not dead yet.'

'It would need a sporting insurance company to take the risk,' was Judy's only comment.

Whereafter the situation remained unchanged, as it seemed, for centuries, and the growing torture of those ropes still haunts me like a nightmare. But, for all our dolours, we managed somehow to discuss the position in its every aspect. Our conclusions were not consoling. At best, we were out of the game—as O'Gorman had truly remarked. At worst?—the fishermen supplied a thoroughly unpleasant precedent. And gradually the light failed as the short winter's day drew to a close.

It must have been just after sunset when at last we caught the sound of approaching footsteps. They came to a stop outside the hut, and a voice, which we recognised as O'Gorman's, remarked, 'They're in there safe enough, Lala-ji. You can go right in and see them for yourself, if it'll make you feel any better.'

'Oh no,' an unctuous voice replied. 'I do not wish to see. But it is most unfortunate that they came to-day. Most unfortunate.'

'That's Essar Dass,' Judy whispered. 'I'd know the old fox's voice anywhere.'

'Now, don't you have any sleepless nights about that, Lala-ji,' O'Gorman went on. 'That's all O.K., I tell you. The moon will be down by one o'clock, and then we'll take 'em up and drop their bodies where they'll be good and conspicuous in the morning. There's only three more days to go, and—with the bodies

found a good twenty miles away—who's going to come smelling round here? And you say you've got the swamp watched in case that Indian got through. Well, then, what's your trouble?'

We heard the sound of retreating footsteps, and then Essar Dass's voice again, growing faint in the distance. 'My trouble? That Kanjar—that untouchable—have you not let him get away? Are your men fools that they did not catch him? But at least I can stay here to see that there is no mistake about these two.' That thought seemed to please him, for he laughed—a fat chuckle of anticipation.

Afterwards silence reigned once more, and we lay digesting the programme provided for us. I think we were both too depressed for conversation. By this time it had grown quite dark; we had at most six hours' respite left. And perhaps it was some such thought which led Judy at length to break the silence—at the precise moment, as it happened, when a faint cry from without first reached my ears. 'There's a charming couple for you,' he murmured. 'You heard what they said? The only hope left now is that fellow Dulloo of yours. And he's an obvious rabbit.'

As though in answer to his words the cry came again, this time much nearer. 'Keep quiet!' I interrupted. 'Didn't you hear that? There it is again; the screech-owl's call.'

'Kur-r-reet! Kur-r-reet!' The call was repeated, this time close beside us. A most indubitable screech-owl, you'd have sworn. But the human night-birds of India have a whole vocabulary of their own, and Dulloo had taught me at least a part of it, the meaning of the night-jar's chuckle and of the whistle of the 'did-he-do-it' (plover), and how to interpret the variations of the jackal's howl. And I knew that the cry of the screech-owl means, 'I am coming to help.'

'Don't make a sound, for Heaven's sake,' I had just time to whisper. And a moment later the fringe of dead reeds round the ground-line of the hut trembled very gently as a dark something slid inside.

II.

For some time, perhaps a minute, Dulloo lay beside us, panting quietly. Then he began to speak in a low whisper. 'That was a near thing, sahib. There are four men with guns round your hut. Not that they troubled me much—sleepy buffaloes chewing the cud. It was that son of shame, the Sindi boy. He nearly trod on me in the grass. I'm a cripple now and slow.'

'But listen while I tell you quickly what you must do, for that boy—I do not trust that boy—he may look in. This morning from the boat I saw the *gora-walla* * with the gun before

* White man.

you did, but too late to warn you. I could not help by staying, so I went, as you saw. Once in the reeds they couldn't find me, though they passed twice within a few yards.

'But what was I to do? I could not go back along the line, for they were waiting for me. So I followed through the reeds—the water hereabouts is shallow—and when they took you to this island I lay hid, and watched till dark.

'About two hours before sunset the boy went off in the dug-out. After dark he came back, bringing that fat swine Essar Dass. When all was quiet I paddled myself across with a bunch of reeds on my head—you know the trick, sahib. Essar Dass and the *gora-walla* were sitting together in the *gora-walla's* hut, and the men were waiting for their evening meal before they slept. And, sahib—here he clutched my arm in his excitement to whisper in my ear—'tomorrow morning they won't wake up!'

'Not wake up?' I asked in astonishment. 'You haven't killed them, have you, Dulloo?'

'No, I haven't killed them. But I waited by their kitchen in the darkness while their *langri* was cooking their food. When he had finished making their vegetable-curry—a great pile of it—he laid it outside on a big brass dish while he went in to fetch the chapattis. Just a pinch of the datura then, sahib, sprinkled over

the curry; nothing more. They won't die—at least, I think not—but they'll sleep for three days, and nothing will wake them.

'Now, this is what you must do. Here is a knife to cut your ropes; see, I shall put it here beneath your head. But you must not cut now. I can pass the guards; but not so you. And they have only just fed. It will be two hours before the sleep of the datura comes. Meanwhile some one may look in.

'So you must wait till near midnight. Then, with the knife in your teeth, cut the other sahib's hands free. After that you are two strong men, and there will be none left to reckon with but the *gora-walla* and the boy, for Essar Dass is naught but a fat slug. I could not put these three to sleep, sahib. The boy cooks for the *gora-walla*, and Essar Dass, the twice-born, eats apart.

'And now, sahib, I go. If I am seen, the alarm will be given before the sleep has come. Remember, wait two hours.' And Dulloo slid out as he had come. All at once the reeds rustled again as Dulloo's head reappeared. 'Have I paid now for that matter of the arm?' he asked in a whisper, and I caught the flash of his smile. But before I could answer he was gone.

(Continued on page 555.)

THE ROMANCE OF RUBBISH.

By JAMES H. YOUNG.

I.

ONE of the most interesting phases of the world's development is the manner in which the people of civilised nations are utilising so many things which were only recently considered as valueless—to be thrown away as worthless; while what we have thought was useless stuff, merely fit to be trod under the feet as so much dirt, has been converted into a product of great value.

There is, in fact, no such thing nowadays as rubbish, for the modern manufacturer, collaborating with the modern scientific chemist, makes use of practically every sort of waste material, and transmutes the 'unconsidered trifles' of the universe into gold.

In this country recent scientific study and research have been singularly successful in achieving results which go far to demonstrate that the economic lessons of the war have not been forgotten, and that new methods of using things that were once thrown away are being continually discovered. New industries have been inaugurated, up-to-date factories built, modern machinery laid down—all as a result of the wonderful miracle of transforming waste into wealth.

A well-known Midlothian firm of paper manufacturers have given us a concrete example of this remarkable achievement. Experiments, which have been brought to a successful issue, have resulted in the perfecting of a process for making from various waste products of the company's paper-mills a material which can be used instead of vulcanite or ebonite, and which is in some ways superior to them for electrical work. The name of the new material is indurite, and the company has been reconstructed in order to deal with the product in an efficient manner.

Co-incidental with the foregoing triumph of chemical science in the utilisation of waste, Mr S. J. Peachey, a lecturer in chemistry in the Manchester School of Technology in 1920, has, after three years of experimental work, produced some extraordinary results. He has discovered that, with certain organic materials like leather-waste and cork-dust, new classes of material can be made to take the place of linoleum and all kinds of leather. By mixing leather-waste with a small percentage of rubber, and vulcanising by means of the new process, a new leather, which the inventor claims to be two and a half times as durable as ordinary leather, is produced at about one-third of the cost.

Leather for upholstering and bookbinding purposes, and for the manufacture of attaché cases and numerous fancy goods can be prepared in the same way.

From wool-waste a new felt can be prepared, suitable, its inventor claims, for a tennis-court, and from wood-meal a floor and wall covering can be prepared. 'We do not know where developments will end,' said Mr Peachey to a Press representative. 'We are experimenting in various directions—motor-car tires, boots and shoes, and other things. At present we propose concentrating on boots, shoes, and upholstery, and a new company is being formed.'

That there is 'nothing like leather'—old leather, too, at that—has, of course, long since been strikingly illustrated by the many amazing ways in which cast-off boots and shoes and apparently useless scraps of leather can be profitably used. First they—the old boots and shoes and scraps—are cut up into small pieces, and then put for two days into chloride of sulphur, the effect of which is to make the leather very hard and brittle. When this is fully effected the material is withdrawn from the action of the chloride of sulphur, washed with water, dried, and ground to powder. It is then mixed with a substance that will cause it to adhere together, such as shellac or other resinous material, or even a good glue, and a thick solution of strong gum. It is afterwards pressed into moulds to form combs, buttons, and a variety of other useful articles.

Prussiate of potash is also made out of old leather. It is heated with pearl-ash and old iron hoops in a large pot. The nitrogen and carbon form cyanogen, and then unite with the iron and potassium. The soluble portions are dissolved out, and the resulting salt, added to one of iron, produces the well-known Prussian blue, either for dyeing purposes or as a pigment.

Further evidence that there is money in old boots and shoes is furnished by the fact that wallpapers, screens, &c., are made from this valuable waste leather pulp. The finer the original quality of leather the better it takes the bronze and old gold of the designs which make these hangings things of beauty.

Bookbinders and frame-makers also know the value of this pulp, and carriage-builders press it into sheets which are invaluable for the roofs of the most luxurious vehicles.

II.

A sharp-witted American has discovered a silver mine in the waste products of the big cinema studios. Four ounces or more of silver are used in the making of every film you see, and until quite recently two of those ounces went into the sewers when the film was completed. Now, the silver is recovered and sent to the mint to be turned into dollars.

As most photographers know, plates or films are sensitised with nitrate of silver. When the exposure is made the light turns some of the silver salt into metallic silver. After development hypo is used to dissolve and remove the excess silver nitrate, that part of it which the light has not affected. On the average about half the original silver in the film goes into the hypo bath.

From every 5000 feet of film developed about four ounces of silver are washed off in the hypo fixing-bath. In the big film studios the fixing is done in immense tanks of hypo, which have to be emptied and refilled frequently, as the hypo becomes saturated with silver salts.

Three or four years ago these tanks were emptied into the sewers. Now, the waste hypo is collected by the 'mine' owner into precipitating tanks, in which the silver is freed, and finally emerges from the furnace as an ingot of pure metallic silver, fit for the mint. At Los Angeles alone over £2000 a month is saved in this way.

Bricks from beans is another of the most recent illuminating examples of the progressive and economic spirit permeating industry to-day.

Hitherto, castor-oil beans have been put through the process which extracts the oil, and the remainder flung away or used for fertilisers. It is of no value as feeding-stuff for cattle. No less than 100,000 tons were left over in one year from the factories. It has now been discovered that the residue makes up into very excellent tiles and bricks for interior building purposes, being both tough and light. The cost is very little different from that of stone or mineral composition tiles. In appearance the new building material is like polished stone, only it is not cold to the touch. Specimens were recently shown at the new botanical department of the Imperial College of Science, London.

Time was when the cotton-grower threw away thousands of pounds every year. The cotton-seed to him was an insufferable nuisance, to be got rid of at trouble and expense. After being separated from the cotton fibre it was thrown away. It has become now, through chemistry, the basis of a whole catalogue of activities known as the cotton-seed oil industries. Chemistry has shown the cotton-grower how to refine the oil made from the seed, and now it is extensively used as sweet oil for salad dressings, while much of it is employed as an adulterant or masquerades openly in the guise of olive-oil.

It is used also in the various lard mixtures, such as cottolene, and it makes a good wholesome food. From the residue, after the oil is pressed out, is manufactured cotton-seed cake, which is used as a cattle food. The crude, unrefined oil is good soap stock, and the cotton fibre taken from the hulls is variously employed

to make a high grade of paper, a good fuel, and a fertiliser.

Every one is familiar with a wad of cotton-waste carried by engine-drivers. It is waste, thrums, doubler's waste, winder's waste, picked loom-shed sweepings, and soiled thread waste generally. And it is found all over the world, whether it be called engine-waste in Great Britain, wiping-waste in America, known as *déchets d'essuyage* in France, or *putzwolle* in Germany. This, however, is only one of the uses of waste.

If you have a Bolton bleached counterpane on your bed, the web of it is waste. If you like a substantial bed sheet, the web is also waste. The beautiful cotton tapestries woven in France have a proportion of threads spun from waste. Medicated absorbent cotton is generally waste. The little tuft of cotton you see on bananas at times is waste, being part of the wadding in which they have been packed. The basis of the cordite used by our army and navy is waste. The cotton flock in cheap bedding and upholstery is waste. Celluloid is made from a fine quality of waste. Some methods of making artificial silk have waste as their basis. Very large quantities of waste go into consumption for mixing with wool in Yorkshire. And there are other uses for this wonderful fabric—a fabric which was surely misnamed waste!

III.

Sawdust, too, has a romance of its own—sawdust which was once a problem to the millwright, who scarcely knew how to get rid of it, and which now forms the basis of a considerable independent industry, with a handsome profit per annum. As a matter of fact, the one-time despised particles of sawdust are now more valuable than solid timber. By the use of hydraulic pressure and intense heat the particles are formed into a solid mass capable of being moulded into any shape and of receiving a brilliant polish. The only materials used are sawdust, alum, and glue. Imitation marble can be manufactured from a mixture of sawdust with ivory waste, water, glass, and glue.

There is no end to the uses of sawdust, and, after many years of experiment, an inventor has discovered how it can be utilised to make artificial wood.

A mixture consisting of sawdust, together with chalk and some chemicals, is subjected to very heavy pressure, and the result is a substance possessing all the qualities of real timber. Its specific gravity is the same as that of genuine wood, its hardness the same as oak. It can be planed, sawed, bored, nailed, painted, stained, or polished, and submitted to every process of carpentry or manufacture to which real wood is subjected. It will not deteriorate

in water, and on account of the chemicals it contains is impervious to rot, and burns only at a temperature very much higher than that at which real wood catches fire.

There are few people who are not now more or less familiar with that wonderful fairy tale of science relating to the utilisation of coal-tar and its products in the arts. At one time the most useless and inconvenient of waste products, there is scarcely an important industry to-day that does not utilise in some form coal-tar or one or more of its derivatives.

It is scarcely conceivable, but it is nevertheless true that this oily, dirty substance is now used as the basis of scores of the most exquisite perfumes and extracts—patchouli, attar of roses, verbena, heliotrope, and most of the other delicate extracts most favoured by dainty women in the boudoir. And these are only some of its more frivolous uses. Of the so-called newer remedies of the pharmacopœia, no fewer than three hundred, which are now more or less well known to medicine, are made from the same unlikely substance or its derivatives. Among these are phenacetin, antipyrin, anti-febrin or acetanilid. Those beautiful colours, now so common, known as the aniline dyes, are about nine-tenths coal-tar derivatives, and it was the discovery of Sir William Perkin, the celebrated scientific chemist, which gave to the world these rich hues that have revolutionised the dyeing industry.

To persons not trained to chemical science it still remains a mystery how all the most delicate hues of the rainbow can be produced from this once despised coal-tar, but it must be an even more difficult matter for them to associate a substance like saccharin—the quintessence of sweetness—with the old gasworks product. Saccharin, nevertheless, is obtained from coal-tar, and is *three hundred times* sweeter than sugar!

How the products of the slaughter-house are now utilised, even to the last scrap of horn, hair, or hoof, is too well known to need recapitulation. Suffice it to say that among the articles manufactured out of the former waste products of the abattoir are glue, fly-paper, sand-paper, gelatine, isinglass, curled hair, bristles, wool felt, hair felt, laundry soap powders, ammonia, bone meal, pepsin, glycerine, poultry food, and many others.

Slag—the refuse of mines and furnaces—old iron, wrought or cast, rusty or clean chips of steel and brass, old battered cans and other tin refuse, broken glass, old bones, rags, waste paper, even the sweepings of the street are all utilised in such a way as to become a source of usefulness and wealth. By what is known as the Wells system, gas is now being obtained from all kinds of waste vegetable matter. By it practically every kind of town and country refuse and waste that will burn can be used for

the extraction of gas. Electric light is also being obtained from waste.

How waste whey may be turned into profit was outlined recently by Mr Dampier Whetham, a member of the Scientific Research Department of Cambridge. In a paper read at a meeting of the Farmers' Club in London, Mr Whetham said the Ministry of Agriculture estimated that forty million gallons of whey, a by-product of cheese, was wasted in a normal cheese season. On a low basis this could not be valued at less than £1,000,000. Many hundreds of tons of lactose, which can be extracted from whey and is used as a basis for infant foods and is largely used by brewers, are consumed in this country, but at present our supplies come from abroad, mostly from Holland and America.

Cheese factories, he pointed out, could put down whey-condensing plant, a central lactose factory could afford to pay an adequate price for the whey and make a satisfactory profit from lactose, and in this way a new industry would arise.

Pearls from herring scales is a typical illustration of wealth from waste—and of Yankee 'push.' This new industry is being established at Peterhead, where an American syndicate are setting up a centre for the manufacture of 'pearls' from herring scales. The pearls will not actually be manufactured in Scotland, but the Peterhead centre will collect the scales and prepare them for dispatch to America, where they will undergo the completing process.

In conclusion, emphasis must be laid on the fact, which of course is now known to almost everybody, that radium, a substance of well-nigh incalculable value, is extracted from pitchblende, which was formerly regarded as worthless rubbish. The discovery of radium, in fact, is universally admitted to be one of the most remarkable results of chemical research and investigation that has occurred in modern times. The romance of its discovery is fitly crowned by the knowledge that it must ever be regarded as perhaps the most marvellous instance of the utilisation of waste products.

WHERE THERE'S A WILL THERE'S A WAY.

PART II.

III.

THE 24th of August dawned blue and clear after a week of somewhat showery weather. Never had Wellwood Golf Course seemed in better condition; never had the fairway looked fairer, the grass greener, the bunkers bigger, the rough rougher. Before half-past ten an enormous concourse of people had gathered in front of the club-house. Special trains had brought hundreds from London; every golf pressman was there; scores of cameras were in evidence, and the representatives of an enterprising cinema company were making active preparations.

The game was to commence at ten-thirty. A few minutes before that hour, Mr Bentley, Sir John Merriam's solicitor and a member of the committee, stood upon the steps of the club-house talking to M'Alister, the club professional.

'Well, Andrew, who do you think will win?' queried Bentley cheerfully.

'It a' depends,' said M'Alister cautiously.

'Depends on what?'

'On a variety o' things.'

'Well, whom are you backing?'

M'Alister considered a moment. 'Ah dinna bet,' he said, 'but'—he paused—'I'll tell you who's the best player,' he went on. 'It's Mr Vincent.'

'You really think so?' Bentley exclaimed. 'Then you expect him to win?'

'No, I expect him to lose. He's no' the best man.'

The clapping of hands cut short their conversation. The brothers Merriam were coming out of the club-house. The crowd arranged itself; stewards stretched the ropes, and the game commenced.

Vincent, having won the toss, had the honour at the first tee. As he drove off, he felt an elation such as he had never before experienced in a match. He was absolutely confident. He knew he would play with unfailing skill and precision; he knew he would win. As he walked from the tee he glanced over his shoulder and met the dark eyes of Foster, who pressed closely after him. They exchanged the faintest of smiles.

At the end of the morning round Vincent was three up on his brother. He completed the round in sixty-eight, breaking the record for the course; and yet in discussing the game during the luncheon interval the spectators were forced to the conclusion that his actual play had not seemed so brilliant as the figures appeared to make it. He had holed no very long putts, had made no marvellous recoveries; but he had not made a single mistake. In fact, his play had been monotonously flawless.

Harold, on the other hand, had not been so consistent. He got into difficulties several times, and had it not been for flashes of real brilliance—as, for instance, a magnificent three

at the long seventeenth—the margin against him would have been greater.

The afternoon round began in an atmosphere of strained excitement. Many bets had been made on the result, and it was obvious that Harold would have to put up a very strong game if he meant to wipe out the adverse balance. He rose to the occasion by winning the fourth hole after a succession of halves, but try as he would he could not reduce his brother's lead further.

Vincent still played with faultless precision and an absence of 'nerves' that delighted those who remembered his record. At the famous seventh hole he recovered his lead of three by laying a magnificent iron shot from the tee a foot-and-a-half from the pin, and holing the putt for a two. At the ninth Harold was badly bunkered, and lost. At the thirteenth the same performance was repeated. Vincent was thus five up and five to play.

Harold's supporters abandoned all hope. Their man had played a good game, but he could not stand against Vincent's sheer consistency.

The enormous, excited crowd surged and pushed from the thirteenth green to the next tee. It was necessary to cross a rather deep and precipitous gully by means of a narrow bridge, and the stewards had a difficult task marshalling the spectators across it. So intent was every one upon getting a view of the game that only those in his immediate vicinity saw the accident that happened to Foster. Just as he was on the point of stepping onto the bridge he was jostled by an imperious and athletic dame. He slipped past the end of the bridge, made a violent effort to recover his balance, and then fell down the bank into the gully. His head came into violent contact with the trunk of a tree, and for a minute he lay stunned. Some of the stewards went to his assistance, and when he came to himself it was found that he had a twisted knee. They carried him into the club-house. Meanwhile the crowd, absorbed in the game, passed on.

Just after Vincent had driven from the fourteenth tee he began to feel vaguely uncomfortable; with every step the feeling increased. His confidence was ebbing away. He looked round, scanning the faces that pressed eagerly after him. Foster was not to be seen. What had happened? A cold fear seized him, causing the sweat to start to his brow.

He came to where his ball lay on the smooth, green turf. Facing him was the enormous bunker that guarded the fourteenth green. He had outdriven Harold by a yard or two, and he watched the latter's ball rise high in the air and fall on the green, stopping not far from the hole. He selected his heavy mashie. Even if Foster was not here to help him he couldn't lose now; he had only to get a half some-

where. Supposing he were to put his ball slap into that bunker, it would only make the game more exciting. He looked at the bunker. It fascinated him. In his mind's eye he saw a shot which put the ball under the sleepers on the far side.

Next minute his ball *was* lying in the bunker, right up against the face. He required two shots to get it out. 'Down to four,' buzzed the crowd excitedly, as they rushed to the fifteenth tee.

From the fifteenth tee Vincent sliced his drive into the wood and lost the hole. Going to the sixteenth, he took a brassie and played his ball into the stream, instead of playing short with an iron, as he ought to have done. Once more his lead was reduced. At the seventeenth green, when he had an easy chance of getting a half and winning the match, he laid himself a dead stymie, which he failed to negotiate.

The excitement became intense. The spectators were hardly able to support the strain. 'One up and one to go' was whispered and muttered on all sides. 'He couldn't play worse if he deliberately *tried* to,' groaned young Ratcliffe to his neighbour.

Vincent faced the eighteenth hole with set teeth. His face was pale and haggard. He *must* pull himself together. A half was all he required to give him the match. Surely he could manage that! He glanced at Harold, who betrayed not the faintest hint of nervousness. He was nonchalantly lighting a cigarette. One might have thought that he regarded the winning or losing of the match with supreme indifference. Vincent hated Harold for his coolness. It infuriated him.

The eighteenth hole was not very difficult. For an ordinary man it took two shots with a wooden club to reach the green, for a player of Vincent's calibre a drive and a long shot with an iron. Harold drove straight down the middle of the fairway. With a supreme effort Vincent pulled himself together. His drive was a beauty, for he was fully fifteen yards past his brother.

Harold's second shot was a magnificent one. The ball, dead on the pin the whole way, landed on the green, ran up to the hole, and then travelled some three yards beyond it.

When Vincent took up his stance he knew that he was playing the most critical shot of the round. If he could get a half all was well. Thanks to his longer drive the shot was appreciably easier than Harold's had been. Besides, Harold had had to carry a nasty bunker that stretched half across the entrance to the green on the right. He was clear of the line of the bunker.

'Anywhere on the green 'll do you, sir,' said his caddie.

Vincent took out his iron. Whatever he did he must not on any account get into that bunker.

With quivering nerves he played, saw the ball rise in the air, swerve out to the right, and finish right in the back of the bunker. A sound between a sigh and a groan went up from the crowd. The game was certain to go to the thirty-seventh hole now.

Vincent settled down with his niblick amid a dead silence. The ball was lying very badly. With a terrific effort he got it just out and on to the edge of the green.

As he went up to putt, the hole seemed infinitely small and remote. Harold had played two; he was about to play four. What chance had he? He set his teeth and shut his eyes, and played the shot before he had time to think any more, played it entirely at random, careless whether the ball went near the hole or not.

A long-drawn 'A-ah!' went up from the crowd. The ball had travelled straight for the hole, and had pulled up on the very lip. Harold bent down to putt. He was about three yards away, and he had played only two to Vincent's four. It seemed almost impossible that he could fail to win the hole now. The crowd watched in tense silence.

Then an extraordinary thing happened. Harold's ball, deflected by an invisible irregularity on the green, touched Vincent's on the side, knocked it into the hole, and itself lay an inch or two away. Just for a moment the spectators could not grasp the significance of what had occurred. Then with a rush came the realisation that the hole was halved, that the match was Vincent's. There was a loud cheer. The crowd poured across the green from all sides, excitedly discussing this most extraordinary finish to the most remarkable game ever played over the Wellwood course. Each player was surrounded by his friends; cameras clicked; pressmen jumped on to their waiting motor-cycles. . . .

As in a dream, Vincent felt Harold's handshake, found himself being carried forward in the stream of his supporters towards the clubhouse. People thumped him on the back and showered congratulations upon him. He answered mechanically. He was filled with an exultation oddly mixed with regret. He had won; that was the central fact. Yes, but in the end he had won by a fluke. If Harold's ball had not struck his and knocked it into the hole. . . . Besides, had he played fair? He would have to confess to Harold and make him take half the money. How could he bring himself to do it?

All the members had gathered inside the club-house, and the smoking-room was filled to overflowing. It was understood that there was to be some formal congratulation of the winner. At one end of the room Hay, the captain of the club, was seated behind a little table, with Bentley on his left. Harold and Vincent were escorted to chairs upon Hay's right. Bentley

was whispering in the captain's ear. Then, as the applause died away, he rose to address the audience.

'Gentlemen,' said Bentley, 'before our captain proceeds to congratulate the winner and to thank the two players for providing the most magnificent and thrilling game of golf it has ever been our fortune to witness, I have an interesting and important communication to make. The late Sir John Merriam summoned me to his bedside two days before his death and handed me this packet.' Here Bentley held up a long blue envelope. 'He gave me explicit instructions that it was not to be opened until the morning of a certain golf match which he told me was arranged for in his will. I opened the packet, gentlemen, at nine o'clock this morning. It contained a letter addressed to me, and one other document. I propose to read the letter.'

There was dead silence as Bentley drew a sheet of paper from the envelope and unfolded it. Harold lay back in his chair and gazed at the ceiling; Vincent leant forward with a strained expression on his face.

Bentley began to read the letter in a clear voice.

'DEAR BENTLEY,—You will recollect that I asked you for instruction as to how a man could make his own will. Following thereon I made a will leaving the residue of my estate to whichever of my two nephews should prove victor in a match over Wellwood Course. By the time you read this letter you will have found that will and be acting upon it, and I trust the arrangements for the match will be complete. I wish I could be there to see it. Alas! I am here, dying rather slowly and with time to think things over a bit, and I have come to the conclusion that it is scarcely fair to the boys to settle the whole of my fortune on the result of a game between them. That intolerable ass Fotherington would probably raise a question with the Championship Committee as to whether they were not thereby made professionals.

'Personally I have nothing to pick and choose between my two nephews. Accordingly I have written a fresh will, which is enclosed herewith. I think it is all in order. It has been witnessed by the night nurse and the second housemaid. Generally speaking, it revokes all former wills and testaments expressly. The legacy to the club is increased, those to M'Alister and the cottage hospital remain the same, and the balance is to be divided equally between my two nephews.

'Of course you may say that there is now no necessity for the match being played. Legally speaking, that is true enough; but I rely on you, Bentley, as a sportsman and a golfer, to let the game go on. Use your own judgment, Bentley, but as you are a better golfer than you are a lawyer, I am sure you will let the game

proceed without disclosing the contents of this envelope beforehand.—Sincerely yours,
'JOHN MERRIAM.'

There was a slight pause as Bentley finished reading this letter. Astonishment, pleasure, annoyance, laughter, and a great number of conflicting emotions were registered on the faces of the members.

'Using my own judgment,' continued Bentley, a little nervously, 'I thought it better to let

this match proceed without saying anything. I hope, gentlemen, that you will say that I was right.'

'Quite right,' shouted voices all over the room. Then the whole audience got to its feet as one man and cheered loudly.

Vincent rose from his chair, the haggard look gone from his face. 'Harold, old chap,' he said, holding out his hand, 'let us congratulate each other.'

THE END.

RUNNING THE BEHRING SEA PATROL

By FREDERICK A. TALBOT,

Author of *The Steamship Conquest of the World*, *Lightships and Lighthouses*, &c.

I.

WHEN the American Government, in 1886, dramatically seized three British schooners while roving the Behring Sea, the world's stage was set for what promised to become more than a passing *affaire diplomatique*. Public attention became riveted upon the loneliest stretch of salt water to be found upon the Northern Hemisphere, one which, hitherto, had been known little more than by name. At the same time interest became centred upon one of the lesser-known industries of the world—the quest of the seal and the sea-otter, the skins of which feminine vanity had decreed to be without a peer for warmth and lustrous beauty.

The upshot of this seizure was the Behring Sea Conference in Paris, notable for bringing Great Britain a diplomatic victory, and the bestowal upon the United States of America of the right to prohibit seal-fishing within a zone of sixty miles drawn round the Pribiloff Islands, the home of the animal. At the same time the arbitration court promulgated a close season for pelagic or open sea sealing.

The delivery of the award was one issue; its enforcement was another and of quite a different character, as the American Government speedily discovered. The majority of those engaged in the fishery accepted the finding of the court, but the less law-abiding decided to acquire by stealth what was denied by international political decree. They knew the sea rimmed to the south by the Aleutian Islands through and through, regarded American policing with indifference, and raided the Pribiloffs with impunity.

Remarkable stories of poaching audacity came drifting down from the north. One night the Commissioner of St Paul's Island, perturbed by reports brought to him of raids upon the herds frequenting the adjacent islands, and apprehensive of being the victim of a predatory visit, was seeking to evolve effective combative

measures. A messenger hurried in to say that a schooner was standing-in towards the eastern shore. The commissioner hastened to the scene, to realise that the ship was far from being engaged upon an honest mission; indeed, she continued her suspicious movements heedless of the crowds gathered on the shore watching her. Suddenly the schooner stood out to sea, and slipped over the horizon.

The commissioner redoubled his guard; the seal herds were watched night and day unceasingly, but no sign of the return of the strange vessel was recorded. The commissioner, thinking the danger past, relaxed the guard, but a night or two later the raider swooped down, landed a party, penetrated the rookeries, slaughtered the seals right and left, and made away again in the darkness before any opposition could be mustered. The swiftness and audacity of the attack brought complete success.

Another schooner swept down upon one of the outlying islands, and in about three hours clubbed nearly a thousand seals and got away with the skins. A little later this self-same poacher conducted a similar swift raid upon another rookery, harvesting a thousand skins in five hours. So audacious did these sea-rovers become as to regard the patrol with contempt. One vessel, completing its work in the fog, was surprised, when the protective blanket suddenly lifted, to discover a patrol boat a short distance away. The guard called upon the raider to surrender, but the latter weighed anchor, crowded on speed, and showed a clean stern to the watch, although in this instance the poacher was forced to abandon some 200 dead seals upon the beach.

The perfection of wireless telegraphy rendered the suppression of this nefarious traffic exasperatingly difficult. The raider was now able to lie 'doggo' in the blanket of fog so common in the Behring Sea, its captain, ears glued to the receiver of his apparatus, familiarising him-

self with the movements of the patrol and the actions of the island guards. He merely listened-in; never once did he touch his transmitter. The majority of the messages flung across the waste of the Behring Sea were 'open,' and from the information thus unconsciously vouchsafed, the poacher could determine just when and where to make his raid. Eaves-dropping by wireless proved the most powerful weapon ever placed in the hands of the seal-poacher; it could not be combated.

Realising the hopelessness of its efforts under the ruling conditions, the United States Government called a round-table conference of the Powers concerned—Great Britain (on behalf of Canada), Japan, and Russia, because their territories are washed by the waters of this sea—to determine individual responsibility for the maintenance and safety of the herds. As the result of the deliberations this duty was entrusted to the United States, because of the facilities which the Alaskan ports offered as bases for the patrol, while it was realised that such vessels, if American, could fulfil a variety of other essential duties, such as the shepherding and protection of the herring, halibut, and cod fisheries, and the control of maritime traffic in general.

II.

The Behring Sea Patrol, which was thus brought into being by common arrangement among the signatory Powers, is probably the most arduous police duty any country has ever assumed. For one half of the year this northern sea is practically closed to traffic, being as forbidding as the Arctic Sea next door. During this period Nature is allowed to reign supreme, the vessels engaged in the duty wintering a thousand or more miles to the south. With the coming of spring they awaken from their hibernation, to push off to the north during the early days of May. Swinging through the southern portal to the Behring Sea, they barge about its wild reaches for weeks, even months on end, swinging restlessly to and fro, up and down.

Running the patrol sounds attractive to the ear; the spice of adventure and possible brush with a sea-rover make irresistible appeal. But a few months of buffeting, drenching, and freezing in those lonely, silent, indifferently charted waters dispels the atmosphere of romance. Privation and hardship, inseparable from the fringe of the Arctic Circle, divest this northern sea of its peculiar fascination. Frost-bite, close confinement, the constant feeling of suddenly being called upon to make a desperate fight for life, and the other hard knocks rudely administered by Nature, which leave permanently visible physical traces, testify to the run about the Behring Sea being no marine joy-ride.

Few navigators venture into this saucer of salt water for trade, although the development of Alaska has brought more ships than were to be found twenty years ago. Woe to the captain who places implicit faith in his charts. The currents are vicious; gales spring up with dramatic suddenness, to rage with vessel-splitting fury. It is the sea where the snow and hail of the blizzard and the rain of the hurricane have an open ring to struggle for supremacy, and they drive against the intruder with the force of tenpenny nails. Withal, Nature is still pursuing her moulding process in this corner of the globe, and with unwonted activity. The seabed rises and falls with the restlessness of the waves which roll over it. Islands spring into existence during one night, to vanish the next. The natives, clinging precariously to the islets, recite strange and weird stories of enormous fires, tongues of flames, and huge plumes of smoke curling from the watery expanse where the lead sounds its deepest depths, for the Behring Sea is the safety-valve to the terrific forces working within the earth itself.

Hidden perils lurk on every hand. It was one of these which caught the *Tahoma*, one of the finest and most stately craft ever put on the patrol. In the darkness of the night, black as pitch, the captain moving ahead with the lead at easy pace, there came a sudden rending and splitting. The ship nearly turned stern over bow. She had slipped over a ragged reef of rocks, to be caught in the pocket of water within as neatly as a mouse in a trap.

The wireless sputtered and flashed the S.O.S. to every point of the compass. Within five minutes every vessel catching the radio was steaming full speed towards the wreck. Stranding or piling on a bar or granite fang is so common an occurrence in the Behring Sea as to induce every vessel, no matter whether it be ten or ten score miles away, to turn at the first call for help to lend a hand to her luckless sister. After valiantly battling for hours in the effort to save the ship, the commander gave the order to break away in the boats for the nearest island; and, as the wind sprang up, scattering the cockle-shells, it was every boat for itself. The order had been given to make for Agattu Island, and fortunately every boat reached safety.

Long after the *Tahoma* had been abandoned, her S.O.S. bounced to and fro over the northern sea, being passed on from a vessel unable to render aid, to another in a more fortunate position. Some vessels were willing to give succour, but could not do so as they had only enough coal aboard to make the nearest port. In this way it was a wild bevy of messages which came pounding into the radio-room of the steamship *Cordova*, southward bound from Nome. She swung round to hurry to the wreck, and at the same time flashed the *Kodiak*, which similarly

deviated from her course, but only to turn aside to make a wild dash to port to get more fuel. Still, she passed the message on to the *Patterson*, which happened to be nearest the scene, and which was the first to reach the *Tahoma*, only to find her abandoned.

The *Patterson* now warned the *Cordova*, which stood off towards Agattu, the nearest island, thirty miles from which she picked up the commander, four boats, and sixty-eight men. Being short of coal, this steamer had to break off to make port, but, intercepting the *Patterson*, gave her instructions to search Agattu for the survivors. The last-named ship succeeded in this quest, though she almost missed the distress signals of the marooned men, owing to the thick, stormy weather. The *Patterson*, having accounted for all missing souls, endeavoured to warn the *Koliak*, now hunting the seas, but the elements intervened, and so her captain headed for Unalaska, in the knowledge that the other ship could not stay at sea for more than two more days through fuel exhaustion.

Such are the hit-and-miss methods which rule in the Behring Sea. When the *Patterson* wallowed into Unalaska this little settlement was overwhelmed. In addition to the eighty-seven survivors from the *Tahoma*, there were the rescued members of the ill-fated *Karluk*, snatched from the Arctic Sea by the sister patrol-boat *Bear*, and severely short commons had to be observed by the whole resident and marooned population until the shipwrecked men could be sent south. It was subsequently found that the *Tahoma* had run full tilt against a reef seventeen to twenty miles out of its charted position—another instance of the luck of the Behring Sea.

III.

These sturdy little craft which run the patrol can relate stories of adventure without end—adventure strange, tragic, and grave, relieved with splashes of grim humour here and there. Many and varied are their duties. To-day they are hot on the trail of a reported seal-raider, to-morrow they are labouring frenziedly to snatch a vessel from the pitiless rocks. A week hence they are hurrying mail to a lonely outpost of civilisation, or, acting in the capacity of the 'Black Maria,' are bringing malefactors to justice. They are called upon to hunt for crazy men who, in the search for gold, have strayed from the beaten track; or perchance are striving to catch a whisky-runner who has stirred up trouble by landing his illicit cargo upon the Russian mainland in defiance of all law, Siberian and international. It is chevy and chase; fetch and carry; hold-up and be held up from sunrise to sunset, from twilight to dawn.

Fortunately, to-day, seal-raiding is seldom encountered. The poacher is cognisant of the big risks he runs, and he who indulges in this traffic is consequently made of stern stuff, while

his ship is sturdy, has a good turn of speed, is well equipped, and carries a powerful radio installation. The poacher roughs it, takes long chances, is steeped in cunning and strategy, but he finds himself matched against men of similar calibre. Possibly many raids are attempted, but few succeed, and the cost of the enterprise nowadays, coupled with the slender possibilities of success, acts as a powerful deterrent.

One of the most determined raids was that attempted a few years ago on St Paul's Island, brought to nought through the superior strategy of the captain of the patrol-boat *Unalaga*. The latter was making for Attu, when the wireless from St Paul reported heavy firing off the island and frantically requested assistance. The cutter had an eighty-miles' run to make the station, but steam was crowded on, the risk of the fog being taken. The *Unalaga* reached the island, wrapped in fog, and lay off-shore hidden in the white pall. An officer was sent ashore to deliver a ruse-message for wirelessly. Then the captain of the *Unalaga*, after steaming round the island, made full steam to the rim of the sixty-miles' territorial zone, to lie in wait near the point where he surmised the two reported raiders would attempt their escape.

A game of diamond-cut-diamond commenced in grim earnest. The fog persisted, and the patrol captain was running short of fuel. He realised that the raiders were staking their plunge on this knowledge, and so were lying 'doggo' until the patrol-boat was compelled to return to port, because they could calculate how long the fuel would last. The captain of the *Unalaga* essayed a daring stroke. Before his fuel was exhausted he hurried back to port, rebunkered, and was back again, watching and waiting along the circle. The vigil was irksome, and, by instruction, the air grew strangely silent. No radio flashed hither and thither.

The captain of the *Unalaga* now set out upon his master-stroke. He commenced to circle the Pribiloffs in a decreasing spiral, every man on the alert, and the quick-firing guns fully manned, ready to let drive the moment the outline of a vessel loomed up through the fog. But no sign of the poachers was ever found. Evidently they took alarm at the uncanny silence and scuttled to safety. The rookeries were found to have been disturbed, but there had been no slaughter. Those financing the luckless venture must have been heavily hit; they did not obtain a single skin.

IV.

It is the weather up north which the men running the Behring Sea Patrol regard with the greatest dread. One of the cruises of the *Unalaga* will never be forgotten by those who were on board, because the little boat encountered such a burst of weather as even the notorious Behring Sea has seldom equalled. Wind and wave were absolute masters of the sea for

days; every ship was driven to shelter, and the wonder is that the patrol-boat, which went out to lend assistance to any vessel in distress, lived through it.

The *Unalaga* was coaling-up as fast as she could at Sitka, in the closing days of the first month of the year, to cruise the fishing-grounds. A northerly gale sprang up, sending the mercury in the thermometer helter-skelter into its bulb. The cold became so intense as to compel the captain to issue the order 'cease coaling.' Then came a whole string of calamities, due to the terrifying wind and the low temperature—seven degrees above zero. Pipes froze and burst in all directions, and the wind nearly blew the vessel, riding in the crazy harbour, bodily over, several hawsers having to be run out to keep her in position. For forty-eight hours the hurricane held sway, when it eased up sufficiently to permit the resumption of bunkering. The little harbour was packed with thirty-nine fishing-vessels, huddled together like lambs exposed to the blast. One and all were badly battered by the storm, while their skippers were so terrified as to abandon every idea of putting out to the grounds until settled weather returned.

But the *Unalaga* had to make the patrol. Some unfortunate vessel might be wallowing and floundering among the angry rollers, her crew stricken down by frost-bite and injury. So, weighing anchor, the captain put out to sea in the teeth of the gale. The cutter is only a puny 190-footer of steel, of 1180 tons and 12½ knots, and she was bounced about like a cork. Towards evening the wind got up again, bringing with it a disconcerting low temperature. The scud came flying aboard, wreathing the rigging and upper works, and freezing as it fell. Life-lines had to be run round the decks and everything made fast. The sea, still rising, soon commenced to sweep the little craft from stem to stern, and brought with it a blinding snowstorm accompanied by low temperature, the result being that during the night icing-up commenced in grim earnest. With the gale increasing in fury, the speed of the boat had to be persistently reduced, until she was only just maintaining steering-way, the commander, realising his perilous situation, having swung round to the wind. When the blizzard had expended itself, a curious atmospheric condition, peculiar to the Behring Sea, set in. The thermometer dropped to one degree above zero, and the vapour rising from the water partly congealed, rendering it impossible to see more than 400 feet ahead, this caprice lasting for twenty-four hours.

This phenomenon completely iced up the cutter; and when once more the wind rose, and to the fury of a hurricane, the boat was in parlous plight. The weight of the ice caused her to roll and pitch heavily. The frozen spindrift brought down first one and then the other aerial of the wireless, cutting off com-

munication. Then the sea got a trip-hammer blow home, smashing the whale-boat and carrying away the gripes—though the actual damage inflicted could not be determined at the time, because the boats and falls, from the rail to the davits, were a solid mass of ice. The blow so shook up the cutter as to cause her to assume a starboard list of twenty degrees. The commander sought to mitigate this dangerous position by shifting all the coal over to the opposite side, the crew spending twenty-four hours on this task; but it had little effect, while the low temperature also began to wreak havoc among the crew, striking them down one after the other with frost-bite, though, happily, owing to the victims being turned over immediately to the surgeon, no permanent physical disabilities arose from this cause.

The captain deliberated. He had two courses open to him. The one was to cut all boats and the motor-launch adrift from the starboard side, and make a dash southwards to run into warmer weather to melt the ice and rid the cutter of this encumbrance. The other was to let the boat drift to leeward, with engines shut down, until the hurricane had blown itself out, keeping her on the starboard tack, and allowing the combined forces of wind and wave to hold the cutter in the upright position when she rode easier. As, however, in this attempt to make Yakutat the vessel would be exposed to bitterly cold weather, it was imperative to keep the crew between-decks, no one being allowed above except when necessary for the performance of some duty.

The second choice proved fortunate. With characteristic Arctic suddenness the wind dropped, and the temperature rose from three to nine degrees above zero in five hours. Ocean Cape was picked up, and the *Unalaga* staggered into Yakutat Bay and dropped anchor, carrying on her deck about one hundred and seventy-five tons of ice. This was cleared away with such tools as could be discovered—axes, mauls, hammers, and shovels, while streams of hot water were played upon the glittering mass. As the ice was dislodged the cutter returned to her even keel, but her after-deck was found to be severely strained. That run was probably the most nerve-racking made by any vessel in the patrol: it was a desperate grim struggle, waged continuously for nearly seventy hours, between the navigator and the blind forces of Nature.

v.

Other vessels in the service have had tempestuous experiences up north, notably the *Bear*, but she is a vessel which can withstand the hardest buffeting put up by the Arctic Sea. She was built expressly to fight the Polar hurricane and ice, and her Scottish builders completed their work thoroughly. Fashioned solidly of wood at Greenock in 1874 for whaling service,

she was bought by the American Government for the Greely Relief Expedition, and set out on that historic enterprise accompanied by another toughly built Scottish ship from Dundee. Subsequently, they were both turned over to the American Navy for exacting duty, to be detailed to the Behring Sea Patrol upon the assumption of seal protection by the United States.

Every year the *Bear* makes the run into the Arctic Ocean, rounding the top of the Continent to call at Point Barrow, and it is no unusual circumstance for her to steam 15,000 miles and be under way for 2250 hours during the brief season of nine months. She has a diversity of duties to perform. They range from the carriage of a ton or more of mail to distant settlements, inspecting the sanitary conditions of the remote villages, educational facilities, and reindeer herds; settlement of disputes between the local authorities and natives relating to taxation; conveyance of stranded natives, blown away from their homes while at sea by contrary winds; salvage of wrecked vessels; treatment of sick and injured; transport of fresh meat; landing of oil at the lonely lighthouses; suppression of illicit liquor traffic with the natives of Siberia; and the adjustment of delicate domestic differences among the natives, including the extension of advice upon such matters as those of divorce!

The year 1919 is one which will long remain a memory in the minds of the men who run the patrol, and of the officers and crews of the *Unalaga* and the *Bear* in particular. When the first-named reached the outpost of Alaska upon her northward run from winter quarters wireless messages of fearful portent came pouring in. Spanish influenza, which had ravaged the world, had swept over this inaccessible territory to exact heart-rending toll. How the epidemic contrived to reach this remote region remains a mystery. Yet white men, government officials, prisoners in the jails, natives—everybody, everywhere, was stricken down, and to such a degree of helplessness as to be unable to bury the dead.

Upon reaching Unalaska the commander wireless the government at home for immediate assistance. From many villages no news had been received since the previous year. The crew had to set about digging graves, making coffins, nursing, distributing food, keeping up the fires in the houses, gathering and tending the orphans of tender age, and cleaning up the homes. Scouring the country-side for the helpless children was the most arduous and distressing duty. In one house a mother and child were found dead, with four children nearly frozen to death clinging to them. In one day the crew discovered and rescued twelve motherless babies, transferring them to, and nursing them in, an improvised orphanage. From the surrounding villages and settlements poignant frantic messages came raining in. One ran:

'All down'; another read: 'Practically all adult natives dead; children destitute.' For a week no man had a wink of sleep, while food could only be snatched piece-meal. The commander became apprehensive of the safety of his men; they could not stand the strain much longer, and so it was with intense relief that the *Bear* was greeted on the eighth day, a date which coincided with the first collapse among the complement of the *Unalaga*; her commander contracted the fell disease.

The crew of the *Bear* took up the work of succour, and laboured frenziedly to get the epidemic under control before the arrival of the two battleships hurrying north with doctors, nurses, and supplies. Meantime, the *Unalaga*, owing to urgency, pushed on to Nushagak River, whence the most dismal reports had been received. Here the work of succour was particularly strenuous, as the ravaged districts were from three to thirty miles from the base, and approachable only over the trails or by canoe. In this district the humane labour of the sailors was complicated by the savagery of the stray dogs. The animals had been devouring the unburied, were as ravenous as wolves, and fought the rescuers incessantly. Indeed, a special detail had to be sent ashore to guard their comrades. The orders given were curt—shoot all stray dogs on sight. At one village the struggle between the animals and the armed men was particularly spirited and prolonged. The ferocious dogs returned to the attack repeatedly, in packs, but happily one and all were shot down before they could inflict any injury.

For six weeks the epidemic was fought tooth and nail before any ascendancy was observed. Many heroic incidents were narrated. One small party of relief workers had to make a journey of seventy-six miles by boat to reach stricken villages, where they laboured for thirty-seven hours without the slightest rest or sleep, so desperate was the situation. In one district the authorities collected two hundred orphans; a home had to be built, equipped, and staffed to secure their welfare before the season broke. Notwithstanding the superhuman efforts put forth, many of the afflicted villages could not possibly be succoured; their populations were either wiped out completely, or furnished only a few survivors, who made their way painfully to other settlements for assistance. In these instances the dead were simply left unburied, the majority to be devoured by the marauding dogs.

The Behring Sea Patrol has a long record of brilliant endeavour, exciting adventure, and thrilling romance, but the most illuminating chapter is the fight which was waged so desperately against the influenza scourge. There is not a man of the *Unalaga* and the *Bear* but hopes, and devoutly, that he may be spared a repetition of that 'fierce time.'

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

THE sound, the smell, and the changing colour of the sea, its restless movement, and the sombre mystery that seems always to hang upon it, have struck powerfully upon the hearts and senses of British people of all times, and once a year, at this season, they almost universally as a nation pay to it, as no other people does, a homage which is also a delight. It yields health and life; it soothes and rests; it pleases the eye by its beauty and constant change, and even among the dullest of holiday-makers it awakens some dim half-conscious wonder upon the infinite and all that is beyond human knowledge. It is perhaps the case with our people that many of them do not visit the seashore in the season of relaxation so much positively because they have a definite and reasoned desire to do so, as because they feel an instinct for this course and cannot hold away. In such intensity one might nearly dare to say that this instinct is peculiar to us. Others, like the Scandinavians and the Dutch, who won some fame and fortune upon the ocean, have had a great natural affection for it, and have courted it on all occasions. The French and others have their popular *plages*, like Deauville and Wimereux, where people of means display the fashions, bathe, and gamble. Italians have the Lido by Venice, the Spaniards have San Sebastian, for the Portuguese there is Mont Estoril, which serves the Lisbon people, and Espinho for the more industrious community of Oporto. Away from Europe the summer seaside-resort is a carefully developed idea wherever the people are of British stock and speak our language. The Americans apply their peculiar spirit to the arrangement of their own kinds of seaside-resorts. One thinks of the wild, hysterical diversions of Coney Island, of the massed mechanical system of Atlantic City, and of the wealthy respectability of Newport in the region of Boston. And in very different parts, everywhere, there are organised pleasure-places by the shore. In Tunisia lately I wondered on seeing the manner in which the French idea of the *plage* had been carried out at La Marsa and Hammam Lif, both near to Tunis and Carthage, while at La Goulette the people of humbler order shaped their system and enter-

tainment somewhat more upon a Blackpool or a Coney Island model. (Not to say that Blackpool with its Wheel and Tower and its versatility in provoking peculiar emotional disturbances, to the accompaniment of sea breezes of remarkably invigorating quality, is fairly comparable to Coney Island, where some American tastes and instincts are displayed in their rarest forms, as when one witnesses cock-shying for prizes at the head of a live nigger, laughing and dodging when he can, and 'sticking it' when he receives a hard wooden ball full in the face.) I have attempted seaside pleasures in varying moods and circumstances at all these places, and many others in distant parts. Of all of them San Sebastian, in the north of Spain, a bay with dainty islets, horned by dominating peaks, the most beautiful resort of the kind where artifice is liberally applied to nature to serve the needs of fashion, lingers most pleasantly in the memory for a general charm that in some respects places it above all others. At none of them, however, not one in foreign parts, do the visitors seem to assemble with that experienced sense of devotion, homage, affection, and delight—a finely blended mixture in their instinct—which may be witnessed at more than a hundred places round the sinuous line of our British coast in this present month. Our people in the mass are familiar with the sea as few others are, because in these small, railway-netted islands one can never be so distant as to be unable to reach it in a single afternoon—and, if it came to that, put a man in almost any part of England or Scotland and he could walk to the shore in a couple of days or less. How, on such an occasion, even though simple traveller by rail, one feels an emotional quickening in the moments just before the blue line comes in sight, despite that days and weeks or years had been spent upon its margin! This sense of a crisis of anticipated delight is remarkable, telling surely of the instinct. The fields, trees, a levelling, a suggestion of something ceasing, a little suspense, and there in a gorgeous, dazzling sweep, something of transcendent magnificence, seeming to sing mightily of God and freedom and infinity, is the sea. Whatever the means of approach and whatever the circumstances, this is an emotion that never fails, while an occasion may enhance

it to something bigger than can be contained by any common life. Those lines of Keats :

Or like stout Cortes, when with eagle eyes
He star'd at the Pacific—and all his men
Looked at each other with a wild surmise—
Silent, upon a peak in Darien.

convey a feeling that has hardly ever been so well represented in a poet's words. Even without the great adventurer's sense of discovery, in our own humble tramps is not a special dignity, honour, and affection awarded to that hill-top from which we can 'see the sea on a fine day'? And, familiar as the ocean may be to companions tramping for a day, with what sense of unfair disappointment, of utter failure, are they possessed who, having climbed the hill that was the goal, find that clouds and mist hold a curtain over the distant scene that imagination had been feeding on for hours!

* * *

These emotions are for British people as for no others in equal measure, for the sea is always so near to them, and they are so much of it and it is so much to them. In a country like Spain, for example, that also owes so much to the sea, and once built an empire through it that ranks in modern history nearest to our own, the sea, as it is strange to think, is a thing unknown and unseen by a majority of the people, dwellers in the inland parts from which it is not easily accessible. But in our islands it is for nearly all in the holiday-time of summer, and no other country has such a number and diversity of resorts upon its coast, all of them with some special quality or charm. Pair the urban suavity of Brighton with the rocky, breaking wildness of the Cornish coast; the rasping breeze of Margate with the smooth, languid air of Lytham; the castle-crowned bays of Scarborough with the open shore of Rhyl; the gray austerity of St Andrews with the shimmering opal tones the eye delights in when looking out to Arran from the Ayrshire coast. The sea, here at its best when beating on our islands and caressing them, is specially our possession, and our instincts have always quickened to this prideful truth. Britannia is Neptune's daughter. And so we have sung of her in ballads of the sea, the like of which are not known elsewhere.

But the standing toast that pleas'd the most
Was 'The wind that blows, the ship that goes,
And the lass that loves a sailor!'

Tom Bowling, of fine virtues, so kind and soft, so blithe and jolly, whose soul has gone aloft; Ben Backstay, a very different kind of mariner, who did so love his grog; Black-eyed Susan, who, waving her lily-white hand, was left pitifully behind; that fearful night in The Bay of Biscay, O; the density of feeling when The Anchor's Weighed; what happened in The White Squall—these are sea-songs of our home-

land matchless in their spirit. Yet at this moment when we speak of possession and of the rare ballads with which our fathers honoured it, a thought, with apprehension, creaks into senses lulled by sea-music and salt air. Scarcely ever are those songs sung now. A generation back no public dinner, where there was singing with toasting, was right and fairly done without 'The Anchor's Weighed' and 'The Death of Nelson'; yet a lad of twenty might call himself a Briton and be a good one now, without shame, if he had never heard them. This slipping off and sinking of our old sea-ballads is really a disturbing thing. It means the loss of a great sentiment; not a total loss, but one that is truly serious. Recently I visited an important music-shop in London and asked for a copy of an old duet, 'What are the Wild Waves Saying?' which a family affair had brought into sudden and quick remembrance. The attendant had never heard of it. I called the manager, but he could not bring to mind that old and lovely song. For his justification he consulted the printed lists of the music publishers, and could not find it named among them. Yet I cannot believe that it has gone. At least, some who are forty remember it and love it, and its music touched them deeply once. Carpenter took the uneasy words of Paul in Dickens's *Dombey & Son*—'I want to know what it says—the sea—what it keeps on saying'—and spread them out to a duet between Paul and Florence, wherein the music of Stephen Glover flowed and moaned in mysterious melancholy. It is easy to complain that the idea and sentiment, the tone and manner, of this song were Victorianly simple; but I heard my mother sing it, she who herself so much loved the August sea, and, with my compliments, I would not change her tattered lilac-covered copy of that song for all the stock of coon-stuff that the dealer holds or could gather within miles of Charing Cross.

* * *

Yet some of us are taken by moods at times when we wonder if the sense of possession, and respect and affection with it, for great and essential things that have seemed to be peculiarly ours, things of our existence and of our nation's soul, is quite so keen and pure as it was with the last generation; whether young people are not too careless of the greater sentiments, so distracted are they by new conditions and circumstances. But there are other reasons and excuses for them. They may look with some doubt and suspicion now upon the sea as on a friend who is truckling with the others. The sea is not Britannia's own, as through all the splendid time from Elizabeth to Victoria. She has parted with some of her rights and powers to the air above, and at the same time her nobility seems lessened by mean manœuvres below her surface to which she, one of the

most magnificent and awe-inspiring elements of Nature, has surrendered herself in the age of mechanics and materialism. We must go in with the rest, and one better than the rest, in the matter of the submarines, but it is a filthy business. Save for the supreme law of self-preservation and the justification that accompanies, we could have nothing to do with it. Those hearts of oak were Britannia's proper furniture for the sea. Steam and iron merchant vessels and the Dreadnought monsters were necessary concessions to what is called progress, but even they stripped the sea of some of its natural glamour, and the wireless has shrivelled up its mysterious immensity. At midnight lately I sat with a friend in his own private snugger in his house in a manufacturing town in the Midlands, and soon after the radiated concerts at London, Paris, and Glasgow had finished, and we were talking upon our own affairs, the air of this apartment was filled with pretty little chirpings as though fairies of the night were kissing and cooing in their ethereal element. In reality it was just the ships of the sea, many ships all over the sea, every sea, sparking and spluttering their wireless messages to each other and to land as well, and by the Morse code those at home in slippered ease in the Midland town could find them out. It is very wonderful; it is the new romance, but it has nearly finished with the old. Britannia of the hearts of oak, the mother-in-spirit of Raleigh, Drake, Nelson, and such a family of heroes as has never been equalled, is uneasy with these invisible murmurings and machinations, and these underwater cruisings, with a peep at the top and a shot and down again. She can neither rule nor love these things. Schooners! Clippers! Frigates! these were the sea-birds that Britannia loved and made her fortune by, and that is why a sail on the horizon touches the imagination and the sentiment of a seaside loungee at this time of holidays more than a biggish steamship by the pier. Nothing ever told of heroic, ubiquitous men, and nothing ever led so well to empire, as schooners and frigates, Britannia's white-winged darlings. Although it may be found better now to cross oceans by aeroplanes, a sky full of machinery will never stir the Briton's pulse like the picture of such ships, full-sailed in their freedom, leaping to the song of wind and wave, painted with a pretty cunning of appeal to our British instincts by Mr Spurling, that I see on the bookstalls in these days. His picture of the old *Macquarie* and the tale that went with it made me—who only started voyaging with the *Lusitania* and her like—uneasy for a day, morose and sadly regretful for a youth that missed its chance, fiercely envious of Joseph Conrad and my departed friend Frank Bullen, not for their enchanting skill and deserved success in authorship, but for the seas they roamed in sailing-ships

when they were young, learning ocean life from zephyrs to typhoons and strengthening their artist's souls from which they later penned their stirring salty tales. The *Macquarie*, built in 1875, last ship of her line and kind—she in all the ravishing glory of her canvas was a queen of the sea, and a fine figure-head of Victoria was at her bows. From 1875 she made grand voyages from London to Australia; then she became a cadet ship; next she was sold to the Norwegians; and now, not long ago, there was a report that she lay by Darling Island, in the Australian south, turned into a coal elevator, grabs fitted to the starboard-deck on which ladies and gentlemen, our parents and grandparents, basked amid thoughts and sentiments of their tremendous adventure, as she flew with them over the equator to the new Britain in the south.

* * *

But even another age of the sea has come and gone since then. Nearly six years ago there was a ceremony which had a twofold meaning for the naval men who, amid duties and emotions, had time and perception to reflect upon the second part of it, and, by favour and fortune, I was privileged to be present. It was a small dinner-party in the private cabin of the captain of one of our greatest battleships. He had invited an admiral of his acquaintance, myself, and one other to a feast which to him was a celebration of a magnificent climax to British naval history, and at the same time the sign of entry into a new unknown, which, to the mind of the naval man, seemed to bring peace with a certain kind of beautiful desolation. We were in the Forth, and nearly the whole of the British navy, with units of the American and French, was there that night. Laughter rippled through the lighted fleet, but there was a peculiar tension, suspense, and sense of an eve of formality with it. The conversation at dinner in the cabin of our captain host, all lights subdued save those which shone on the gleaming napery and flowers of the table, was unforgettable. The admiral, who had had some close and adventurous business with German mine-fields in the North Sea, and had played some pretty and successful tricks with the enemy and our own mine-fields, entertained us with great stories of the happenings of the naval war; but presently he and my host were led irresistibly to discussion upon a theme which, titled plainly, might be, 'What is to become of us?' For at that moment the German navy was steaming towards a fixed point off our shores, and on the morrow it was to become captive to us. Those were days of greater hope and faith than the present; and that night, even among experts, there was viewed a future when, the greatest danger gone, navies would be of little more use, the

gigantic British fleet would have accomplished its supreme task of making the ocean safe for all, and there would be nothing left to do but to abolish most of it. So these distinguished officers saw themselves relegated to idleness. They accepted the prospect cheerfully, as men sacrificed to an ideal, but there were inevitable human reservations. A few hours later that long amazing line of Britain's glory was creeping along the starlit Forth, and from the bridge they pointed out in the deep shadow of the bank the old first *Dreadnought*, done for, idle, left behind. The *Lion* was in our line that night, and she, a hero of the North Sea war, has lately been given over to the shipbreakers, useless in her turn. A change, a sad one, has come upon thoughts and policy since then, and it is that change, and through it, that Britons may come half-consciously to look upon the sea in a way that is new to them, and not wholly agreeable. The great British idea, its base, its principle, is at least disturbed, and seriously. There shall be sea-heroes yet, and victories too, but the old idea has gone. Yet, however careless may be its public expression at times, how the old instinct in our people does still survive! An interesting and impressive example may be adduced. We being a sea folk, it is natural that our sea-painters and their pictures have been great among all others. The subject has been irresistible to all our artists. You would find even John Constable, of the lanes and fields, the big trees and the pools, the grand masses of clouds and rare atmosphere, making pictures of the sea. Turner was not primarily a sea-painter, but how magnificent were his pictures of sea subjects. There is nothing like our gallery of marine painters. And the line continues. How the work of Mr Wyllie subtly appeals to the feelings of the people! And whose pictures of broad, blue, swelling oceans with modern ships, liners, on them, gray and rosy coasts and lighthouses, such as we see them gratefully in brilliant sheets at the railway stations, cheer us more in August than those of Mr Norman Wilkinson?

* * *

Now what among masterpieces is the most popular gallery picture in Britain at the present time? With the centenary of the National Gallery there have lately been discussions upon the merits of the masterpieces of that collection and the favour shown them. The old Italians, the Dutch, the Flemish, the British have been considered. But in the mass we are not a people of great artistic tastes and preferences, and our likings have a way of shining from our simple hearts and instincts without much trained regard for line and harmony. If there were to be a public vote for first favourite in the class of human life, I believe the sweet 'Innocence' of Greuze in the Wallace Collection

would prove the darling; but the picture that in these present times is placed by the people as their champion is clearly indicated. It is proved in the windows and on the walls of all the dealers, by reproductions in all sizes and everywhere, an inescapable but endlessly welcome and refreshing vision of the sea. 'Off Valparaiso' by Thomas Somerscales, that is it. It is a great picture by a sailor who knew the sea, and he painted it simply with no colour tricks or fantastic details. He made a great big blue swelling heaving sea, flecked with foam, and he set upon it a spanking British sailing-ship, all her canvas bellying, a little boat from shore—with a saucy red patch at its stern—come out to hail it, a gull skimming the waves, soft clouds in the sky, a distant shore, and all above and everywhere the air of the sea, the atmosphere, the wind, the freedom. This picture belongs to the Tate Gallery, but it is so much in demand in the provinces that it is constantly on travel in these times. They tell me that it is by much the most popular picture there, that people of all sorts gather round it when it comes home and linger there as in a spell. They say, too, that sailors come to look at it, and yield their expert praise to the accuracy of the yards and sails. Thomas Somerscales in a wonderful simplicity was inspired to a work that sailed home straight to the core of the Briton's instinct. And by that same instinct now, in ease and idleness, we seek the shore, for the life that is given us by the sea, and the hope with life.

'TOPSY TURVY.'

When I am just as wide awake
As any child can be,
And having such a lovely time—
Then Nannie comes for me
To go to bed, for 'it is late,'
She says—at half-past seven or eight!

When I am oh so sound asleep,
Tucked cosily in bed,
Then Nannie comes to waken me,
And calls me 'Sleepy Head!'
'Get up, or else you will be late
For breakfast—it is nearly eight!'

When I am ill, then people bring
The things I long'd to eat
When I was well and hungry too,
And would have thought a treat:
They, when I'm not dispos'd to play,
Give toys denied another day.

The world is all turn'd upside down;
'Twould be a happy place
If people only would have sense,
Which doesn't seem the case.
My children—I've made up my mind—
Will do things when they feel inclin'd!

ANNE MACDONALD.

AMÉLIE.

By C. J. NAPIER.

I.

THIS is the story of Amélie, a beauty of the Pyrenees, whose graceful form and large lustrous eyes made her appear good in the sight of men; and if her complexion left something to be desired, being, of a truth, somewhat spotty, she was, nevertheless, much admired and sought after by countless Frenchmen, and not a few Englishmen into the bargain. For years she held out against the most tempting offers, but fell at last. She is dead now, though her fame still lives amid the mountains that were her home.

Where a turbulent stream, born between two snow-capped peaks, reaches the foothills, and there, putting on girth and sedateness, winds its way through vine-clad plains, eventually to lose its brightness in the muddy bosom of the slow Adour, there exists one of those primitive Basque villages that the passage of time seems to have left untouched.

Built on either side of a rocky gorge, through which the stream tumbles in a succession of deep pools, its squat houses almost overhang the water, which thus becomes the natural receptacle of all the village rubbish. Stand on the narrow Roman bridge which through the ages has spanned the gorge at its upper end, sometime after mid-day, and you will see, splashing all over the place, a regular bombardment of bones, bread crusts, and other dinner-débris, flung out of the open windows by the inhabitants, a labour-saving device much appreciated by the goodwives—and the fat trout.

During the day you will discover only old men, women, and children about, the younger part of the male population being at work in the fields below; at least so you will suppose, but if you could take a peep into the dark interiors of the houses you would find many robust young fellows sleeping the sleep of the just. Lazy rascals, eh? Not a bit of it, for their vocation takes them out into the mountain passes, treading the rugged sheep-tracks all the long night with infinite caution, halting here, crouching there, lying flat amid the bracken until a low whistle falls upon their ears, telling them that danger, for the moment, has passed. Each man carries his bale of smuggled goods, and risks a Spanish bullet as he creeps across the frontier; and when he returns, an hour or two later, with his two *bidons*—old petrol cans—filled with spirits, he has the revolvers of the French Douaniers to avoid. Ten francs a trip, each way, is the pay the head of the gang deals out, though what the smug merchants of the big

frontier towns give the leaders for the use of their men the writer knoweth not. But this has nothing to do with Amélie.

In spite of systematic poaching, the river holds many trout, those in the village pools being as cunning as they are well fed. It is a waste of time to throw a fly here, though the villagers get fish out of them, using the loathly gentle. These larvæ they throw into the pools in handfuls at the same time as their tiny hooks, on which a couple of wrigglers are impaled. You can see, deep down in the clear water, the trout darting about seizing the little squirming white morsels, and, now and then, some greedy and inexperienced troutlet will, in the scrimmage, swallow the extra fat one that his elders avoid with such care. Then out he comes in one fell sweep of the long bamboo rod, describing a glittering arc in the air, to fall with a death-dealing thud on the rocky ground, or against the wall of a house behind the jubilant fisherman. They give no law and take no chances, do these old gentlemen; and if, as sometimes happens, they do hook a decent-sized fish, then their fine gut just goes smash. *Tant pis*, so much the worse, they say, and soon rig up another tackle and begin again.

Their argument in favour of these summary methods is not, perhaps, unreasonable. If you played a fish for a moment, they declare, he would at once put the wind up his companions, and you would have to wait maybe an hour or more before they would look at a bait again; so it's out you come, or break—there is no between. Below the gorge the stream becomes an excellent fly water. There are miles and miles of it, all free, preservation being unknown in these remote regions.

The villagers do not trouble these parts, except in certain tranquil and nearby spots, and then it is but a few old gentlemen, who look rather to a happy Sunday spent with a crony and several goatskin bottles of the rich red wine of the plains, than to a pocketful of fish—a basket is considered an affectation in Borda Churi.

In summer a good many Frenchmen come up from the big towns below, but they do little good. Fly-fishing is not their speciality, and in June and July the melting of the snows above keeps the water white and glacial, and not a fish moves. The melt over, the river falls with extraordinary rapidity to its summer level, and the fish retreat to the pools and rocky sanctuaries. Now and then an Englishman comes, like myself, for some enthusiastic idiot, keen on seeing his name in print, once wrote a fantastic account of the river to our leading sporting paper, with

the usual result. Still, it's a long way from London town, is Borda Churi.

II.

I was sitting outside the little town where I had taken up my simple and cleanly quarters, a couple of days after my arrival, smoking the after-dinner pipe and revelling in the glorious air and mountain views, when a ragged urchin of about fifteen sidled up towards me and stood fidgeting about with that timid manner assumed by country children all the world over when they contemplate a raid on your purse.

'Well, my lad, and what do you want?' said I.

'Will you buy some gentles, sir? Look, beautiful fat ones,' and bending down until his head nearly touched the ground, the little horror carefully removed his blue *béret* (the flat cap of the Basques, something like a Scottish bonnet), with both hands, and held it out to me, full of wriggling things, many of which still careered over his curly pate.

'You little beast, get away. No, I don't use gentles. How can you keep them in your cap!' I cried in disgust.

'It's the safest place, monsieur, and you hardly feel them so long as they don't get into your ears. I keep slugs there too when I get them for father to bait his night-lines, but they do creep, if you like. Have you fished yet for Amélie?' he went on. 'You will, of course.'

'Ame—what?' I said. 'What sort of fish is that?' with visions of grayling, perhaps—one never can tell with local names.

'Why, our Amélie, sir; the big trout that lives under the bridge; every one fishes for Amélie.'

Ho, ho! thought I, so there is the usual fabulous village fish even in this out-of-the-way spot. 'Now, how big may Amélie be, my gentle youth?' I asked.

'This big,' opening his arms to their widest stretch; 'and nobody can catch her because she is so wise, and has lived here for so long.'

'I see,' I said; 'about three feet long. Some fish, that! But what about the drag-nets, the chinkas, the night-lines, and all the rest of the damnable poaching dodges you people use? How is it that you have not succeeded in annexing Amélie long ago?'

'Oh well, monsieur, you see the *garde-forestier*, who is also the *garde-pêche*, lives alongside the bridge, and he sits at his window when he is not drunk in the café, and though he never interferes with any one, for he gets all the trout he can eat given him, he says he is fond of Amélie, and won't allow her to be netted. Also he points her out to people, and they give him money. And then the fat merchants who come up for a week with their families fish for her all day, and stay on always in hopes, and that means money to every one.'

'Very well, young man; to-morrow morning at nine come round here and you shall show me your three-foot Amélie, and we will consider her, though I feel pretty certain that I shall not trouble your village beauty with my attentions. I wouldn't harm her for worlds.'

'*Mais non*, of course not; monsieur is a real fisherman. I have seen him down below with his little flies. Ah, it is only the Anglais who are fishermen of merit; I know, for have I not carried for them their net and wickeski bottle!'

III.

And so, next morning, I and my sluggish guide stood on the bridge and sought for Amélie. The stream here was slow, and not over-deep. One could see the bottom easily—a dam, a hundred yards lower, holding up the water. But immediately under the arch there was a deep, dark hole, and it was here, with a hole in the masonry where some stones had been dislodged, Slugs informed me, that Amélie had her residence. There were no signs of her as yet. She was evidently a lady of shameless habits, who kept late hours, supping at one or two in the morning doubtless. Still, the boy declared that she would come out presently and lie beside a patch of weed well within sight.

'*Bon*,' I said. 'You can watch while I smoke;' and I lit my pipe, sat on the parapet, and unfolded a three-day old copy of the *Daily Lyre*. I had just digested an important letter, 'Stand by France. Curzon must go,' over the signature of Jane Smith, chairlady, Paradise Buildings, Upper Tooting, a letter which undoubtedly expressed the opinions of the influential section of the public, when my sentry cried, '*La voilà, monsieur*,' and I folded up Jane and looked over the wall.

Amélie was there all right, a fine well-shaped fish of a bit over two pounds, I should say, lying by the weeds, her broad tail gently fanning the current.

'Dear me,' I muttered, considerably stirred by the sight, 'I wonder if a well-spun natural minnow properly presented from the other side of the bridge would tempt you? I've half a mind to fetch my rod and try.'

But I soon got over my first and natural excitement, for I knew these old over-fed town fish; they were highly educated, and could tell an enemy from a harmless spectator as well as you or I. I had experienced the hopelessness of trying to catch them in the Itchen and the Canterbury Stour.

So I turned to go, when I was aware of an addition to our crowd of two.

It was a tall, rather cadaverous young priest, armed with a stout bamboo, strong enough to hold a shark, to the end of which was attached a few yards of thick cord, such as sea fishermen

use, a couple of feet of heavy-twisted gut and a formidable tinned—yes, ye gods, a tinned hook! He peered over the parapet in a short-sighted way. 'That's a fine fish, monsieur l'Abbé,' I hazarded, pointing to Amélie. 'Are you going to fish for her?'

'Possibly, yes, monsieur. Ah, I see it now. What may it be—a dog-fish? I am not well versed in piscatorial affairs. From its proximity it should be easily captured. But I cannot assert that I am a good fisherman,' he continued. 'I have only tried a little in the sea, from a rock. This is the line I used, and I have just purchased the pole.—No, I have not as yet caught a fish; but I apprehend that this small one should not be a matter requiring much skill.'

'Of course you will catch it,' I cried, hugely delighted at the naïveté of my companion, and scowling at the Slug, whose contortions were horrible to witness. 'But what bait do you propose to use?'

'Hitherto I have employed shrimps, but here they do not appear to catch them, so I have brought the remains of my evening meal;' and unrolling a bit of newspaper, he displayed, to my astonished gaze, half-a-dozen small yellow objects, such as arrive in France from Algeria about this time of year, and pose as new potatoes.

Gravely he threaded the biggest on to his terrible hook, which unfortunately it completely covered, and solemnly he lowered the lump into the water, where the current took it in charge and deposited it on the bottom, not a

yard from Amélie's blunt nose. And then the appalling thing happened.

Slowly, disdainfully, Amélie drifted towards the yellow blob, inspected it critically, as I expected, and then, oh shades of Walton! instead of looking up at us and winking, metaphorically speaking, of course, for she had no eyelids to wink with in reality, ignoring the rope-like line, she gently absorbed the thing and drifted back to her weeds.

Dumb with amusement, I heard the fisherman say, 'I no longer perceive my potato. It has probably fallen from the hook.' But the Slug was at hand. With a yell of rage he seized the bamboo and gently tautened the line. Alas, the potato had journeyed too far, and it was evident from poor Amélie's convulsive plunges that the anchor had taken hold, deep in her Little Mary.

There was nothing to be done; Amélie was doomed. Only a surgical operation, which must be fatal, could release her, and sadly the Slug gave the rod into its rightful owner's hands, with directions to tow the now-gaping and expiring beauty to a flight of steps which ran down to the water's edge at the end of the bridge. Here Amélie was hauled up to the bank, and when I saw the Slug opening a fearsome knife, disgust and sorrow darkening his expressive Latin features, I turned for home, pondering on the waywardness of fate that could bring about the death of a cunning, much-fished-for old trout at the hands of a *padré*, a pole, and a potato.

OVERLANDING WITH HORSES.

By WILL H. OGILVIE.

I.

TWENTY years ago I had my first and only experience of travelling overland with a mob of horses. Of sheep and cattle droving we had our fill in those days, but horses were seldom travelled in large mobs throughout the more settled districts. So that when I found myself 'at a loose end,' as they say, and heard of a mob travelling from the south-east of South Australia to Adelaide—a city which I had long wished to visit—I took the opportunity of gaining some new experience by offering myself to the drover as an assistant.

This drover was a typical specimen of the local sheep-shifter, but a very different kind of individual from the drovers with whom I had so far been acquainted—the dare-devil, hard-riding, and hard-swearing Queenslanders who came down with cattle from the Gulf. He was a quiet, rather seedy-looking, elderly man, who spent most of his time moving small lots of sheep from one south-eastern station to another.

He was, however, a most shrewd and capable drover, and a kind-hearted, decent fellow—illiterate and slow in speech, but quite clever enough to look after himself and his stock. He had with him one good man, a young fellow named Collingridge, quiet and well-behaved, a superb horseman and handler of stock. He had another young Australian with him—the son of a doctor in one of the south-east towns—a great strapping giant, good-natured and willing, but without any experience of droving whatever, and a very poor horseman. These three, with myself, made up the party.

There had been a large sale of horses at the breaking up of a well-known station stud, and as most of the buyers had come from Adelaide and the district surrounding it, there was quite a large mob of about two hundred horses to be taken overland.

On the morning appointed I joined my companions, riding my little hack race-horse, Molly O'Connor, and leading another thoroughbred colt of mine, on which I had strapped the few

belongings necessary for the journey. My pack-horse was slightly lame, but my intention was to let him run loose with the mob and have a chance of working sound before reaching Adelaide. I found the drover waiting for me, his pack-horses saddled, his assistants at hand, and the big mob of horses collected in the station stock-yards. 'Better turn your own horses loose,' he said; 'there are plenty to ride here.' I agreed; and we went over to the yards. He pointed to some horses in a small yard. 'We have to be careful,' he said, 'for half of them are unbroken. You see those two big grays in there? they tell me both of 'em are good hacks, but one of 'em's quiet and the other bucks like hell, and I can't remember for the life of me whether it's the horse or the mare.' I looked them over and decided that the mare was the quiet one. 'All right; catch her!' said my seedy-looking employer.

I saddled and mounted, and found I had chosen wisely. The mare was a gentle creature with easy paces, and would have given me a delightful ride but for the fact that she would not go a yard without the gray horse, and was eternally either boring after him, waiting for him to come up, or whinnying when she lost him; but for the first couple of days I rode her, and I have ridden many worse.

After I had changed my pack onto a rough-looking, under-bred brute, I let my horses go in the yards, and we were ready to start.

A station boundary-rider took down the rails, and our mob streamed out—a motley and mixed collection. There were race-horses, brood-mares, unbroken colts and fillies, a number of wild ponies, and some coarse-looking nondescripts, but no really heavy horses—which was something to be thankful for. The spirited young horses and a band of mischievous ponies started galloping at once, but Collingridge, well mounted on a fast horse, immediately slipped away to the lead and steadied them on to the road, while the rest of us rode on the wing and behind them. After four or five miles they settled down to a steady jog, but, being still on their own ground, we had to watch carefully for attempts to break away.

I do not know what we should have done without Collingridge. The drover, though capable and shrewd in the movements of stock, was no horseman, and much too slow for work of this sort. The doctor's son was inexperienced and unreliable. I, of course, had had plenty of experience in the saddle, but had still a good deal to learn about handling horses in large mobs on the road. Collingridge was everywhere, cool, capable, full of mature judgment and an almost uncanny prescience; it was a swift move indeed that caught him napping. He never wheeled a wing too far, or stopped the leaders too abruptly; he never chatted like the

rest of us, but kept his eyes always on his work—keen, alert, absolutely dependable.

II.

We gave the horses a long stage that first day, and when we yarded them some thirty miles from the head-station they were steady enough and easily held. When we let them out next morning they were hungry, and we fed them slowly over some rich flats that led towards the coast.

Now, between Adelaide and the south-east corner of South Australia lies the Ninety-Mile-Desert, a stretch of barren sand covered with mallee bushes. A railway runs across it, but there is—or was in those days—no stock-road; so that all stock travelling north or south had to keep to a narrow strip of land between the desert and the coast, the southern portion of it as bare and barren as the desert itself, though it opened out into better country as it neared the Murray River. Along this strip, and parallel with the beach, lies a curious piece of water, a far-reaching lagoon which follows the coast northward, divided from the sea by only a few hundred yards of rabbit-riddled sandhill.

The water in the Coorong, as this lagoon is called, is salt. There is, in fact, no fresh water on the first part of the Coorong track except that which is supplied by a couple of deep-sunk wells which stand near two long-abandoned and ruined houses. This makes the road impossible to sheep in a dry season, but those with cattle or horses may, by pushing on over long stages, surmount its difficulties even in a drought. Naturally, it is not a popular route; but on this occasion it was our direct and inevitable path.

On the second night we camped at a small bush hotel at the southern end of the Coorong, and as the yards were not big enough to hold our two hundred horses, we put them in a small paddock, where they rested contentedly till morning. At the first gray of dawn we started off merrily along the beach of the lagoon, which lay like a glittering shield upon our left, while the dark line of the mallee scrub marked the margin of the desert on our right. Our horses travelled well on the hard sand, and as I was now riding a beautiful little chestnut race-horse called Saracen, I enjoyed thoroughly every moment of that golden morning. Thousands of wild-fowl of every kind floated on the salt lagoon, or whirled above our heads, startled by the rattle of the horse-hoofs or the crack of our stock-whips. The young horses were in playful mood, and raced at the head of the mob, occasionally trying to break into the scrub on our right; but I had only to loosen the rein on Saracen and in a stride or two he was up with the leaders, and we would wheel them back into the line with a roaring whip-crack that woke the echoes. It was sound galloping; very

different from the broken ground over which we had come on the two preceding days.

Looking seaward, I was much bewildered at first by the appearance of the low sandhills which divided the Coorong from the coast. They seemed to shimmer—to shiver—to move, almost. I thought it was some trick of the sun-glare, but soon realised that these sandhills were moving—with rabbits! From crest to base each hill was a crawling mass of Australia's most hated enemy. Never before nor since have I seen so many rabbits together. What they lived on was a mystery. Desert sand, salt water, mallee roots and rough spear-grass seemed the only ingredients of that valley of the dead at that particular place. Either they starved in their thousands, or they travelled far afield to feed.

There were no sheep in this part of the country, no cattle or horses, and for many miles there was no sign of human habitation. A more desolate region could hardly be imagined, and yet it had a lonely beauty all its own.

Our drover, who had only travelled this road once before, had a somewhat hazy recollection of what lay ahead of us; but he remembered that there was a fresh-water well at an old ruined cottage about a day's journey on. As there was no object in lingering on this grassless track, we let the horses push along at a useful jog-trot, and we arrived at the old well some time before dark. There was little to guide us to it; the remains of an old chimney stood upon a grassy flat a little off the road—the first grass we had seen since we struck the Coorong. A broken and tangled wire fence surrounded what had once been a small horse-paddock, and just outside it was the much-looked-for well. The horses, which had had no feed all day, soon spread themselves over the grassy flat and showed no wish to stray from it. We, thirsty after our long day's ride, approached the well. 'Here it is, right enough,' said the drover; 'but the last blighter who was here has forgotten to put the lid on it, and there's two—no, three!—dead rabbits in it. Very dead, too,' he added, sniffing. 'Never mind, it'll be all right boiled.'

I was thirsty, but I should have had to be twenty-four hours thirstier before I could have drunk the tea with which our friend regaled himself that night. The doctor's son also passed what he called 'the rabbit soup.' Collingridge took a few sips and then went and leaned meditatively over the wire fence; but the drover seemed to take it all as a matter of course, and made no complaints.

III.

We kept a horse saddled all that night, in case the mob strayed; but we had no trouble. Without any fence to hold them but the old gapped and broken wire, they kept religiously

to the green patch of grass, ate greedily, and then rested in groups with their heads to the lagoon.

We were up before dawn and waiting impatiently for the drover to finish his 'rabbit soup' and let us get on to more congenial country. Collingridge's horse had gone lame the day before, and he wanted a fresh one. He expressed a desire to ride the big gray which I had avoided on the first day. With some trouble we caught him in an angle of the old wire fence, and Collingridge, with fine courage, mounted him in that cold, inhospitable dawn and rode him triumphantly, though he bucked savagely and long. I was more than ever glad I had chosen the mare.

After an hour or two's ride along the lagoon we came to a homestead and a creek of fresh water. As there was feed here and good camping-ground, as well as a yard large enough for our horses, we took off our packs and determined to remain for the rest of the day. To drink clean fresh water, to lie on our backs upon our blankets and blow our tobacco smoke into the shimmering heat-haze, while our horses fed greedily around us, was a pleasure never to be forgotten.

We yarded the horses early that night, and then borrowed the settler's boat and his gun and went duck-shooting on the Coorong. We got a few, and enjoyed a supper fit for a king, with the brook babbling in friendly fashion at our feet. Unfortunately—for me at least—we made one mistake; we laid our blankets that night on some damp grass. I had no waterproof sheet, and undoubtedly this fact was to blame for the agonies which I suffered two days later.

Early next morning we packed up and left, the horses, refreshed and contented, swinging along the sandy beach in great style. By this time even the ponies had given up trying to break from the mob, and all four of us were able to ride together behind them and steer them with a shout or a whip-crack.

At midday we left the beautiful but inhospitable Coorong behind us, and turned slightly inland; a little later we passed more homesteads and some cultivated ground, and found the stock-route fenced into a narrow lane. In a part of this lane we camped for the night, lighting two fires about a couple of hundred yards apart and holding the mob of horses between them. Two of us camped at each fire, and divided the night into two watches. Collingridge and I were at one end, the others at the other. I took the first watch up to midnight. Collingridge rolled himself in his blanket and was asleep in a moment. I crouched over the fire, turning the horses back when they came up to our end, and hearing the drover shout at them when in turn they tried to pass his fire. We had come a long way,

and I was dead tired, and very, very sleepy. Every now and again I roused myself with a start as the restless horses came trampling up to the fire—and mechanically turned them back. At last I must have fallen asleep, if only for a moment, as I woke with a start to find horses rushing past me at a canter. I called Collingridge and he was up in a moment, but though we ran our hardest, about a dozen horses kept ahead of us on the road, dashed through an open gateway and disappeared in the darkness. Knowing that it was futile to chase them farther on foot, we returned to our fire, driving the other truants in front of us, and Collingridge took up his watch, while I was no sooner on my blanket with my head on my saddle than I was sound asleep.

In the morning we were lucky enough to come on the lost horses feeding in an open glade, and we recovered them without trouble and proceeded on our way rejoicing.

We had not gone far that morning when I was suddenly overtaken by the most acute rheumatic pains, undoubtedly a result of the wet camp two nights before. This pain grew worse and worse, till I groaned in agony. If one had been flogged with heavy sticks, or put through a threshing-mill, one could not have felt more absolutely bruised and broken. I begged the others to go on with the horses, while I found some corner into which I might crawl—and die! They were sympathetic, but unhelpful; after all, there was nothing that they *could* do; and the mob passed on along the dusty lane. I tied my horse to the fence near some farm buildings, and dragged myself into a large hay barn and lay down in some hay. Gradually the pain grew less, and I fell asleep. I must have slept for hours, as it was late afternoon when I woke, strangely refreshed and rejuvenated. I mounted my horse and cantered on, catching up the mob in about ten miles. The drover's delight at seeing me again was obvious. He had evidently given me up as a hopeless victim to the rigours of the track. He was the more pleased because they were now in open country, and the horses had been wild and restless and had given them a lot of trouble, short-handed as they had been throughout the day.

I had no return of the pain, and no ill effects.

IV.

We now began to travel through better feeding-country. The horses filled themselves as they sauntered along, and there was no lack of fresh water. They no longer looked like hunted devils, but began to do credit to their drovers.

We left Lake Alexandrina to our left and approached the Murray River, our track now taking us through well-settled country and past comfortable and well-built homesteads. At one point of our journey we came upon an unusual

sight—a single ostrich jogging slowly across the stock-route. This puzzled us all for a while, as, though of course the emu is an old friend and comrade in the Australian Bush, the ostrich is a rarity seldom seen outside zoological gardens. In this case we found that a neighbouring squatter had an ostrich farm, from which this bird had evidently strayed. It was interesting to note the great attention which the horses gave to this lonely traveller; whereas, had it been an emu, they would scarcely have lifted their heads.

In due course we reached the Murray River. After the uninteresting and often arid country which we had passed through, there could have been no more pleasing sight afforded us than that of the wide rolling river, flanked by its beautiful drooping willows, under the feathery boughs of which the black fellows paddled their flat-bottomed river-boats, busy with the cod-fishing which is the universal industry of the dwellers along that noble river. There was no bridge over the Murray at this point, and we were obliged to cross our horses by the slow and wearisome process of loading them in bunches of fifteen or twenty on a large flat-bottomed punt in charge of a fussy little boatman. At first I thought we should have difficulty with the younger and wilder portion of the mob, but they had all by this time become amenable to discipline, and as the loading-yards were convenient and suitably designed, we soon shipped our charges to the Adelaide side of the river without accident or mishap of any kind. Once across, we turned them into the large stock-yards and proceeded to a small hotel on the river bank, where we sat down to an excellent meal of the famous Murray cod, magnificently cooked. After many days of mutton and damper and tinned jam this was a luxury which we duly appreciated.

We now proceeded northward through the hilly country which surrounds Adelaide, passing through a number of small towns and villages—mostly with German names and filled with a population undoubtedly German. Large wheat farms lay at the back of these villages, and perhaps no part of South Australia was more prosperous or supplied a more contented and law-abiding population.

The stock-route was now for the most part a fenced lane, and we had small opportunity for feeding our horses, so we pushed on as quickly as we could towards the city. Going through one of the German villages I had a lively experience. I was riding in front of the mob to steady them—as one of us invariably did when going through a town. As we were jogging quietly along the very quiet street, one of the mob happened to kick an old tin bucket which was standing on the side-walk, and it somehow got carried into the middle of the roadway and among the horses' feet. This was too much for

the equanimity of the unbroken colts and fillies. Frightened by the banging of the tin and the clatter of their own hoofs on the metalled roadway, they broke into a mad gallop, and the whole mob stampeded through the town. I tried to stem the rush with whip and voice, but the horses were blind with fear and excitement, and as I could not get off the fenced road had I wished to, there was nothing for it but to gallop ahead of them till we reached open country. I could not help thinking that if my horse stumbled and fell I should have had the whole trampling two hundred on the top of me. Fortunately Saracen was as fast as the wind, and we managed to keep ahead until we got out into the mallee, where I at last succeeded in steadying them up; but it was an exciting gallop for more than a mile.

The horses were very nervous and edgy for the rest of the day after this experience, and late in the afternoon a train rushing by within fifty yards of the road set them all galloping again, and they broke away into some scrubby ridges on our left. From these, without Collingridge's daring riding, I think we should never have gathered them. With the highest skill and the greatest gallantry, he drove his gray buck-jumper through the close-set saplings at top speed, heading and putting together the scattered bunches of horses. I helped him as well as I could. The other two were left far behind us; but they pushed the slower nags along the road, and before dark we were able to put the correct count of horses into a small hotel paddock which we had wisely secured beforehand.

This was our last night before reaching Adelaide, and it remains vividly in my memory. The drover, for some reason best known to himself, determined that we should not camp out in the open, but should treat ourselves to a comfortable bed and a good feed at the rather pretentious hotel to which the paddock belonged.

'The horses are safe,' he said; 'this is our last night on the road. I'll treat you to a good dinner and as many drinks as you want.'

Collingridge was indifferent; the doctor's son welcomed a spree; I, for my part, guessing the nature of the hotel, thought we should be much more comfortable camped under the stars in our dusty rags than making the social pretence which would be required of us; but I fell in with the more popular plan.

We pulled the pack-saddles off our horses and threw the gear into an outhouse. Then, a seedy-looking lot of scoundrels, with inches of dust on our clothes, faces streaked with sweat and dirt, our jackets torn to ribbons by our last wild ride in the saplings, we marched up to the hotel and asked for rooms. I shall never forget the face of the magnificent painted barmaid as she confronted with a fine scorn our humble and unwashed employer. Her manner and words would have been a deep insult to any less modest and easy-going person; but our friend swallowed it all with a smile. Good-naturedly he accepted her scornful appraisal of himself, and finally we got our rooms—if not exactly the best in the house; and our supper—if not in the fashionable dining-room.

The fact of the matter was, it was not a bush hotel at all, in the sense understood by our drover—not a hostelry for the accommodation of travelling man and beast—but was one of those pretentious week-end establishments, built a few miles out of every city, for the use of business men and others, who conveyed their 'ladies' there on short and rather riotous visits.

Nothing more incongruous could have appeared in such a place than our rough-bearded and shabby leader in his travel-stained riding-breeches, and our three disreputable and dust-ridden selves.

Two of us, at all events, got great fun out of the experience. The drover enjoyed his drinks, and pledged the tow-headed barmaid in bumpers of beer without the slightest trace of ill-feeling.

We got him away as early as we could in the morning, and before traffic had become general in the suburbs we had our horses safely behind the rails in the city yards, ready for distribution to their various owners.

THE GARUDA.

CHAPTER IV.—*continued.*

III.

AFTERWARDS Judy and I agreed that the period of time immediately following Dulloo's disappearance was by far the most trying of all that hectic night, for hope had been born again. We lay with nerves stretched to breaking-point, straining our ears for the first sound of an alarm. So great was the strain that disaster, when it happened, came almost as a relief. Suddenly our suspense was ended by

Ali Haider's shrill scream shattering the silence. 'Who's there?' he cried; and then in tones of fury, 'Ohé sintri! Wake, you dog! and shoot that son of—'

At the sound of the first words Judy threw all discretion to the winds. 'Get that knife, for God's sake, and cut me loose!' he exclaimed. 'There'll be hell to pay in a minute.'

There was no need to tell me twice, and I set to work like a beaver with the knife in my teeth. But the hut was dark and the rope tough—

I'll never forget the taste of hemp till my dying day. And as I worked there came an answering shout from O'Gorman, who must have left his hut to find out what was wrong, for Ali Haider cried again, '*Woh jata! Woh jata!*' ('There he goes! There he goes!') 'And the sentries are asleep. Shoot, sahib; shoot!'

My lips were bleeding and a tooth had broken, but two strands of the rope were through. And then there came a gun-shot, and, after a pause, another.

With a mighty jerk Judy got his hands apart. Snatching the knife out of my mouth, he cut his legs free, and then, rolling me over unceremoniously, he did the same for my hands. 'Free your legs yourself and come on,' he cried. 'They're murdering that poor beggar outside.' And I found myself alone with the knife in my hand. Judy had gone berserk.

I followed as quickly as I could. I still retain a vivid mental picture of the scene outside. O'Gorman was standing by the water's edge, outlined black against the reflected moonlight, with a shot-gun in his hands. And there was another smaller figure, capering and fawning round him like a jackal. It was Ali Haider, and by the fiendish joy expressed by his antics I knew that the shots had told.

Judy went straight for his man as fast as a pair of very numb legs would carry him. But at the last moment, before they met, Ali Haider saw him, and his cry of warning brought O'Gorman round to face Judy's spring. Now in the ring the money would have been on Judy, though he was giving away two stone. But here he had an armed man against him, and was still numb and crippled from the ropes. O'Gorman caught his rush on his gun-muzzle, and tossed him back as you might toss a truss of hay. Then, giving ground slightly, O'Gorman proceeded deliberately to reload his gun. 'Oh, it's you, is it?' I heard him say. 'Well, you had to have it anyway, so you may as well get it now.'

Do you know the nightmare wherein you run frenziedly for countless æons to avert some prodigious ill; and yet, for all your running, remain anchored in the spot you started from? While all this was taking place before my eyes I was the runner in that nightmare. But as O'Gorman opened his gun I stumbled over a prostrate body, which moaned and tossed its arms deliriously. I saw that it was one of the sentries. And it flashed through my mind that the datura had anticipated Dullooo's reckoning. The sentry's weapon—an old Martini carbine—lay on the ground beside him. In my impatience my arms seemed to work like dead things; but with the click of O'Gorman's closing breech ringing in my ears I got the carbine to my shoulder.

Though you may be the most unselfish shot in the world, there must have been times when

you have halved a bird with another man. And no matter how gracefully you may have waived all claim to it, how often have you not known in your heart of hearts that, by a millionth of a second, the bird was yours? I never heard O'Gorman's shot; it was swallowed by the roar of black powder from the carbine. But I felt that that millionth of a second had been mine. And the margin was enough; Judy did not fall. But O'Gorman pitched forward on his face, a dark mass on the beach.

About twenty yards from the shore, with the moonlit ripples breaking round it, there was another dark mass in the water. And that was my first concern. Dullooo was fatally wounded; a glance told me that. He must have taken most of the contents of a twelve-bore through the lungs at twenty yards. But at least he was still alive. I picked him up and carried him to land. And there Judy joined me.

'O'Gorman's as dead as a door nail,' he announced. 'You put half-a-dozen buckshot through him—and incidentally you thereby saved my life. I felt the wind of his shot by my ear. How's Dullooo? A bad show, I'm afraid.'

At the sound of his name Dullooo opened his eyes and tried to speak, but a fit of coughing choked him. We propped him up on our coats; there was nothing more we could do for him. But he wanted to speak—wanted to badly; his whole frame quivered with the efforts he was making. With some notion of easing his mind, I whispered in his ear that the old matter of his arm was repaid a thousand-fold. And I'm afraid I talked a lot of nonsense besides. But he only nodded impatiently. And at last, with a supreme effort, he managed to jerk out—'Watch that boy! I fear that —' The sentence was cut short by a convulsive spasm, followed by a gush of blood; Dullooo had died in the act of warning us. But he had recalled us to our senses, for we had wholly forgotten that there were other living men on the island still besides ourselves.

And as he died, a sudden angry glare lit up the island and the whole lagoon, swamping the moonlight and showing the water oily black against the unearthly whiteness of the reeds. The aeroplane shed and the dump were both in flames. The work of Essar Dass and the boy, no doubt, and they had not spared petrol to make a job of it.

We both had the same thought, but Judy recovered from his surprise before me. 'The explosives!' he gasped out, and started to run frantically towards the dump. But he had scarcely gone two strides before there was a small explosion—I can best liken it to the preliminary crack of the cap with a hang-fire which just precedes the cartridge's full dis-

charge—and next instant the entire earth split in twain.

IV.

When I recovered consciousness it was daylight, and I was lying on my back with Judy bending over me. He was busy sluicing me with water, which I resented strongly. Also, my head ached atrociously, and some one seemed to have stuffed my eyes, nose, and mouth with peat. There was something odd, too, about Judy himself when I came to look at him. One of his eyes was closed and bleeding; his eyebrow hung over it in a most peculiar way.

'For heaven's sake, man, stop pouring that water over me,' I expostulated peevishly. 'You don't want to drown me, do you?'

'Oh, you've come to, have you?' he answered. 'That's good. I was beginning to think there must be something really wrong with you. Well, just you lie still like a good little boy, while I see to this eye of mine.'

I did as I was bid, and gradually the happenings of the night came back to me.

'Judy!' I called.

'Hulloa!' he shouted back from the water's edge.

'Judy, look here, I'm devilish sorry I was so peevish just now. I didn't remember.'

'That's all right, old son,' he said. 'And I've just discovered that I haven't lost an eye. So all's well.'

'And what about the—the others?' I asked.

'Well, as far as I can gather, most of the drugged brigade have come through all right. You see, there's nothing in this blooming island but mud—for which we can thank our lucky stars—so the explosion was localised. And their hut was down here at the far end. The hut's gone, of course, but I've counted eight of them—a bit flushed and starey about the eyes, but still breathing. And the rest are probably somewhere about. We'll know as soon as help comes from camp. With the island smoking like a volcano, they're bound to find us soon.'

'And Essar Dass and the boy?' I asked.

'I can't be sure,' said Judy slowly; 'but I've found what looks uncommonly like bits of them. Hoist with their own petard, I imagine; and a good job, too. Poor little Dulloo! Well, at least there's this about it, "He went to his God in state."'

THE END.

THE MONTH: SCIENCE AND ARTS.

WARNING DEVICES OF GAS IN COAL MINES.

NOT only is it of the utmost importance that all lights used in coal mines should be so protected that they cannot ignite inflammable gases, but the proportion of these gases present should be accurately known, in view of the liability of electric sparks from the cutting operations to cause explosions. Devices for giving visual or audible indications of too great a percentage of gas have been invented recently by Professor W. M. Thornton, O.B.E., D.Sc., D.Eng., of Armstrong College, Newcastle-upon-Tyne. These are applied to miners' safety-lamps. They are based upon: (1) the burning with a pale blue secondary flame of combustible gas, such as fire-damp or petrol vapour, round the flame of a miner's oil safety-lamp; (2) the curving, when heated, of strips made of two metals, one of which expands considerably, while the other expands very little. Two of these strips are fixed vertically and parallel to each other above the flame of a safety-lamp, and separated by heat-resisting material which is also an electrical insulator. The heat from the oil-flame is not enough to curve them much, but when a dangerous percentage of gas is present, the additional heat from the burning of the gas causes the strips to bend towards each other until their ends touch. One of the strips is connected to a tiny electric lamp, such as is

used in torches, but with a red bulb. The other lamp-contact is connected to one pole of a dry battery housed in a chamber under the oil-container. As both the second bi-metal strip and the other pole of the battery are connected to the frame of the lamp, the circuit is completed when the ends of the strips make contact, and the red lamp immediately lights up. A variation of the device consists of a single bi-metal strip, the curving of which moves a pointer over a scale graduated in percentages; another, also with one metal strip, acts by releasing an extinguisher, which at once reduces the light from the lamp, but leaves a glimmer by which the miner can find his way out of the dangerous area. The device can also be made to ring a bell; and it has been successfully applied in a slightly modified form to electric safety-lamps.

ALMOST A POCKET GRAMOPHONE.

Many will appreciate the advantages for caravans, yachts, and picnic parties of a gramophone which folds up into a box measuring only $6\frac{1}{2} \times 5\frac{1}{2} \times 4$ inches. The lid, which is deep, and hinged at one end, houses a collapsible leather amplifier, at the inner end of which is a socket for the tone arm. In place of the metal disc employed in an ordinary machine for carrying the records there is a central detachable socket from which four folding arms radiate. The inside of the

box is, of course, occupied by the motor. Full-sized records are played by this machine; and, as the sound disc and the tone arm closely resemble the standard pattern, the tone is satisfactory. The folding-arm socket, the tone arm, and the handle, when detached, pack neatly into the top of the box, and it is the work of a few seconds to place them in position. All the metal parts are nickel-plated; the box is covered in black cloth, crocodile, or real hide; and the price of the instrument is moderate.

THE ARRIVAL OF MACHINE TELEGRAPHY.

Although printing telegraph systems have been in use for many years, it will be news to most readers of *Chambers's Journal* that manual telegraphy (Morse Key and sounder) is being rapidly supplanted by machine telegraphy, and that telegraph operators now send messages by means of a lettered keyboard similar to that of a typewriter. When the keys are depressed they punch perforations in a paper tape which passes to a transmitting instrument, where the holes cause electric impulses to be sent through the telegraph line. At the receiving end the impulses may be transformed directly into letters and words by a printing machine, or they may be caused to perforate another tape for retransmission. By means which cannot be described here, four, or even six, transmitting instruments can send messages over one wire in each direction at the same time. This system, which is known as the 'Multiplex,' has proved very successful, especially for transmitting messages between London and the provincial centres, but it is too complicated and costly for lines which carry comparatively few messages. For these a much simpler instrument has been devised, known as the 'Teletype,' a machine about the size of a typewriter. It would be impossible within the limits of one of these notes to describe how this instrument works. All that can be done is to give a general idea of the mechanism. The teletype consists of a keyboard transmitter and a printing machine; there is no tape to be perforated, the signals being sent direct by the keys and printed at the receiving end in the form of letters and words. The printing machine at the transmitting end also prints the messages, which can be kept as a record. Except the signals for the different letters, which are necessarily electrical for transmission, the instrument operates mechanically, although the mechanism is driven by a tiny electric motor. The signals for transmitting the letters are made on what is known as the five-unit code. If a given unit of time be divided into five intervals, during each of which electric current may or may not be transmitted, it is possible to produce thirty-two different combinations of current and no-current intervals. The five time intervals are provided by five cams on

a rotating shaft. If each cam were to make an electric contact, the contacts would occur one after the other at regular intervals. Whether a cam does or does not make contact is controlled by the keys of the keyboard. If the A key is depressed intervals 1 and 2 make contact, while 3, 4, and 5 do not. For C the first interval is a blank, while 2, 3, and 4 make contact, and 5 is a blank. These signals transmitted to the other end of the line cause the receiving instrument to print the corresponding letters at the rate of forty words a minute, this having been found to be the best practical working speed. The British Post Office is using sixty-two teletypes, and it is being widely adopted by the Eastern Telegraph Co., the Marconi Co., the Dutch Government, and other Administrations. Messrs J. & J. Colman, Ltd. (Colman's Mustard), are using the teletype on their private wire between London and Norwich, and it is thought that there will be a wide extension of the use of the teletype by private firms. This development is already taking place in America, where there is talk of teletype exchanges on the same plan as telephone exchanges. The teletype is being successfully used for wireless transmission of telegrams in the United States, and the transmission is secret, the Morse code not being used. The American Navy Department has made successful experiments with the teletype on aeroplanes communicating by wireless with teletypes at base stations.

HUGE DUTCH DRAINAGE PUMPS.

Some of the most powerful drainage pumps in the world are to be found in Holland, where they are used to keep large areas of land which are below sea-level free from water. In a paper which he read before the Institution of Engineers and Shipbuilders in Scotland, Professor J. C. Dijkhoorn, of Delft Technical University, described some huge pumps which are in service at Zoutkamp. In these Dutch drainage schemes the water has to be raised only a few feet, the maximum lift in this case being 5 feet 9 inches, but enormous quantities are dealt with. There are three pumps at Zoutkamp, which together are capable of raising 100,000 cubic feet a minute through a height of 4 feet 3 inches. These pumps are known as screw-pumps, because they consist of what are practically screw-propellers working in pipes. Each pipe takes the form of a siphon with a horizontal portion in the middle, from which the legs spring downwards at an angle of about 45 degrees. The mouths of the pipe are cut off at a like angle to make them horizontal, and they are well below the surface of the water on the high-level and low-level sides respectively. At the suction or inlet side the mouth of the pipe is 12 feet 9 inches in diameter, but it becomes smaller towards the horizontal pump casing,

the inlet of which measures 9 feet 10 inches across. The mouth of the discharge pipe is slightly larger than that of the inlet pipe. In the horizontal pump casing the pipe is swelled, while a stream-lined hollow cone is arranged in the middle, leaving a space all round, through which the water is propelled by the screw. The screw consists of a central portion which forms a cross-section of the cone, upon which are mounted the propeller blades, these rotating round the annular space between the cone and the inside of the pump-casing. The propeller is mounted on a horizontal spindle, which passes through a water-tight device to the outside of the casing, where it is coupled to an electric motor of about 450 h.p. By means of reduction-gear the motor drives the propeller at 53 revolutions per minute. At the outlet side the propeller is 11 feet 7 $\frac{3}{4}$ inches in diameter, and fixed blades are provided to take the rotation out of the water, so that it flows straight to the outlet mouth. Pumps of this description which are above the water-level have to be filled before they will start. This is effected by pumping the air out of the pump-casing, when the water flows in to fill the void. An emergency valve is fitted to each pump to let in air in case the electric motor fails. If this were not done the water would siphon back from the high to the low level.

A SLOW LANDING SPEED DEVICE FOR AEROPLANES.

A slow landing speed is a desideratum for every aeroplane, especially if it can be obtained without detriment to the full speed of the machine at other times. This is realised with the De Havilland automatic camber gear, which has been recently brought out. The device consists of a hinged flap at the rear of each wing, extending along its whole length. These flaps are pulled downwards by springs to an angle with the wings. But at speeds of 70 miles an hour and over, the air pressure keeps them up and in line with the wing curve, and the wings then act like those of the ordinary pattern. As the speed is reduced the flaps are pulled down by their springs until they reach the limiting stops at 45 to 50 miles an hour. In this position they have a braking effect, and the landing speed is reduced by about 8 miles an hour. This, however, is not the only benefit; the flaps improve the angle of climb, and they make the machine safer to handle at low speeds when approaching a landing ground.

A SIMPLE BEATING AND MIXING MACHINE.

So far as the amateur cook is concerned, it is a safe assumption that many attractive dishes are seldom made because of the time and trouble involved in beating up or in mixing the ingredients. Once this irksome feature is eliminated, the production of whipped cream,

omelettes, batter, and cakes can be undertaken with a light heart. A beating-up and mixing machine has lately made its advent, which vastly reduces the time and labour needed for these operations. The mixing bowl is made of stout aluminium, measures 7 inches across the top, and is 5 $\frac{1}{4}$ inches deep. At the bottom the diameter is 5 inches, and the corners are well rounded to facilitate cleaning. Across the top is a bar, which is extended into a handle at one side, for steadying the machine during its operation. It is not necessary to clamp the bowl down, as is the case in many culinary appliances. A 'sun' gear-wheel is fixed centrally under the bar, and a spindle passing through the bar and the centre of the sun-wheel carries a horizontal arm and terminates in a flat mixer which increases in width towards the bottom of the bowl. A handle is attached to the top of the spindle, by which the arm and the mixer are rotated. The arm carries a spindle at its outer end. This spindle has a flat mixer secured to its lower part, similar to the central mixer, but wider at the top than at the bottom. When it is turned it clears the central mixer by about $\frac{1}{8}$ inch, the clearance being parallel from top to bottom. A planet pinion on the top of the second spindle meshes with the fixed sun-wheel, the ratio between the two being about 1:5. But as the sun-wheel is fixed and the planet pinion revolves round it, an extra turn is given to the latter for each revolution. This means that when the handle with the arm and the central mixer is turned at, say, 100 revolutions per minute, the planet mixer rotates at six times the speed and has a beating-up effect. As a matter of fact, the handle can be turned at 140 revolutions per minute without any great effort. Splashing on to the gear or outside the bowl is entirely prevented by a cover-plate which extends over about one quarter of the top, leaving the contents clearly visible at all times. Lastly, both the bowl and the mixers are very easily cleaned, the latter having plain flat surfaces, while the gear can be lifted off the bowl in a second, without undoing any screws. All parts are made of aluminium, and every item is of ample strength. Now for the results. The time taken to whisk-up cream into a stiff paste is quartered. For Yorkshire pudding $\frac{1}{4}$ lb. flour, one egg, and $\frac{1}{2}$ pint milk were put into the bowl together and turned into a perfect batter in 3 $\frac{1}{2}$ minutes. By hand several separate operations are needed and as many utensils, with a big increase in the time taken. Fluff cakes are mixed in two operations by the machine in 8 minutes, against 35 minutes by hand. Great saving in time is also effected in mixing other types of cakes. Moreover, the mixture is kept in a cooler state throughout the operation than it would be if the mixing were done by hand, a consideration which will be at once appreciated by all good cooks. Finally, the effort required is less than for hand mixing.

A CURRANT-PICKING DEVICE.

Any fruit-grower accustomed to stripping currants from their stalks preparatory to their being cooked or preserved will welcome the appearance of a handy little contrivance which renders this tedious and somewhat dirty task quite superfluous. The device consists in the main of a lidless box made of tin-plate, much longer than it is broad, and narrower at one end than the other. In this narrow end a number of steel prongs, like those of a dinner fork, but rather more rounded, take the place of the tin-plate which forms the other sides of the appliance. The method of using it in gathering currants is quite simple. A branch of the bush which is to be picked being held in a convenient position with the left hand, the pronged end of the appliance is passed behind the end of a bunch of currants; on drawing the vessel outwards and slightly upwards, the currants are removed, leaving the stalk on the bush. When the vessel is about two-thirds full the contents are emptied into a basket or other larger receptacle. In the case of black currants, should there be any unripe berries in the bunch, the appliance can easily be manipulated so as to avoid picking them. These unripe berries are always at the end of the branch, and therefore can be left to ripen by not drawing the prongs far enough to detach them.

LIQUID-AIR MINE RESCUE APPARATUS.

In the third and final report of the Mine Rescue Apparatus Research Committee of the Department of Scientific and Industrial Research a very interesting account is given of liquid-air mine rescue apparatus. This apparatus is worn by the men engaged in rescue operations in mines where the air is unfit to breathe. There is carried a sufficient supply of liquid air, the evaporation of which enables a man to breathe while undertaking more or less strenuous exertion for two hours. The equipment comprises an insulated container for liquid air at the back, together with a purifier, while in front is an indiarubber breathing-bag, the two being supported by pipes from one to the other, which pass over the shoulders. The inner container, which carries the liquid air, is a perforated case of nickel silver tightly packed with calcined asbestos wool, which soaks up the liquid. Surrounding the inner container is an air space, which distributes the liquid when filling, and collects the evaporated air. The latter gathers in a perforated pipe passing through the container, and is led into a space packed loosely with asbestos. This space is formed between two vessels of nickel, of which the inner surrounds the inner container, leaving the air space already described. From the asbestos-packed space the air passes through a cooling-pipe to enter the pipe crossing the left shoulder; thence

it passes round above the breathing-bag, with which it communicates to the pipe over the right shoulder, and thence to an inhaling valve. The exhaled breath passes to a purifier, in which it is brought in contact with caustic soda. This chemical renders part of the air fit for breathing over again, which economises the use of the liquid air. Every precaution is taken to render it impossible for a man wearing the apparatus to breathe the external air, the mouthpiece being very carefully supported, while the nose is closed by a clip. The container holds five and a half pounds of liquid air, and can be filled in one minute. The complete apparatus weighs forty pounds, which does not exceed the weight that an infantry man was called upon to carry in the Great War. Flexible pipes connect the mouthpiece with the inhaling and exhaling valves. The containers are, of course, very carefully heat-insulated, and they are stoutly protected by a leather case. The breathing-bag is also protected by bronze springs, so that even if the man lies face downwards, it does not collapse; it is further guarded by a canvas cover. Rescue-stations, where a number of these outfits are kept and where liquid air is manufactured, have been established at several stations in coal pit areas, such as Rotherham, Newcastle, and Mansfield. The liquid air is stored in vacuum vessels, but even so, a considerable amount of wastage takes place, which has to be made good from time to time.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

AN AUTOGRAPH ALBUM.

How the dead pages wake to pulsing life
At the creative touch
Of friendship's magic finger!
Surely even such
The pages of our life are; for there comes
A vibrant word, the glow
Of minds in contact, the swift lightning flash
Of sympathy, and, lo!
From out the soul's blank whiteness rainbow
glories rise,
Out of its silence, surging melodies.

ETHEL HOLDSWORTH.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

'DON QUIXOTE' AND THE ORPHANS.

By ASHMORE RUSSAN.

CHAPTER I.—BILLY BROOKE ACQUIRES NEW RESPONSIBILITIES AND A FAMOUS NAME.

I.

AS a Court for the administration of justice, a temporary jail, and the centre of all happenings of consequence, the house of the *Juez* in the little Oaxaca town of San Pedro Mixtepec, although not much to look at, served its useful purposes. It was also a house of call for travellers. At any rate, Juan of the Spurs—so called from the enormous size of his heel decorations—had taken there, as to an inn, the mining engineers, Billy Brooke and Jerry Marshall, whose adventures in the aforesaid Mexican state I propose to set down.

For the rest, the squat, one-storeyed building, with the broad, many-pillared veranda where guests were accommodated, overlooked the *plaza* with its sparse tufts of rusty grass, its lone, ragged coconut-palm, and its patchy pink-and-white church, whose discordant bells had started ringing soon after daybreak, when, after riding all night, the travellers had arrived. Since then they had jangled incessantly; not, however, in honour of the new-comers, but of the town's patron saint, whose day it was.

As the *Juez* himself, old, with features grotesque as a gargoyle, but with humorous twinkles in his deep-set eyes, had risen extra early to bid his visitors welcome and indicate the proper veranda-posts to which their horses and pack-mules should be tied, and their own hammocks slung, the travellers had quite settled down when the children began to gather for the *fiesta* heralded by the bells, filling the space immediately in front of the building, perhaps because it was customary to assemble there, possibly to inspect the strangers.

As, however, Juan of the Spurs was unpacking the provisions, it may have been the spectacle of such plenty in a land of beans and *tortillas*—and not too many of either—that drew the youngsters; but, whatever the attraction, the said adventures were largely direct consequences of the gathering.

Having breakfasted, Billy Brooke was sitting sideways in a hammock, with a tin of chocolate on his knees, amusing himself by tossing pieces of the *dulce* amongst the crowd of little ones

yelping shrilly with unaccustomed joy, when his attention was drawn to two who looked different; not better clad, for all were three-parts naked, but whiter, cleaner, fairer, and more wistful.

'What d'ye think of those two, Jerry?' he cried, turning to his colleague and indicating the pair, a boy of about nine and a baby-girl some four years younger.

'What do I think?' Marshall snorted, lifting heavy brows and snapping his jaws like a trap. 'Well, if you want to know, I think some miserable scamp of a mining man has been along before us, and they're two of the little things the rascal's left behind him.'

Brooke got upon his legs, still stiff from his forty-mile ride over the Sierra Madre, and, tin of chocolate in hand, hobbled to the two white children. '*Por Ustedes*,' he said in his stilted Spanish, and gave a cake to each. Then, noticing the jealous, hungry looks of the others, he emptied the tin amongst them.

A rather whining, high-pitched chorus of '*Muchas gracias, señor!*' greeted the unwonted largess, but the children with the fair hair, and, as Billy now saw, blue eyes, uttered not a word until the cries had subsided. Then, with a wistful glance and a half smile at the stranger, the boy nudged the baby-girl, whose mouth already was stained brown with chocolate, and took off his ragged hat. 'Thank you, sir,' he said in English, and bowed gravely. And to the still more staggering surprise of their benefactor, the baby dropped a most astonishing curtsy and echoed 'Tank you.'

It was too comical. A sort of tattered towel, held in place by a long thorn, was the curtsying baby's only wear. Mr William Brooke, M.I.M.E., of the famous Exploring Company of London, roared—rather hysterically, perhaps—for an emotion to which he was no stranger had suddenly gripped him by the throat. 'Did you see that? Did you hear, Jerry?' he cried. 'These two are English!'

Mr Jeremy Marshall, A.I.M.M., also of the great Exploring Company, likewise hobbled stiffly from his hammock to the edge of the veranda. 'Miserable scamp of an English

mining man then, Billy,' he said indifferently. 'And that's about all there is to it.'

Brooke shook his head, fair as the boy's before him. 'Not by a long shot!' he rejoined emphatically. 'These are no stray fossicker's kids. They've been brought up properly. It's a little lady and gentleman we have here. Clothes they haven't any to speak of, but their manners are O.K.' He turned to the boy. 'What's your name, sonny?'

The youngster's face lit up at being addressed directly in English. 'Hugo Lestrangle, sir,' he answered.

'And your sister's? She's your sister, of course?'

'Adelaide, sir.'

'Juan!' shouted Billy Brooke. 'Is there a *tienda* in this town?'

'*Sí, señor,*' replied the guide, looking up from the packing-case he was handling.

'Then take these children and buy them some clothes. Here's the *dinero*.' And Mr William Brooke, M.I.M.E., gave the *mozo* twenty dollars in Mexican money.

Marshall laughed sarcastically as Juan of the Spurs clanked away with the youngsters, holding each by a hand. 'At it again, Don Quixote!' he said. 'I am wondering what next you'll do.'

'Find out all about them,' Brooke replied. 'Their mother was a lady, whatever or wherever she is now. Hugo and Adelaide Lestrangle—just consider that conjunction of names! Discovered at San Pedro Mixtepec, a place right off the map. Never heard of it till its cocks and dogs greeted us, and just as I'd concluded I couldn't ride another yard, and was looking for a soft spot to fall on, Juan shouted, "This is San Pedro Mixtepec, where I was born. They know me here."'

II.

The presence of the two mining experts on the Pacific side of the state of Oaxaca was due to the willingness of the Exploring Company to take risks. That way British trade and the empire has been built up. A sample of very rich silver ore, accompanied by a report, had reached the London office. The locality of the 'prospect'—the writer of the report called it a 'mine'—was Santa Elena, Oaxaca.

At Miahuatlan, about half-way from the city of Oaxaca, the experts should have been met by the owner of the 'mine,' a certain Pablo Revuelto, for so the covering letter indicated. But either he had not turned up, or they had missed him. Declaring that he knew Santa Elena, Juan of the Spurs, otherwise Ramirez, had offered his services as guide.

He had brought them safely over the Sierra Madre, but had then pretended that he had forgotten the road. Hence the visit to San Pedro, for the purpose of making inquiries,

Juan said—but they soon discovered that his real object was to see his *novia* and get married on the strength of the substantial reward for which he had bargained.

When the *Juez*, dressed now in *fiesta* clothes, reappeared with a quirt to drive away the clamorous crowd of children, Brooke questioned him. Yes, he knew the *niño* and *niña Inglés*. They lived with the Widow Natchez. He was unable to give any further information. This was absurd, and Billy Brooke told him so bluntly. But the *Juez* countered by asking questions on his own account. What was the strangers' business at San Pedro Mixtepec? What were their names, and where had they come from? Marshall, whose temper was short and humour of the pawkiest, resented the questioning. '*Bueno!*' he said. 'That's all right, *Juez*. I'll introduce you to my friend at once. Possibly you may have heard of him before—Don Quixote de la Mancha; and he's bent on living up to his reputation. Myself—well—I'm Sancho Panza, of course. From London last. Travelling in Mexico for our health. What do you think?'

The gargoyle puckers about the judge's mouth deepened; a quick gleam came into his slits of eyes. Suddenly, without a word, he backed off the veranda and into his house.

'You've done it now!' said Billy Brooke.

But the *Juez* returned in a moment and came towards them smiling, with his hands behind him. '*Señor,*' he said, addressing Marshall, 'as a *caballero* of Spain I am bound to believe what you say. But truly, if you ever really existed, you ought to have been dead some centuries, you and your friend. But possibly you are *aparecidos* (ghosts), in which case I must inform you that, according to an old Spanish law, which to-day remains a law of this republic, it is my duty to arrest all witches, possessors of the evil eye, lepers, wandering foreigners, and *aparecidos*, and send them to the prison at Miahuatlan. That old law, of which I am a careful student and an exponent by my office, has never been repealed. Will you read it for yourselves, *caballeros!*' And with a victorious grin that almost extended from ear to ear, the old fellow held out a book.

One glance was enough. The cover was lettered boldly: '*Don Quijote de la Mancha—Cervantes.*'

Billy Brooke shouted, 'Properly had! Good for you, *Juez!* That's one for your nob, Jerry, and it serves you right.'

'You see, gentlemen,' the old fellow went on, and his small eyes twinkled, 'it is never prudent to take ignorance for granted. I am not a Mexican born. I am a Spaniard. But I have lived in Mexico a very long time. Many things I have learned—that it is wise to keep one's tongue from jesting until one knows with

whom one is speaking. You questioned me about the little *Inglésas*. Ask of the Widow Natchez. She knows. And should you meet him, which is not unlikely, but I pray you may not be so unfortunate, ask of Don Pablo Revuelto. He should know, also. You will remember that name—Pablo Revuelto? Beware of him.'

Naturally his auditors started and exchanged glances. It was the name of the man they were in Mexico to meet; the sender of the ore; the writer of the report; the declared owner of the 'mine' they had travelled so far to examine.

The *Juez* proceeded: 'But do not ask more of me. As I have told you, I have learned many things, the chief of which is prudence. You must now excuse me. I have to assist the band, or it will not play on the *fiesta* of San Pedro, and I shall not be forgiven.'

He trotted away towards the pink-and-white church, leaving two rather astonished Britishers staring at each other.

Billy Brooke was the first to speak. "'Here endeth the first lesson,'" he quoted. 'What does the old chap know?—Beware of Pablo Revuelto? That's not much of a testimonial.' And he took from a wallet the original report received with the samples of ore.

The handwriting, thin, pointed, hardly legible, was evidence that the actual writing must have been the work of a Spaniard or of a Latin-American. It was signed 'Pablo Revuelto' in a different, bolder hand, by the man who had failed to meet them for some reason unexplained, and who, it had been suggested, knew something about the English children, with regard to whom the *Juez*, no ignorant Mexican *Indio*, but a law student and a scholar, preferred not to be questioned further. That there was a mystery somewhere was patent even to the matter-of-fact Jeremy Marshall.

III.

When presently Juan returned, his charges were scarcely recognisable. For the boy he had bought a white cotton jacket, trousers of the same material, sandals, and a small *sombrero* with silver decorations; for the baby, sandals, petticoat, and tiny *rebozo*. But Juan of the Spurs had a third companion, whose presence perhaps accounted for the success of his shopping—a rather pretty Indian girl, whom he proudly introduced to his *padrónes* as his *novia*, Felipa.

Having probably made a nice little commission, he beamed when congratulated on his various purchases; and, asked if he knew the Widow Natchez, replied that he did, and could take them to her *ranchito* in five minutes. This the boy confirmed, and they set out at once. At the door of the hut, a poor place of *adobes* thatched with palm-leaves, they encountered a very old Indian woman, who stared at the party

in amazement, but mostly at the children's new garments.

'Doña Catarina,' said the boy, by way of introduction, whilst the baby ran to her at once. To Brooke and Marshall's eager questions she answered briefly. The children had been left in her care by their mother when dying. She had also left money, many *pesos*, but a bad man had stolen it. He had also stolen the children's clothes, so that they had been forced to wear rags. Often they had not enough to eat, for she was only a very poor old woman, but she had done her best.

'Was that bad man Don Pablo Revuelto?' asked Brooke by a sudden inspiration.

The old Indian's face turned ashen. She shook with fear, glancing about her in terror. 'I am a poor old woman,' she repeated in a high-pitched wail that told of extreme alarm.

Brooke took out his wallet. 'I know,' he said. 'But we are friends. This will prove it.' And he gave her money—a handful—which she clutched as untold riches. 'Now tell me,' he went on, 'where is Señor Lestrange, the children's father?'

'Dead,' she answered. 'He died first. I can show you where they are buried. The children often go.'

'You shall,' Brooke rejoined. 'But tell us more. Was there nothing that Don Pablo didn't steal—no papers—nothing?'

Again the old woman glanced about fearfully. Then whispered in her questioner's ear, 'There are papers and stones—a boxful. I buried them. Don Pablo does not know where.'

'Take us to the place.—Juan, go back and fetch tools—a spade and a pick,' Brooke commanded.—'Wait here, Hugo,' he added to the boy, 'and bring him along with you.'

Doña Catarina led the way to a small wood, open, and with many flowers on the trees—orchids and tillandsias. 'This is where they are buried,' she said—'not in the *cementerio*. The *padre* said the *Inglésas* are heretics. There is the grave, *señores*.—No, *niña*, thou must not cry. These are friends.'

A white-washed wooden cross gleamed in the brilliant sunlight above a mound. It bore one word, written in ink—rain-smeared and almost illegible—'Hugo.' On the grave lay a wreath of long-withered flowers to which a card was still attached, weather-stained, almost pulp. Brooke picked it up, and with difficulty read what was written thereon: "'To my ever-loved Hugo. From Adelaide. Would that I might join you soon, beloved.'" The reader's voice broke. He finished stammeringly: "'But I must live—live—for the children—in a strange—land. Yours, Hugo—and mine. Farewell.'"'

'Where did you bury the papers?' Brooke asked, when able to control his voice.

'There,' she said, pointing to the mound. 'It is the only safe place. Don Pablo searched

everywhere—tore their *ranchos* to the ground. But I had given the box to those to whom it belonged. Even Don Pablo dared not disturb their resting-place.'

When Juan and the boy came with the mining-tools, the old woman bade them watch well in every direction before she indicated the place to dig. But the box was buried scarcely a foot deep. Tied up with strips of rawhide, no impediment to sharp knives, it was open in a moment. Brooke seized a bundle of papers, which he proceeded to examine. Marshall, with all an expert's eagerness, pounced upon a packet of ore. 'By thunder!' he cried. 'It's the same stuff—the Santa Elena stuff! Impossible to mistake it. What have you got, Billy?'

'Mining titles. Two hundred *perenencias*. That's five hundred acres. Properly surveyed and demarcated. Plan all in order. Location Santa Elena. Granted to Hugo Lestrangle, British national, and everything paid for two years. And—hello!—here's a draft of a letter addressed to the Company. Why, it's an English version of the report we received in Spanish—word for word.'

'What do you make of it all?' Marshall asked.

'Dirty work—damned dirty work!' Brooke answered. 'What happens to the despoiler of the fatherless and the orphans?'

'He gets rich—sometimes,' Marshall answered cynically.

'I'll see to it that Don Pablo Revuelto doesn't,' said Brooke grimly. 'We must talk to the old *Juez*—find out just what it is he's afraid of, and a lot more.' He turned to the ancient Indian. 'Take the children home, Catarina, and don't spare that money I gave you. They're going to have plenty very soon, and so are you, or my name isn't Billy Brooke. Fill up the hole, Juan, and bring the box along.'

The discordant clangour of the bells had ceased when they reached the *plaza*, and a brass band was playing '*Cuba Libre*.' It was a good band and a credit to a little town in the wilds of Oaxaca. Crossing the *plaza* to the church, they found that the conductor was the *Juez* himself. Presently he came to them, when Billy Brooke, who had the better knowledge of Spanish, told him everything. His confidence was not misplaced.

'You have made a great discovery, Don Quixote,' said the *Juez*, with his queer, puckering smile. 'A wonderful discovery, and you have confirmed a belief to which I have clung in spite of much discouragement. There is a Judge of the Orphans in every municipality in Mexico. I am the Judge here. But now I know that in the municipality of San Pedro Mixtepec there is also a *God* of the Orphans. But come to my *casa*. There is much I have to say that must not be overheard.'

Don Pablo Revuelto was chief of a band of brigands, the *Juez* told them, when the key had been turned in his door. The band dwelt in an inaccessible place, where the country police, the famous *rurales*, could not get at them. Don Pablo was a most dangerous man, and many people who had offended him had died or disappeared. He had been the Englishman's guide, so must have known of the great find at Santa Elena. Most probably the report had been entrusted to him to mail to London, and he had destroyed it and substituted a translation signed by himself. The Englishman had died of some mysterious disease after a short illness, and his wife had followed him very quickly. There were many strange rumours. They might be true. *Quien sabe?*

Brooke examined the dates on the documents and plan. 'The original grants have only a few weeks to run, and more taxes will be due shortly,' he said. 'We must get busy and make a show of working the mine. Mr Lestrangle's draft report is dated nearly two years back. Don Pablo's is dated almost eighteen months later.'

'As he couldn't get hold of the original *escrituras* and destroy them,' Marshall suggested, 'he waited until the titles had nearly run out before communicating with the Company, intending to let them expire, then re-denounce the mine himself, and so get new titles.'

'Well spoken, Don Sancho,' said the *Juez*. Then, gravely, 'When you get busy, as Don Quixote has said you should, and I agree, you should remember that your lives will be in considerable danger. Don Pablo is reckless and vengeful. He is greatly feared. Even I fear him. But somebody must go to the city of Oaxaca to pay the taxes and renew the titles in the name of the heirs, and, as I have told you, I am the Judge of the Orphans here. It is therefore my duty, and I will go.'

'*Señor Juez*, you're a brick!' cried Brooke. 'Also a *caballero muy grande*,' which, being interpreted, means a very fine gentleman.

Santa Elena, the old man then told them, was merely a bluff looking over the Pacific, twenty leagues to the south-east. The best way to get there was to go to the coast and follow the coast-line.

A brief conversation after the interview sufficed to settle everything. They had a tent and camp-beds. They would leave for Santa Elena on the morrow, and for their safety take the children with them. Also old Catarina, if she would go. This agreed upon, Brooke fell to examining some memoranda he had discovered amongst the documents.

The writing was in pencil and barely legible, but there was a name with an address—'Rupert Lestrangle, Chertsey, Surrey, England.' To that gentleman he addressed a telegram, which he

gave to the *Juez* to despatch in Oaxaca city, with another to the company. That to Rupert Lestrangle read: 'Have found children late Hugo Lestrangle at San Pedro Mixtepec Oaxaca

Mexico. Communicate Exploring Company, London.' That to the company was long and explanatory.

(Continued on page 581.)

THE PERSONAL DEVIL IN SCOTLAND.

By C. W. MACGILLIVRAY.

I.

WHATEVER may be the views held at the present time about the existence of a personal Devil, there is no doubt as to the implicit belief which obtained regarding his personality in Scotland during the early years of last century; but, curiously enough, the personality was not the same in all districts. In the south, the land of Burns, the Devil was regarded as crafty and unscrupulous, but with something comic in him, to be over-matched by guile similar to his own; while in the stern north he was regarded more as some one terrible and awe-inspiring, to be feared and dreaded, and not lightly to be alluded to. The following two stories, one of the south, the other of the north, illustrate these qualities far better than anything we can say.

The first was related to us by a much-loved and respected professor, now no more, and was told to him in his youth by an old minister in Ayrshire. It was known to us as 'The true history of John McNeill and the Devil,' and is as follows:

Ye see, when the Apostle Peter was wanderin' about in these pairts, convertin' the heathen, it happened that his mare cast a shoe, so he askit where he could hae anither pit on. They tell him, 'If ye gae doon to the smiddy at the cross-roads and ask for John McNeill, he's the best shoeing-smith in a' the country.'

So doon he gaed, and John made a fine job o' it. Peter thankit him an' said, 'As ye ken, I hae nae siller in ma pockets, but I'll dae better for ye than that. I'll gie three wishes, an' see ye dinna forget the best.'

'Aw,' says John, 'that can bide a wee. Ma first wish is, that if any one clims intae the peer-tree in my back yaird he canna come doon again till I let him.'

'That's a very foolish wish,' said Peter, 'but it's granted; but ye've only twa mair, so dinna ye forget the best.'

'Toots,' says John, 'that can bide a wee. Ma second wish is, if any one sits doon on that chair he canna get up again till I let him.'

'That wish is as foolish as the first,' says Peter, 'but it's granted. An' noo ye've only ae wish mair, so dinna ye forget the best.'

'Aweel,' says John, 'that can bide a wee. Ma third wish is that if any one gets intae this wee

purse o' mine he canna get oot o' it unless I let him.'

John's wee purse was made oot o' iron rings netted thegither.

'That's the maist foolish wish o' a,' says Peter.

'Ye werena a'ways very wise yersel,' says John, giein' Peter a queer look.

'Aweel,' says Peter, 'it's granted, but ye're no' verra wise either; an' awa' he gaed, an' nane saw him mair.'

Noo John McNeill was a jovial, drouthy chiel, but his ain warst enemy, an' when fou an' fearin' tae dee had made a pact wi' the Devil for ten mair years o' life. An' the years cam' an' the years gaed by, an' the ten years were up. When the Devil cam' tae the door o' the smiddy an' lookit in an' says, 'John McNeill, are ye ready?' 'Oh aye,' says John. 'Deil, I'm ready, but bide a wee till I feenish this shoe.'

'Oh tak' yer time,' says the Deil. 'I'm in nae hurry.'

'Mebbe,' says John, 'ye'd like tae gae intae ma back yaird; there's a wheen bonny peers there. They're fine an' fresh, an' they'll be a change for ye frae where ye've cam' frae.'

So oot gaed the Deil, an' a few minutes later oot cam' John.

'Weel, Deil, I'm ready noo.'

But the Deil tried an' tried, but doon frae that tree he couldna get.

'What's wrang wi' me, John?' the Deil cried.

'Weel, I'm no' hinderin' ye,' says John, 'but gin ye gie me ten mair years, ye'll come doon fast enough.'

'I'll see ye far enough,' says the Deil.

'Aweel, it's a' ane to me,' says John; 'ye can bide there as lang as ye like, but there'll be naethin' but peers tae eat, sae ye'll need tae become what they ca' a vegetarian.'

'Aweel, John,' says the Deil, 'ye will hae yer joke, sae I suppose I'll hae tae gie ye thae ten years; but ye'll no' catch me the next time I come.'

An' awa' gaed the Deil.

An' the years cam' an' the years gaed by, an' again the Deil cam' tae the door o' the smiddy, an' says he, 'John McNeill, are ye ready?'

'Oh aye,' says John. 'Deil, I'm ready, but bide a wee till I feenish this job. Ye'll no' be wantin' ony peers the day, I'm thinkin'.'

'Naw,' says the Deil. 'I'm gaein' tae keep ma eye on ye, John, tae see that ye play nae mair pranks on me.'

'That's a' richt,' says John. 'Sit ye doon an' mak' yersel' comfortable, an' I'll no' be oot o' yer sicht. I'll be ready the noo. . . . Come awa' noo,' says John; but the Deil couldna rise.

'What's wrang wi' me?' says the Deil.

'Weel, I'm no' hinderin' ye, but if ye're no' comin' I'll be gettin' on wi' ma wark. Weel, are ye gaein' tae gie me anither ten years?' says John.

'No' me,' says the Deil.

'Weel, ye can sit there till Doomsday for a' I care,' John says.

So the Deil wriggled and wriggled, then says he, 'Weel, ye'll need tae hae thae ither ten years, I'm thinkin';' an' up he got an' went oot o' the smiddy cursing.

Weel, the years cam' an' the years gaed by, an' anither ten years were gone, an' the Deil stood at the door o' the smiddy.

'John McNeill,' says he, 'are ye ready?'

'Oh aye,' says John. 'Deil, I'm ready noo. Ye'll no' be wantin' ony peers or tae sit doon, I'm thinkin'.'

'Naw,' says the Deil, 'I'm no' comin' in. I'll stan' here an' wait for ye.'

'I'll pit on ma coat an' come wi' ye, but whaur, Deil, am I gaein'?'

'Ye'll fin' that a' in guid time,' says the Deil.

'Aweel, a hantle siller never comes amiss where'er ye are,' says John, pullin' frae his pouch his purse made o' iron rings. 'Losh keep me, I didna ken there was a hole in it tae let the siller through.'

'But there's nae hole,' says the Deil.

'But there is,' says John.

'But there's no,' says the Deil.

'But there is,' says John. 'I kent ye were gey and auld, but I didna think ye were blind. But they tell me ye are still wonderfu' clever an' that ye can mak' yersel' sae sma' that ye could even get intae this purse, an' then ye could see whether there's a hole or no'. But I'm thinkin' that's only auld wives' clash.'

'Oh, ye think sae,' says the Deil, an' wi' that he got sma'er and sma'er and loupit intae the purse. Wi' that John sneakit it to, an' says he, 'Ye'll be able noo tae easy see whether there's a hole in the purse or no'.'

'Let me oot,' says the Deil.

'Nae fears,' says John. 'Will ye gie me anither ten years?'

'Naw,' says the Deil; an' wi' that John started tae blaw up the fire till it was white heat, an' then he drapped the purse intae the middle o' it.

'That'll be a hame frae hame for ye,' says John.

'Aye, but ye can get too much o' hame,' says the Deil. 'I'll gie ye the ten years.'

An' then John minded that he hadna got anither wish.

'Na, na, Mr Deil,' says he. 'Ye'll need tae let me aff a'thegither.'

'No' likely,' says the Deil; and wi' that John

reaches oot for a pair o' pinchers, an' picks oot the purse red-hot an' lays it on the anvil, an' taks a heavy hammer an' gies it twa or three hard dunts, an' the Deil squealed.

'I'll gie ye twenty years, John.'

'Na, na,' says John, 'it maun be for a'thegither. I've got a heavier hammer here, gin ye would like it.'

'Aweel, ye maun hae yer wey,' says the Deil, an' gettin' oot, he girns at John. 'But I'll get ye in the lang run a' the same in the nateral way;' and awa' gaed the Deil.

An' the years cam' an' the years gaed by, an' ae nicht John dreamed that he was deid, an' up he cam' tae the golden gates o' Heaven and knockit, and Peter cam' tae the gate an' askit, 'Wha's there?'

'It's me,' says John.

'An' wha's me?' says Peter.

'It's John McNeill,' says John.

'Oh, I hae ye noo,' says Peter, 'an' I mind ye fine. Ye had yer three chances an' ye didna choose the best. So ye canna get in here. Ye maun gae doon tae the ither place an' see gin they'll tak' ye in there.'

So awa' doon gaed John, but when the Deil saw him comin', says he, 'Ma certes! here comes John McNeill. Close the gates o' brass an' pit up the bars o' iron, for gin John McNeill gets in here there'll be nae peace for ony o' us.'

An' at that John woke up in a cauld sweet, an' frae that nicht he mended his ways. So noo, gin yer mare draps a shoe, an' ye gae doon tae the smiddy at the cross-roads, ye'll fin' nae mair God-fearin' man an' mair regular church-goer or better shooin'-smith than auld John McNeill, an' I'm thinkin' he'll manage tae jink the Deil efter a'—at lang an' last.

II.

In the above narrative the quaint and comic predominate, and it is a mixture of farce and fairy tale.

The second shows its northern qualities. As will be seen, it was told to my father directly, and with an absolute belief in its truth. We called it 'The Man on the Spit,' but whether the explanation is as hinted, each one must judge for himself.

It was on a fine spring morning that my father, a young Edinburgh doctor, strolled down from his father's manse on the hill-side to the edge of the loch, smoking his after-breakfast pipe. The long road stretched away in the distance, and on it was to be seen a solitary figure. On coming nearer my father recognised an old friend, John Mackay, the shepherd; but he hardly knew him. Instead of the strong, ruddy figure, he beheld a pale, drooping, haggard creature, with a look of fixed despair on his features.

'Dear me, John, what's wrang wi' ye?' he asked.

'Oh, doctor, man, but I'm gled tae see ye,'

says he. 'I've had an awfu' nicht. I've been wi' the Devil, an' he nearly caught me, an' I'm feared he'll catch me the next time.'

'What nonsense are ye talking now?' says my father. 'Tell me all about it.'

'Oh I'm gled tae see ye; ye're the first ane I've met, an' I maun tell some one. Ye see, doctor, I was on the far side o' Ben Clibrick lookin' efter some sheep, an' ye ken what a storm it was—cauld an' wind an' rain—an' I was wet through an' half-deid, an' as I cam' ower the brow o' the hill at the heid o' the lang glen, I thocht o' the lang miles between me an' hame, when suddenly I saw doon in the fit o' the glen a bricht licht whaur I kent there was nae hoose. Whaur's that, I wunner, thinks I, but I was ower cauld an' weet tae care muckle. There maun be a fire there, I thocht, an' I'm gaein' for it. Sae doon I stumbled through the heather, an' sure enough, when I got near, there was a wee bit thatched hoose wi' a windy an' a door, an' frae the windy cam' the bricht flickerin' licht. Sae I gaed tae the door and rappit, but naeboddy answered, sae I gaed tae the windy an' peered in. There, on the hearth, was a roarin' fire o' peats an' logs, an' sittin' before it on a low stool was a tall, dark figure, wi' his left elbow on his knee, an' his heid restin' on his hand; while wi' his richt hand he slowly turned a long spit placed ower the fire an' restin' on twa uprights, an' maist curious o' a', there on the spit was a hale sheep, the spit goin' in at the side o' its neck an' comin' oot between its hind-legs. But I couldna stand the sicht o' a' that warmth an' me sae weet an' cauld, sae back I gaed tae the door an' rappit again, an' there bein' nae answer I pressed doon the sneck and gaed in, shuttin' the door ahint me; but the man took nae notice, sae I gaed ower tae him, an' pittin' ma hand on his shooder, said, "Ma mannie, I'm awfu' weet an' cauld; can I sit doon by yer fire a wee while an' warm masel?"

'At that he turned his heid an' lookit up at me wi' a queer, mockin' look in his dark een. "Ay, ma man," he says; "ye can sit here an' warm yersel' gin ye'll turn the spit."

"Fine that," says I; an' wi' that he gets up and gaes tae the door. As he pressed the sneck I lookit roun'; tae find him starin' at me wi' a queer, sneerin' laugh, an' then he opened the door an' gaed oot, closin' it ahint him. Sae doon I sat, an' takin' the handle o' the spit in ma richt han' began tae turn it slowly; an' what wi' the heat an' the fac' that I was fair tired oot, I maun hae got sleepy, for I suddenly woke up an' couldna believe ma een. The sheep seemed tae hae lengthened oot. Its hind an' fore legs were longer, an' its heid was a' covered wi' lang black hair, an' I saw that it had become a naked man. The spit gaed richt through it frae the side o' the neck, an' its heid hung doon on ma side o' the spit. I still turned the handle, no' knowin' what I was daein', an' as I turned, the heid

cam' slowly up till it was facin' me, an' its awfu' glowerin' een, like coals o' fire, were starin' straight intae mine, an' juist as I thocht I would hae deed, roun' gaed the spit an' doon tumbled the heid. I turned on at the spit, no' knowin' what I was daein', an' very slowly roun' cam the heid again, wi' the awfu' starin' een lookin' again intae mine. We maun hae stared at ane anither for mair than a meenit, when the awfu' cratur suddenly opened his lips an' cried, "Turn quicker, man; yer burnin' me." Wi' that I sprang tae ma feet, knockin' ower the stool, an' made for the door. As I pit ma han' on the sneck, I lookit roun', an' there was the awfu' cratur standin' up wi' his legs wide apairt an' the spit richt through him, an' his arms stretched oot as if tae spring on me. I managed tae open the door an' oot intae the darkness, an' I ran wi' the fear o' death on me. Once I lookit back ower my shooder, an' there, in the open doorway, stood the cratur, ready tae spring. He couldna run, for the spit was ower lang, but wi' great spangs he cam' efter me as I ran ower the rough hill-side an' heather, an' he was juist comin' up on me wi' his arms outstretched an' his hot breath on the back o' ma neck, when click went the spit on a stane, and ower he tumbled. He was up again in a second, an' again efter me cam' he wi' thae big spangs, an' he was juist on me when again, click gaed the spit on a stane, and ower again he gaed, heid ower heels, an' on I ran. But noo I sort o' kent whaur I was. The first licht was juist breakin'. Ye ken the spot yersel', doctor—the big burn wi' its steep banks ran doon on my richt, while on ma left the bigger burn cam' tumblin' doon the hill-side, wi' a waterfall where it joins the ither in a dark black pool, deep lyin', wi' sheer rocky sides. What was I tae dae wi' the cratur efter me? I juist commended ma soul tae God and sprang. Ye ken that nae man in his sober senses ever thocht o' jumpin' that linn, but I did it. I gripped the heather wi' ma twa han's, and pu'd masel' up, an' turnin' ma heid I saw the awfu' cratur juist pausin' tae loup across on me, and then click gaed the spit on a stane, an' ower he fell an' doon intae the deep black pool. The water fizzed an' biled as if ye had drapped a het coal intae it, an' wi' that I fainted an' kent nae mair. When I woke up I was lyin' on my face, grippin' the heather wi' baith han's, wi' ma legs hangin' ower the brink o' the cliff. The mornin' sun was shinin' brichtly frae a cloudless sky, the larks were singin' in the lift, an' a' was calm an' peacefu'. Sae up I got an' lookit roon'. There was the glen, lonely an' desolate, wi' nae trace o' any hoose nor any cratur in sicht, an' the black pool quiet but for the swirlin' water. I thankit God for my escape, an' awa' doon I cam' hame. But I ken fine, doctor, it was the Devil that was efter me, an' he'll get me yet; sae oh, doctor, man, what am I tae dae?'

'Toots, John man, ye must hae dreamt it,' says my father.

'Sure as deith it's a' true; ye needna doot ma word.'

'Tell me, John,' says my father, 'ye didna by chance look in at the bothy on the far side o' the hill where they've got the still gaein?'

'Ah, weel, doctor, it was awfu' cauld and weet, an' I'm no' sayin' that I didna hae a gless or twa o' whisky tae keep oot the chill—but that, doctor, had naethin' tae dae wi' it.'

My only reason for bringing forward these stories is that it seems a pity that such old tales should be lost by the death of the original narrators.

WHITE AURORA.*

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

PART I.

I.

THOUGH the scion of a race well acquainted with halter and stall, White Aurora was truly a wild beast, harking back to some remote ancestry which knew only the lash of the storm, the shafts of the Thunder King, the kerb which marks the borderland of race. His mother was quiet for a hill-run mare, but for White Aurora the fetters of the 'breaker' could never be. They might, indeed, have broken his spirit, but never his wild will; and so Aurora lived to the end—a child of the storms.

For a number of years this horse ran with the herds on the Bentland Range. It is a wild region, comprising an unfenced area of approximately four hundred square miles, given over to the foresting of deer, consisting of rugged glens, heather-grown, wind-swept slopes, and here and there smiling little dells rich in those treasures which are rare outside Caledonia. As far back as history goes, a drove of horses has run in this wild land, the herd, as a rule, numbering about fifty head. Close watch is kept over them, and when a foal is born the mother is separated, haltered, and taken down to the lowland pastures, where she remains with her foal till the latter is old enough to fend for himself. Thus he is weaned and duly broken to his task in life, so that, no matter how wild his branded mother, he, at any rate, never knows the freedom of pasturage which is her happy lot.

As is often the case with a beast which, distinct by outstanding characteristic or colour, lays claim to notoriety, White Aurora became surrounded by such a fabric of legendary that fact and fable have become inseparable. He became, as it were, a double personage—not merely the great white stallion, fleetest of deer, who could cut rings round his herd in full stampede, but, further, a white ghost spirit, which fled on the storm-winds and achieved strange and incredible things.

When little Aurora was born in a grassy corrie far back in the range, he did not for long escape the observation of the shepherd on

account of his colouring—or rather his entire lack thereof. For Aurora was white as a snow-flake, without spot or blemish, and a few hours after the shepherd had picked him out, a man turned up mounted on a long-limbed, speedy animal from the Shires. Very quietly he went to work, and, in spite of her initial coyness, the mare was soon munching contentedly from the sieve of oats, while the man slipped a halter over her ears. So, with her white foal frisking about her, the mare was taken down to the valley, the first and last time that White Aurora followed submissively at the heels of man.

Ere Aurora was many weeks old it became evident that the foal was to make a very beautiful animal, and since both his mother and his father came of excellent stock, there was at once some talk of retaining him to run with the herd. He and his mother were given a croft at the back of the old farm-house, and, chiefly on account of his beauty, no doubt, Aurora became a great pet of the household. So far he had proved a gentle, winning little beast, and the children of the old house loved him dearly. Clutching his forelock, they could lead him where they willed, and he would leave his mother quite gladly to accompany them to the hayfields, or on some other delightful ramble; but a very different story was it if any one tried to fix a halter over White Aurora's delicate ears. He was quite prepared to follow, but to an indignity of that kind he objected from the first.

Nevertheless, the halter was duly fixed, and White Aurora was left to wear it, a proceeding to which he submitted quietly enough, having no alternative; but if any one applied himself to the other end of the halter it was quite a different matter. Up would go his heels, and with a piercing scream he would set off, his would-be captor merely touching the hill-tops till a tree or some other obstacle demanded an immediate release of the rope.

In due course Aurora's mother was returned to the hill, and there followed the most uninteresting period of the white foal's life, for he only ran in the lowland pastures with other colts till such time as his training fell due. He

* All Rights Reserved, H. Mortimer Batten.

was to be broken only to the saddle, so that, whatever the future held for him, he would be to some extent manageable, but the breaking of Aurora reflected more upon his would-be tutors than upon himself. He gave them very clearly to understand that that kind of thing was not for him—that in his veins there lived the blood of a race which submitted to none, save those swifter than themselves. He rolled, he screamed, he kicked. Then, showing his white teeth, Aurora made for his tormentors.

All of them managed to gain the high stake fence, but one, a little slower than the rest, was in the act of getting over the bar, eight feet up, when Aurora sprang at him like a panther. He caught the man's forearm in his teeth, himself striking the fence with such force that he crashed backwards into the corral.

The man's arm was terribly injured, indeed marked for life, while it seemed that White Aurora had broken his own neck, for he lay very still, just as he had fallen. The gate was thrown open, and the men ran in. Instantly Aurora was on his legs, and, glancing wildly round, he saw the way of exit. One gigantic leap carried him through the gate, and next moment, with streaming mane and tail, he was speeding across the pasture.

Then, for the first time, those present realised Aurora's marvellous turn of speed. Two skilled horsemen on fast mounts were after him, but, half-stunned and still a foal though he was, he left them standing. Over the boundary wall, lightly as a roe-deer, and while his pursuers made the detour he plunged across the river, and was streaking over the meadows towards the blue hills of his birth.

At the foot of the rocky slope White Aurora, wild-eyed and with head aloft, whinnied shrilly, and from high above, faint and far, came an answering call, or was it merely an echo? A moment Aurora faltered, then, glancing back, he leapt the last boundary, and into the wild he plunged. Thus the freedom of White Aurora opened.

Up, up, they saw him go, smaller, smaller, now merely a snowflake on the blue of the mountain face, then finally he vanished into the glens which were to hold so many of the secrets of his afterlife.

'We'll never break that beast,' said the man with the injured forearm. He spoke truly. He had good reason to know.

A day or two later an attempt was made to round up White Aurora. It was the last attempt, for he charged one of the horsemen, striking his mount broadside on, and both rider and horse were hurled in sickening fashion down the steep and rocky slope for a hundred feet or more. Nearly every bone in the man's body was broken, and it was a sad and dispirited party which conveyed him home.

Thus, though some diversity of opinion existed

as to the wisdom of allowing an unbreakable beast to run the range as master-blood, it seemed that White Aurora had taken the matter into his own hands. For a time opinion remained divided, but those who favoured Aurora made good use of their heavy-ended weapon—'Let those who don't want him, go and catch him!' And in the end, being men slow of action as of tongue, a soft-voiced, easy people who loved the ways of least resistance, they left White Aurora to establish his own strange history, like some wild chieftain of undisputed range.

II.

In many ways were the daily lives of the hill-horses similar to those of the wild deer which shared their range, for in both cases the ruling spirit was ever the desire for peace and plenty. So alike they sought the most secluded glens and corries, where the coarse green grass grew sweetest, and many things that the wild deer knew the horses had come to know. There were certain pools, foul with moss water, at which neither drank; other sequestered pools which both loved to visit. There they met on a common footing, but never as friends. The horses were quite prepared to be friendly with the deer, particularly the old mares with the old hinds, but the deer regarded them as a kindred apart, for they belonged to man. And though together, one difference marked them as apart. Both dwelt in instinctive dread of a lurking foe. So a stag, because he was the boldest, would lead the herd to the drinking-place, ever watchful, pausing with ears erect; so the horses, as they drank, were wont suddenly to start and fling aside, in inherited terror of the watcher by the pool. And as with the browsing deer-herds there was always one with ears up and eyes watching, so with the horses. But the difference lay in this: the deer knew for what they were watching. It was man; for them man was Fear in the material form. But the horses merely feared something, an inherited fear, of what they knew not. Man? No! For when, as he appeared on the skyline, and the deer fled for the ptarmigan heights, the horses would simply mass and remain where they were, watching but unafraid.

This fear of a foe that did not exist was at all times with the wild horses of the Bentland Range, and it led them to a fuller knowledge of the wild kindred about them. There were, for example, the blue hares, the appointed sentries of the heights, for they are many, timid, and their eyes are keen. And when a hare limped by, the wild horses knew by the manner of his going why he was shifting his quarters. One day he would bound wildly through their midst—perhaps many hares, till the whole heather seemed alive with them—but, save for a passing glance, the horses and the deer would heed them not. By some mysterious means they knew that

the peril, be it falcon, eagle, or fox, presented no menace to themselves; but at other times the sight of a single hare, doubling under the peat-banks and crouching as he ran, would cause the deer and the horses instantly to pack, watching whence the hare came, where soon the outline of shepherd or stalker would loom through the mist. Similarly White Aurora with his clan learnt to read the wild, high curlew calls, and knew that the wind was going to change, and from which quarter it would blow, an hour or so before the change took place.

So, amidst their wild surroundings, many of the ways of the wild crept into the lives of the Bentland horses. But now there was in their midst a wilder spirit indeed, ever ready to flee with the deer, snorting the man-taint from his nostrils, ever the first to mark the alarm and the first to heed it.

That winter, when the storm-winds began to blow, two mounted men set out to round up the drove. The young white stallion 'broke,' and as he plunged down the glen, at full gallop among the rocks, the men let him go, and were glad of it, for they knew that, having broken, fire and water would not turn him.

The mares were taken down to the rough river-pastures, thankful for their shelter and abundance, but White Aurora ran wild on the wild white hills of his own choosing. Very wild indeed he became, swift and wary as the oldest hind. There were indications that at night-time he came down to the valley, leaping the high boundary walls or crashing through the fences, spending some hours with his herd. But ere the first glimmer of daylight came he was back in his snowy, ice-bound heights, and no man saw his coming or his going. So wary and wild was he, indeed, that the first threads of romance soon began to weave their fabric about his ghostly presence. Some said that none but a supernatural horse could thunder as

Aurora did through those ice-bound glens with never a stumble; others prophesied that it would merely be a matter of time ere Aurora crashed to his doom from one or another of the slippery ways he was wont to traverse with such reckless ease.

How many hundreds of miles White Aurora covered that winter, lonely and at times hard pressed for food, no man can say. At sundown he would be seen by the shepherds of the Tinnan on the extreme north of the range; at midnight he would visit his herd at the southern extremity, thirty miles away; and the first dim lights of dawn would reveal him wending his way upwards from the cattle-pastures of the Tevara, twelve miles to the east. Thus, with the whole universe at his fleet hoofs, free as a gull, Aurora, never weary, seemed indeed to hold time and distance as no barrier.

But, sullenly distrustful of man as he was, one thing never failed to draw him forth from his mist-wraiths—the passing of the mail-coach; and be it day or night, the clatter of hoofs on the highway would bring him thundering down the slopes with a gladsome whinny of greeting. Sometimes he would accompany the coach for miles, circling about it, crashing through the fences, lightly leaping the walls, truly a glorious and romantic figure with his streaming mane and tail, in which the frost-jewels often glinted. So his name became widely known, and many there were who made the trip by coach just to see the wild white stallion, which could be seen in no other way but from the decks of that vehicle. And no matter how icy and devilish the gale, how stormy and wet the night, at some time during the stage the lamps would reveal that fleeting ghost of the storms—if only to appear for a moment, then thunder back into the night, as though to wish them Godspeed on their errand.

(Continued on page 589.)

ISAMBARD KINGDOM BRUNEL, F.R.S., D.C.L., M.I.C.E.

By J. and S. HARRISON.

I.

IF one may judge from the amount of space devoted to such topics in the daily press, it seems that the general public is considerably interested in the speed rivalry between Atlantic liners, and in such a matter as the recent record run of a Great Western train from Swindon to London. It is therefore all the more remarkable that so little is known or said of the extraordinary engineer whose work so largely made the giant locomotive and the big ship possible.

On second thoughts, however, one realises that there are two reasons why the name of Isambard Kingdom Brunel has been allowed to

sink almost into oblivion. First of all, his name is not associated with any one epoch-making invention of the sort which makes a date in the school history-book. Secondly, his work was his life; and one cannot find any of those interestingly scandalous tit-bits of information about his private life, or any memorable bon-mots in his public utterances so dear to the scribes of our popular magazines. And yet a remark of his, made on the spur of the moment during a dinner given by the directors of the Great Western Railway, started a chain of events vastly more important than any caused by the most explosive utterances of Victorian statesmen and diplomatists.

II.

Brunel was born in 1806 at Plymouth. He was the son of Sir Marc I. Brunel, a well-known engineer and inventor. At the early age of twenty young Brunel came before the public notice by an act of heroism performed during the construction of the Thames tunnel, which he had helped his father to design. An accident occurred while he was working in the tunnel, and his self-sacrificing endeavours to help the workmen in his charge caused his directors to insert the following notice in the leading newspapers of the day :

'That this court, having heard with great admiration of the intrepid courage and presence of mind displayed by Mr Isambard Brunel, the company's resident engineer, when the Thames broke into the tunnel on the morning of the 12th inst., are desirous to give public testimony to his calm and energetic endeavours, and that generous impulse which induced him to put his own life in more imminent hazard to save the lives of the men under his immediate care.'

By the time this amazing man was twenty-four years of age he was awarded the Fellowship of the Royal Society for his research into the use of carbonic acid gas and for completing the designs of the beautiful and much-photographed Clifton Suspension Bridge.

About this time the merchants of Bristol, realising the inadequacy of transport facilities between their town and the metropolis, endeavoured to get a bill passed through Parliament for a railway. A second attempt proved successful, and royal assent was granted in 1835. Brunel was appointed engineer to the new Great Western Railway at the age of twenty-seven. He did not get this appointment without some difficulty, however, for the committee delegated to deal with the applications for the post at first resolved to give it to the candidate who would offer the lowest estimate for building the line. Brunel immediately withdrew his name and wrote to these gentlemen thus : ' You are holding out a premium to the man who will make you the most flattering promises. It is quite obvious that the man who has either the least reputation at stake, or who has most to gain by temporary success, and least to lose by the consequences of disappointment, must be the winner in such a race.' This brought the committee to its senses.

His first years with the Great Western Railway were attended with difficulties, placed in his way by vested interests and by various people who made it their business to safeguard the public. When he wished to place his terminus at South Kensington, the inhabitants of 'salubrious Brompton' objected that 'streams of fire would proceed from the locomotive engines.'

Nevertheless Brunel went on building his

line in the face of all difficulties. Paddington station, the Brentford docks, Hanwell viaduct, and the Maidenhead bridge are a few of his works which Londoners may see. The $1\frac{1}{4}$ mile-long Box tunnel gave the medical profession some misgivings. So thoroughly did the medicos of ninety years ago poison the public mind that, for some time after its opening, there were travellers who used to avoid the terrors of the tunnel by posting along the turnpike road in that part of the line. Brunel's love for beauty, which expressed itself whenever opportunity allowed, led him, when part of a tunnel slipped away during construction, to plant it with ivy so that it would present the appearance of a ruined gateway.

Brunel's railway was remarkable, among other things, for the fact that his tracks were 7 feet across. Stephenson and most of his imitators had used the now almost universal narrow gauge of 4 feet $8\frac{1}{2}$ inches. This latter dimension had been adopted merely because the ordinary trucks and carts of the day were built with this width of track. Brunel was firmly and, as it now proves, rightly convinced that the narrow gauge could not accommodate a locomotive large enough for the work to be done. The lack of standardisation in gauges, however, led to such inconvenience on the railways that in 1845 a Royal Commission sat to report on the matter, and Brunel, in order to demonstrate the advantages of the broad gauge, ran trains from London to Exeter in the then unprecedented time of $4\frac{1}{2}$ hours, including stoppages. The Commission was either unconvinced of the necessity for speed or, owing to the scaremongering medical men, were afraid of it ; and when it came to scrapping one of the systems, they decided on making the broad gauge illegal. And now in the age of motor transport, railway engineers are realising how much the narrow gauge is hampering efficiency ; and the Great Western Railway has to be content with scheduling a train between Swindon and London (77 miles) in 72 minutes. The fight over the gauge question led to Brunel's immediate defeat but ultimate vindication. In all, he designed 1200 miles of railway for the Great Western Railway.

III.

During the construction of the London-Bristol section of the railway, the directors held a dinner at Radley's Hotel, Blackfriars. One of them spoke of the enormous length of the railway, and provoked Brunel to exclaim, ' Why not make it longer, and have a steam-boat to go from Bristol to New York, and call it the *Great Western*?' The remark was, naturally enough, treated as a joke, but Brunel was in dead earnest, and got to work at once with his project.

If his innovations in the railway world gave

his contemporaries shocks, they were small compared with the upheaval he caused in the world of steam navigation. Dr Lardner, a noted authority on steam practice, wrote in the *Times* of 27th August 1836 that 'he thought it would be a waste of time, under all circumstances, to say much more to convince them of the inexpediency of attempting a direct voyage to New York.'

In spite of all the warnings of philosophers and experts, the steamer was launched on 19th July 1837, and her early career was a hectic one. It had become known that the St George's Steam Packet Company had bought the *Sirius*, with the object of anticipating the *Great Western* in the Atlantic run. The latter boat steamed down the Thames for Bristol in a great hurry, and a fire broke out on board. It charred the timber frame, and nearly killed the boat's designer, who fell eighteen feet into the hold. Brunel was, however, fortunate enough to fall on Captain Caxton, and thereby escaped death. The fire was quickly got under control, and the people of Bristol were surprised to see the steamer which rumour had declared destroyed by fire. Nevertheless, fifty of the fifty-seven passengers who had booked passages cancelled them.

The *Great Western* left Bristol eight hours after the *Sirius* left Cork, but arrived at New York on the same day as, and only a few hours after, her rival. The palm, however, went to Brunel's steamer, for, not only was she the faster boat, but she had over 200 tons of coal left in her bunkers at the end of the journey. The *Sirius*, on the other hand, had used up all her fuel and, further, consumed every combustible thing on board, including, so it is said, a child's doll. The *Great Western* crossed the ocean in fifteen days, and demolished criticism by making regular passages till the end of 1846. She then worked among the West Indies until 1857.

In 1857 the *Great Britain*, Brunel's second ship, was launched. This remarkable boat was the first steamer to be built of iron, and was the first of any size (she was 2984 tons displacement) to use a screw propeller. It should be noticed in passing that Brunel introduced the screw into the navy in spite of Admiralty obstruction.

If further proof is needed that Brunel was no narrow specialist, one need only remember that Brunel designed the Brentford docks and the Monkwearmouth docks, improved the Bristol harbour works, and constructed the Plymouth Great Western docks and the Royal Albert Bridge. The Great Exhibition found him an ardent supporter. He designed the exhibition buildings, and the two great towers of the Crystal Palace are his work. He actively opposed the granting of awards and diplomas. 'I think money-prizes a mistake,

and medals and diplomas nearly as bad,' he wrote. His contention was that the products of a man's brain belonged to humanity. In this belief, he never took out patent rights on any of his numerous inventions, and he made his discoveries public through the medium of papers read to the learned societies. When, at the close of the Great Exhibition, he was compelled, unwillingly, to accept pecuniary acknowledgment of his services, he spent the money in building model cottages for the workmen on his Devonshire estate. He spoke in emphatic language of the necessity of housing the lower classes adequately.

During the Crimean War he designed a floating gun-carriage for attacking the forts at Kronstadt. But when Captain Cowper Coles, C.B., submitted a better design in the form of a turret ship, Brunel dropped his scheme and, free of cost, placed his drawing-office at the captain's disposal.

Essentially a man whose mind ran to construction rather than destruction, Brunel designed the hospitals for the Crimea. They were used too late, unfortunately, but were of such advanced design that the Germans copied them sixteen years later during the war against the French.

The closing years of Brunel's life were occupied with the construction of the leviathan steamship *Great Eastern*, a vessel six times as large as any of his day. Built of iron and driven by both screw and paddle-wheels, she held the record for magnitude of dimensions for nearly half a century. In 1856 the company building her was in financial difficulties; but new capital was found, and she was launched at Millwall in the following year. Against Brunel's expressed wishes, the directors crowded the docks with friends and spectators, and in the confusion some people were killed. The news of this tragic happening was a severe blow to Brunel's already failing health, and he was seized with a paralytic stroke on the deck of the *Great Eastern*. He died two days later at his house in Westminster, on 7th September, before the ship underwent her trials. During her life the *Great Eastern* was engaged in cable laying, and the two Atlantic cables were her most important work.

IV.

Of the private life of Brunel extraordinarily little is known. He ate and drank very frugally, and sometimes went days and nights without sleep. Excessively fond of smoking, he was never seen without a cigar in his mouth. He loved children, and on one occasion, when he was attempting to amuse some kiddies with conjuring tricks, he very nearly killed himself. He was pretending to pass a coin from his ear to his mouth, and a half-sovereign became stuck in his throat. Tracheotomy was performed,

and an attempt to extract the coin with forceps nearly ended fatally. Brunel was, however, enormously interested in the experiments being conducted on himself, and, on his advice, an apparatus was constructed for inverting the body of the patient. He was placed in the machine, his body inverted, and the back gently struck. After two or three coughs the coin dropped from his mouth, six weeks after the accident occurred.

One of Brunel's sons (two boys and a girl survived him) wrote an exhaustive *Life of I. K. Brunel*, and it is interesting to note that, in the whole of the very complete account of Brunel's works, only one meagre paragraph is devoted to mentioning—almost casually—the marriage of the biographer's parents.

For the rest it is only necessary to point out that Brunel brooked no interference from directors, and was never deterred by 'experts.'

He demanded a high standard of loyalty from his assistants (whose rights and amenities he jealously safeguarded), and expected that contractors should obey the spirit as well as the letter of his contracts. He never spoilt a ship for a ha'p'orth of tar, and the longevity of his railway and other works amply justifies his methods.

His death occurred during the same summer as that of his friend Robert Stephenson, and the president of the Institution of Civil Engineers said, 'We at least, who have benefited by their successes, who feel that our Institution has reason to be proud of its association with such names as Brunel and Stephenson, have a duty to perform; and that duty is, to honour their memory and emulate their example.'

Brunel believed that humanity would not forget its benefactors. How far he was justified in that belief the reader may judge for himself.

SPOTTING SLEUTHS.

By SHERLEY MCEGILL.

I HAVE always considered that it is a mistake to recruit detectives from the rank and file of a police force. In the first place, a police recruit must possess certain standard physical qualities before he is accepted. He must be big, strong, and active. Then, a few years in the ranks helps to conform him to a certain type which is easily recognised by even the average unobservant man in the street. Drill, for instance, develops a peculiar stiffness of carriage which immediately betrays the policeman's or soldier's identity. Street patrol work has also the inevitable effect of stereotyping the policeman's walk into a slow and steady gait.

As a rule, when a policeman's ability and his aptitude for detective work have convinced his superiors of his fitness for the C.I.D. branch of the force, he has already developed all the physical characteristics of the conventional constable.

The modern scientific criminal, who is of necessity a very keen-witted and observant individual, can invariably see a 'tec before the 'tec spots him. He knows that a detective is usually over 5 feet 9 inches in height, and that he is broad-shouldered and well-built. He also knows that he walks in a particular way and that there is a direct, searching look in his face.

All the members of the detective division of one famous British police force are big, burly, red-faced giants. They are remarkably fine specimens of manhood. But even a child would recognise that they were merely policemen in mufti.

The detective whose appearance advertises his profession is not quite so fortunate in shadowing criminals as his less noticeable colleague. I can

illustrate this by what I know of the records of several men in a certain detective force. Some of the sleuths are ordinary-looking men. One of them has the stooped shoulders of a student, and there is a dreamy, abstracted look in his eyes. Nobody would suspect that he has tracked more criminals than any other man in the force. A colleague of his, a corpulent, red-faced, jolly-looking, prosperous man, who looks as if his sole interest in life consists in having a good time, has also a great record as a successful detective. Another detective is a slim, clean-shaven, delicate man with iron-gray hair and the appearance of finding it difficult to make ends meet. He looks like an insurance agent with a very small book. Yet this man has succeeded in bringing off several sensational coups.

A Government department which employs a number of its officials on work of a detective character states that it prefers the members of this Special Inquiry Branch of the service to be not more than 5 feet 8 inches in height and about thirty years of age. They must not have any marked physical characteristics. In other words, they must look like the average man in the street. But this appearance of being ordinary must be mere camouflage. They must be keen, active, quick-witted, and possess plenty of initiative.

A detective, who has now retired, owed much of his success to his genius for make-up. He was a veritable Sherlock Holmes in this respect. He had also some ability as an actor, and to this fact many unsuspecting criminals owed their capture. He could carry off the part of a tramp or a dock labourer with the same ease as the more difficult parts of a Burlington Bert

or a moneyed young aristocrat with very little sense.

However, one of the best disguises of which I have ever heard was adopted by an eminent sleuth who was shadowing a notorious criminal. This man was afraid of nobody but the sleuth referred to. The latter knew this, and he also knew that his quarry would be expecting him in all sorts of disguises. He, therefore, conceived the bold idea of dressing up as an ordinary policeman. The criminal did not suspect the 'slop' until it was too late.

I know a detective who was detailed to watch the movements of a number of criminals suspected of frequenting a house in a certain busy thoroughfare. He hit upon the bold plan of watching the house as a blind man. For several days he frequented the street wearing a placard on his breast bearing the words 'Blind from Birth.' He sold matches and bootlaces, and some days he received over a pound from charitable passers-by. Several charming young ladies

took his arm and piloted him across dangerous thoroughfares. Moreover, to make his disguise more realistic, the police kept moving him on whenever they saw him. In the course of a week he had collected £5, which he afterwards disbursed in charity, and sufficient information to justify a successful raid on the headquarters of a dangerous conspiracy.

The personnel of a detective force should consist of as many men of different physical and mental types as possible. There should be no bar against a man because he is small. The men with the keenest and most analytical brains are usually small men from a physical point of view. The criminal never suspects that the small man has a warrant or a revolver or a pair of handcuffs in his pocket. He invariably suspects the big, powerful-looking fellow. Moreover, the pay and prospects in the detective branches of our police forces should be big enough to attract the brainiest men in the country.

KEEPING TRYST.

By D. E. STEVENSON, Author of *Peter West*.

I

EVERY evening at sunset, before she shut up her little shop for the night, Mistress Maclagan climbed the hill at the back of Port Andrew, and placing one hand above her tired eyes, gazed out westward over the sea.

Sometimes the sea was stormy, and great heaving billows, capped with white, stretched away to the horizon where the sky merged grayly with the deeper-toned water. Sometimes it was calm and peaceful, and soft fleecy clouds, edged with red, floated in the still heavens. But Mistress Maclagan was no artist; she had lived too hard and too practical a life—one too monotonous in its daily and sordid details—for any artistry to have survived in her. Nor did she come to see the fishing-boats floating into the little harbour with lowered sails or tacking adventurously homewards against the steady land wind. These things were nothing to her; she saw them with her outward eyes only; they did not penetrate to bring comfort to her soul.

The path up the hill was steep and slippery—stony in places—and to Mistress Maclagan it seemed to get steeper and stonier as the years went by. Nevertheless she persisted in her evening climb; wet or fine, summer or winter, she watched the sun set from the slight shelter of three gnarled fir-trees, and then made her way home in the gathering gloom.

All these years of loneliness had not accustomed her to being alone, to walking alone through the haunted dusk. Dark monstrous

shapes watched her hurry home from the shelter of round boulders or plucked at her gown from behind gorse bushes. Little hands caught at her ankles as she tripped over the loose stones, and eerie shadows lurked beneath the high wall of Mr Peddie's garden, ready to spring out at her.

Sometimes imagination ran riot, and the little woman would pick up her skirts and run, never stopping till she found herself safe and sound in her cosy shop. Here the neatly labelled boxes of silks and cottons, pins and needles, and various other useful commodities peculiar to a haberdasher's establishment would soothe her to a more reasonable frame of mind.

It may well be asked why the widow persisted in her expedition, when it not only afforded her little artistic satisfaction, but caused her such acutely uncomfortable sensations. It was, in her neighbours' eyes, a 'daft-like reason.' The habit, however, was by now so ancient that the village folk had come to accept it without remembering its origin, as is often the way with old-established things. If there happened to be neighbours with her at tea or supper when the hour for her mysterious climb arrived, she would excuse herself with a little ceremonious bow—for she was an old-fashioned person.

'Awa' wi' ye,' they would say genially, with nods and smiles of encouragement and comprehension. 'Awa' wi' ye—we'll hae a bit crack till ye come back.'

But when she had gone they would shake their heads over her with morbid relish.

'She wears ill!'

'Aye, she luiks mair nor her years.'

'A bittie daft, ye ken.'

Well, well, we're all a 'bittie daft' if it comes to that. Don't we all dream dreams and see visions? Don't we all climb a hill at sunset to see the dear face of a loved one out beyond the evening mists which veil the sea? That's not daftness, Mr Worldly Wiseman; no, the daftness lies not in the visions, but in letting the world guess at them—not in dreaming, but in being caught in the act.

II.

One cold evening in November—the wind was blowing icily from the sea, whistling through the keyholes of Port Andrew, and moaning in the lums—Dr Dingwall passed the Fir-tree Brae just at sunset and saw there a slight figure shivering in the wind. Now the good man considered it his duty to keep the folk of Port Andrew in health, just as much as to attend to them in sickness—in fact he treated his patients like a pack of children, to be humoured or scolded as occasion demanded—so he stopped to pass the time of day with Mistress Maclagan, and incidentally advised her to go home and take a hot drink.

'This is no' a nicht for ye tae be out,' he told her kindly.

'But I come here ilka nicht,' she replied, looking at him with dazed eyes.

'An' what d'ye see?' he questioned, looking round and half-shuddering at the desolate bleakness of the scene.

Mistress Maclagan did not answer. Her brain felt numb—too numb to tackle the task of explaining to the doctor. She turned to stumble home through the haunted shadows that beset her path, and Dr Dingwall took her arm, because, to his practised eye, this was a sick woman, if ever there was one. So for one night the little widow arrived at her door without having run the last fifty yards, for the leering shapes fled at the sound of the doctor's firm footsteps.

'You'll go tae your bed,' he told her firmly, as he pressed her into a chair. 'I'll be sending in the nurse tae give ye a hand, and there's tae be no more gallivanting up yon hill.'

Mistress Maclagan raised her eyes to the doctor's with the look of a trapped animal. They were blue eyes, faded now to a dullish gray, and her smooth cheeks had grown thin and pale, save for a patch of high colour below each cheek-bone.

III.

All that night and the next day the sick woman lay in her bed, tossing and turning and murmuring with fever. She was back in her youth, living in a big industrial town near a factory where her husband worked. Big

John—how good he was to her; he was always buying her little presents as surprises, and he could afford it, for he got good wages at the works, and was a trusted man at his job. She fancied herself watching for him at the window, with her baby in her arms. The bright splash of sunlight which fell in the narrow street tired her eyes; she hid them in her baby's neck. It was such a soft neck, and smelt sweetly of nuts—the scent of the warm firm flesh came back to her after all these years. Little Will—little Will with his father's fair thick hair and her own sea-blue eyes—'A bit of us,' his father called him. Little Will, who was their pride and joy.

The scene changed, and in her fevered imagination Mistress Maclagan re-lived the darkest time in her life. John's brief illness and death, which left her at once husbandless, homeless, and penniless, with little Will dependent on her. Once more she stood in the tiny house where she had been so happy, taking leave of all the dear things that had made her home. The little table they had bought together—she and John—the dresser with its shining array of china. Oh God, it had been hard, hard! She turned and moaned with her face in the pillow, and the nurse bent over her with soothing hands which raised her for a few moments out of the dark abyss of the past. The room swayed and trembled as she drank some medicine obediently, and then she sank back, and the waves rolled over her once more. . . .

She was in the house of her husband's people, a mere drudge, a thing of no account, with only little Will to save her from utter shipwreck. For his sake she had stood it all for three years—the endless labour, thankless and futile, the ignominy of being dependent on people who did not care for her. But at length she had broken loose, and, taking her boy, her one treasure saved out of the wreck of her young short married life, she fled to Port Andrew and started the tiny shop with money borrowed from her husband's former employer.

How good he had been to her, how understanding of her need! She did not want sympathy or charity, but just to be trusted. The money was lent 'as from one man to another.' It was to be paid back by yearly instalments. That and his smile as he shook hands with her had set her on her feet, bracing her for her struggle against the world.

Once more the scene changed, and Mistress Maclagan saw herself in her new home, full of the peaceful happiness which comes after much suffering, Will growing up sturdily to school-age, a small edition of his handsome father. It was, indeed, peace after storm, and the haven sufficed the world-weary woman; but it did not, could not, satisfy the untried spirit of her son. Will, grown to man's estate, found the village

too small to hold his wide ideas of youth and freedom. She saw it coming for long, watched the wander-fever grow to maturity like a magic beanstalk which was to lead him into the unknown.

So Will ventured forth into the world to make his fortune. He told himself that it was for his mother's sake; she should spend her old age in comfort, with silk dresses and servants to wait upon her, and she, poor soul, only wanted Will, and wincey dresses, and porridge, and hard work.

Ah me, those wide ideas of youth! What cruel geni! scatter the seeds? How they must laugh to see the pain they cause, the wild hopes brought to naught, and the promising lives wrecked.

Mistress Maclagan was left behind, to gaze westward with blurred eyes, to sink down slowly but surely under the burden of lonely terrors, left to grope in the darkness for a loved hand that was lost for ever in the immense unfriendly world.

Gradually, as the years went by, Mistress Maclagan, in her fond dreams, saw her boy as he had been in boyhood, when he was all hers, and before any visions of the great world had come to disturb their peace. She saw him as a merry lad with curly fair hair and a pair of patched knickers—patched until little of the original stuff remained. What a laddie he was! Not bad, mind you, but wild and mischievous as a Shetland pony. Oh, Will, Will! . . .

IV.

She sank at last into a stupor of weariness, seeing in her fevered dreams the great world go round with its myriads of strange faces, and herself searching amongst them for her boy. Would she know him again after more than ten years? That worried her, and she roused herself to ask the nurse, who was sitting by her, 'Will I know him?'

'Yes, yes, of course you will,' soothed the nurse.

Sleep came then, and the nurse left her to visit some other patients, left her sleeping peacefully, and returned an hour later, to find the bed empty and her patient fled.

The doctor found her at her usual post on the hill, and carried her home. Nobody knew how she had managed to drag herself there, for she could scarcely stand on her feet. Only sheer determination had prevailed over the weakness of the flesh.

The doctor's heart failed him as he laid her down gently on her bed and covered her with the patchwork quilt. There was something in her which was wearing her and driving her, so that the soul of her shone through the etherealised body with an almost unearthly radiance.

'It's that son,' he told the nurse, who had

come but recently to the village. 'She's just wearying away.'

He determined to be with his patient at sunset on the following day, and so prevent her from attempting her usual climb. That she would attempt it he was sure. He gave a few simple directions to the nurse, and went home wearily enough to his belated dinner.

Half an hour before sunset on the following day Dr Dingwall knocked at the door of the little shop, and found his patient in a deep sleep. He sat down and watched her for a few minutes, marking the uneven breathing and troubled aspect. There was little he could do for her; she was worn out with waiting and watching; he suspected that for some little time she had had insufficient food. Gad, why was life always harder on a woman? It made one boil! Would she wake, he wondered. Was the magnetism which drew her each night to the deserted hill-top sufficiently strong to rouse the spirit from the exhausted body?

The thought had scarcely formed in the doctor's brain when Mistress Maclagan awoke and tried to sit up.

'I mus' gang out for a breath o' air,' she whispered huskily—it was her usual formula.

'You're too tired the nicht,' he told her gently, and pressed her back on to the pillows.

For a few moments she lay there quietly with closed eyes, and two bright tears gleamed on the dark lashes, whose beauty time and sorrow had failed to destroy. 'You'll be better to-morrow,' he added mendaciously, for he could never bear to see a woman cry, and there was something about those silent tears which wrung his heart.

'I've never missed a nicht yet.'

Silence fell in the little room, a silence that could be felt. Only the ticking of the clock could be heard, and in the corners the dusk gathered as the sun set redly over the hill and tinged the white waves with palest pink.

The sick woman began to murmur softly, and in the gathering gloom her husky voice took on an added significance. It was like the voicing of all the sorrows of the world rather than the lament of one neglected woman.

'Oh, Will! I've watched for ye ilka nicht these ten years—it's a long time to wait, laddie, a long time—I canna watch for ye ony mair. There'll be nae mither waitin' on ye, laddie, dear; ye've left it ower late comin' hame.'

She was quiet then for a little, and then suddenly she cried aloud, 'Oh, Will, I'm comin'; laddie, they'll no' can stay me.'

The doctor leaned over in sudden anxiety and called for a light, but even before they brought it he knew that she had spoken truly—the brave spirit which dwelt within her frail body had indeed gone to Keep Tryst.

Chambers's Journal

SEVENTH SERIES

CHALK STREAM AND MOORLAND BECK—A CONTRAST.

By ROWLAND BURGESS.

I.

FED by perennial springs that rise in the chalk hills far away across the wide valley, the placid river flows deep and clear, winding through marshy water-meadows that are brilliant with the living gold of kingcups and the flaunting banners of the yellow iris.

The water-level changes but little, winter or summer. Sudden spates are unknown, and the water remains calm and unclouded through weather that would bring down a roaring chocolate flood in wilder streams.

Here the river is tamed and harnessed. Weirs and sluice-gates regulate the flow, the surplus water finding its way to a smaller stream flowing at a lower level, through carriers and ditches innumerable; the meadows between are full of pitfalls for the unwary when the grass is high.

Coarse fish of all kinds flourish in the weedy depths, pike among them. Against the pike relentless war is waged, regardless of season, yet some escape the nets. There was one in the mill-pool that, to the eye of the miller's boy, a youth of fourteen, appeared to be 'as big as I be.' I hooked him once! It was a catastrophic incident, not to be dwelt upon.

Trout, the fish *par excellence* of the river, are less plentiful than they used to be in the good old times when tar was used for its legitimate purpose of rendering buildings waterproof. Nowadays one is fortunate if at the end of the day the creel contains a brace of two-pound trout.

Still, even yet, in may-fly time, there is the chance of a seven-pounder. I may as well confess at once that I have never caught one. Indeed, prior to my introduction to the chalk streams, I had a hazy sort of idea that brown trout of this weight occurred only in glass cases, as mural decorations.

I came to know one well; his name was Jonathan, and he lived below a foot-bridge, alongside some camp-shedding, where the water was ten feet deep—lives there yet, for all I know. Twice daily during may-fly time, at 11 A.M. and 7 P.M., he left his stronghold and moved up a few yards to the safe harbour of a willow that trailed its branches in the water, and with

NO. 715.—VOL. XIV.

quiet dignity absorbed a few selected may-flies, presumably as dessert after an aldermanic meal of minnows.

II.

My red-letter day occurred toward the end of the hatch, when the fish were becoming picky. A week earlier trout had taken may-fly of any sort readily, provided always that it was the genuine article, and not a spurious imitation. Now they discriminated. One fish would look only at young and tender virgins, newly hatched, with their dainty wings unfolding; another preferred the elderly matrons, who, worn out with their three days of strenuous life, floated quiescent with outspread wings to their fate; others, again, would have none of either, but picked out the few spent males (darker in colour than the females) that happened to be above the water when the paralysis of age came upon them. The males at the end of their short lives do not, like the females, seek a watery grave, but collect in swarms over the meadows for their dance of death; rising and falling in the air in perpendicular lines as long as the sun shines upon them, falling ever lower until they reach the grass, to rise no more.

The day was perfect, soft and warm, with a whisper of wind from the south to break the surface of the smoothly-flowing water. The transparent sheen of pale green leaves upon the trees, not yet sufficiently dense to mask the tracery of their branches, gleamed and quivered in the bursts of sunlight breaking through a light drift of cloud. The new growth of willow-herb upon the margin of the river was not high enough to interfere with casting, yet afforded some measure of camouflage to the kneeling angler. Swifts were weaving back and forth, dipping to the surface to snap up the may-flies that came sailing down like a fleet of fairy yachts. Conditions all seemed favourable, yet not a trout was rising, either on the shallows where the water rippled swiftly over clean, sharp gravel, or from the depths, where banks of trailing weed swayed in the slow-moving stream.

Three barren hours I passed, slowly pacing the bank, or seated in hiding below the haunt of a warrantable trout, scanning the water ahead through field-glasses for a distant rise.

[All Rights Reserved.]

AUGUST 9, 1924.

Dace there were in plenty, and occasionally a monstrous chub quietly cruising in the shadow of the bushes would raise my hopes, until I got a clear view of the markings of his big scales as he turned.

Presently, amid the splashing rises of a shoal of dace in mid-stream, an oily ring broke the water. It was no place for a self-respecting trout, but, as I watched, he came up again—certainly not a dace. Worth trying, at all events.

Twice my fly floated over the spot with no result, but at the third cast there was a queer sloshing rise. The line tightened, and for the space of a heart-throb I thought I was into a big one; his play was erratic and sidelong, and he proved to be a small fish, a little over a pound, foul-hooked near the ventral fin. The fly had displeased him, and evidently he had tried to drown it with a slash of his tail. We were fishing a self-imposed limit of two pounds during may-fly time, so he was returned to the water.

One more undersized fish fell to my rod before the light clouds of the morning had all cleared away, and the noontide sun-glare on the water had put down all the trout. Spearing my rod upright, with a few yards of line streaming in the wind to dry the fly, I lay down to rest and dream in the shade of a sycamore that grew upon the bank.

While I was watching the antics of a pair of dabchicks—the only things moving on the river—suddenly my reel squealed; looking round hastily, I saw a bird gyrating wildly in the air above my rod! A swift had taken my fly as it flickered in the breeze, adding another item to my list of strange captures, which included a water-rat, a cow, and a boy—foul-hooked in the left ear. (It was his own fault; he *would* stand behind me, in spite of repeated warnings.)

Considering the speed and strength of the swift's flight, it was surprising how little resistance the bird offered. A slight twitch of the line, and it came to earth in a wide spiral, crouching in the grass with outspread wings, dazed and motionless, allowing me to pick it up without a struggle, but digging sharp claws deep into my flesh. The hook was held only by the neck feathers, and I had the satisfaction of seeing the bird fly off, when tossed into the air, as though nothing had happened.

Rounding the next bend, which brought me within sight of our fishing-hut, where the luncheon-basket awaited our pleasure, I came full upon a wild duck paddling slowly up-stream, followed by a string of fluffy babes. The instant I was seen the chicks scurried to the bank, and hid themselves in the rushes. Their mother, instead of following them, splashed and floundered on, squawking and trailing one wing in the water as though it were broken, keeping with apparent difficulty just ahead of me until

I reached and entered the hut, when she rose from the water and flew like an arrow back to her brood, congratulating herself, no doubt, on having misled me. Here my friend, who had been fishing the upper beat, joined me for lunch. He reported no fish moving, but his creel contained a glorious three-pounder, which he had spotted rising in the white water of the mill-tail.

III.

There was no likelihood of fish until the evening, so during the afternoon we strolled leisurely down to the lower end of the water, a distance of three miles, where the small stream came in. Here we separated again, he to fish the main river, while I turned my attention to the tributary.

This stream was chiefly of value to us as a spawning ground for the trout, but each year just a few of the best fish, their domestic duties over, elected to remain there, as the weeds, which if left uncut would cover the water with a white flowering mass, were crawling with shrimp and tiny water-snails, and there were myriads of minnows.

The white glare of the sun had given place to a tender mellow light when I resumed my sport. It was one of those calm, cloudless evenings of early summer when the very air seems luminous, giving to meadow and woodland a clear and soft gradation of colour seen at no other time, and to the lengthening shadows, transparency.

Here and there small fish rose at the spent gnat, which was beginning to fall on the water, but to cast at them were folly indeed. The stream was only about six yards wide, the shallow water flowing on a level with the meadow; to show oneself near the haunt of a big trout before his feeding-time meant putting him down for the night.

Cover for the angler there was none, save at one place where a screen of hawthorn bushes masked the stream on each side with branches interlacing over the water, forming a dusky tunnel where a mighty trout cruised slowly up and down at such times as he deemed the supply of surface food to be worth the expenditure of energy. There was but one opening in the bushes, a gap barely four feet wide, with thorny trouble waiting on either hand if the cast were not straight and true.

I took up a strategic position, lying prone upon the bank with my rod at hand, to await his pleasure. The fly was coming down thicker every minute, and it would not be long before he began his patrol.

Soon I heard a faint 'plop' somewhere down the tunnel, the outer edge of a widening ring appeared, and I essayed the crucial cast—there would be no second chance.

The fates were kind, and allowed my fly to miss the bushes and to fall in mid-stream at the critical moment, just as a dim gray shape came

sailing up out of the shadows. He took the fly in a quiet and dignified manner, but lost his dignity a moment later. With a sweep of his broad tail, and a plunge that set the water rocking, he turned and tore off down stream, whither I could not follow. For a moment the reel sang, then the line stopped dead with a heavy strain upon it, fouled in some hideous snag that he knew of and I did not. It was the end. For a minute I could feel him, then all was over. Peace reigned upon the water, and profanity upon the bank.

The next fish saw me first, and all that I saw of him was a wave of water travelling swiftly up-stream from a spot twenty yards below where I expected him to rise. The big fish here are cruisers all; the hatch of fly is not so strong as on the river, and there are no long, deep runs beneath the banks where a trout may lie and have his meal brought to him by the current.

About a quarter of a mile higher up a cart-road crossed the stream, carried upon a low brick arch. There was no wall on either side of the bridge, which was, indeed, little more than a culvert. If one lay flat upon one's stomach, and peered cautiously over the edge, one might chance to see the tail and hinder-end of a grand trout that lived beneath. Many times I had seen this much of him, but never his full length, nor had I ever found him feeding; perhaps this evening—

Yes! A long-range reconnaissance through my glasses revealed a rise under the bridge; then another in the shallow pool below it, where the cattle had trodden out a drinking-place. A few seconds later he was up again, a dozen yards lower down the stream among the weeds. Crouching, creeping, and grovelling, I got within thirty yards of the bridge, and then lay still; I dared approach no nearer until I knew the extent of his beat. There was no sign of him at the moment; probably he was working the other side of the bridge.

Soon he returned, rising leisurely on his downward journey. There was no need for him to hurry over his meal; he was sucking in the spent fly that were too feeble to rise from the water, and no small fish durst trespass upon his preserve.

Nearer and nearer he came, but I might not venture to move hand or rod while he was coming towards me. Then a rise not three yards from where I lay gave me a clear view of his noble proportions. He turned when abreast of me, and when he rose again some ten yards above me I cast from my recumbent position as well as I was able. It was a feeble effort, but a lucky one; he took the fly without hesitation, and the fight was on. He made for the bridge, but I managed to stop him in time.

Leaping, he turned and raged down past me before I could recover line, and plunged into the middle of a thick weed-bed. Orthodox

methods of persuading him out of it were of no avail, and there was only one thing for it. I was not equipped for wading—it was not done—but what mattered wet feet in June?—the water was but knee-deep. At my approach he dashed out, carrying with him a bunch of torn weed attached to the line, and went like a torpedo into the next clump.

For ten minutes it was a chase from one weed-bank to another, but the cast held out, and at last in a patch of clear water he turned on his side, and I got the net under him.

A glorious fish, in panoply of bronze and silver, mighty of girth, and small of head. Six pounds? Well, no, not quite. Call it five, for safety. I had no balance with me, so was unable to register his live weight, but on the kitchen scales, three hours later, he, or rather she, tipped the beam at four pounds fourteen ounces.

My friend came in with a brace that together rather outweighed my solitary kill, but I was satisfied—nay, more than satisfied—and this, my record trout, enshrined in glass and gold, now adorns the wall of my study.

IV.

A blustering wind from the Atlantic, bearing upon it the aromatic perfume of sun-warmed gorse blossom, sweeps down the valley. Fitful sunshine and misty rain in turn bathe the steep coombs of Exmoor, whereon the russet brown of last year's bracken is stippled with the tender green of new unfurling fronds. The wine-coloured water, clearing after last week's flood, chafes white against the boulders that cumber the stony bed of the stream, breaking into a smother of foam as it cascades over low rock ledges into deep, quiet pools where clots of froth revolve slowly in the eddies, to rest awhile ere it goes churning down over the stickles below.

The flood has left its traces. Grass laid flat, as though a comb had been passed over it; drift-wood upon the bank, and tufts of river-wrack upon the lower branches of the alders that overhang the stream.

Through stockings and waders the water strikes cold at first as I splash up through the stickle toward the deeper water, casting in front of me as I go. Although the rushing stream is here but ankle deep from bank to bank, a good trout may lie behind any stone.

The fly, a long hackled 'blue upright,' floats bravely, dancing down over the ripples. A glint of silver, a twitch of the rod, and the line tightens. A six-inch fish is lifted from the water without ceremony, tenderly unhooked, and returned; our limit is seven inches.

A few fish are rising on the sill of the pool, where the deepening water runs smoothly in stream-lines over the gravel. They are better left alone; the fly is sure to drag in such a place, and small scared fish will carry the

warning to their betters in the deep run under the bank.

Edging into the bank, pushing beneath branches and tearing away from brambles, I get well up into the pool without disturbing them. No fish appear to be rising here, but one need not wait for that. A short horizontal cast under the bushes brings a fish splashing up, to refuse the fly at the last possible moment.

Try a few yards higher up, by the root of the oak tree. Got him! Over ten inches, and full six ounces in weight—a good fish. Now the edge of the fast water in the centre, where it comes pouring down between the rocks. Difficult to see the fly among the foam-flecks. Was that rise at my fly? Try him again. No mistake this time! A plump quarter-pounder is dipped out in the small landing-net, killed, and dropped into the basket. It is well to use the net for all but the very small fish; 5 × gut, and the slender tip of a 'fairy' rod are neither of them adapted for weight lifting.

Comes next a chain of turbulent rapids and small swirling pools, the bed-rock channel carved and broken into deep narrow gullies, pot-holes, and sharp ledges by the grinding torrent of flood-time. The water surges angrily round my waders as I slip and stumble over the rocks, threatening every moment to sweep me off my feet, although it is less than knee-deep. Unless one knows the river well, this part is unfishable; at any moment an unwary step may plunge the fisherman into four feet of tearing water.

A veil of mist upon the craggy heights, and a rainbow spanning the narrow valley, herald a passing shower which lashes and stings my face as I struggle on, casting into each rock basin and channel as I go. Three small trout are added to the basket. A big one, full half-a-pound, hooked in rough water, goes dashing over a fall and is lost. No matter; the day is young and the fish are bold.

At the head of the rapids lies the 'holly tree pool,' amber brown and clear, embowered in trees, unapproachable except from the water. If one wades up carefully, keeping close in against the bushes, and, by casting low, can manage to send the fly far enough up under the prickly canopy of dark green leaves, a good fish is almost a certainty. One only, as although the small pool, some four yards wide, shelving to four feet deep beneath the tree, is always full of fish, all the others will have scurried to cover by the time the first is landed.

The luck holds. From behind a submerged root a fish darts out and seizes the fly as it floats slowly past. There is a commotion in the pool as he flashes and turns. I grope with my left hand for the net, but it has gone from my belt! Looking wildly round, I see it hanging in a thorn bush a hundred yards below; it might be a hundred miles away, for all the use it is to me now. In these waters, however, the net is more

of a convenience than a necessity. Playing the fish out, I strand him on the shelving bank, and lift him ashore. A beauty! The first authentic half-pounder of the season.

V.

The steep hills, thickly wooded upon their lower slopes, crowd in ever closer until the valley narrows to a rocky gorge streaming with water from the hill springs, the river pouring headlong through in a series of falls and rapids.

As I climb out on to the bank for lunch, rabbits scatter in all directions. A startled stag, with head thrown back, goes bounding up the hillside, followed by his retinue of hinds, and stands for a moment at gaze upon the skyline. A buzzard is wheeling high above the tree-tops, and a hawk, hanging motionless in mid-air above the bracken, drops like a stone to earth, then rising, circles slowly round, and again hovers on the wings of the wind.

Birds in these solitudes have little fear of man. A robin, chattering at my elbow, shares my lunch, accepting eagerly such small offerings as I throw to him, attacking fiercely with voice and beak any other bird that comes to share the feast.

My sandwiches finished, and my line, which has been strung out on the bushes to dry in the wind, greased and wound on to the reel, I essay the passage of the gorge. It is rough going, but not too difficult; there is a kind of rugged broken path among the trees where wading is impossible.

Above the gorge the hills fall away, and the moor becomes more wild and open. Trees are left behind, save for a few stunted wind-blown thorns scattered singly upon the rounded slopes that stretch away, fold upon fold, to Dunkery Beacon, the highest point of all. The stream, laid bare to the sky, flows through a barren land that knows no man-made boundary.

It is smaller here, and the fish are wild and shy, yet they rise freely enough if not scared by the sight of the fisherman, or the gleam of a waving rod. Far more are returned to the river than go into the basket. I have caught enough small trout, and only exceptional fish are retained.

It is time to return, yet I still fish on; there is always a better pool ahead.

At last, four miles from home, with the sun low in the west, I break away from the water, and with a heavy basket and a light heart take a short cut across the moor that leads back to mankind.

Which is the better? The slow stalk by the quiet chalk stream, with its long hours of hope deferred, and its few minutes of glorious life, or the strenuous day upon the moorland stream, with the rod never idle, and the fish never large?

For the life of me, I cannot decide!

'DON QUIXOTE' AND THE ORPHANS.

CHAPTER II.—AT SANTA ELENA.

I.

WITH the boy Hugo astride a small mule, and baby Adelaide safely stowed in a disused packing-case slung on another, which also carried the Indian girl Felipa, who had volunteered to go in place of old Catarina, too feeble for such a journey, the party set out for Santa Elena, as arranged.

Juan, who had suddenly discovered that he knew the road to the Bluff perfectly well, rode ahead with a Winchester rifle slung across his back, an example followed, as regards rifles, by the mining engineers on the emphatic advice of the *Juez*, whose name they had ascertained was Don Salazar Romero.

Reaching the coast in a few hours, they turned eastward into a roadless and almost trackless uninhabited country, keeping to the *playas*, or little beaches, wherever possible, and camping, within a few feet of the surging waves, upon one of them at sundown, to the boy Hugo's great delight.

Next evening they arrived at a great promontory rising some hundreds of feet above the ocean. This, Juan of the Spurs declared, was Santa Elena, and gaining the top by a narrow, winding track made by wild cattle, they camped upon it in the dark. It was a bleak, eerie kind of place, crawled over by hordes of pugnacious land-crabs, illuminated fitfully by myriads of fire-flies as large as morpho butterflies and as erratic in their flight. Brooke and Marshall, old campaigners, pitched the tent, whilst Juan lit a fire and looked after the animals, very uneasy owing to want of water, and, as he said, to the presence of prowling *tigres*.

The children were soon asleep, and, having eaten, the mining experts sat smoking at the fire, where, assisted by Felipa, the guide was cooking some of the smaller land-crabs for his own delectation. While thus engaged a voice suddenly hailed them out of the night.

'*Buenas tardes, señores!*' it said. 'I've a fancy to come and sit by your fire, if you have no objection.'

The tone was impertinent, but Brooke gave the desired sanction, and the new-comer stepped into the light—a wild-looking fellow, with ragged beard and hair, and of generally unkempt appearance, but armed with rifle, revolver, and *machete*. At sight of him Felipa disappeared into the tent without a word.

'You're welcome to our fire, and to food if you want it,' Brooke went on. 'Perhaps you can tell us where to get water for our animals?'

'The nearest is a league away,' said the man

gruffly, as he sat down with his rifle between his knees. 'It's a drinking-place for wild cattle,' he added, 'and very dangerous at night. Always after sunset *tigres* lie in wait there. There's no water near this hill.'

'If that's so, it isn't a very desirable camping-place,' said Marshall. And observing that the fellow was eyeing covetously a bottle of whisky which stood unopened on a packing-case, he drew the cork, poured some of the spirit into a glass, and proffered it.

'*Bueno!*' cried the man, swallowing the whisky at a gulp and smacking his lips. 'No, señor,' he replied; 'it's the very worst camping-place in Oaxaca, for several reasons. One is that the chief objects to *injustos ocupantes* (squatters). You are trespassing on his land at this moment, and I would strongly advise you to continue your journey at sunrise, and earlier if you've got a pair of owl's eyes amongst you. It will be a lot safer.' And the fellow laughed hoarsely at his own pleasantry.

'I wasn't aware the Bluff—Santa Elena, I think you call it?—had an owner,' Brooke remarked.

'Don Pablo owns whatever he fancies,' the fellow chuckled, 'and people don't tumble over each other to say him nay. He takes what he wants and keeps what he gets. So do his *hombres*. He has taken a fancy to this hill. That's why it isn't a good camping-place for travellers. But that is excellent *aguardiente* you have, señor—or is it *mescal*?'

'I thank you for the warning,' rejoined Brooke, not in the least surprised to learn that the 'chief' owned the name of Pablo. 'If you are hungry, eat.' He indicated bread and dried meat on the packing-case. 'If still thirsty, drink again.'

At once Marshall took the hint, and measuring the quantity by the greed in the fellow's eyes, he poured a good four fingers into his glass. Had it been *aguardiente*, *mescal*, or *tequila* of the strongest, it probably would not have had much effect, but the Scottish brew was of a new and pleasing flavour, and as the fellow had no scruples about asking for more, his tongue was speedily loosened.

The chief was called Don Pablo Revuelto, '*un hombre muy grande, muy valiente*' (a very great man and very brave), he told them disjointedly, and he set such extraordinary value on the Bluff that he had ordered the speaker, José Guerrero, *capitán* in his illustrious service, to watch it day and night. He, Guerrero, had seen the fire from a distance, and had almost killed his horse in his haste to warn the intruders off.

However, as the new sort of *mescal* was so exceedingly good, and as his dear *amigos* had been so generous with it, he would disobey orders and permit them to stay till morning. Having thus expressed his great consideration for weary travellers with a small supply of whisky, he presently staggered away into the night. They heard him galloping off at a furious pace—evidence of great familiarity with the neighbourhood, or he would not have dared to ride at such speed, drunk or sober.

The moment he had gone Felipa returned. 'That man is Don Pablo's friend,' she said. 'He is a *bandido* and a brute, one of the worst—the second chief amongst them.'

'Then we are in for trouble,' said Brooke. Marshall nodded, and his rat-trap jaws set firmly.

II.

At daybreak Juan of the Spurs took the thirsty animals in search of water, found in plenty in a near-by creek, while the mining experts set out to 'prospect' the Bluff, a steep, triangular slope of some thousand acres, the apex being the highest point. Many outcrops of mineral were visible, but they first sought for evidence of the demarcation.

Within a hundred yards of the camp the first boundary pillar was discovered, strongly constructed of stones from the hill and cement. At each angle of the claims a pillar had been erected, and once one of them had been found, the locating of the others was a simple matter.

'Mr Lestrangle may not have been a mining man,' Brooke remarked thoughtfully, 'but he didn't do things by halves, and somebody certainly had a theodolite.'

The next task was to find the mine, or 'prospect,' and they set to work examining the outcrops within the discovered boundaries. This was not difficult for their trained eyes. The small excavation which Lestrangle had made had been filled in, and the surface planted with bushes. But fragments of ore had been left in the scanty grass around, and thus the rich outcrop was betrayed. Thither they at once removed the camp.

This done, they set to work to trace the direction of the rich vein, which was easy. Right to the top of the Bluff they followed it, and with Marshall holding the end of a rope which he had twisted round a small tree, Brooke descended the ragged face of the cliff, overlooking the Pacific Ocean. In a score of places similar veins showed where broken off in the great cataclysm which had split the hill in halves and toppled a part of it into the waves. Then he climbed back, sat down, and lit his pipe.

'Well, my adventurous, neck-risking Don Quixote,' said Marshall, when he had gathered up the rope. 'What do you make of it?'

'It's no windmill, Jerry. It's huge. It's fabulous. It's millions. I doubt if in the whole wonderful history of silver mines in Mexico you'll find anything to compare with this. I can see a pier out yonder'—he pointed over the thundering surf to the seemingly still water beyond—'and a score of freighters—argosies—taking away ore to the smelters. Coming and going—coming and going—day and night.'

Marshall laughed at his colleague's enthusiasm. 'Going to cable home?' he asked.

'Ping—cr-r-r-k!' A bullet had flattened itself on a piece of rock beside them. The report of a rifle followed immediately. Juan, who had just joined them, pointed to a thicket of bull's-horn thorns a quarter of a mile off. A wisp of smoke was rising above it, and disappeared as they watched.

'I fancy little Adelaide and Hugo would be a lot safer in San Pedro Mixtepec,' said Marshall grimly.

'That's a question,' Brooke rejoined, then sprang to his feet. 'Get a move on, Juan! Our rifles are at the camp. There are boulders enough lying about for a breastwork, and we can stand a siege. I'm not going to run away to-day, or to-morrow, from this new El Dorado—or Platado, to be correct—unless I have to.'

They walked fast, but not hurriedly, down the hill to the camp, and working behind a screen of the horses and mules, built a breastwork four feet high around the tent. A council of war followed, Juan participating.

He suggested that Felipa should take a swift horse and ride to the *Juez*, who would summon the nearest force of *Rurales* (the famous Mexican police troopers). But the shot might have been fired by the brigand Guerrero, not yet sober, as a joke, and it might be well to wait and see what happened. If Don Pablo's *bandidos* were really about in force and surrounded them, so that it would be too risky for Felipa to go, then he, Juan Ramirez, who, he was proud to inform them, was the best scout in Mexico, would undertake to ride through them, or ten times as many. Of course he might, by some mischance, be shot, or captured, and it was rather a pity he hadn't married Felipa the day before yesterday, as he had intended. But *quien sabe!*

'What do you say, Marshall?' Brooke asked when the loquacious Juan had brought his harangue to an end.

'Post a sentry, of course. I'll take the first turn.' And rifle in hand, Marshall strode to a thicket, whence, himself unseen, he could command the whole of the Bluff and the edges of its bordering scrub and wood.

III.

Meanwhile Brooke, with the help of Juan, cleared away the rubbish hiding the small ex-

cavation. Below the outcrop, weathered near the surface and friable, the vein was two feet thick, and judging by the samples, amazingly rich throughout. Doubly satisfied, he filled up the hole and sat down to play with the orphans, who were having the time of their lives.

Whilst baby Adelaide prattled in lisping Spanish to Felipa, Hugo told him much. The boy had been to Paris, and had lived in San Francisco and Mexico City. His father had brought them to San Pedro, as he expected to remain there a long time. He had an uncle and aunt in England, and his mother had often written to them—home, she called it. Brooke listened and confirmed his resolves.

Herecalled his instructions and also Marshall's, so greatly in the interests of the orphans, who had been thus miraculously rescued from what seemed a certain life of ignorance and poverty. Marshall's instructions were to assay and prove the ore in bulk. That now was only a matter of form. Apparently the mineral was rich throughout. His own duties were to estimate the quantity of the pay ore and the probable life of the mine, and, if satisfied, to make a contract with the owner, organise a labour force, and prepare ore for shipment.

Of course, the contract would now have to be made with the Judge of the Orphans for the municipality of San Pedro Mixtepec, and an amusing mental picture presented itself to him of the *Escritura* which the old *Juez* would prepare—the parties being Don Salazar Romero in his capacity of, &c., of the first part, and Don Quixote de la Mancha of the second part. But his reflections were suddenly interrupted.

'Billy! Get everybody behind the *schanz*.' Marshall had learned his business in South Africa. 'The trouble seems to be coming to a head.'

At once Brooke saw the children and Felipa to the tent, and with Juan joined the look-out.

Three groups of mounted men were visible, each at a different part of the base of the triangle. Clearly their approach had been concerted. They appeared to number about fifty, most of whom dismounted and flung themselves on the ground, evidence that they had ridden far. From the party in the centre two men detached themselves and rode forward, rifles in hand.

'I think we'd also better get behind the *schanz*,' said Marshall. 'And it may save trouble if we show them we're armed and prepared for a row.'

With their weapons plain to be seen they climbed over the wall. At less than a hundred yards distance the approaching men reined up. One of them was their visitor of the previous night; the other was taller and better clad and accoutred. They could see his face clearly in

the strong light. It was exceptionally dark, that of a mestizo, and its expression was savage.

'Who are you? And what in the name of *El Diablo* are you doing there?'

The questions were yelled fiercely by the taller man. Straightway Marshall's irascible humour took fire.

'If you want to know, we're Don Quixote de la Mancha and his esquire, Sancho Panza,' he shouted back. 'Don Quixote's a knight-errant. His job's redressing wrongs, rescuing orphans, putting rogues in durance vile—in the *Carcel*, *sabe?*—and anything else quixotic that comes his way. Who the devil are you?'

The tall man turned to his companion. He appeared to be considerably puzzled. Presently he shouted again: 'I am Pablo Revuelto.' For which intimation the listeners were quite prepared. 'Two *extranjeros* I should have met at Miahuatlan left for this place a few days ago. I believe you are they. You have been watched—seen tracing the boundaries of my claims, where you are camping now. If you come from *El Compañia de Exploración de Londres*, all is well. I am the owner of the mine, and you deal with me. If not, I order you to leave at once.'

While the brigand was speaking Brooke was thinking hard. What would be the use of temporising? At the moment they held the advantage, being in possession. And as Revuelto probably knew they had brought the orphans with them, of what avail would be ostrich methods? Without turning his head he spoke to Juan of the Spurs standing close behind him. 'Listen, Juan! My horse is the fastest. Saddle him behind the tent and ride to the *Juez*. Tell him what is happening. Take the cattle-track down to the *playa*. Go by the coast, and hurry. If you keep the tent between those fellows and yourself, you may slip off unseen.' He raised his voice, addressing the brigand chief.

'We are from London. We are aware you are Pablo Revuelto, but you are not the owner of these claims. The owners are the children of Hugo Lestrage. They are safe with us. I advise you to keep away, for if you cause any trouble, we shall know how to protect ourselves and them.'

It was a declaration of war, immediately accepted. Don Pablo jerked his rifle to his shoulder and fired three shots. Two of the bullets struck close to Marshall, who had not moved.

Without a word he returned the fire—a snapshot—apparently without taking aim. Don Pablo reeled in his saddle, clutched at his shoulder, and nearly dropped his rifle. Next moment, recovering himself and shouting out a savage oath, he and his companion swung their

horses round and galloped off, riding recklessly down the hill to their fellows, an opportunity taken advantage of by Juan of the Spurs to steal away unobserved.

'I had no idea you were that kind of a shot,' said Brooke admiringly. 'I never saw anything quite so quick. You hit him hard.'

'Yes; I hit him where I wanted—in the right shoulder,' Marshall rejoined. 'He won't be able to shoot at me again without warning for some little time, unless he can fire from the left shoulder, which isn't common. And he won't give me such an easy mark again, either—if he gets over it. But we're in for a rough job, certain. I fancy they'll try to rush us at night. Felipa knows the country. Hadn't we better try to get away with the children?'

Brooke pointed to the rude track which, skirting the Bluff, led to the beach below—the way Juan had taken. All the brigands had ridden off, but one party had wheeled and was now galloping in that direction. 'Juan only got away just in time,' he said. 'They'll pick up his trail in a minute or two, and if he doesn't ride like the devil, he won't reach San Pedro. What chance would Felipa and the kiddies have?'

Clearly there was nothing to be done except to hold on and trust to luck. It was four o'clock in the afternoon. Nursing his horse, Juan of the Spurs, a splendid rider, like most Mexicans, would cover the twenty leagues in six or, allowing for darkness, eight hours. For themselves they must watch through the night. It had been an eventful day, but its surprises were not nearly over.

IV.

At six o'clock, approaching sundown, after which it would be dark almost immediately, Marshall shouted a warning. He had heard firing—single shots at regular intervals—about every five minutes. Faint at first, the sounds had quickly become louder—nearer. He did not think a Winchester was being used, but something much heavier. On the instant another shot rang out, not half a mile away.

'Shot-gun, I think—black powder, anyway,' Marshall declared.

He had scarcely spoken when they heard a straggling volley, from a much greater distance apparently. A shout from very near followed, and immediately a party emerged from the scrub in the west, the direction of San Pedro, galloping hard. At once Brooke recognised his own horse and Juan, leading the others, six in addition to the guide.

There was no sign of pursuit, and the party rode obliquely across the Bluff, as straight for the camp as was possible. Juan of the Spurs was the first to arrive. He sprang to the

ground, breathless. '*El Juez!*' he panted. '*Rurales*—and a *señorita*—and *señor* from *Inglaterra!* I met them—on the way.'

Then, with a great clatter of accoutrements and jangling of chain bridle-reins and huge silver spurs, two gray-and-silver clad troopers dashed up and sprang to the ground. The next to arrive was a Mexican, who greeted the mining experts in a mixture of Spanish and American English. '*Buenas tardes, gentlemen. I Englese Intérprete—sure! I bring Englese Mees and Meester from El Ciudad de Mexico, pronto.*'

Before the mining experts had time even to begin to guess at the meaning of Juan's and the interpreter's announcements, the old *Juez*, looking desperately tired, rode up accompanied by a youth carrying a shot-gun, and a flushed, dishevelled, but strikingly handsome girl. That these were the '*Englese Mees and Meester*' was evident, for clothes, saddles, bridles, and seats alike were English. Off came the hats of the mining experts, who were much too astonished for any other form of greeting.

'Oh, *Señor Morales*,' cried the girl rather breathlessly, springing to the ground and addressing the interpreter, 'please find out which of these gentlemen is known as *Don Quixote*.'

The question was answered by the *Juez*, who seemed to understand it perfectly. With a grin that altered the angle of every wrinkle of his gargoyle face, he pointed to Billy Brooke and panted, '*Don Quix-óte, señor-ita.*' Then, indicating Marshall, '*Señor-ita, Sancho Panza.* You will—perceive—that as yet—neither is an—*aparecido.*' He chuckled with delight.

'Oh!' she cried. 'I am so pleased to meet you and thank you—both of you. Where are poor Hugo's little ones? Poor darlings! I must see them immediately—'

She was interrupted by one of the *Rurales*. '*Pardon, señorita,*' he said, and addressed Brooke. '*We have been attacked, señor. The brigands did not come to close quarters, but they will, and if we are to beat them off, that breastwork must be raised and extended. Also the horses must be watered. There is much to do and little time.*'

Just then Marshall, who had exchanged a few words with the English youth, drew his colleague aside. '*As a miracle of speed and effectiveness, Billy,*' he said, '*your telegram to Chertsey, Surrey, England, ought to take first prize. It has Ariel and Marconi beaten to a frazzle. That boy's Rupert Lestrangle. The girl's his sister.*'

'I was wondering,' said Billy Brooke. 'It does seem a bit miraculous, but as the telegram can't possibly have been despatched, the *Juez* being here, I'm afraid we shall have to call it a singular coincidence. Let's get to work.'

SOME REMINISCENCES OF NIGERIA.

By J. M. STUART-YOUNG,

Author of *Merely a Negress*, *The Seductive Coast*, *Minor Melodies*, &c.

I.

BURUTU-ITES are boasting that their town is to be the finest in West Africa when it has been rebuilt. The last time I discussed the matter orally, it was with one of those few men who are really typical of the Niger delta, a man who has been stationed there during two decades, and who sneers at the claims of the hinterland.

'Give me the bush!' exclaims the official, with an eye to his allowances and the possibilities of economical living. But, 'Give me the coast!' cry others, with an eye to the autocracy and almost unquestioned power that centres around headquarters.

Yet both Burutu and Forcados can be very depressing. At Forcados—as at Manchester—it rains on the slightest provocation. And the swamps around Burutu are certainly neither salubrious nor invigorating. The men, necessarily, become liverish and irritable. It is imperative that they get through a heavy toll of work; but their encounters with the shipping of three or four nations, and the incessant handling of cargo, make them inclined to dispute. It would almost seem, especially when these men get a trifle 'run down,' that a quarrel is courted, and welcomed, as a relief to the feelings.

II.

I vividly remember my first voyage up the Niger from Burutu to Lokoja. That is nearly twenty years ago. Obviously there have been great improvements since then. The British Government had at that period held the reins for only a few brief seasons. The Niger Company was still 'the' company; and the agent, at each little station on the way up, was generally both postmaster, customs officer, and M.O.

Going up the Niger in those days seemed like travelling back to the prehistoric ages, so far as natural conditions were concerned. Almost as soon as the stern-wheeled paddle-steamer left Burutu we found ourselves in the wilds. Vegetation rioted on the banks. And nothing in Nature can be so depressing as mangrove swamp! After the first twenty or thirty miles the vegetation becomes more individualistic; huge trees can then be distinguished rebelling against the parasitic growths around them.

But for weary league after weary league the delta appeared then to be quite empty of human life. A great silence, impenetrable as the hush that heralds the dawn, reached on either hand into the depths of the virgin forest.

It was December, and the air was warm as wine, sluggish as syrup, heavy as an anæsthetic. The sun was so ardent that there was no pleasure to be found except right in the front of the vessel; and I remember wondering why—so different from the ocean steamers!—the natives had the best part of the decks, while the European was left to swelter in a veritable oven of congested capacity.

On the morning after leaving Burutu we reached the first clearing, on the right bank of the stream. There was then no European house. To-day it marks one of the most prosperous stations on the lower river. Then, it was merely a wooding-station. Our stay was only sufficiently long to allow the crew—Igaras and Nupis, then even as now—to take aboard the half-score cords of billets for the steamer's furnaces.

There were natives on shore—wild-looking creatures—quite naked. The children were semi-aquatic. They could swim like little frogs. They were all over and around the ship, demanding empty tins and bottles. When we moved from the shore they darted around us in small 'dugouts,' and so adept were they with their paddles that the canoes seemed a very part of themselves.

It was amusing to watch four or five of them dive for the one bottle, and afterwards struggle around the bobbing canoes, until each one marked from the others his own special property, and re-embarked.

III.

It was on a sandbank near to this village that I caught my first glimpse of saurian life. There lay a group of three crocodiles quite immobile in the sun. Their bodies overlapped in the most curious way. One would have believed that they were mere tree-trunks, until the use of the binoculars made their outlines leap upon the vision. We could then see clearly their ugly snouts and their wicked little eyes.

On the same sandbank, pluming themselves at the edge of the water, was a flock of tiny kingfishers. They ran hither and thither so rapidly over the sand, that one could have believed they were volplaning over the surface. On the other bank were a couple of saddle-billed storks, gravely fishing, and occasionally raising a meditative leg.

As our voyage continued, the tortuous passages that had belonged to the delta seemed to give way to a much broader stream, although we were not yet in the main river. Gana-Gana,

even then, was an island trading-station of importance. We anchored there for some time, and I had the pleasure of meeting men who have helped to make the history of Nigeria.

Our next stop was to be Assay. Meanwhile I had had several chats with the pilot-captain of the vessel. He told me that the channel was a mystery to all save the most experienced of natives. It was as easy to 'lose oneself' on the Niger as if one were traversing a pathless desert.

Snags abounded, but the fall of the river had left most of these exposed. Shoals were in the habit of changing every year. Nor were the banks exactly the same for two seasons in succession. I could well recognise what difficulties there would be in ascertaining the right course to follow, in the middle periods, when the water stood between high and low. The Nupi captain assured me that he had been trained to the waterways ever since he was a boy. When I asked him if he did not find the life monotonous he gave me a glance of wonder, and replied that, on the contrary, he thought the Niger a fascinating river.

IV.

It was during this initial trip, also, that I saw my first hippopotamus. I went out on the second day with two fellow-passengers into a wide creek that lay on the left bank. We were not out for sport so much as for curiosity. The 'boys' had promised that they would find hippo for us. We had the good fortune to discover three of the beasts asleep. On the mushy beach, near to a great complexity of dark-green undergrowth, they lay—male and female and baby. Despite its uncouth shape and its unwieldy bulk, I felt in the young animal all the irresistible charm of youth. I should ardently have liked to examine the young beast at closer quarters. Our safety, however, demanded an early return to the ship.

Even while we lingered on the farther bank the animals awoke. They entered the stream. I could see the two grown creatures yawning, their great mouths like red-roofed caverns, inside which gleamed whitely their tusks. The baby climbed onto its mother's back, while she swam along the bank. It was a sight both amusing and charming.

There ensued several small stations, all greatly resembling each other. Iron-roofed stores, a small bungalow, and a gang of about twenty labourers—that was all! But the accumulation of produce, demonstrated by both beach and stores, proved the perspicacity with which the trading firms had chosen their sites for future development.

We reached Onitsha on the third day. It was then only a tiny village. I remember that we went ashore to purchase fowls and eggs, but that (it not being market-day) the whole

commercial 'native community' seemed to be under a hundred. When I recall that, in the years 1908 to 1919—my own trade-period there—the market has frequently held no fewer than five thousand traders at one time, the reader will need no assurance that the Middle Niger had not yet been properly developed.

It was just above Onitsha that I saw my first egrets. On the neck of the swamp that connects the Anambra creek's right bank with the mainland flourish hundreds of these birds. We could not go ashore, but we saw several flights of them from tree to tree. The feathery acacias threw their long arms over the rank rush-grass that marks the island, and these white herons, so prized for their tail-feathers, make their perches on the branches.

V.

Between Onitsha and Idah, and between Idah and Lokoja, were innumerable sandbanks, so that our passage was often difficult. There had been a disappointing rainy season, and the water had not risen so high as was expected. We saw several more groups of crocodiles, and two more schools of hippo. Strange bird-life and weird orchid-formations on the banks met one's gaze at every new turn of the river.

It was delightful to be in wider and less congested areas. The ground was rising all the way; and as the surrounding country became more imposing, and as the flat banks merged into hills and even mountains, I found the Niger full of lure.

Butterflies there were by the thousand, gaudy and gay—scarlet and chrome, crimson and blue, black and gray and primrose. The great stillness was as insistent as ever, and made one sometimes doubt the reality of one's very existence.

I have passed up the Niger a dozen times since then. But the journey can never again have the same thrill of mystery—with that vegetation, massive, immense, running from the very edge of the water right up the bank, until it was lost among the great outstanding trees! Millions and millions of grasses and bushes and shrubs, until the immense green whole kissed the horizon, and seemed to be absorbed by the deep-blue summer sky!

And our little steamer, with its freight of four or five Europeans and about a hundred negroes, seemed to be like a restless ant, tentatively feeling its way along a runnel of water between unknown banks of emerald-green matter.

Nature, when confronted in this way, made one feel so infinitely *small*! Man, in comparison with this riotous wealth of vital energy and power, seemed impotent and as weak as a child.

I remember quoting to a fellow-passenger William Watson's poem on 'World Strangeness.' He could only give me an amazed glance

of curiosity in answer to my query whether he felt himself to be either a guest or a prisoner. He had made this journey many times before. He found the scenery depressing, and he had no use of any kind for mere romantic speculation.

What an acquisition to a nation's wealth are these great waterways! As the unknown reaches out before the bows of a steamer, and as each earlier view closes behind, who can fail to realise the meaning of Empire?

It seemed to me, on that initial journey up the Niger River, that this 'house with starry dome' was indeed only *one* tenement in God's great scheme of town-planning. It seemed indeed as though I were straying 'from room to room,' and that the Eternal Owner—Whom we had not seen, and Whom we might never see!—stayed behind for a moment to close each of the doors. But, like William Watson, whose lyrical cry of wonderment I had quoted, I could not tell whether that Owner were Host, or Guardian, or Warder!

VI.

Sometimes at night, from either bank, would come the throbbing of tom-toms. It gave a most eerie sensation to one who had never before traversed a tropical river. The sound would hover in the air, and then gradually die away. One could readily guess that a message lay behind each of the rhythmic sequences of beats, but whether a message of peace, or prayer, or warning, or resentment, one could never know.

Only twenty years ago, in territory which the old Chartered Company had already occupied for half a century, and yet it was as though the absolutely unknown lay before!

These occasional glimpses of trading-stations—corrugated-iron roofs, emaciated Europeans, sluggish natives, self-confident coloured clerks—did very little to remove the impression that we were travelling over undiscovered territory. Everything seemed so primitive, and yet so strangely old and mysterious! These were pagan populations mostly, and crowds of them would swarm to the beach to welcome us, especially if (as often happened) it was a busy trading-day on shore, and they had *trekked* many miles to the river-side station.

We would see a great swirl of naked black limbs, and the gleam of eyes that showed up white and prominent in ebon faces. Behind all would rise the interminable green vista—that impenetrable forest, motionless and weirdly threatening, from which they had come.

My acquaintance, who had listened so coldly to my quotation of Watson's verses, promised me a strange phenomenon below Lokoja. He was an engineer connected with a cotton ginnery in Northern Nigeria, and he held both country and people in amused tolerance and

contempt. We were passing, at this time, huge cliffs. On the top of these the trees seemed to hang like fragile green toys. The night was falling. He spoke to the man at the wheel, and the steamer went nearer to the shore, until it was *chugging* a path right under the lee of the mighty rocks.

Then he pulled the rope of the siren. The steam shrilled forth in a discordant yell. The hush of advancing night had been around us. But now—before the shriek of the siren had subsided—there arose a wild answering clamour from the cliffs. It sounded so fiendishly desolate, so like a soul in torment, that I grew pale. My blood ran cold with the unexpected horror of the sound. My companion pulled the siren again and again; and it seemed as though all Hell had been let loose.

The natives of the lower deck were covering their ears with the outspread palms of their hands. Their eyes rolled in terror, and they shouted their expostulations, until the Englishman desisted from his frolic.

Those wild echoes, that had been chained up in the rocks from time immemorial, hold deadly terror for most of the natives. They do not ascribe the sounds to natural causes, but fervently believe in the imprisoned spirits of the river-banks. The effect upon me was so bizarre that for many days afterwards I had need only to recall those supernatural yells to feel as though the tropical night itself had found a voice, and had hurled a message of warning and horror into the ears of the puny mortals who had dared to intrude into her domains!

A score of years can be as wide an interval in Nigeria as in progressive Europe. I feel that I shall never again see the Niger, unsophisticated and alien from advancement, as I saw it first in 1905.

VII.

I commenced these musings by referring to Burutu. The old Burutu was practically wiped out of existence in the disastrous fire that we all remember in the early part of 1918. It is said that three-quarters of a million pounds sterling 'went west' in that one tremendous burst of flame.

'You know how it happened?' a friend asked me recently.

'Yes,' I replied, 'for I happened to have a clerk down there supervising the despatch of produce, and he gave me the fullest details. It arose from the simple fact of a native woman frying fish inside a mat-house. The roof caught flame, and the fire spread to other native houses, until the whole compound was in a blaze.'

My interlocutor had been in Burutu during the great conflagration, and he nodded his acquiescence. 'We never expected that it would seize upon Niger Company property,' he averred. 'The thing was practically beyond our

control before we were awake to the terrible danger in which we stood. Where were you at the time?'

'I happened to be at Awka, building a station there,' I replied. 'Strange to say, I was the first man to hear on the Middle Niger. My clerk wired to me within two hours of the commencement of the fire, and he kept me advised at three-hours' intervals right onward. I repeated the disastrous tidings by telegraph to Onitsha, but the agent of the Niger Company there knew absolutely nothing. In the excitement at Burutu he was not *officially* warned until thirty-six hours had elapsed. Meanwhile Onitsha went on calmly despatching its produce down-river (for it was the shipping season) as though nothing was toward.'

'It took us all by such deadly surprise,' my friend returned. 'Except when a steamer is alongside, there is something reactive in the air of Burutu. In spite of our hard work, or maybe because of it, a lapse between steamers throws us into a languorous sort of mood. Everybody believed that the fire would be confined to the native quarter. Added to this, the fire first became apparent during the heat of our noonday vacation. Nobody was very eager to be worried by the disturbance. The whole group of mat-houses seemed to go up before you could say *knife*. It was just as though the tropical sun had shot down a levin, to destroy the whole trumpery framework of the native compound. When we got back to work we had all reason to be upset; but even then we scarcely feared for the safety of the produce and the stores. If anything, we felt considerably resentful against the outcry of the natives.'

'I know the sort of feeling,' I interposed. 'I have sensed that kind of thing several times when a native house has caught fire. The negroes seem to go literally mad. They gesticulate, they wail, and they rage against the fire, just as though they were combating some incarnate devil. It all, somehow, seems gratuitously forced, a sort of *fake*, or an artificial pose. But they are wiser than we are. They have learned to their sorrow and agony what a fierce master fire may be.'

VIII.

My companion continued his narrative. 'I saw some of the other Europeans scattered about the beach, with gangs of labourers in attendance. They were now seeking to isolate the flames. Although I felt still very dubious, I thought it time to lend a hand, and so I joined in the scene, which was now one of great noise and flurry. The hungry tongues of flame had already leapt several gullies and caught the palm-oil. I quickly saw that the sheds and stores were threatened. The building in which we keep large quantities of kerosene and petrol was in danger. By this time the group of native

houses was nothing but a heap of crimson embers. The women and children had rushed pell-mell into the bush. We Europeans were frantically urging every possible man and boy into service to help isolate the fire. It was, I can assure you, quite a breathless experience.'

I nodded. It was easy enough to visualise the whole scene. 'Did the negroes work well?' I asked.

'Like devils,' my friend replied laconically. 'But our biggest difficulty lay just there—in the insufficiency of labour. The government could have been more helpful than they were if they had—during the afternoon and evening of the first day—allowed us to *force* labour, for the whole town was soon in imminent danger of being wiped out. The task of moving the tremendous stock of palm-oil, in the casks, was beyond our capacity. There were literally thousands upon thousands of casks, and we had to have three men rolling each one. We needed practically *unlimited* labour. To make an unbridgeable gulf—that was the problem. But the fire seemed to leap spaces that were impossibly wide. The ground, also, was soaked with many long years of oil-leakings. By the evening of that day, though we all worked until we could scarcely stand, the ground seemed to be one wide prairie of red-tongued fire. And when the kerosene went up—well, it almost seemed as though earth and sky had linked hands for one impassioned moment. There was one great column of flame and smoke; and the heat and smell combined was deadly, terrible, past my powers of description.'

He pulled thoughtfully at his pipe.

'We quite forgot the existence of the upper river,' he went on after a pause. 'Fortunately for us! We therefore had steamers alongside, and were able to save the firm's papers, books, records, and, incidentally, our own skins! On the day after the first outbreak all we could do was to stand helplessly looking on. But, even then, we made efforts to retrieve the sea-end of the compound, and we were comparatively successful. Like common stevedores we all slaved away until night, occasionally pausing to exchange remarks upon the grandeur and incredibility of the spectacle. I don't believe there has ever before been such a fire in Tropical Africa, and I cannot believe there will be one like it again! Late that night we all stood on the veranda of the A.G.'s house (which, as you know, was saved), and the *sis-sissing* of the flames, as the rivers of blazing oil lapped their way to the wharves, was simply marvellous. The wharves themselves were destroyed. When the fire had died down—after several days—in such a degree that we could examine the results, we found six-inch iron girders twisted and bent and gnarled, just as though they had been made of the flimsy texture of a child's wrecked Meccano toy!'

I remarked upon having myself seen, six months after the event, many hoops of palm-oil casks standing erect in long regimental rows where once the produce itself had been. My friend nodded. The oil and the casks had been consumed so rapidly that the latter had dropped into ashes on the ground, leaving the hoops standing erect through the fiery ordeal. For many months they were a dreadful landmark of the passage of the flames.

IX.

However, as I remarked at the commencement of these reminiscences, there is soon to be a completely new Burutu. It will, we all hope, make amends to the Niger Company for the heavy financial loss which they sustained from the fire of January 1918. If all the plans

coalesce into actuality, there are to be giant wharves, large enough to accommodate several steamers at the same time. The extension of the ground will allow space for the accommodation of all the casked produce that arrives from the river. There are to be a dozen great stores for the accommodation of merchandise, and also adequate roofing accommodation for 'bagged' produce. Then there are to be recreation grounds and gardens; a fine group of residential bungalows; and last, but not least, well-made roads to link the town with its scattered annexes. All sanitary precautions will be taken, and there should be in this new Burutu-by-the-Sea health, comfort, and happiness for all.

We await the realisation of that optimistic, yet eminently realisable, project.

WHITE AURORA.

PART II.

III.

ONE night a party of smugglers, returning from their bothy, startled the white stallion from his lair in the corrie. They saw the wild-fire in his eyes, the moonlight shining on his lustrous silver coat. He wheeled, and made for a goat-path along the cliff-face, a path no wider than a man's body, and in places caked with ice where the moss-waters had oozed over it. The foothold was impossible for any but a goat, yet White Aurora took it at a gallop.

They all saw what happened, and swore to it to their death-beds. They were not imaginative men, and they were sober. The white horse had not gone thirty paces ere he lost his foothold, fell, and spun downwards into space.

Four hundred feet below lay the deep waters of Loch Vault, ice-covered and snow-coated, and the men, standing watching, heard the stallion strike the ice with a booming crash at the point where he was wont to drink. They went down to see, and there, sure enough, was the great black rift in the snowy sheet, about which the troubled wavelets still licked. It remained all winter, and many saw it, including men of learning, and thus the news spread that White Aurora had met his inevitable fate.

I have said that in his foal-days White Aurora loved the children at the old farm-house, who could lead him hither and thither as no man ever could. These children went to school over the hill, and the journey was rough and tiresome for little feet during the winter months. One night, a week or so after the event last described, a terrific storm, of the kind which lives in history, swept up from the north-west at the hour of the children's returning. Men saw it coming across

the pasture-lands like a waving muslin curtain, with night behind it.

The children's father ran out, taking his dog, but the storm smote him with stunning force ere he was clear of the policies. His lamp was blown out, he could hardly make headway, but his dog was wise and full of all the understanding of the hills. So he bade her go on and 'seek the weans,' and crouching low against the gale, she went on into the whirling blackness.

Ten minutes later the dog returned to her master, trembling and afraid, casting terrified glances towards the darkness ahead, as though some fearsome devil lurked therein. In vain the man cursed and coaxed and urged. Nothing would induce her again to leave his side.

Some time after, when the storm had abated a little, the children were found on the road home, little the worse for their experience. Their story was not quite clear, for they were dazed by the fury of the storm. But of this all were certain, that when the peril first befell them a great white horse loomed suddenly from the maelstrom, and coming up to them, sniffed their faces in friendly fashion. One of the little girls gripped its forelock, and holding hands, sheltered by the animal's body, which moved belly-deep in the drifts, they were led on their way, for none could see in such a blizzard. To the very gateway of the occupation road it led them, and here their father, who saw nothing of the horse, found them awaiting him.

If indeed White Aurora had met his fate by the cold waters of Loch Vault, it was a very material ghost he left behind him, for his offspring run to this day in the valleys of the Bentlands. In other words, White Aurora, after his alleged death, ran with the herd for years,

and under his ghost leadership it remained a materially prolific herd. What the whisky pedlars saw was doubtless a great ice-cake his pounding hoofs had dislodged, but nevertheless the strange incident lent lustre to his romantic life, and many there were who held that during those latter years it was a spirit horse which ran with the Bentland herd.

IV.

Early the following spring the mares were again given the freedom of the range, and White Aurora, joining them, was content for a time to spend his days in indolent ease. But at night-time he left his herd on wild deeds bent, and many a lonely shepherd drew his plaid more closely about him or shuttered his shieling window on hearing the thunder of hoofs, quick and even as the bark of the mitrailleuse, pounding nearer and nearer, presently to melt into the night. Dread superstition there was, and no little fear, but the feeling grew that the spirit of the white horse was a good spirit, because the deer herds thrived, the barley crops ripened, and many sturdy sons and daughters were born to the happy homes of the valleys.

With the coming of the rutting-season and the earliest frosts a change came over the wild deer. The stags became swollen about the neck and hunched in the back like greyhounds. Sedentary at other times, living often in pairs remote from the hinds, travelling no farther than their food requirements demanded, they now became restless as White Aurora himself. When the harvest-moon came, their hoarse and savage roarings could be heard from dawn till dusk, and terrible and inspiring the sound was as it rumbled and rang among the crags. Now and then the dry crash of antlers could be heard, now and then a stag would be seen rolling with grotesque and savage energy in the peat pools, to rise, slimy and dripping, uttering his primeval challenge.

The stags were anything but good neighbours at this season, and the horses had learnt to give them a wide berth. Formidably equipped they were, and in the right mood to use their equipment—quick as weasels and ready as rattlesnakes with their venom. More than one old mare had been severely gashed by the stags—more than one, indeed, had been mortally wounded by some vicious monarch of the hill whom she could not escape.

One evening, when the stags had attained their full voice and the rifles of the stalkers were laid aside, a tinker on the hill witnessed a strange contest. White Aurora was quietly browsing with his drove when a royal hart suddenly stepped into their midst from among some crags. His head was drawn rigidly back, his red eyes rolled, and he uttered a grating, rasping bark, which at once made clear his evil intentions.

Instantly the horses bunched and began to make off—all but one. The white stallion stood his ground, his glorious head aloft, and because he was so much a landmark the hart singled him out. At a stiff-legged run it whirled towards him, then down went the spreading antlers, and, casting high the peat, the great stag charged. It seemed for a moment that they were to meet head on, but in the ace of time White Aurora turned to present his hind hoofs.

This was a mode of defence with which the stag was unacquainted, and in an instant it was done. The human observer heard the hacking thud as the stallion's hind hoofs struck the well-timed blow. The stag seemed to crumple backwards, then it sprawled grotesquely, and the man saw its legs bristling stiffly skywards as over it rolled.

The stallion looked at his vanquished foe, then with a whinny to his herd he went on quietly browsing.

When presently the gipsy went down, White Aurora streamed across the corrie towards the crags, and as he went the observer saw a parcel of hinds jump out from behind the rocks and fall in behind the snow-white leader! They, at any rate, knew that where he led it was safe to follow.

V.

That winter perhaps the strangest incident of White Aurora's authentic career occurred. Again he ran in solitary possession of the range, when one December night the Christmas coach was on its way over the lonely road, which, with many a twist and hair-pin turn, finally gains the valley. Rain had fallen for many hours, but now it was unnaturally mild and calm, so that the clatter of hoofs and the rumble of wheels echoed far across the stillness.

The coach had reached the foot of the hill, and, its decks crowded with Yuletide passengers and fare, was in the act of rounding the bend, when the yellow light revealed White Aurora standing motionless in the centre of the way.

The driver cracked his whip and shouted, expecting the wild stallion to leap aside and leave the road open; but no! White Aurora stood his ground, and next moment the brakes were forcibly applied to avoid what promised to be a lively collision.

As the coach came to a standstill Aurora uttered an eager whinny to the horses in the traces, and trotting by within reach of the whip, he vanished into the night, leaving all with the feeling that they had beheld a ghost.

The driver was a superstitious man. 'Now, what did that mean?' he asked, half to himself. 'I've seen him a hundred times, but never known him act like that before!'

As he spoke the roar of angry waters came to

his ears, and he shouted something to the footman. The latter took one of the oil-lamps and went ahead fifty paces. Presently he returned. 'Yes, gentlemen,' he said, 'the bridge is down and the burn bank-full. Another few yards, and we'd have been over the edge.'

But ere they turned the coach a ceremony was performed, and there in the silence of the night they gravely toasted the wild white stallion.

VI.

Many years passed by, each with its fruitful crop of stories concerning Aurora, for it is to be feared that, finding him a source of revenue, the Highlander knew no limit in his wily efforts to beguile the wealthy Sassenach tourist. Many visited that land to see White Aurora, and, his fame spreading the length and breadth of the island, his offspring were sold at fabulous prices. And during his latter days many noble beasts ran with his drove.

But the hand of time must tell, and one night a shepherd, out on the hill, heard a crazy, cackling laugh mounting the hillside, and as he crouched in the bracken he saw a witch woman, who was known to be bad, seated upon White Aurora, who, slowly and dispiritedly, as though her curse were upon him, was at her bidding. A little later the witch was found dead in the heather, having left her spirit, so it seemed, to dwell within the white horse.

Thus evil days fell upon White Aurora, and, cursed himself, the shadow of that curse fell upon the range he ruled. No foals came to the drove, dread sickness fell upon the sheep, the barley rotted where it stood, and clear it became that Aurora must go. No longer could the range profit by his presence. Yet there were many who believed that dire retribution would fall upon him who raised his hand against the spirit beast—though, if indeed he were a spirit, the hand of man could never harm him!

But among the disbelievers there was one—a disreputable, devil-may-care old soldier who had seen much service abroad—who declared that he would rid the range of this pest. White Aurora had raided his barley patch—an evil habit the old stallion had recently acquired in no small measure—and several times had broken down the fence. Indeed, White Aurora had become a rogue in many ways, and was known to have killed several stags as he had killed the first.

More than half-tipsy one evening, and full of heedless boastfulness, the old soldier rammed a double charge of powder into his gun, and loading it with ball and a crooked sixpence, he betook himself to the shores of Loch Vault. Hiding behind a cairn of stones at the end of the rugged glen, overlooking the pool where

Aurora was wont to drink, he began his lonely vigil.

But his valour began to wane as the chill night wore on, and many a stiff pull from his bottle the old soldier took to brace himself for the meeting. Then, just before dawn broke, there sounded overhead a strangling, evil cry, and, looking up, the hunter saw the great white horse sailing silently and majestically down the glen towards his hiding. Not a hoof clicked, not a pebble stirred, yet in a moment the ghost beast would be upon him. He flung up his gun and pressed the trigger. There was a shattering report, then silence.

Next morning the old soldier's friends found him lying unconscious, with his gun burst beside him, and twenty feet away, blown to atoms, the remains of a great black-backed gull!

The ridicule of his comrades merely served to raise the mettle of the old soldier, and a little while later he again took hiding by Loch Vault, but higher up the glen this time and accompanied by a young stalker, both armed with modern rifles. They had chosen a brilliant moonlight night, and, faithful to the hour, White Aurora came down the glen. They heard the click of his hoofs as he drew near, they saw the moonlight glimmer on his heavy coat, and tensely they held their breath as the great white beast came on towards his drinking-place.

Simultaneously two shots rang. The white horse stood a moment like a marble statue, but an awful scream, which they knew to be the scream of the witch woman as her evil spirit tore from Aurora's keeping, rent the quietude. Then, leaping high, Aurora plunged headlong down the glen.

Swifter, swifter now than ever before, while the boulders flew like pebbles from his hoofs, and as he ran his coat became lustrous, like the glow of the Aurora Borealis. Brighter and brighter still, till it outshone the moonlight, and then they saw above his streaming mane a wild, mad, human face with flowing hair and eyes which fixed them with a stony, death-like glare.*

So to the water's edge, and never pausing in his headlong plunge, White Aurora smote the waters. A cloud of white foam, shining as he had shone, rose to engulf him, but in a moment that, too, settled with the echoes, and the silence of the night closed in.

So never more was White Aurora seen by mortal man, and, mark you this, never since his passing has stag or horse or sheep been known to drink from the waters of Loch Vault.

THE END.

* It is said that the old soldier died within a month; that the hair of the stalker turned snowy white, and that he, too, died within a year.

COTTON GROWING IN BRAZIL

By GEORGE M. CHARD.

I.

WHEN the Portuguese, in the year 1500, discovered Brazil, they found the natives already wearing cotton cloth, and it is evident that cotton is indigenous to the country, for everywhere one goes there is to be seen the cotton-plant growing by the highway. At present there is a cotton famine throughout the world, due, *inter alia*, to the following conditions.* The United States, which have been the principal exporters of cotton, are suffering from a shortage of labour; the negroes, who constituted the principal producing element, are migrating to the North, and the fields are without labour. India and Egypt can barely produce sufficient to supply their teeming millions; the South Sea Islands and Africa cannot fulfil the domestic demand. Against this, place the fact that the coloured races, the chief users of cotton goods, are increasing rapidly, and one gets a fair view of the situation.

Let us take this country of Brazil, with its population of 25,000,000, lying mainly within the Tropics. This year there has been a 'bumper' crop, and yet prices are many times higher than before the War, and three times greater than they were six months ago. Cotton grown here is nearly all consumed in the local mills—fetching approximately as high a price as if sold at Liverpool. For some long time past the daily market report has been 'buyers but no sellers.'

Now, this country can produce cotton in a manner that is probably without equal. A man acquires a stretch of land; he burns off the brush; he prods holes in the soil, drops in a few seeds, and sits down and waits. In six months he has a crop of cotton; but his luck does not end here, for in a further four months he has a second crop, and so on for five years. It is small wonder that planters here denominate cotton 'white gold.' In the U.S.A. the cotton crop is an annual affair, and in each season there must be fresh plantings. In Brazil one planting suffices for five years, and even weeding is non-essential after the first twelve months owing to the rapid growth of the plant.

II.

The question of successful cotton-planting involves the following conditions:

1. A sufficiency of cheap labour when the crop is ripe.
2. A sufficiency of rain.

3. A dry season for the gathering of the crop.

4. Proper transport and market.

Having these conditions, the planter cannot help making money.

Providing the plantation is not too far distant from the port, the cotton-seed—which forms roughly some 70 per cent. of the crop—can always find a ready market, and at a good profit, in Hull or Liverpool; but planters here are making so much money from the lint that they either burn the seed or allow it to rot. The population of Brazil is growing apace; poor, war-worn Europe is depositing its surplus on these shores in unheard of quantities, and they all require cotton clothes, and are at the same time accentuating the distressful shortage. In the city of Bahia, where these lines are written, there are five great cotton-weaving mills, employing in some cases over 2000 operatives. The shortage of raw material has become so acute that they are daily threatening to 'close down.'

All cotton lands are not alike as regards soil and other conditions, but it is estimated that some of the best are paying a net profit of £40 to £50 per acre; this, in spite of the fact that, apart from the government experimental farms, there is scarce a plough or a harrow to be found in the whole state of Bahia. What the profits would be were the scientific methods of the British introduced it would be difficult to say, but they should be sufficient to satisfy the most grasping. Land is cheap. Freeholds can be purchased at from ten shillings to three pounds per acre, according to proximity to the railways and rivers. The cotton lands are situated on the breezy downs of the central plateau—a region bracing and free from fevers. The state of Bahia is about three-fourths the size of France, and the greater part of this area is suitable for cotton culture. Labour is plentiful, cheap, and of a skilled variety. The seasons are regular, and, in short, all the conditions necessary to success are at hand.

If science were absolutely essential to the making of money by the cultivation of this crop few, if any, fortunes would be made here. That the plant will respond to careful treatment, and that profits will be proportionately larger is a certainty. Local diseases, of the cotton are few and far between, but if a crop be wholly or partially destroyed, there will be another in a few months to retrieve the loss. Large fresh areas are being laid down this year, but it will be a long time before supply overtakes the demand, and the price of lint becomes normal once more.

SEVENTH SERIES

THE STRANGE NARRATIVE OF SERGEANT MILLEFEUX.

By ALEXANDER BIRD.

PART I.

I.

WATERLOO! Shall I ever forget that day? No! I, Jean Millefeux, who have been in sixteen pitched battles and more skirmishes and affairs than I can count—I who have seen such sights as burning Moscow and the crush on the Beresina Bridge, I tell you that Waterloo was greater and more terrible than those. Why? For this reason: it was the end. When we lost Waterloo we old ones of the Guard at least knew that it was not merely a battle we had lost—it was the Empire, it was France, it was Napoleon. Waterloo was the finish-up of everything, and we did not need St Helena to teach us that.

We of the Old Guard had stood all day noting one move after another on that fatal chess-board. In close column we had stood, with one eye on the battle and the other on Napoleon. He stood quite near to us behind the plain deal table which they had carried out of the farmhouse. He had his map spread all over it, with a cannon-ball at each corner to keep the wind from lifting the paper. There he stood, now bending over his plan of battle, and then looking through his telescope over the field. The historians tell a lot of nonsense about what he said at different times during the battle. They tell you that when the Scots Greys tumbled over that unlucky infantry of Reille's he cut an attitude, just like an actor, and exclaimed, 'Oh, those terrible Greys! Those terrible Greys!'

Now I was quite close to him all the day, so near that I was inclined at times to advise him what he should do; so it is certain that I know better than those historians. Now, what he really did say about the Greys was just this: 'D——!' That was all. And then he turned to an officer of the staff and said, 'The fools are coming too far. Ride like the devil to Marcognet and tell him to eat them up.'

Well, as everybody knows (except, perhaps, the English), we had won—or at least we were going to win—the battle, when the Prussians came up. That turned the tables, of course. It was then that the Emperor made his supreme effort. He mounted his horse and came to the head of our column, sitting as calm on his white

horse as if nothing was the matter, and Ney was beside him with his red face and his bull-dog jaw.

'My lads,' said the Emperor to us, 'I must sleep in Brussels to-night. You will make me a way, won't you?'

What a cheer we gave him—it rings in my ears yet. Up went our bearskins by the hundred on the bayonet points, and the *Vive l'Empereur!* was like the roar of an ocean. I believed then that we should win the battle after all, but we were too few. Half of the Guard had to go and keep back the Prussians. However, we did our best. Ney formed us in three columns, and when he took his place on horseback at our head and drew his sword, there went a movement down the ranks like a lion tossing back its mane. To see that iron column marching steadily on the English centre with the white gaiters stepping like one—ah, that was a sight!

But heavens! what a tornado of fire we marched into. Such a hurricane of lead I had never experienced in all my hundred fights. And, indeed, it was only a hurricane of lead that could have stopped us. We paved the road with our men. Ney himself went down three times, but he had a charmed life in a battle, had Ney. Friant fell into my arms with two bullets in his chest—one for each lung. As for me, I was never touched. It was like a nightmare; the battle became a blur, and then, somehow, we were back again, a mere handful. However, we formed a square round the Emperor, and then we moved off the field, and the night gathered in darkness all around. There were men there with their heads bandaged up, others with their arms in slings. Our clothes were riddled with shot, and half of us had lost our bearskins. But Corporal Morand had the flag safe, with the head of the eagle all right in his pocket; it had been slashed off by an English dragoon.

We marched off over the fields, keeping clear of the general rout, for that was like a torrent—horse, foot, artillery, wagons, all mixed together and hurrying pell-mell to the rear. If we had got into that flood of fliers we should have been scattered in a moment. But we kept

away to the right, and when the Prussian hussars came upon us they found us in steady ranks, and, *ma foi*, we gave them to understand that we were still the Old Guard, and not to be meddled with.

After that we were unmolested, and about three in the morning we halted at a tiny hamlet for rest and a meal.

II.

I had just lain down to snatch an hour's sleep when our captain came and called me. 'Sergeant,' said he, 'the Emperor wants you at once.'

'Right, my captain,' said I, and I went off to the cottage where Napoleon had established himself, and such of his staff as were with him. Ney and Soult were standing at the door, and seemed to be waiting for me. As soon as I came up Ney led me into the kitchen of the cottage and announced me to the Emperor.

'Sergeant Millefeux, sire,' said he, and then the door shut to, and I was alone with Napoleon. He was sitting at the fireside, poking at the coals with his boot. He turned towards me.

'Ah! sergeant,' said he, 'I can rely upon you, I think?'

'Sire,' I replied, 'you have relied upon me before.'

He smiled at that. 'It is true, my friend,' he said, 'but this is the greatest of all. See, *mon vieux*,' he exclaimed, jumping up off his chair, and pulling at my ear as his custom was, 'do you want to save your Emperor?'

'Sire!' I said, and I did not say anything more—that was enough. And so Napoleon felt, for he smiled again.

'Sergeant,' said he, 'the safety of your Emperor will soon be in your hands. Follow out implicitly what I shall tell you to do, and you will have served Napoleon Buonaparte.' He drew himself up proudly as he mentioned his full name, and a shiver passed through me. It seemed to me at that moment as if I had been appointed to save the world—the responsibility frightened me for a moment.

'Listen,' suddenly resumed the Emperor. 'You will leave here now and go to Bourges. You know how to ride a horse, and a disguise will be provided for you. Your uniform would bring all the royalists on the road about your ears. To-day's misfortune will unloose the leash of all the curs in France. Two miles short of Bourges on the Paris road you will come to a house—the Maison Rouge. You will find two Italians living there. Say to them these words, "The Emperor wants the priest." You will stay at the Maison Rouge till they tell you to go, and then you will—' the Emperor paused a moment, and then, staring fixedly at me, he went on—'you will kill both the Italians and bring the priest to me wherever I am. Do you understand?'

'Yes, sire,' I replied.

'Then go,' said he, 'and do not fail me, for it is the last errand you will do for your Emperor,' and he laughed. It was a laugh that made me shiver. I did not know why, but I think I understand now.

Next moment I was outside the cottage, and Ney led me to a barn, where I found a horse all ready for my journey and a civilian's suit of clothes. When I had changed my uniform for these I looked like a farmer, but, all the same, I had a pair of excellent pistols in my pocket.

III.

Very little happened to me on my way to Bourges. I stayed at various inns, and I got several good nights' sleep, and that was a very good thing after such a battle as Waterloo.

On the tenth day after leaving the Emperor I was drawing near to Bourges, and presently I came in sight of a red-brick wall, which ran along the road for some distance. It was the boundary wall to a large house, also of red brick, which stood back from the road, and which I could see through the screen of trees and shrubs that filled the space between the wall and the house.

I rode on till I came to a large gate, and on the stone-work over that I read the name: 'La Maison Rouge.' I was no longer in doubt then. Here was the house, the object of my journey. I pushed the gate open, and found myself in a broad avenue which led up to the house.

It was a square-built mansion, with a door in the middle, a window at each side, and three in the upper storey, precisely like what a child draws on a slate. A grassy lawn stretched along the front of the house, and a couple of peacocks strutted about on it. Everything was quiet as death. There was no sound, and no sight of human beings, either master or man. It was merely a moment that I stood in front of the house, taking it all in, when a most remarkable thing happened. The house-door opened, and a man stepped out upon the lawn. I almost fell from my horse in astonishment—it was the Emperor!

There he was in his gray coat and his little cocked hat, with his full face and his piercing blue eyes. I threw myself from my horse and advanced towards him. 'Sire!' I exclaimed. 'Sire?'

He turned towards me, looking me through and through. 'Ha!' he exclaimed at last, 'who are you?'

'Sire, I am Sergeant Millefeux,' I replied. 'I am wearing the disguise you ordered.'

'Millefeux,' he repeated reflectively. 'Ah!' he continued, 'one of my old *grogards*, is it? Ah yes, I remember you now; it was in Egypt I saw you last, I think.'

I was about to remind him that he had seen

me many times since then, when, suddenly, a voice broke in behind me—a voice full of rage, and yet also of terror. I turned round and saw a short dark man who had come up the avenue behind me. He gesticulated in true Italian fashion, and poured out a flood of Italian speech. I do not know that language, but one can easily tell it when you hear it spoken. He addressed himself to the Emperor, and I was wondering how he dared to speak so cavalierly, as it seemed to me, when Napoleon suddenly swung round and walked back into the house without reply, and the dark man turned to me.

'Who are you?' he demanded in French. 'How dare you come here? What do you want?'

There was no doubt he had a most threatening way with him, as if he wished to frighten me—me, Sergeant Millefeux! Ha, ha! he did not know he was speaking to one of the Old Guard. However, I saw that he must be one of the Italians to whom I had to deliver my message, and, as my instructions were to kill him after I had got the priest, and not before, I merely said to him, 'Listen, my friend. The Emperor wants the priest.'

At that you never saw such a change in a man's countenance. The scowl departed instantly, and a look of relief and confidence and friendliness took its place.

'Oh,' he said, 'is that it? I did not know. I thought you were a stranger. Just wait here a moment,' he continued, 'and I will tell my brother.'

Thereupon he hurried into the house, leaving me standing there full of puzzling thoughts. How on earth was the Emperor here in the *Maison Rouge*? The plot was evidently deeper than I had suspected. However, I concluded at last that I had nothing to do with that. I had only to carry out my orders—to get my priest off to wherever Napoleon wanted him.

By the time I had got through this amount of thinking my Italian friend had returned. He invited me into the house.

'You must stop here for a while,' he said,

'and when the time comes you shall take M. le Curé to His Majesty.'

'But the Emperor——' I began.

'Is here, you would say,' he interrupted, with a smile. 'M. Millefeux, you are a soldier, and, what is more, you are a servant of the Emperor. That should teach you to carry out your instructions and not look beyond them. Now,' he continued, 'let me show you your room, and in an hour's time we shall have some dinner ready for you.'

He then led the way up a wide, noble staircase, opened a door on the landing, and ushered me into a handsome room.

'We have been in constant expectation of you,' he said, 'and you will find everything to your hand.'

He then left me, and I spent the next hour in resting myself on a splendid couch, in brushing the dust of the high-road from my clothes, and making myself as presentable as I could in case I should meet the Emperor again in this mysterious house. All the time, too, in spite of myself, I could not help wondering about the presence of the Emperor in the house, and I was still vainly trying to find a solution to the problem when the Italian returned to tell me that dinner was ready.

In a large room downstairs covers were laid for three persons. The Italian whom I had already met, and another as like him as one monkey is to another—these were my companions at the meal.

The cooking was very good, and I put all troublesome thoughts out of my mind and applied myself to the viands with the gusto of an old campaigner.

When the dinner was over one of the Italian brothers went away, while the other proceeded to clear the table. As for me, I filled my pipe and settled myself comfortably in the biggest arm-chair in the room, with the second biggest to put my feet on. I always make the best of things—on the retreat from Moscow, for instance, I have slept inside a dead horse.

(Continued on page 620.)

A FEW DAYS IN DOMINICA.

By the Rev. MONTAGUE L. FOYLE.

I.

IT is impossible for one who has spent only a short time in Dominica to do more than describe a few first impressions of what has been called the loveliest and grandest island of the Caribbean Archipelago. Only faintly is it realised, even by experienced West Indian residents, that Dominica is a vast, undeveloped, and most mysterious stretch of country, ranking after Jamaica and Trinidad as the largest British

possession in the Caribbean Sea, practically unsurveyed and unsettled except along a thin strip of coast-line. The population crowded into its estimated area of two hundred and ninety-one square miles has never been satisfactorily computed; there does not seem ever to have been any extensive geological survey, and one wonders what surprises will reward the enterprise of the pioneer when once the development of the island is tackled in earnest. During my stay there I had constantly before me a survey map dated

1904, on which the main roads were indicated in red, and a glance was sufficient to show that the thin streak of colour was almost entirely confined to the coast; only once did it manage to struggle across the island. Experience led subsequently to the conclusion that it would have been far more fitting to call the roads 'horse-tracks'; in no case were they for any distance suitable for the motor, whilst even the most primitive specimen of West Indian cart soon reached a point from which no farther progress was possible. Motor traffic, indeed, is possible only in the neighbourhood of Roseau, the capital; none, therefore, but good horsemen should ever think of becoming planters in the island. Before our steamer reached anchorage we had obtained from her deck some idea of Dominica's size. Our course was south-westerly from Montserrat, the last port of call; *en route* we had passed the large French island of Guadeloupe, with its dependency, Les Saintes, and at about ten o'clock in the morning found ourselves abreast of Cape Melville, Dominica's most northerly point. Steadily the vessel ploughed her way through the deep blue tropical sea, yet it was well on in the afternoon before we were on shore at Roseau, three-quarters of the way along the west coast. There is nothing like actual West Indian experience to give a correct idea of the vastness of the Caribbean Sea.

The journey along the coast had also served to give some idea of the marvellous scenery for which Dominica is famed. As the steamer approached it was immediately obvious that our objective was even more mountainous than the average West Indian island, the view at two miles from the shore being one extensive vista of lofty towering peaks, which eventually became familiar as Morne au Diable, Morne Diablotin, Morne Laurent, and Morne Trois Pitons; Morne being a French word peculiar to the West Indies, and signifying little mountain. Diablotin is computed at 4747 feet above sea-level, and Morne is the highest peak in the British Leeward Islands, in which colony Dominica is included. Imray's View, as it is called, is the crowning peak of Dominica. The name perpetuates the memory of a devoted botanist and physician, who, in the middle of last century, by introducing cotton cultivation and establishing the lime-juice industry, helped to tide over, as regards Dominica, that distressing time which was general in the West Indies after emancipation.

As we drew nearer and the coast features became more distinct, there came such a deepening sense of grandeur that even the most experienced traveller was held spell-bound. Bold promontories jutted out into the sea, majesty was given to the coast-line by a series of deep and stately curved bays, whilst creeks and inlets, fringed with white sand, and overhung with thick tropical vegetation, added marvellously, as the

water sparkled in the fierce sun, to the general witchery of the scene. Very remarkable is the fresh-water supply of the island, and in few other equal areas in the world can so much running water be encountered. What appear at the distance to be thin white lines streaking the mountain-side turn out on closer acquaintance to be foaming, rushing waterfalls, and already three hundred and sixty-five watercourses, none of them ever dry, have been charted. Some, like the Indian and Layou Rivers, are of quite respectable dimensions, and could easily be made navigable. The rainfall of the island is naturally heavy; the mountains act as huge, never-ceasing condensing machines; and showers perpetually fall, half-a-dozen drenchers a day being quite the ordinary measure in the capital.

II.

It is strange how these West Indian islands vary; Antigua, less than a hundred miles away, is flat, often rainless, more or less barren, the scenery presenting, in the main, features so like those of the homeland, that the island has been described as the most English-like in appearance in all the West Indies. Dominica stands at the other extreme: drought is unknown, water perpetually runs to waste, rain never ceases, mountains defy the explorer, and vegetation is typically tropical. A seventeenth-century traveller left on record the words: 'One of the real beauty spots of the earth, its only drawback is the rain, which falls every day, and often out of a clear blue sky. The island must surely be the wettest spot on earth.' The latter part of this statement is an exaggeration, but it will serve to show how remarkable is the humidity of Dominica.

It is not surprising, therefore, that the island has become far famed for its superbly luxuriant foliage; the combined action of heavy rainfall and perpetually brilliant sunshine upon a soil naturally fertile could not do other than produce a vegetation both profuse and abundant. Our attention had early been attracted by the great forests covering the mountain slopes, and one could not help speculating as to how many species of timber were concealed in those mysterious depths, and what would be their market value. It was very evident that we were about to land on an island where only a small portion of the total area was under cultivation, and that our gaze was resting upon primitive, virgin, tropical forest. In this respect Dominica, as seen from the sea, offers a most striking contrast to such an island as St Kitts, where it is obvious from the large patches of green pleasantly dotting the mountain-side that man has to a very large extent succeeded in subduing Nature. About ten miles before reaching Roseau we passed an extensive grassy plain, known as the Grand Savannah, and reminding one very forcibly of the Sussex Downs as they

slope towards the sea. Here is land which Nature has left clear for immediate cultivation, and the visitor wonders why some enterprising planter has not already entered into possession. It is interesting to remember that during the Boer War this Savannah was suggested as a very suitable place for internment of our prisoners of war, and that arrangements were commenced for the reception of visitors, who subsequently found accommodation in St Helena.

Towards Roseau the mountain slopes had been partly cleared, and it was obvious that we were approaching the domain of man. The little town, with its population of some nine thousand, stood out distinctly, white-walled, white-roofed, and red-tiled, against a rich luxuriant foliage, in the midst of which the stately palm was the predominating feature; whilst yet another mountain, Morne Bruce, crowned with ruined fortifications, constituted a perfect background to the scene. To do justice to the vegetation encountered during the course of a short journey in and around the town is impossible; gigantic ferns, lovely creepers, rows of lime-trees with their attractive dark green leaves and beautifully golden balls, tropical flowers, banana, citron, and coffee plantations, all these (with many other tropical growths) passed before the eye as the panorama unrolled. The Botanical Gardens, of which Dominicans are justly proud, are beautiful in their stately grandeur, and excellently cultivated, models, one would venture to say, of what such establishments should be.

One of the never-to-be-forgotten aspects of the life of the island is the vast numbers of large toads to be encountered everywhere. They flourish in thousands, and by night the air is filled with their hoarse croakings. The tourist is almost certain to return to the steamer having purchased as a souvenir one of these objectionable-looking amphibians, skilfully preserved and stuffed by the Dominican blacks. It is a relief to be able to add that, unsightly though they be, these pests are quite harmless.

III.

There is a question, however, that is bound to arise as soon as the traveller finds himself face to face with the people of the island. Can this really be a *British West Indian* island? he asks, as he wonderingly looks round. Perhaps he has already familiarised himself with the other islands of the Leeward group, and has therefore been led to anticipate a certain type of negro. But here in Dominica he finds himself encountered by a black population which absolutely refuses to be squeezed into any British West Indian mould. The colours of the clothing are exceptionally vivid; the facial types are distinctive—the men, for example, frequently favour that short, pointed beard which is generally regarded as the Frenchman's peculiar asset; the names above the stores are not

English, whilst the language spoken is a very corrupted French patois, absolutely unintelligible. If by any chance the visitor has touched at one of the large French islands of Martinique or Guadeloupe, he will be forced to confess immediately that Dominica constantly reminds him of *them*, and *not* of any British West Indian islands he may know, an impression which becomes stronger as he notices the all-prevailing Roman Catholicism, passes the residence of the Belgian bishop, or enters his spacious cathedral. A French island under British rule, such is a correct description of Dominica, and one is led to an investigation of its history.

It was on Sunday morning, 3rd November 1493, that the great Columbus first sighted the same lofty peaks that attract attention to-day, and with great appropriateness he gave the island the Latin name for the Lord's Day. In some ancient records Dominica is frequently referred to as Sunday Island. It is said that Columbus was so impressed with the rugged appearance of his newly found treasure that when, after returning to Spain, he attempted to describe its configuration to Queen Isabella, all he could do was to crumple up in his hands a piece of stiff parchment. For years no intrepid colonisers dared to try to displace the native Carib, who strongly entrenched himself in those impregnable mountain strongholds, and for a very considerable period, therefore, the island was unsettled. In 1627 it was one of the places in the West Indies granted under letters patent to the Earl of Carlisle, but his lordship seems to have done nothing at all in the way of colonisation. Subsequently the Spanish, French, and English all found themselves settled there at the same time; the hold of the last two nations was, however, far stronger than that of Spain, whose colonisers gradually retired, so that in 1748 France and Britain were able to enter into an agreement whereby Dominica, in joint-occupation, was looked upon as a neutral island. But our fellow-countrymen forgot that Martinique was not far away, and that the French had been very firmly established there since 1635, a state of affairs which has continued to the present day, for Martinique is nothing if not exclusively French. During those neutral years there seems to have been a constant stream of colonists from that island into Dominica, so much so that when, by the Treaty of Paris in 1763, Dominica was restored to Great Britain, there were loud but unavailing protests on the part of the population, the majority of whom proved to be of French extraction.

Time and again in the struggles of the eighteenth century Dominica was attacked, changed hands, and then changed hands again. The last struggle for possession was in 1805, when Roseau was bombarded by a powerful French fleet and reduced to ashes. The thanks of Great Britain are ever due to a certain Sir George Prevost,

who, by his skilful handling of the local militia, saved for our Empire this gem of the Caribbean Sea. At the close of the Napoleonic wars Dominica was finally handed over to our nation, the French element speedily settled down under the new régime, and from then till now the history of the island has been largely a record of agricultural successes and reverses. But the all-preponderating element which France has contributed to the local life will never be eliminated, and on that account alone Dominica is well worth the closer attention of the tourist. The place-names are perpetual reminders of that foreign influx during bygone days; such village names as Coulihaut, Coulibistre, Barroui, Mahaut, Marigot, and Saline are only a few illustrations amongst many of the firm French stamp that rests upon the island, whilst it is safe to say that the use of the patois will never be abolished. It is gratifying, however, to remember that upon the recent West Indian tour of the Prince of Wales, Dominica, as the first of the Leeward Islands visited, led the way in demonstrating the loyalty of the whole colony, and that in this, as in any of the islands once French but now British, there is no trace whatsoever of those problems so vexing in the French parts of Canada.

IV.

Amazing stories are still current in Dominica concerning the Maroons, as the fugitive slaves of bygone days used to be called. The island's impenetrable forests naturally afforded these unfortunate desperados great protection; once safely concealed within the thick tropical growth covering the mountain-side, the runaway was so untouchable that Dominica became the great objective of all the blacks planning a dash for freedom. Escaped negroes from all the neighbouring islands gradually congregated in the interior; they were speedily joined by fugitives from Dominica itself, so that in the middle of the eighteenth century there existed in that dark, mysterious interior a large, free, black population, little removed from savagery, living very comfortably on foodstuffs easily raised on such a fertile soil, defying all attempts at capture, congregating in camps under negro chiefs, perpetually engaged in civil war, and at times committing depredations on the planters. It seems incredible to us in these days of law and order that the wild men of Dominica, as they were called, should have defied for close on two hundred and fifty years the united efforts of both British and French, and that for their eventual suppression quite a large military force was needed. With the coming of emancipation the need for Maroon life ceased to be, though one cannot help wondering whether any untouchable people still dwell within that mysterious hinterland.

There exists in Dominica to-day a feature of

West Indian life profoundly interesting to the anthropologist, for the island shares with those small pieces of land off the coast of British Honduras the distinction of housing within its shores the last of the original Caribs. These were the inhabitants whom Columbus encountered, and some idea of their disposition may be obtained from a remark by an old writer that they held the French to make the most tasty meat and the Spaniards the toughest. Slavery practically exterminated the Caribs, and had it not been for the action of the British Government in preserving them in Dominica and Honduras, the race would now have to be classed as amongst the dead peoples of the world. Their chief receives his staff of office direct from the Colonial Office, and is also granted a small pension by the Government. It should be added that 'His Majesty' is a very unpretentious ruler, and has occasionally been seen selling baskets in the streets of Roseau and offering fruits on the steamers.

V.

Three excursions were possible during the few days spent at the island; two of them were by horse, and it was amusing to watch the efforts to remain in the saddle of some of our party who were unused to equestrian exercise. On the first occasion we revelled in the glories of the Roseau valley. Philatelists have commented at times upon the size of the stamps of Dominica; it is well to remember, however, that these somewhat large pieces of paper bear a representation of Roseau as seen from the sea, very skilfully prepared and neatly printed, and those who desire to obtain some idea of the wonder mountains of the island can hardly do better than examine carefully its unused postal specimens.

The valley ran for several miles in a gently inclined slope, profuse vegetation covered every mountain-side, whilst on the lower reaches we noticed especially limes and coffee. Down the middle of the valley the Roseau River flowed in a deep, roaring stream, every ravine providing its own mountain torrent, which tumbled with a rush into the main water. At the extreme end of the valley the rocks converged into an acute angle, and from the apex a cascade fell hundreds of feet in one white sheet of silvery foam with a thunder that could be heard a long distance away. On the way up the valley our attention had been called to the iron telegraph poles, unobtrusive reminders of the awful ravages that can be accomplished by tropical insect life, for wooden posts would speedily be eaten away.

The second excursion was to ride by the side of the sea practically all the way to Layou, through village after village bearing French names, past people to whom we could not speak, and feeling all along the road that we were encountering at every step conditions

of life absolutely different from those of a 'pukka' British island.

The third excursion was by motor-boat, twenty-two miles along the coast in a northerly direction, a journey which gave ample opportunity of studying the shore from close in. Foliage overhung everywhere; deep caves were noticed; tiny settlements, accessible from Roseau by boat only, were passed every mile or so, and at many of them our vessel halted for the purpose of taking off and receiving mails. Rodney's Rock was passed, an imposing projection rising sheer out of the sea, and earning its name from the fact that, after the great admiral had on 12th April 1782 destroyed the naval power of France by obliterating her fleet between Dominica and Guadeloupe, one of the shattered enemy vessels drifted ashore at this spot. Portsmouth, the end of our coastal journey, proved to be a small West Indian town of about one thousand inhabitants, standing on a spacious bay affording wonderfully safe anchorage. Close by the pier a tomb

is shown which is said to contain the remains of Prince Rupert, the redoubtable nephew of Charles I. Whilst it is an historical fact that this prince did sail the West Indian seas, yet there is no record that he died in these waters. Nevertheless the beautiful expanse of water bears his name, and most West Indian voyagers know of Prince Rupert's Bay as a very secure anchorage.

The story of the complete exploration of Dominica has yet to be written. In the meantime the words of that great traveller and distinguished writer, William Gifford Palgrave, best sum up the glories of the island: 'In the wild grandeur of its towering mountains, some of which rise to five thousand feet above the level of the sea, in the majesty of its untrodden forests, in the gorgeousness of its vegetation, the abruptness of its precipices, the calm of its lakes, the violence of its torrents, the sublimity of its waterfalls, it stands without a rival, not in the West Indies only, but, I should think, throughout the whole island catalogue of the Atlantic and Pacific combined.'

THE VISIGOTHIC CROWN.

By ROBERT H. HILL.

I.

ALARIC STANE signed the cheque with an exaggerated flourish, and threw it across the table like a penny to a street minstrel.

'Thirty thousand pounds, my friend. I have paid high to call the old manor of Pidcote my own, but I do not grumble. Precious few pickings will be left out of that sum after the Jews have had the meal they're waiting for, eh?'

His face, which was handsome after a bold, arrogant style, was just then spoilt by a malicious gleam in the eyes and a hard, cynical twist about the mouth, but the youth opposite him was too full of his own loss to resent the other's insolent tauntings. 'Don't remind me of that, Stane,' he said moodily. 'Every Shipton for the last hundred years has been a careless spendthrift, but this crowning humiliation has been reserved for me. I haven't come to whine, though, but to ask you a straight question: What are you going to do with the place? Of course I have no right, really, to question you, but don't you see that if I can feel it is in your hands, and that, perhaps—some day—you'd be willing to let me buy it back, I could go to work with an easier mind? Because that, henceforth, will have to be my whole ambition—to win back the old place for future generations of Shiptons.'

Stane very deliberately produced an old pipe and puffed for some minutes without replying. His eyes had narrowed, and he seemed to con-

sider the question. Finally he said, 'That is just exactly what I expected you to ask me before we parted, Tony, and I am bound to say the ambition does you credit. Yes, I'll swear to hold the manor in trust for you—on one condition.'

'I'll promise anything in reason.'

In spite of all his self-assurance the new master of Pidcote appeared to hesitate for words. 'This, then, is my condition,' he said at last. 'It concerns a certain young lady named Helen Meighan—'

Tony Shipton sat upright, and his mouth formed into an uncompromising line.

'Yes?' he questioned. 'Be careful, for Helen and I are practically engaged.'

'So? Then you should have no fear in putting her to something of a test. I propose that you shall leave Pidcote to-morrow, and that for the space of one year no letter shall pass from you to her. Do you accept?'

Tony gasped, and then flushed angrily. 'What in thunder! So you want me out of the way, do you? Is it possible you hope to induce Helen to marry *you*?'

Stane frowned ominously. 'I did not undertake to discuss my motives,' he said shortly. 'You have my offer, and let me say that its rejection means good-bye to all your hopes of regaining the manor; I shall know how to make sure of that. If, on the other hand, you consent to our pact, it is, of course, understood that you say nothing about it to the young lady in question.'

'Then I refuse absolutely.'

The other raised a deprecating hand. 'Think, before you make it irrevocable. I would point out again that you are unjust to your—your sweetheart if you are afraid to put her to this little test, for both your sakes.'

'I am not afraid, but, hang it, it's beastly unfair to her——' It was plain, however, that the argument had struck home.

'You will find me willing to re-sell the manor at purchase price whenever you care to approach me,' interrupted Stane suavely.

The younger man subsided into thought. 'It is her ambition as well as mine,' he mused aloud; 'but to leave her without a word——' Then he looked up at the other. 'Give me until to-night to answer you,' he said, and rose to his feet.

Stane waved his hand smilingly. 'With the greatest pleasure. Until to-night, then, let us dismiss the subject. Ah, there is something on which I wished to consult you among your collection of antiquities.' He moved across the room and opened the polished mahogany doors of a cabinet displaying a heterogeneous collection of pottery, arrow-heads, and prehistoric relics. From a top shelf he lifted down a ponderous crown of iron, and held it before him admiringly. 'This specimen of royal headgear,' he remarked, 'has a strange attraction for me. Will you be so good as to tell me its history?'

But this nonchalant change of topic was too much for the dispossessed owner. He faced the other's smiling effrontery for an instant, and then turned on his heel. 'Oh, look it up in the catalogue—and go to blazes!' he shouted, and flung out of the room.

II.

Alaric Stane watched the door close, and the satisfied smile was still upon his face. 'He'll accept the bargain undoubtedly,' he murmured. 'Well, well, a year is a long time, and it will go hard if I cannot make that forlorn little songbird the mistress of Pidcote Manor before he returns.'

Then he sank into an arm-chair and proceeded to follow out his visitor's advice by reaching for the auctioneer's catalogue, already drawn up when he had notified his intention of buying the old house out-of-hand. A few minutes' search revealed the object of his hunt, and he read the brief notice through slowly: 'Lot 59. Barbarian Crown of fourth-century workmanship. Unearthed near Rome in 1894, and purchased for the Shipton Collection in 1907.' Little enough, and yet the thing itself held a strange fascination for him as he turned it over and over in his hands.

The sun poured in through the open French window behind him, and outside there reigned the absolute, drowsy stillness of a midsummer afternoon. He got up again, and walked rest-

lessly over to the window, then down the steps, and out on to the well-trimmed gravel paths around the house. A gardener working on an adjacent flower-bed looked up and touched his cap, but the figure moodily treading the gravel-path passed on without a sign of acknowledgment, and the labourer stared after it with a frown of puzzlement until it passed from view along one of the winding paths which led through the shrubbery.

The sequestered path ended in a wicket-gate leading out into the highway, and on this Alaric Stane leaned, staring unseeingly up and down the little-frequented road, and across the deserted stretch of common land which bordered its opposite side. And then, in a sudden return to present consciousness, he awoke to the fact that the barbaric crown was still gripped in his right hand. He poised the thing on the top-most bar of the gate, and studied it with an ironic smile. Presently, still in the same mood, he lifted it in both hands and set it upon his head. . . .

From the flower-covered common across the road there came the drowsy murmuring of bees; a breath of air brought a sudden rustling stir among the leaves around him. With a flash of black-and-white feathers a swallow circled in front of his eyes and was gone. Away down the road, where nestled the red roofs of Pidcote, there was the distant rumble of wagon wheels. But Alaric Stane, as he stood by the closed gate of the shrubbery path, was motionless as a figure of wax; for the moment a dull listlessness seemed to have overcome him, while through it there pierced a persistent question which strangely worried him. How came it that this ponderous thing of iron, so heavy to the hand, should rest so easily upon his head, and its weight pass unnoticed? Devil take it, it was almost as if he were accustomed to the thing, had worn it before.

There was, too, an indefinable something else, but what it was he did not know.

He stared along the road towards the village. After all it was nearer than he had realised, and his eye could travel for some distance along its broad street. It seemed to be in quite a bustle of activity, too, which attuned ill to the midday sleepiness of all Nature around; a number of people had gathered in the road, and their shouts were wafted to him on the still air. Their faces were all turned in the same direction, and they pointed away over the common at the horizon.

Stane stiffened and clutched the bar of the gate as a new and unexplained sound beat faintly upon his ears. It was like the first dull rumbling of thunder, and it came from far across the billowing country beyond the common. He turned once more towards the group at the village end, and saw that now there stood out ahead of the others an old,

white-bearded man, unknown to him, and wrapped in a long white robe which reached to his feet. His outstretched arm pointed over the common, and his high-pitched voice came distantly to Stane's ear. In the listener's state, almost of torpor, it caused him no surprise that the words were in a foreign tongue, since he understood them well enough: 'The storm gathers in the north. Away, my children, to Rome—to Rome! Stay for nothing, or the deluge will have broken over your heads. Fly, for it is the barbarian hordes; it is the Visigoths!'

And still that faint rumble sounded from far beyond the horizon, while Stane continued to watch the little group around the bearded patriarch, which, however, was now fast dispersing. He caught his breath in a quick gasp of surprise, for a movement on the crowd's outskirts had revealed to him unmistakably two figures he knew. Standing hand in hand, their eyes still fixed on the old man's face, were Helen Meighan and Tony Shipton! That their dress was different from anything he had ever seen mattered nothing; it was undoubtedly they, clasping each other's hands, and the sight drove the watcher to instant action. He threw wide the gate, and sprang into the centre of the road.

III.

Out on the road Stane halted. Something told him that that white highway leading into the village was not his path. Also a new thing was stirring deep inside him, and the thought of Helen Meighan no longer excited him. Without understanding he perforce obeyed; he struck off the road, and took his way with long, unhesitating steps across the common towards the north. On and on he went over that open country, sometimes taking easy strides, and sometimes urged unaccountably into a swinging run. The landscape appeared changed, but he had no astonishment to give to the increasing roughness of his way, or the gray outlines of unknown mountains rising in the distance; even the white, deserted villas sparsely sprinkled on both hands had the appearance of something seen long, long ago, yet still vaguely familiar to his eye.

On a grassy knoll he halted, listening. The ominous sound in the distance came to him more clearly now across the still air, and suddenly he understood its import. It was no longer the muffled rumbling of thunder above the hills, but the thudding hoofs of countless horses—heavens, of how many myriads of horses, to cause such reverberations from the remoteness of the hills? Shading his face with his hand, he stared across the open stretch of country as far as his eye could reach, and in a moment he saw. . . .

Straight ahead it seemed as if the whole dark

outline of hillside crept slowly downwards to meet him. A violent tremor shook him from head to foot, but it was not of fear; that found no place among his emotions. In his tingling ears there rang again the cry of the old patriarch, 'The storm out of the north—the Visigoths!'

Impelled by an impulse he could not pause to analyse, Alaric Stane began to run in long, exuberant bounds. And he ran *towards the hills*! His mind was empty of all coherent thought as he ran onwards. Instinct alone was directing his steps. The trampling of the horse-hoofs was mingled now with strange, savage shouts, while ever and anon there rose above the tempest of sound a strain of wild, haunting music which oddly stirred him. The galloping hordes of the barbarians were coming with incredible swiftness towards him; only a few hundred yards separated them now, and it seemed that the storm must inevitably sweep him to destruction at the moment it broke upon him. Yet he waited its coming without fear, for the knowledge of many things long forgotten was slowly awakening within him, and already he knew how to act.

With a roar like the falling of a thousand cataracts they came, and for an instant he stood in their foremost ranks as they swept around him. Then he had clutched the flowing mane of a riderless animal, half-horse, half-pony, and with a lithe, easy swing he was upon its bare back. Jubilant shouts of greeting echoed round him, but the headlong advance did not check for an instant, and in the front rank of the warriors he galloped back over the grass-lands. He lifted his right hand for a moment from the shaggy mane, and felt the ancient iron crown still resting easily upon his head; and at the touch, in a final flash of awakened memory, he knew himself for what he was—Alaric, King of the Visigoths!

IV.

King of the Visigoths! All thoughts of any other existence, all sense of unreality, had slipped from him. He was nothing at last except the barbaric conqueror, with his chiefs around him, riding into the enemy's country upon the greatest of all his raids. The war-cries of his people sounded on every hand. A short distance behind him there thundered an uncouth chariot, in which stood women—strange, warlike creatures with flowing hair, and wrapped in cloaks of skins which reached to the knees. The sound of the harps they twanged rose ever and anon above the shouting and the hoof-thuds, a weird music, half-wailing, half-triumphant, which yet fired the blood, and seemed to spur the horses to an ever more furious canter.

Now they had reached the point at which the ground sloped down to the Roman village below, and could look away over the wide-stretching country beyond it. Along the white

Roman road was winding the dark column of refugees from the village, seeming at that distance scarcely to move at all, with their hampering baggage. But what was that in the remoter distance on which the light of the sinking sun was glinting fitfully? Alaric, straining his eyes, knew it for the breastplates of Roman soldiery, and knew that, once among their escort and mounted behind swift horses, the fugitives might yet be safe. To the ruthless spirits of the Goths, the idea of losing even such booty as that slight column represented was enough to drive to frenzy. But the refugees could still be overtaken.

Down the long road galloped the stream of warriors, until the white stone houses of the village uprose on either hand, when, into the centre of the road some twenty paces ahead of Alaric and his foremost warriors, there strode a young Roman.

So unexpected was his sudden appearance, and so calmly did he stand his ground, with his hand raised in a gesture of command, that the horsemen instinctively checked their steeds and pulled up, rearing and plunging, almost within arm's length of the youth, while those behind were thrown into instant confusion. As for the boy, he dropped his arm, and began to speak at once in a clear, ringing voice: 'Ho, which among ye is King Alaric, the son of the Balthi? I come to challenge him to combat, as it was foretold me I should, these three summers gone, by an old wise woman among us Romans. Alaric, I summon thee to answer.'

Then Alaric the king threw back his head and laughed, and called back in the Latin tongue, 'And how ended the prophecy, stripling? Doubtless the witch whose palm thou gilded promised thee victory over the barbarian king, hey!'

Thereat such of the warriors as understood his words broke into shouts of laughter, but there was no change on the face of the Roman boy. 'The issue of the combat I tell thee not. Come, therefore, and put it to the test, or before these thy people I will call thee coward.'

V.

There passed a scowl over Alaric's face, and without a word he sprang from his horse and stepped up to the boy. 'Thou hast called thy death upon thyself,' he shouted, and brandished his axe.

For answer the Roman unsheathed his short sword—his only weapon—and stepped lightly backwards. The king followed him with a bound, and with all his strength he brought his axe crashing upon his opponent. But the youth sprang nimbly to one side, and the battle-axe cleft the empty air. Next minute a sharp pain in his shoulder told the Goth that the short sword of his opponent had found a mark. The sting of the wound, and the knowledge

that his whole army looked on at the fight, fired Alaric's blood, and he closed with the Roman in earnest. Not for an instant did he doubt the ultimate result of the combat; the youth, bareheaded and without armour, with no weapon but his sword, had no advantage save his greater speed. Yet Alaric fought guardedly, for he knew as well as any how evil is the fate which awaits the over-confident. For a time they circled each other, the youth's lightness of foot still telling to his advantage, and once again the Roman sword bit into the shoulder of the king. And then came the opening for which Alaric watched. Throwing himself forward, he brought down his axe once more with all his strength, and the boy's right arm hung limp at his side.

The Roman stooped, and in a flash had picked up his fallen sword with his left hand. But now, although the adversaries circled and struck continually as before, the issue was foregone. It came at last, for with a mighty crash the Gothic battle-axe found the home it sought, burying itself deep in the shoulder of the Roman. He fell without a sound, and the king, obeying the law of the barbarian, had heaved it forth and raised it again to deal the death-blow, when from behind him there came a piercing shriek, 'Antonius!'

A girl, dishevelled and with black tresses flying in the wind, was rushing from a house at the roadside towards the prostrate form. Alaric stepped back and watched the scene grimly. Kneeling down, she raised the youth's head to her lap, and began to tear away the blood-stained doublet. Slowly he opened his eyes.

'Helena—go,' he murmured, and then, as he raised himself on an elbow, a haughty smile stole over his face, and, in something of his former ringing tone, he cried, 'Ho, King Alaric, where art thou? Come near, where I may see thee. The end of the prophecy thou askedst of was this: that I, being vanquished, should have bought safety for my friends. Look to the horizon.'

Alaric raised his eyes, and there, on the distant ridge, a black speck showed where the last of the fugitives was passing out of sight under guard of their escort.

A low murmur of rage burst from the lips of his marauders, but the king silenced it with a gesture. When he turned back towards the Roman he saw that he had once more lost consciousness, and that the maid was bending over him, oblivious of all that vast audience.

'Listen, girl,' he said softly, and at the sound of his voice she raised her eyes towards him. 'He is thine, and I give thee his life, if indeed thou canst still snatch it from the grasp of death. If not, take comfort in believing that he is thine hereafter through all the ages.' And raising his voice, the king swore it in a mighty oath by every god of the Visigoths. Then he

beckoned to his warriors that they should bear the wounded man indoors, and himself turned away and walked thoughtfully back through the ranks of his army. . .

VI.

The sun had almost sunk now, and was setting an edge of gold upon the far-away western cloud-banks. Alaric walked on along the road alone; his head was bent forward, and across his mind the crowding thoughts chased one another like scudding clouds across the wintry moon.

Yes, the sun was almost at rest, and the last twitterings of the birds hailed the coming of the night. He reached and passed through his wicket-gate, and leaning upon the topmost bar he watched the two figures who, hand in hand, came slowly along the road. All the harshness and arrogance had gone out of his face, and in its place had come a very wistful expression. He spoke to himself, slowly, disjointedly—"Antonius—Helena—"he is thine for all time." In this life as well as in the last, for it was fated to be so. . . . No, it has not been a dream, but a memory——' He shook his head and sighed softly, but already his inward struggle had ended in victory.

The two figures were only a few paces away from him now. Suddenly they saw him, and approached the wicket-gate. Tony Shipton's mouth was set in a line of firm resolve. 'Mr Stane,' he began at once, 'I cannot accept your offer; it would be too cruelly unfair to Helen. I have not explained anything to her—yet,' he hastened to add.

Stane regarded them a moment in silence. 'I wanted Tony to promise not to write you a line for a whole year, Helen,' he remarked.

Astonished indignation showed on the girl's face.

'But he will not consent, you see,' added Alaric.

'Not in any circumstances,' put in Tony firmly.

'Not in any circumstances, Tony?' A sudden smile lit up the face of the older man, and none could have guessed how great an effort his words cost him. 'Not even if—you go together?'

The girl was the first to grasp the sense of his words, and if he yet clung to any lingering, selfish hopes, that radiant light which lit up her face had instantly dispelled them. The look of happiness faded almost at once. 'We can't, you know, yet,' she said. 'We are both poor now.'

Leaning across the little gate, he placed one hand on a shoulder of each. 'You two children were always destined for each other, and you can't refuse to let an old buffer like me lend Fate a helping hand. No, no, don't interrupt me, Tony; it will only be a loan, to be repaid when you come to take back the manor, as I'm trusting some day you will.'

They did not speak, but each held on for a long time to the hand he extended to them, until Alaric gently drew away and picked up the crown of the ancient Visigoth king.

'You can't buy this back, Tony, for I've taken a fancy to it,' he said. 'It seems to hold a lingering memory of vanished ages and states, and of old-time battles fought and won.—Of another battle, too,' he added to himself as he bent over it, 'quite modern and not at all spectacular, but, oh Heaven! none the easier for that, all the same.'

WRITINGS WRONGLY ATTRIBUTED TO DICKENS.

By B. W. MATZ, Editor of *The Dickensian*.

I.

MUCH has been written concerning the way Dickens suffered at the hands of literary pirates and journalistic hacks during the early days of his career as author. How these writers, devoid of originality themselves, and possessing no imagination or literary ability of their own, waited hungrily for his stories to appear in order to turn them to their own sordid and commercial account, is common knowledge; how by plagiarising them, attempting to continue them, or by closely copying their titles, characters, plots, or by adopting a colourable imitation of Dickens's pseudonym, it was possible to create an utterly spurious interest in their wares.

Readers will readily recall how the *Pickwick Papers* and other books of Dickens's were treated in this respect. The names of *Pickwick* or Sam

Weller were used to cover up the inanities of many a publication, or to attract the enthusiasm of the Dickens public. We had *Pickwick Abroad*, *Pickwick in America*, *Sam Weller's Jest Book*, *Nicholas Married*, *Nicholas Nickleberry*, *Oliver Twiss*, *Dombey and Daughter*, and scores of others. Dickens became so enraged at one time that he brought an action against one of the pirates, with, however, no very satisfactory results.

But there was another phase of this dishonest trafficking with his name that has been little dealt with—that of reprinting stories and articles by other writers over his illustrious name in order to trade on his great reputation and reap a substantial benefit thereby.

Perhaps it would be charitable to assume that some of these cases were due to jealousy or sheer ignorance, although we suspect that the

chief aim was to make money out of his name and fame, even at the risk of chicanery being discovered. We wonder whether Dickens heard of, or saw any of, these deceptive publications, and if so what he had to say of them. Being chiefly perpetrated in America, possibly they never came under his eye.

The mine in which most of these pirates worked was *Household Words*. As is well known, it was a rigid rule of Dickens as editor of that journal that all contributions to its pages should appear anonymously, no matter how famous and distinguished the writer might be. Even his own contributions did not bear his name. It is also well known that he so rewrote many of his contributors' articles that it was often difficult to judge which were his and which not, and as a consequence many an article was wrongly judged to be his. Even his own son, in attempting to discover his father's anonymous writings in *Household Words*, fell into errors of the kind. It is not altogether surprising that others were equally unsuccessful, and so we find that some publishers, without any other data to go upon than chance guesswork, reprinted from that paper stories and articles which on a cursory glance they determined were from his pen, and published them as such.

Several volumes and pamphlets were accordingly issued during the early days of *Household Words* which would have by now become lost to the world had they not Dickens's name attached to them to suggest a hall-mark of worth. Some of these, through the ardour of the collector of Dickensiana, have been preserved as curiosities and rarities, and a quite fictitious value is put upon them in consequence.

II.

There are two flagrant examples of this dishonest use of Dickens's name. The first comprises three stories, entitled respectively *Fortune Wildred*, *Lizzie Leigh*, and *The Miner's Daughters*. They were published, in one volume with a paper wrapper, in New York without a date, but probably in 1855.

The text on the wrapper reads as follows:

FORTUNE WILDRED

The Foundling
To which are added

LIZZIE LEIGH

and

THE MINER'S DAUGHTERS

A Tale of the Peak
By CHARLES DICKENS.

New York:

De Witt & Davenport, Publishers, 160 and 162
Nassau Street.

The title-page proper differs from the wrapper by the substitution of the word 'also' for the

words 'to which are added,' and by the omission of the sub-title to 'The Miner's Daughters.'

Dickens wrote none of these stories, and although it might have been claimed by the publishers that the wording of the title-page did not credit him with the authorship of the first named, it clearly did in regard to the second and third. We are unable to state who wrote 'Fortune Wildred,' nor can we discover that it appeared in *Household Words* under that title; but 'Lizzie Leigh' was by Mrs Gaskell, and 'The Miner's Daughters' by William Howitt, and both appeared in *Household Words* during the year 1850. 'Lizzie Leigh' had previously been issued by the same firm in 1850 in separate form, and in *The Irving Offering*, an annual published in New York in 1851. In each case Dickens was cited as the author.

The other flagrant instance of such trickery was the reprint of a story called 'Sister Rose,' published in Philadelphia, also without a date, the title-page of which reads:

SISTER ROSE

in Seven Chapters

By CHARLES DICKENS

Author of *Pickwick Papers*, *Bleak House*, *Old Curiosity Shop*, *David Copperfield*, *Oliver Twist*, *Dombey & Son*, etc.

Philadelphia:

T. B. Peterson, No. 102 Chestnut Street.

It was evident that there should be no doubt as to who Dickens was.

In the centre of the title-page are extracts from press opinions in praise of Dickens generally and of Peterson's editions of his works in particular. The author of the story was Wilkie Collins, and it also was filched from *Household Words*, where it ran as a serial in 1855.

We wonder what Mrs Gaskell, William Howitt, and Wilkie Collins thought of these piracies?

Not only publishers but editors also adopted this unwarrantable method of using Dickens's name. We say unwarrantable, because if they had wanted to be sure who actually wrote the stories, they need only have inquired of the editor of *Household Words*.

About this time it was the fashion to publish literary annuals, of which *The Keepsake* was perhaps the most notable and reputable example. These annuals contained contributions from various writers and artists, and were very popular in their day. Three of them contain stories wrongly ascribed to Dickens. One of them, *The Irving Offering*, we have already referred to. Another was entitled

THE JOSEPHINE GALLERY

Edited by the Misses Carey with 8 fine coloured portraits of Notable Frenchwomen. Small 4to Morocco, gilt edges. New York, 1861.

This contains a story entitled 'A Suburban Romance,' described as by Charles Dickens, which, as a fact, was by W. H. Wills, and appeared originally in *Household Words* on 14th December 1850, and was included in the volume *Old Leaves Gathered from 'Household Words'* by W. H. Wills, published in 1860, a year before *The Josephine Gallery* saw the light.

The third annual referred to was called *Leaflets of Memory*, published by W. H. Appleton of New York. It contained a story entitled 'The Daily Governess,' also wrongly attributed to Dickens. This story in all probability was taken from *Household Words* and given a new title. We have been unable to discover if this is so, but it certainly was not by Dickens.

There was also published in America a volume entitled *Confessions of an Attorney*, the second part of which comprised articles grouped under the general heading of 'Abuses of the Law,' all of which were attributed to Dickens, doubtless because they also appeared originally in *Household Words*. Although Dickens wrote a good deal on the subject in his paper, it so happens that none of those collected by the American attorney was actually written by the novelist. We give below a full list of them as they appeared in this book, with the names of the rightful authors appended:

'Martyrs of Chancery,' by A. Cole and W. H. Wills; 'Law at a Low Price,' by W. T. Haly and W. H. Wills; 'The Law,' by Charles Knight; 'Bank Note Forgeries,' by W. H. Wills and Dickens; 'Duties of Witnesses and Juries,' by D. M. Hill.

Perhaps the American attorney in question had no dishonest motive, and would have used his examples of literary abuses of the law from *Household Words* even had he known who actually wrote them. He assumed they were by Dickens, and said so without further inquiry.

III.

The cases so far quoted, with one or two possible exceptions, are manifestly instances of trading unjustifiably on the name of Dickens, and each emanated from America. Mistakes, however, in identifying some of Dickens's writings have been made in this country, the most notable being that of the little pamphlet entitled *A Curious Dance round a Curious Tree*. This was published in 1860, and bore Charles Dickens's name upon it as author. It originally appeared in *Household Words*, 17th January 1852, and was published in pamphlet form in aid of St Luke's Hospital for lunatics in 1860. It was, however, written by W. H. Wills, and appears in his volume *Old Leaves Gathered from 'Household Words'*, which was published in the same year as the pamphlet, wherein it is acknowledged as one of the articles which owed

much to the assistance of Dickens, 'whose masterly touches gave to the Old Leaves . . . their brightest tints.' That Dickens wrote a good deal of it the discovery of a portion of the manuscript testifies; but that he did not claim the authorship is evidenced by the little sketch appearing in W. H. Wills's book during Dickens's lifetime.

A much more intricate problem, and one that is now unsolvable, in which the names of Dickens and Wills are involved, is the case of an article entitled 'A Plated Article' which appeared in *Household Words*, 24th April 1852. In the contributors' book to that paper the authors are stated to be C. D. and W. H. W.; but Wills evidently claimed the authorship, since he printed the article in his volume of *Old Leaves*, with his usual acknowledgment to his editor's assistance. Dickens also claimed the authorship, for 'A Plated Article' appears in his volume of *Reprinted Pieces*, which was published during his lifetime. There the problem must be left.

In 1855 another pamphlet, entitled *Drooping Buds*, was issued in aid of the Children's Hospital in Great Ormond Street. This was a reprint of an article from *Household Words* of 3rd April 1852, written by Henry Morley. The original pamphlet bore no author's name, but a reissue was made in 1866 with the authorship wrongly attributed to Dickens. Only one copy has been seen of this issue.

In 1908 the present writer was fortunate enough to have access to the contributors' book of *Household Words*, and with its aid was able to identify all Dickens's work in that paper. These were published ultimately in the volume entitled *Miscellaneous Papers*, and added to Dickens's already published works. Before this date bibliographers were continually trying to discover amongst the anonymous mass of material in the volumes of the novelist's weekly paper the uncollected work of Dickens which they knew reposed there.

Many were successful in certain cases, but many were far from the mark. The articles in the following list, to which we append the names of the actual authors, were all credited to Dickens by different bibliographers:

'Foreign Portraits of Englishmen' (21st Sept. 1850), by W. H. Wills and E. Murray; 'Household Words and English Wills' (16th Nov. 1850), by W. H. Wills; 'Epsom' (7th June 1851), by W. H. Wills; 'Douglas Jerrold' (5th Feb. 1859), by Wilkie Collins. In the volume entitled *To be read at Dusk and Other Sketches and Essays hitherto Uncollected*, by Charles Dickens, edited with an Introduction by Frederick G. Kitton, was an article called 'By Rail to Parnassus,' which appeared in *Household Words*, 16th June 1855. This was, however, the work of Henry Morley, and not Dickens.

The last delinquent in this respect, and perhaps the worst because of carelessness, was the present writer, who, in compiling and editing the volume of *Miscellaneous Papers, Plays, and Poems* already referred to, committed the error of crediting Dickens with two poems which he certainly did not write, namely, 'Hiram Power's Greek Slave' and 'Aspire.' The explanation of how these errors came about was made in a contemporary at the time, and in subsequent editions of the volume they were omitted.

There is one reflection which the writing of this article inspires: what a wonderful journal *Household Words* must have been! Everybody seemed to read it. They not only read it, but bound the numbers into volumes, and kept them as a storehouse of knowledge and entertainment for continual reference. Even to-day,

when one dips into them in search of a bibliographical fact, one is tempted to read on, and exclaim that Dickens not only knew what the public wanted, but gave it them in ample measure. There was no weekly paper like it before, and certainly there has been none like it since. Authors were given the space they wanted for their purpose, and not restricted to a certain number of lines, whatever the subject, the method adopted to-day which encourages superficiality. Little wonder then, when editors or publishers wanted something good and worthy for whatever purpose, that they should turn to Dickens's paper for it. The error they fell into was that of crediting Dickens with being the author of everything that appeared in its pages, or, at any rate, of the particular item they chose, without making sure that it was so.

'DON QUIXOTE' AND THE ORPHANS.

CHAPTER III.—TO THE RESCUE OF A CAPTIVE DAMOZEL.

I.

AS Marshall had announced, the 'señor and señorita from *Inglaterra*' were Rupert Lestrangle, younger brother of the orphans' father, and his sister Mabelle. Immediately after her husband's death, which had been unexpected and was quite inexplicable, Mrs Lestrangle had written to his people. As no answers had been received to many telegrams and letters sent by them in reply, the brother and sister had resolved to visit Mexico and ascertain for themselves what had become of the widow and the children.

The mining engineers also learned that the dead man had been a great traveller and explorer, that he had no regular occupation, and made his home wherever the country and people took his fancy.

Versed in various sciences, and having discovered the great silver ore deposit by accident, he was able to recognise its value, and had written to his brother Rupert about it, giving particulars of the locality. On arriving at San Pedro Mixtepec, the newcomers, like Billy Brooke and Marshall, had been taken to the Judge's house, but, unlike the mining engineers, they had found the *Juez* immediately communicative. He was just setting out for the capital of the state on the orphans' affairs, but willingly deferred his visit to Oaxaca City in order to accompany the travellers to Santa Elena. The rest has been told.

At the camp on the Bluff, as the trooper had declared, there was much to do and little time to do it in. Quickly the breast-work was strengthened and extended so as to afford protection for the many animals, while the embryo

mine was opened afresh and converted into a dugout for the women and children.

At a council the *Juez* declared, and the troopers agreed, that the brigand leader, for whose body, alive or dead, the governor of the state had offered a reward of ten thousand pesos, could muster about a hundred men, all trained to arms in the frequent revolutions, and outlaws to the last ragged rascalion. The *Juez*, however, was of opinion that if boldly faced they could be beaten off. They were *bravos*, not *braves*, and beyond the plunder of the camp there was not much to gain unless they secured prisoners. There were just two motives for an attack, both strong, however—the prospect of heavy ransoms for the *Inglés*es if captured—all *Inglés*es being reputed fabulously rich—and the passion of the savage man for revenge. On this the *Juez* laid the greater stress.

'There is no more atrocious devil in the *Infiernito* (little hell) which Mexico has become than Pablo Revuelto,' he said, 'or in the *Infierno bajo* (the hell below). He has been wounded by our brave friend Don Sancho. For his blood he will thirst while his fiendish breath pollutes God's good air. Don Sancho,' he added, turning to Marshall and chuckling, 'may not himself fear becoming an *aparecido*, but he would certainly be in much less peril of it if he had made one of Don Pablo.'

'I may succeed in doing that before this business is over,' Marshall returned. 'But you are right, *Señor Juez*. I saw that fellow's looks when my bullet struck him. He'll have revenge, or go cheerfully cursing to your very deepest hell trying to get it.'

That the bandits would attack was the firm opinion of the other Mexicans. But when?

Each answered the question in the Mexican way—'¿Quién sabe?'

II.

At the darkest hour, just before dawn, Rupert Lestrangle, on outpost duty lower down the Bluff, suddenly shouted a warning, and discharged both barrels of his gun. A few seconds later he sprang into the fort. 'They're coming!' he cried in great excitement. 'Couldn't see 'em, but heard their spurs clanking. What fools they must be not to have taken 'em off! What does the fellow say in—in—isn't it *The Last of the Mohicans*?—"Fire low and sweep the glacis!" Did that, by Jove! Must have peppered the legs of a dozen of 'em.'

Just then his sister came up the rude ladder which afforded egress from the embryo mine. 'What is it, Rupert?' she asked. And Billy Brooke, who had thought her fair English face lovely, would have sworn that her voice was the sweetest he had ever listened to.

'They're coming!' young Lestrangle repeated. 'Hadn't you better stay below?'

'Certainly not,' she said, and asked for his revolver and cartridges, as, having a shot-gun, he would not require them. Finally she appealed to Don Quixote.

'The *Juez* is in command,' Brooke replied. 'You would be much safer below, but I shall ask him if it is permissible.'

'There are many precedents,' said the old man in answer to Brooke's question. 'In Spain, the Maid of Saragossa. In France, Jeanne d'Arc. But I am sure the señorita will pardon me if I suggest that by remaining with the orphans in the mine of the orphans she will avoid the risk of speedily becoming the most beautiful of *aparecidas*.' And he chuckled with glee.

'Oh Lord!' muttered Marshall, who stood near. 'He's worse than Mr Dick with his everlasting ghosts. Hullo!' And lifting his rifle, he fired over the parapet at a small flame in the darkness. One of the brigands had evidently struck a match to light a cigarette. The response was immediate.

'*Fuego!*' bellowed a hoarse voice. Next moment flashes from some fifty rifles stabbed the blackness, and a score of bullets spattered on the stones.

At the word '*Fuego*' Brooke had flung an arm round the girl, who was leaning over the rampart, and, exerting his strength, had drawn her swiftly out of danger. 'You must pardon me,' he said. 'It had to be done.'

Except for a whispered 'Thank you,' the girl made no comment on her rather rough handling—perhaps because just at that moment her brother called to her. 'You can have the pistol and the gun now, sis,' he said, in an odd, constrained voice. 'You'll find the cartridges in a satchel near your feet.' And thrusting the

weapons into the girl's hands, he groped his way towards the dugout ladder.

'Funk,' thought Billy Brooke, but he was mistaken. He heard the girl open and close the breech of the gun, then her voice. 'Please take care of these a few minutes. I must see to my brother. He has been hit.'

'Surely not!' he cried.

'He wouldn't have gone away otherwise,' she rejoined. 'Nor would I go now, but for that.'

In the dugout a faint light was burning. The girl disappeared down the make-shift ladder, but returned almost immediately.

'It isn't serious,' she said. 'Just a bullet graze on the arm. I was only needed to tie a bandage. You must remember if any one gets hurt that I am rather skilful with bandages.'

'What a wife for a mine manager!' thought Billy Brooke. It was a reflection which recurred often in the next few days.

III.

As gray streaks were now showing in the east, forerunners of the dawn, Brooke spoke to one of the *rurales* who was lying under the parapet to keep warm, for it was very cold on the Bluff.

'The sun will be climbing up in a few minutes,' he said. 'I scarcely think they will try a rush now. Anyway, they don't seem in any hurry about it.'

The man rose and listened. 'They certainly will,' he answered. 'Ah! They're on the move—creeping up at this moment. Look out!' And from the opposite side of the fort his comrade confirmed the warning.

There was an instant uproar. Yelling '*Muerte a los gringos!*' at the tops of their voices—all English-speaking people being *gringos*, or North Americans, to the Mexican *peóns*—the bandits came on at a run. But the defenders were well prepared. The sharp cracks of the Winchesters blended with the heavier explosions of the black powder cartridges young Lestrangle was using, for at the first shot he had clambered up the ladder and taken his gun, and was now firing as fast as he could, all the time yelling the slogan he had adopted, 'Fire low and sweep the glacis!'

It was soon over. The attack fizzled away in less than three minutes. No bandit got within the fort. Cursing savagely, they scattered down the hill, such of them as were able, to seek refuge in the scrub which bordered it.

While Felipa and Juan of the Spurs lit a fire for coffee, the others discussed the situation. Brooke and Marshall declared that they had not really come to Mexico to fight brigands. They would protect the orphans and their rights, but were not prepared without help to hold the Bluff indefinitely just because it covered a rich deposit of silver ore. What did the *Juez* think about it?

The old man grinned as he answered. 'You are right,' he said. 'It is not to be expected, even of the Knight of La Mancha. For the children, yes; not for filthy lucre. But nevertheless, for my part, most honoured and chivalrous *caballeros*, I would say that I am very pleased to be here. It is a delight to me. The genius of my great countryman conjured up Don Quixote and Sancho Panza out of his soul, and in the spirit I have had almost daily intercourse with them, but I never expected to meet them in the flesh. I have done so notwithstanding, and as I find them worthy of emulation'—here the *Juez* drew up his squat figure and expanded his chest; for the moment he was Don Salazar Romero, Knight of España—'I will do no less than they. This hour I start for the city of Oaxaca, and these bandits shall be swept off the earth. *Caballeros*, I shall only ask you to remain here a little longer. In the shortest time I shall return with fifty *rurales*. I only request that Señor Morales, whose task is finished, shall accompany me.'

'Rummy long-winded old juggins,' said young Lestrangle. 'What has the jolly old beggar been talking about?'

Whilst Brooke explained, Marshall, Juan of the Spurs, and the troopers saddled their horses, and presently rode off to scout around the Bluff, and satisfy themselves that the bandits had really departed. Except the body of *El Capitán* José Guerrero, lying on his back with a cigarette—the attempt to light which had cost the fellow his life—still between his finger and thumb, they saw no sign of their assailants. Half-an-hour later the *Juez*, accompanied by the interpreter, started on his perilous journey.

Feeling sure that the brigands had returned to their hiding-place, wherever that might be, and had taken their wounded with them, Brooke and Marshall resumed their prospecting, following up more of the outcrops, and taking numerous samples for the latter to assay. Later on they were joined by young Lestrangle—with his wounded arm in a sling. Thoroughly interested in their task, having food with them, and feeling perfectly free from danger, they continued their operations until close upon sunset, when they returned to the camp, to learn to their utter consternation that Miss Lestrangle had taken little Hugo for a ride, had not returned, and that Juan of the Spurs and one of the *rurales* had gone in search of them—had been gone an hour.

'Why did you permit the señorita to go?' Brooke demanded of the trooper in charge of the camp.

'We all tried to dissuade her,' he answered; 'but as the señor will know, she is very wilful. She said the horses wanted exercise, and she would only ride down to the *playa*.'

Just then, to add to their anxiety, they saw the other trooper gallop out of the scrub into

the open, leading Juan's horse. In a few seconds he had reined up before them. 'The señorita and the boy have been captured by the *bandidos*!' he cried breathlessly. 'It is very unfortunate, but I warned her of the danger. So did Don Juan, but she would go, and alone with the *niño*. Don Juan, who served in the army as a scout, is trailing them on foot. He says you are not to be alarmed. He will find them.'

'Not to be alarmed!' They were desperately alarmed; indeed, young Lestrangle was frantic. He wished to set out to the rescue at once—proposed a score of plans, each succeeding one wilder than the last. But as the *rurale* pointed out, in a few minutes it would be dark, and nothing whatever could be done until the morning. Of this Brooke and Marshall were only too well aware. The scrub fringing the Bluff and the forest beyond it consisted largely of the myriad spiny growths for which the arid regions of Oaxaca are notorious—impenetrable in daylight except in the trails made by wild cattle, and then at the cost of many scratches, quite impossible to traverse at night by any less familiar with the thorny paths than reckless bandits like José Guerrero.

Old campaigners, who had fought in many revolutions, the troopers, perhaps to cheer the strangers, were inclined to minimise the danger. The bandits were just highway robbers, they urged. Ransom would be their only object, and as the brute Guerrero was dead, and Don Pablo lying badly wounded in some hiding-place, no harm would be done to the captives.

(Continued on page 612.)

THE HILL LOCH.

I CANNOT leave the loch until the dusk
Its pale web spreads upon the hills
And calmness falls. Above, the wild snipe drums,
Like some weird monster, while his mate
From far below sends up an answering call;
The wily trout now roll in careless glee,
The air is full of scent and mystery.

Within the reed-bed's shelter all's astir—
Domestic squabbles of the coot and water-hen;
The wary teal comes swiftly back to rest,
The grouse gives out a sudden rocking cry,
Soft twilight deepens to the verge of night;
Adown the hill creep wisps of fragrant smoke.
The filmy edging to a denser cloak.

Reluctantly and slowly mounting up
Across the hill, by mould'ring drystone dykes,
Past bog and well-ee, and a crofter's homie,
I gain the crest and see a lurid line
Of heather set ablaze by wanton hands;
The hissing, roaring, living tongues leap high
As in the blackened track I pass them by.

Now doubly-dark the glen, scarce seen the path
To where the winter waters tore a way
(Beneath their bed still runs a hidden stream),
But by an easy rise the old cart track
Conducts the wand'rer to the homeward side;
Below, the misty strath spreads far and free;
A distant lighthouse gleams upon the sea.

Chambers's Journal

SEVENTH SERIES

THE GLORY OF SEPTEMBER STARS.

By Professor GEORGE FORBES.

I.

IN our latitudes the stargazer's year commences with the fall of the leaf; partly because, in summer, few hours remain after the long evenings of twilight when stars can be seen; and partly because after that month all our favourite constellations begin to appear at eventide.

Some enthusiasts make a practice of beginning their astronomical year by staying out of doors from sunset to sunrise, during the whole of one clear night when there is no moonlight, in September. They can then witness the night's procession of nearly all the stars, marching from left to right while they face the south. Throughout this 'march past' the stars retain their formations and relative positions, as if they were fixed to a vault of heaven which turns round an imaginary line drawn from the observer to the North-star, Polaris.

During this night-watch almost every star and constellation that ever shines in our sky is passed in review. Only those in that part of the heavens occupied by the sun, near Virgo, the Virgin, in September are outshone by the sun at sunrise and sunset. So that on this New Year's eve of the star-lover, nearly every old friend comes in turn to the saluting point and claims recognition.

Even those people who have not previously learnt to call the stars by their names often find that this 'all-night sitting' in September serves a purpose. It introduces them to that more intimate acquaintance with individual stars and constellations, which gives always thereafter a new zest to their outlook on the heavens.

On a September evening the sight of Capella, at the head of the constellation Auriga, the Charioteer, over the north-eastern horizon, warns the old hand to look out, in the next few hours, for the rising in the east of Taurus, the Bull; Orion, the Hunter; Gemini, the Twins, and all those brilliant stars which will, before the dawn, culminate in the most gorgeous star-picture that can ever be seen in the sky from any part of the earth's surface.

Such a continuous study of the star-pro-

cession, from sunset to sunrise, at one or two dates in the year, helps to unite into one whole the various aspects of the sky as seen in the varying seasons and hours.

On any other night, it is a good plan to spend a short time, always at the same hour, every clear evening, in the enjoyment of recognising old friends among the stars and looking out for any new features. Besides the noting of the phases and place of the moon, this practice leads to watching the movements of planets among the stars. It may lead to the unexpected enjoyment of an exceptionally brilliant meteor-shower of superlative grandeur, as was my own good fortune in 1873, on the 23rd November, when the lost comet of Biela reappeared as the finest meteor-show I ever saw, always excepting the unique display of Leonids on the 13th November 1866.

The same habit may disclose to view on some night an unrecorded comet. But, best of all, the habit may lead any one to the first discovery of a new star. This luck must fall upon some one. In 1892 it was the luck of an Edinburgh man, Dr Anderson, who had the habit of interviewing daily the stars at 3 A.M. And again, in 1902, in the same way, he was the first discoverer of a new star in Perseus, the brightest ever seen for about 300 years. These wonderful new stars are rare. They rise to full brightness from invisibility in less than a day, and seldom remain visible to the naked eye for more than a month or two.

By choosing always the same hour for this interview with the stars, the order of procession from month to month, the same as from hour to hour, can be fixed in the mind. If a star atlas (like Proctor's pocket one) and a flashlight be always used, any one will be able, in a year or two, to name every star that he can see, some three thousand in all.

II.

Suppose, then, that on a moonless September night, say between 7 and 8 P.M., one begins an all-night study of the brighter stars in the south that follow each other from left to right throughout the dark hours. Which are the brightest stars to be seen at that time? There are three, in different parts of the sky, that

will catch the eye as being quite the most resplendent—one in the west, one overhead, and one to the east of north.

Nearly overhead is Vega, or Alpha of the Lyre constellation, shining with a soft steel-blue colour. Then in the west, above the still sunset-flushed part of the horizon, Arcturus flashes in a solitary grandeur with an orange tint. Lastly, a little east of true north, just as high above the horizon as Arcturus was seen in the west, the brilliant Capella shines yellow. Capella is at the head of a C-shaped string of stars, not all risen yet, forming the constellation Auriga, the Charioteer.

Besides these three first-magnitude stars, Vega, Arcturus, and Capella, there are many others to claim special attention at this hour, 8 P.M. in September. Half-way down from Vega to the southern horizon the bright Altair is recognised by his having two less bright companions, all in one straight line pointing up to Vega. Altair is the brightest star in the constellation Aquila, the Eagle.

If we look up again at Vega, the five brightest stars in its neighbourhood take the form of a long Roman cross, and make up the constellation Cygnus, the Swan. If the night be really clear, the Milky Way in this region will be seen to be divided into two luminous branches that meet at the Swan constellation.

Altair and the Eagle being now half-way from the zenith to the south horizon, a glance to the left reveals a great square with four bright stars at the four corners. This constellation is the great square of Pegasus, and its two upright sides point to the Pole-star.

From the top left-hand corner of this very conspicuous square a string of three bright stars runs to the left and downwards, being part of the constellation Andromeda.

If the observer now examines the northern sky, other groups of stars, or constellations, are noted. At this hour, 8 P.M. in September, the seven stars known in this country as the Plough are very low down a little west of north. The Plough is part of the constellation Ursa Major, the Great Bear. It is a guide to other stars. Four of the seven stars form the ploughshare. The other three are the curved shaft of the plough—or the tail of the bear.

The two end stars of the ploughshare are called the pointers, because they point to the Pole-star, fairly high up in the north. A line from the middle of the Plough through this Pole-star leads to the constellation Cassiopeia, or Cassiopeia's Chair. At this hour it is right above Capella, already identified. The five stars of this constellation, if joined by imaginary lines, would form a W written in the sky, so Cassiopeia cannot be mistaken.

Return now to the Great Bear. If you carry the eye along the curve of its tail and beyond it comes to Arcturus, already noted as setting

in the west. This is a useful way for identifying Arcturus at any time. The same curved line carried on an equal distance beyond Arcturus would lead to Spica, the brightest star in Virgo, the Virgin. At this hour, however, Spica is below the horizon. In fact, during September, the sun is close to Spica, and prevents it from being seen.

When to the glory of the few stars that have now been named is added the general impression of the less conspicuous ones, we have before us now, at 8 P.M. in September, a truly wonderful panorama. But it is as nothing when compared with the glory that is about to arise out of the eastern horizon in the next few hours, heralded by Capella and the C-shaped Auriga.

The same panorama as that which we see at 8 P.M. in September, with the same stars in the same positions as now over the landscape, will be seen one month later and two hours earlier; or two months later and four hours earlier; that is to say, at 6 P.M. in October, or at 4 P.M. in November.

So also exactly the same panorama would have been seen, in the same positions as now over the landscape, one month earlier and two hours later, or two months earlier and four hours later; that is to say, at 10 P.M. in August, or at midnight in July. It is always a change of two hours for each month.

III.

Having now surveyed the constellations at 8 P.M., we note that a great change occurs in the next four hours. By 10 P.M. in September Arcturus has set in the west, and Vega has climbed down from her great altitude. But it is to Capella, the third of our brightest stars, and to her neighbours now risen or about to rise above the horizon, that the gaze of any watcher must be directed from now onwards.

At 10 P.M. Capella is twice as high above the horizon. And now she shows herself as the queen of a string of five stars, shaped like a capital C, which at this hour lies nearly on its back. All these five stars belong to the constellation Auriga, the Charioteer, except the bottom one, which happens to belong to the neighbouring constellation Taurus, the Bull, now coming into view as the herald of the more splendid Orion. The king of the constellation Taurus is a ruddy star, just risen, and its name is Aldebaran. It is of the first magnitude.

After another two hours, that is to say, by midnight in September, the grandest constellation of all, Orion, the Hunter, is coming into view below Aldebaran. At this hour Orion has not yet assumed an upright position as the bold hunter, but is fixed in an inclined position, leaning to our left.

Hour after hour the star-gazer will watch the gradual marching of Orion to the right, and his gradual assumption of a more and more upright

position, owing to his turning with all the constellations round the Pole-star, high up in the north behind us.

In September, the watch on Orion will have to be prolonged to sunrise before this splendid group of stars reaches an erect attitude in the south. By that time Capella has reached a position overhead far above the head of Orion.

During these early morning hours of the September day a succession of superb stars have risen in the east and mounted higher. First come Castor and Pollux, the golden pair of twins; then Procyon, followed by Sirius, the Dog-star, the greatest star of all. Half-an-hour later, at 3 A.M. in September, Leo, the Lion, rises in the east. It is unmistakable, because a line drawn through six prominent stars in Leo takes the form of a reaper's sickle, with the very bright star Regulus at the end of the handle.

And finally, toward the hour of sunrise in September, Orion stands erect. Two bright stars mark his shoulders, two more his legs. Three little stars indicate the head. But the three stars, in a line nearly horizontal, that mark his belt, with others suggesting a sword hanging therefrom, are the feature that identifies him best. The more so because these three stars point down to the left towards the superb Sirius, and upwards on the right towards the ruddy Aldebaran.

Sirius and Aldebaran are the feet of an arch of magnificent stars that frames the picture of Orion. This jewelled arch includes Sirius, Procyon, Castor, Pollux, and Aldebaran, some of the most beautiful of all stars.

The splendour of the six stars is overwhelming, and no star in the heavens can rival Sirius, a star upon whose magnificence every human eye must be riveted in silent admiration. Yet, however much the jewelled frame may enhance the picture of Orion, it is the seven principal stars of that constellation itself with their immediate attendants, due south of us, that fascinate the beholder at midnight of Christmas time, towards sunrise in September, or soon after sunset in March. This wonderful spectacle, with the encircling frame of such giants as Aldebaran, Capella, Castor, Pollux, Procyon, and Sirius, creates a picture so complete, so exquisite, that no single one among them, not even Sirius, can for the moment claim more honour than as being a unit in this most superb illumination, a prospect which has drawn forth the admiration of all nations for a hundred generations, nay, for as long as men have been upon our planet.

IV.

And now the ten-hour watch in September is over. We have noted the key-stars and constellations from Arcturus, which set soon after the sun, followed by the Cross of Cygnus at the fork of the Milky Way, and Vega. Then came

Altair of the Eagle, and the great square of Pegasus with Andromeda. The stars which rose during the period of our watch began with Capella's constellation Auriga, the Charioteer. It was followed by Aldebaran of the Bull, and later by Orion, and the twins Castor and Pollux, by Procyon and Sirius, and finally by Leo, the Lion. Thereafter, Virgo, the Virgin, was due to rise, but, that region being now occupied by the sun, sunrise closed the diorama near the bright star Spica of the Virgin, and we have been able to pass in review nearly all stars from Virgo to Virgo.

Given an easy guide to the constellations, a star-atlas or a planisphere, and a flashlight, this ten-hour tour of the heavens may be undertaken without further guidance. The same accessories, if used for half-an-hour at a fixed time on every clear night, will give a steadily increasing pleasure to any one who wants to know the names of the stars and the order of their succession in the nightly review.

Having thus acquired a bowing acquaintance with the monarchs of the firmament, many a watcher will seek a more intimate friendship. Old-fashioned geography, dealing with the towns of the world, was content to indicate their position. The new geography expects its students to know about the manufactures and commerce of each town, why they are there, and its relations with other towns. So it is with astronomy. In old days people were content to know the position of each star. Now we want to know in which direction it is moving, and what it is made of; whether it is constant in brightness, or variable; and whether it is single or attracted by a companion, revolving in a definite orbit. Is it associated with other stars of any well-determined stream? What affinities does it possess in common with any other groups of stars? If our colour-sense be good, we notice that Vega is bluish, the Orion stars greenish, Capella yellow, Arcturus orange, Betelgeuse and Antares of the Scorpion red. In the new astronomy we want to classify all the stars in this way, and to know the meaning of these tints of colour.

It is evident that any one who has learnt the names and places of the principal stars is sure to go on and learn what has already been done by astronomers to know the character of each star, like Vega, for instance. Why does Betelgeuse, at Orion's right shoulder, differ in colour from Rigel and the other stars in Orion? Are Castor and Pollux really so twin-like as they seem? Or in what points do they differ? Is there any kind of physical connection between the individual stars that seem to be associated in one constellation, like the seven big stars of the Plough? Which stars are nearest to us, and which of the bright ones are most distant?

The answer to many of these questions, so far as they are known, is often hidden away

in the periodical literature of astronomy. Occasionally a historian of our science, Miss Agnes Clerke, for example, has delighted us with a summary, or a connected story, of these discoveries. But it is soon out of date, and the earnest student has the great happiness of being himself the discoverer of all these discoveries in the periodical astronomical literature available in some library.

Either in that way, or else by the help of a friend who has made himself acquainted with recent astronomical observations and discoveries, the star-gazer can realise a new form of enjoyment by a more personal contact with the different stars.

The present writer, immediately on recognising any particular star, has his memory alive with most delightful ideas that are associated with the star. This outlook is probably shared by all astronomers, and it is part of the great uplifting emotion that is always to them the accompaniment of a clear, starry night.

V.

To explain what is meant, let us take any simple case—some bright star. Let us praise, for example, the glory of Arcturus, because after this month of September it will have ceased to shine upon us, being then approached too closely by the sun.

It so happens that I never see Arcturus without recalling the fact that this was one of the first three stars whose places were found by Halley, two centuries ago, to be sensibly changed since the time when they were recorded by the ancient Greeks, or even since Tycho Brahe.

Halley, one of our great Astronomers Royal, found that, since the days of Hipparchus, Arcturus has moved among the other stars through a distance actually amounting to six or seven times the apparent diameter of the moon.

And since, more recently, the distance of this star from us has been measured, we now know that this means that the motion of Arcturus, at right angles to our line of sight, is at the prodigious rate of 273 miles every second, and that it is now 12,218,656,000,000 miles away from the position in which it was seen by Hipparchus and Ptolemy.

The thoughts then wander to the proper motions of other stars, to the ingenious device now being used by Eddington and by the Astronomer Royal at Cambridge and Greenwich Observatories for superposing star negatives photographed at two dates twenty or thirty years apart. In this way even minute motions of the stars are being detected and measured. Then the thoughts about Arcturus carry us in admiration to the great American catalogue of the proper motions of twelve thousand stars. And we then recall how Eddington, by the use of this catalogue, was able to confirm Kapteyn's marvellous discovery of systematic motions among the stars.

Twenty years ago Kapteyn, of Holland, made a most surprising discovery, that most of the stars belong to one or other of two great star-streams that are travelling in opposite directions.

There are many other smaller swarms of stars, each swarm having its own velocity and its own direction of motion. But Kapteyn's two opposing star-streams are the greatest wonder of all.

So much for the glory of Arcturus and proper motions. The same kind of association of ideas is aroused by the glory of Vega, Capella, Sirius, the Great Bear, or the Pleiades. Each has a totally different story to tell, always full of interest.

So it may well happen that many a beginner who spends a whole September night with the stars goes on to recognise individual peculiarities. Then, passing from guide-books and atlases, he may himself become an explorer among the orbs of heaven with the help of a telescope. Once started in this way, there are few who would not seek, by books and companionship, to become real students of the most sublime of all the sciences. Some of these enthusiasts, if perseverance upheld them, might add to the discoveries which rejoice the hearts of all real astronomers.

So, the all-night sitting in September has led us on to great thoughts about the heavenly hosts. It has also exposed to us, hour by hour, the changing aspects of the night-sky that we shall behold in the evenings from month to month during the winter.

'DON QUIXOTE' AND THE ORPHANS.

CHAPTER III.—continued.

IV.

ABOUT three o'clock in the morning Juan of the Spurs returned, dead weary, bloody with scratches, drenched to the skin, but inclined to be jubilant. Brag he must at all times. He could not help it. 'I have found the *bandidos*'

hiding-place,' he said, after drinking the last of the whisky. 'The señorita and the boy are there. They are safe. But I have the secret the *rurales* could never discover—never. Two leagues to the east there is an *arroyo*—no water there in the dry season; but now, here a shallow, there a rapid, here a deep pool. I found the

place where the bandits struck it—it wasn't dark then. The señorita has her wits about her—oh yes, señores!

He produced some shreds of red silk, fragments of a scarf the girl had worn. 'These were floating on the water—in many places. I was at a loss, for the first time, if you will believe me, *caballeros*, in all my life. Nowhere could I find tracks on the other side of the *arroyo*. Then I found one of these bits of silk. It came to me floating, as intended. It was a clue. Into the *arroyo* I leaped. Upstream I walked, stumbled, slipped, fell. Sometimes, for a short distance, I had to swim. Alligators!—Thousands! Then I found another bit of red silk—another and another. So I knew the *arroyo* was the path of the *bandidos* to their hiding-place, which no other before me had been able to discover. You will know now, señores, that I am indeed a great scout.'

He leaned back as if well satisfied, half-asleep. 'A terrible place—the bed of that *arroyo*,' he went on presently. 'The banks impenetrable. I had my *machete*, but dared not use it—make a noise. So I had—to stumble—over the stones—and swim the pools. As I said, *lagartos* plenty. To-morrow—you shall see.'

His head drooped and nodded. But with an effort he roused himself to finish his story. 'Two—three leagues—I tramped—and stumbled—and swam. Then I saw some *ranchos*—a fire—much smoke—to keep away mosquitoes, *caballeros*. The señorita and the *niño*—were there. A dog began to bark. It was time to go.' His head drooped lower and he fell asleep.

v.

But there was no sleep for the mining engineers and Rupert Lestrangle. After the first wild outbursts the youth sat silent. The others discussed the morrow's plans. Juan must go as guide, of course. The troopers must stay in charge of the camp. And so on till dawn, when the horses were saddled and they set out.

Juan, who had quite recovered from his fatigue, led the way at the fast pacing amble for which Mexican trained horses are famed. Striking the *arroyo* without a halt, he turned north, upstream.

As he had declared, it was a terrible place—a tunnel with impervious walls from which thorny growths, that met at the height of a mounted man's head, stretched out clutching, snatching arms over the stones and water. The bed mainly consisted of boulders great and small, and what the mining experts called 'hard-pan.' Horses, shod or unshod, left no tracks. How Juan of the Spurs, who, like any other Mexican, would take the trouble to catch and saddle a horse rather than walk half a

mile, had travelled such a road afoot was a mystery.

Then, as he had said, the pools swarmed with alligators, which had come up from the lagoons during the rainy season and were now making their way back. All of their animals being shod, their progress was a continuous clatter, so on reaching a clearing after some hours of slow, painful, back-and-neck-breaking struggle, Juan halted and proposed that the animals should be left in charge of Rupert Lestrangle and the journey be continued on foot.

To this the youth objected strongly, but with his wounded arm he was in no fit condition to travel such a terrible road, and finally he agreed.

From then onwards the others experienced in a measure the horrid discomforts Juan of the Spurs had endured the previous night. The heat was stifling. Mosquitoes in myriads hovered over the pools and ravened on the fresh blood of the Englishmen. Alligators of all sizes, up to twenty feet in length, stared at them with wicked, glassy eyes, and unwillingly floundered out of their way. Billy Brooke, sweating from every pore, thought it no disgrace to the *rurales* that they had been unable to track the brigands to their lair.

After a mile or so of excruciating torture Juan lifted his hand, enjoining caution. They were nearing the *bandidos'* camp. Presently a sound of splashing reached their ears. Following the guide's example, they crouched behind a boulder. From round a bend a horseman came in sight, leading another horse at the end of a lariat. The second animal carried a child, tied up with strips of raw hide, and weeping. Just there the *arroyo* was not overgrown, and they could see distinctly. The child was little Hugo.

Cursing savagely because the led horse dragged, the brigand hauled and snatched at the lariat, and drew abreast of the boulder.

'Hands up!' cried Marshall, who was nearest; and seeing three rifles aimed at his head, the man promptly obeyed. In a moment the boy's bonds were cut. His wrists had been tied tightly to the saddle-bow and were badly swollen. Wiping away his tears, he replied to the eager questioning.

His aunt was safe, but greatly distressed at his being sent away. He was being taken to Don Pablo, who was lying ill in a *ranchito* not far off. He did not know what Don Pablo wanted with him, but had been terribly afraid. The cords had hurt him very much. He had been struck with the flats of *machetes*, and told that Don Pablo would kill him.

As he told the story of his ill-treatment, Marshall's face grew darker and darker. His heavy jaw set. Suddenly he pulled the brigand off his horse and cuffed and shook him. Then, with the muzzle of his rifle within a foot of the fellow's head, he questioned him. Afraid

for his miserable life, the brigand answered freely.

Don Pablo, who was suffering agonies from his wound in a lonely hut, had sent a message to the bandits' village demanding that the boy should be taken to him *pronto*. He had sworn to kill all the *Ingléses*, and the prisoner believed that the boy was to be the first victim. All the members of the band knew of the silver mine, and that the children were the rightful owners. He said that Don Pablo had determined to put them out of the way long ago, and was furious because he had not done so. It was by his orders that the boy had been beaten and roped up.

'This is my affair,' said Marshall, when the fellow had finished. 'I am going to make this man guide me to that murderous brute. You go on; I'll take Hugo with me and join you later. Help me to fix this fellow up and gag him. I'm not taking any chances.'

It was quickly done. Then, having slipped the noose of the lariat over the brigand's head and remounted the boy, Marshall sprang on the other horse and ordered his prisoner to lead the way.

VI.

The journey was short. Almost immediately the brigand turned into another *arroyo*, the entrance to which, being hidden in the dense growth, had escaped their notice. A hundred yards from its mouth they came to a hut of the usual bird-cage sort—walls of sticks; plastered with clay near the ground to keep out snakes, scorpions, and the like; thatched with palm leaves. Even before he saw the hut, Marshall had heard a raucous voice shouting obscene oaths, raving blasphemies.

'Crazy with fever,' he reflected. Dismounting, he appropriated his captive's ragged jacket and tattered conical hat, and lashed him to a tree. Then, pulling the brigand's hat down over his eyes, and accompanied by Hugo, he kicked open the door of the hut and entered.

Don Pablo was alone. Raving in semi-delirium, striking viciously at elusive flies which swarmed about him as around carrion, he lay half-naked in a hammock. His wound, from which he had torn the bandage, showed red and angry on his almost black skin. At sight of the trembling boy he jerked and writhed himself into a sitting posture.

'So you have brought the *Inglés* spawn of hell?' he roared. 'Rope him up where I can see him drink the *zumo del coralillo*! He won't last as long as his father. But where's the girl? Why didn't you bring the *Inglésa*? I want her to see the *niño* drink of the juice of the little red snake. Rope the boy to the table where I can watch him. Get me the bottle, and fetch the girl, *pronto*. Where's Don José?'

'He is dead, señor,' Marshall answered in the whining, high-pitched tones of the Mexican Indian.

'Curse him! What devil's answer is that! *Caramba*! How dare he be dead when I want him?'

'He was shot at Santa Elena. I am inclined to think I shot him,' Marshall replied. And pushing up the brim of the tattered hat, he looked the furious bandit in the eyes.

There was a savage snarl, such as a wounded tiger might have emitted, and Don Pablo, a horrid figure, reeled out of the hammock, snatched up a *machete*, and sprang at the boy, who screamed with terror.

Marshall's bullet struck the wretch full on the forehead, and he fell lifeless.

'Another subject for Don Salazar's stock joke,' said the executioner to himself—'another *aparecido*. *El zumo del coralillo*—juice of the red snake? I wonder what on earth he meant. Come along, Hugo. Let us go.'

CHAPTER IV.—EL ZUMO DEL CORALILLO.

I.

MEANWHILE Billy Brooke and Juan of the Spurs had proceeded warily. On the banks of the *arroyo* were many indications of the near presence of the brigands. Apparently they had used their hiding-place for some considerable time, and had no intention of leaving.

Small cultivations were frequent—a patch of melons, with the great thirst-quenching globes hidden beneath little heaps of sand to protect them from rodents; a tobacco patch; many small *milpas*—tiny maize fields; a patch of sugar-canes ten feet high; pine-apples and *papayas*, small groves of bananas.

When Juan came upon a pool fringed with large flat stones, evidently the place where the women-folk came as to the weekly wash-tub, he halted. 'The village is here,' he whispered. 'If you will lie low in that banana clump, señor, I will scout round and find where they have hidden the señorita. Come to me if I whistle, not otherwise.'

Crouching, he stole away, and following his example of caution, Brooke concealed himself in a dense green thicket of bananas, whose broad leaves rustled gently in a breeze from the Sierra Madre, the foothills of which were near at hand. A great bunch of the fruit, golden-yellow, hung just above his head, and, notwithstanding his anxiety, he could not resist the temptation to satisfy his hunger, which was keen.

Alone, and free to think, Billy's reflections were many. Flitted through his mind the extraordinary meeting with the orphans; the discovery of the character of Don Pablo that

resulted; the amazing arrival of the Lestranges. On this he lingered; on the girl's bright beauty, so different from that of the black-haired Mexicanas; her grace, the lightness with which she sprang from her horse after her long, wearisome ride; her eagerness to thank the benefactors of her kith and kin; on the nature and courage of the woman who had dared the manifold perils of such a journey to succour children she had never seen just because they were her kin.

His own feelings. The touch of her when he drew her so swiftly out of danger, exerting his strength to do it quickly. And now—her present peril. At the mercy of a devil! Well—she might be nothing to him, now or afterwards, but he would snatch her from that devil's clutches, or die in the endeavour.

A low whistle interrupted his reflections. Then Juan's whisper, 'Don Quixote.' Juan of the Spurs knew nothing of the great work of Cervantes—of what the name he had used implied, but the *Juez* called the Englishman by it, and so would he. 'Follow me quickly; not a sound if you can avoid it.'

The guide stood in the banana grove, not three yards away. He was smiling. 'The *bandidos* don't know the *hombre* that's on their track,' he went on, with perhaps pardonable conceit. 'It may be they never heard of Juan Ramirez. They're silly, ignorant *puercos* without *sabe*.'

'You have found her?' Brooke interrupted eagerly, but doubtfully.

Juan of the Spurs shrugged his shoulders. 'Oh, señor, and I have told you so often that I am the best scout in Mexico! But you shall see her yourself.'

He led the way through the bananas, which apparently had sprung up of their own wild will and grew where and as they listed, until progress was barred by the wall of a hut—of the customary sticks and clay, no window, but interstices everywhere. With a finger on his lips he drew Brooke to a crack through which the whole of the one room which comprised the *ranchito* could be seen.

Seated on a rude stool, with her back towards them, her fair hair all dishevelled and her head in her hands, the girl was so close that a whisper would have reached her ears. But Juan would not permit more than a glance. Enjoining silence with a gesture, he drew his *padrón* back into the grove. 'There is a sentry at the door of the *ranchito*,' he explained. 'And many *ranchitos* near. Most of the *bandidos* are asleep. It is their *siesta*. Many are wounded. I think also they are drunk. Everywhere there is a strong smell of *aguardiente*. If we could get rid of that sentry we might easily rescue the señorita.' He pondered a moment.

'If we shot him, they would swarm out like wasps, drunk or sober. There is a trick with a sharp *machete*—as easy as slicing a melon. I have seen it done. We must find a place where we can watch him. Perhaps he'll sit down.'—This with a grin.—'If he does, you'll see how it's done.'

II.

Stealing on, for the banana grove was quite extensive—at least two acres—Juan found a place which commanded an uninterrupted view of the sentry as, with the butt of his rifle between his crossed legs, he leaned lazily against the bird-cage wall. Presently they saw a woman leave a hut opposite carrying a *jicara* gourd, at sight of which Juan expanded his nostrils widely, for he was more than half Mixtec Indian, and sniffed.

'*Aguardiente*,' he whispered, a grin of satisfaction overspreading his dark, handsome face. 'Fortune favours us,' he added, as the woman gave the *jicara* to the sentry, who drank heartily and set it at his feet. The woman returned to her hut and the man drank again, wiping his mouth and the sweat from his brow with a ragged sleeve. Presently he sat down and bowed his head low over the stock of his weapon. Juan laughed softly. 'It is good *aguardiente*. When bad it makes a man quarrelsome. When good it puts him to sleep. Come now. If you would rather not see the *machete* trick, señor, you are not obliged to look. But, señor, I beg you to get the señorita away *pronto*, and into the bananas. I, Juan Ramirez, will settle with any drunken pig of a *bandido* bold enough to follow you.'

He stole back swiftly and silently to the rear of the *ranchito* with Brooke at his heels; then, snake-like, slipped to the front, still followed closely by his *padrón*. Brooke saw the guide's *machete* rise and fall and something rolling in the dust. The next moment he was within the hut.

Wild-eyed, the girl glanced at him, and with a cry of joy staggered up from the stool. 'Oh, thank God! But I knew you would come,' dropping her voice at his quick, whispered 'Hush!' 'But where is Hugo? I am so afraid for him.'

She reeled as she spoke, evidently unable to stand, so without answering her questions, and choking back a curse on the savages who had captured her, Brooke took her up in his arms, and holding her so that she could not see Juan's sanguinary handiwork, he carried her into the haven of the bananas. Swiftly the guide followed with the girl's English saddle, which he had found in the *ranchito*.

(Continued on page 635.)

A SCOUT TREK IN THE CEVENNES.

IN R. L. S.'S TRACKS.

L.

THE pageant of the Cevennes! R. L. S. could not have chosen a route which presents a more varied picture or such a series of kaleidoscopic changes and contrasts. This was more than ever borne in upon me after my second journey in the steps of the Ass and the Author.* From Le Monastier to Florac and Alais, climate, geography, scenery, inhabitants, and manner of life—all assume aspects diverse and distinct. There is no monotony where there is complexity. A watershed which feeds the Rhone valley, and waters towns so distant as Orleans and Bordeaux, is not a simple proposition. So it happened that we crossed the Bouchet plateau in a continual hailstorm, with the thermometer registering 7 degrees of frost at night; later we descended into the almost sub-tropical heat of the valley of the Tarn. I have experienced similar meteorological intemperance in sultry August as in smiling May.

There is contrast too between the basaltic formations and crater lakes of the north and the bewildered canyons of the Tarn; between the filthy hamlets of the former, with their inhospitable, almost inhuman inhabitants, and the quaint old-world coquetry of Pont de Montvert, its hospitality and bonhomie as wide as its mountain stream. We descended from bleak plateaus and mountain fastnesses to follow the *douce* Allier with its wealth of verdant pasture and meadow, only to be led into the hollow of the hills at La Trappe and the wilderness of the Goulet. What a contradiction is the Mount Goulet and the Mount Lozère! The former is dry, stony, and barren. Lozère too is stony—in the Cevennes one is for ever 'in league with the stones of the field'—but this great solid mass of Nature's masonry is bursting with water, and is well cultivated on the lower slopes. Stevenson writes little of Goulet. He says much of Lozère. The most wonderful sunset and the most perfect colouring we saw while crossing the Goulet in the evening, but it was the Lozère which reflected the glory thereof. And on the Lozère one has the feeling of walking on the roof of the world—so solid, so vast its extent, so dominating the view.

* Twenty-four scouts from the Leeds Modern School spent their Whitsuntide holidays in following Stevenson's *Travels with a Donkey*, carrying with them tents and all camp equipment. They followed the identical track of Stevenson. Tents, &c., were placed on one-wheeled carts, the shafts of which formed the tent poles. Personal kit was carried on the back, while for the transport of food a donkey was hired, so as to make the resemblance to Stevenson's trek as complete as possible.

Not least in its appeal to the imagination is the gulf that separates the celibate monk of La Trappe from the *bel amoureux* type of the southern Cevennes. I have seen it to perfection, but it demands two occasions. Near the end of May the monks hold a religious ceremony peculiar to Our Lady of the Snows. The chapel is shrouded in darkness made visible by the glimmer of a candle. From the 'strangers' gallery' one looks down, as it were, into a sepulchre or bottomless pit. One would say that the monks were performing their own funeral rites—dirging forth their final lamentations on the futility of life. The illusion is perfect when in their shroud-like robes they prostrate themselves upon the tiled floor of the chapel. There is no single note of the final triumph over evil. All things taste of death and of the charnel-house.

Now in the month of August, just at the time of harvest, you will find Pont de Montvert alive with its annual fête. Youths and maidens, old men and women, all make merry. There are skittles and bowls, and quacks and pedlars, and dancing and song. Yet it is the *bel amoureux* who dominates the occasion. The very atmosphere reeks of love and life and *laissez-allier*. 'And I blessed God that I was free to wander, free to hope, and free to love.'

Thus did our trek in the footsteps of Stevenson become an extended allegory, a placing side by side of divers experiences and similitudes. Light and shade was of its essence. But it was this contrast between Life and Death which was most striking. Here was the young life of England, the blood coursing through their veins, chests expanded, eyes sparkling, and gait firm and steady. For three days they shouldered their packs and pushed their one-wheel carts in a half-gale out of the freezing north. And now they pitched camp for two nights and a day within the monastery grounds, and were faced with a constant reminder of Death. Here a monk praying before a crucifix resting on a skull; there, as you enter the monastery, a group of skulls grinning down upon you in hollow mockery. At 2 A.M. we were awakened, as was Stevenson, by the monastery bell calling the monks to prayer. The sickle of the waxing moon has disappeared. The night is pitch-black. Yet there they go—night after night, wet, fine, cold or heat. They resort from repose to prayer. This is not Life. It is Death. In the chapel there is a picture of the Fall—Eve presenting the apple to Adam, Satan looking down in fiendish glee.

In the top right-hand corner is an inset. It depicts a Christian baptism. The symbolism may be perfect. Its application would be stark naked Death stalking over planet Earth.

When the time came for farewell, said Brother Sebastian: 'We shall not meet again. I am sixty-two. I am going to the tomb.' Said Brother Augustine: 'Perhaps we shall meet in heaven.' Then, tapping me on the chest, '*Vous devriez vous faire catholique !*'

One is tempted to ask whether the attempt to flee from mother, sister, and wife is as complete as the monk would have us believe. The Trappist has substituted a symbol for reality, the Divine Mary for the earthly mother. '*Our Lady of the Snows*' is the title he gives to his new 'home,' and each monk upon initiation adopts the prefix 'Marie'—thus 'Frère Marie Jean,' 'Frère Marie Augustine,' &c. If the cynic is right—if the possession of the object loved leads merely to the dissolution of the love—then the monk has renounced woman even less than the man of the world. Possessing nothing, he yet possesses all things.

II.

Another very apparent contrast is that between the north and south Cevennes. Apart from geographical differences, it is with the people that the contrast is most marked. Roughly speaking, the north is Roman Catholic and the south is Protestant. There are corresponding differences in character and mentality, and these differences are usually attributed to religion. The Catholic north is supposed to lack the 'moral sense' divinely bestowed upon the southern Protestants. The northerner is certainly more dirty, more 'barbarian,' more ignorant, more callously indifferent to the welfare of others. One recalls Stevenson's experience with the cursing woman full of blasphemous oaths, and her tall, sombre, churlish son on the road to Bouchet. His camp in the dark near Cheylard was the sequel to the inhospitable indifference of the inhabitants of Fouzilhic and Fouzilhac. There is little apparent change to-day. Small groups of peasants gather together to mock and to ridicule rather than to help. Theirs is not natural curiosity. It is rather the curiosity of the imbecile and the weak-minded. It is a very low-grade intelligence which asks if there are horses and sheep, grass and oxen *chez nous*. It was in the little hamlet of Salettes that I was really convinced that it is not lack of moral sense (consequent on difference of religion), but rather mental deficiency (consequent on intermarriage) that constitutes the difference in mentality of north and south. There is more than one 'village idiot' in each several hamlet of the north Cevennes. Half of the inhabitants of Salettes appear to be mentally defective—'in-

sane' is hardly too strong a word. We witnessed there such an exhibition as would have rejoiced the heart of a Freudian psycho-analyst, but it sent us away thankful that we lived in dirty, smoky Leeds. It is *geographical isolation and intermarriage* that account for the deficient mentality of the people. Contrast the chaos of mountains round Le Monastier, Salettes, Goulet, and St Martin (surely here was the battle-ground of the Titans and the gods) with the massive, solid structure of Mount Lozère. Compare—if you can—Bouchet St Nicolas with Pont de Montvert or Florac.

There are other contrasts, but two—of the past with the present—are of particular interest. Arriving at La Trappe, the traveller perceives a fresh landmark. A new pile—convent or monastery—rises on a small hill to the west of the old monastery. The latter appears deserted and strangely forlorn. Something has happened. It was on a cold January midnight, some ten years ago, that the monks watched in helpless dismay the incineration of Our Lady of the Snows. The thoughts of many hearts were revealed, but no less searching are those of the disciple of Stevenson who once walked those chilly cloisters, dined in the hospitium, and slept in the dormitory above the chapter-house.

What is this fate that haunts the steps of Stevenson? Fire and sword have blotted out almost every Stevensonian landmark in the valleys of the Sambre and the Oise. Now in the Cevennes has vanished that around which the Donkey Book has been written. For the three chapters on La Trappe and its monks constellate the philosophy of the Donkey Book. All that has gone before leads up as naturally to La Trappe as all roads once led to Rome. The spirit, if not the letter of those chapters, is continued in the pean of praise among the pines of Lozère and down the valley of the Tarn. If the reader doubts the truth of this conception, let him study the frontispiece of *Travels with a Donkey*. There the story is visualised by the author. His meeting with the monks and his attempted conversion are depicted, as well as the meeting with the old man in the brown nightcap and his sad business of farewell. And dominating the whole picture is the chestnut-tree, though surely not the 'enormous chestnut' beneath which R. L. S. slept before his meeting with the old Protestant. *It, too, has been blackened with fire*, though its great width and height have helped it to withstand destruction.

There is no mistaking Stevenson's camping ground in the Tarn Valley—just 3.50 kilometres from La Vernède. Madame Pantel of this humble hamlet claims to be the little girl who accompanied the old man and the author, and asseverates strongly her conviction that this charred chestnut is the identical tree. To-day,

lopped of many branches, the trees afford no more shelter to the romancer than does the old-time monastery. And so the two scouts who had bound themselves to sleep beneath the sacred chestnut *à la belle étoile* had to renounce their solemn sacrament.

Withal there is more to tell of the chestnut-tree, though I blush in the telling. A certain Englishman, whose commercial instinct for Mammon outran his respectful admiration for Stevenson, wrote to M. Pantel, asking if the tree could be cut down and exported to England. Why cumbereth it the ground? It might be sold and given to the poor! Benevolent education committees and governors of schools would be found worthy patrons. Think of the pencil-boxes and ink-stands made of Stevensonian

chestnut, solemnly presented *virginibus puerisque* on Speech Day for excellence in donkey lore! Better still, since there exist in Great Britain various R. L. S. Societies, why not turn out a few thousand wooden Modestines? These household gods would adorn the chimney-pieces and chantries of the faithful, who would perform before them in the manner and after the fashion of the ancient Israelites before the golden calf. Happily the fires which devoured so much else have spared for us this Spanish chestnut of the Tarn. Long may that wonderful valley, with its sweet perfumes, its delightful colours, its 'craggy summits and hoarse uproar far below,' remain a place of pilgrimage for those who delight in the romance of the Ass and the Author.

THE STORY OF THE LIFEBOAT: 'THE RED CROSS OF THE SEA.'

By Rev. C. A. WILBERFORCE ROBINS.

I.

FOR a number of years prior to the establishment in 1824 of the Royal National Lifeboat Institution, which has this year celebrated its centenary, the design and construction of a lifeboat had been the concern of the philanthropic, and the endeavour of the shipwright. It was a problem calling for the greatest ingenuity—the construction of a boat that must be capable of living in water and weather in which no other boat could live, and be responsive and completely under control in conditions of storm that had already destroyed vessels much larger and stronger than itself.

The first man—and he an Englishman—to devote himself to the idea of constructing a boat of special buoyancy was a London coachbuilder in Longacre—Lionel Lukin by name.

In 1784 he converted a yawl into what he called an 'unimmergible boat,' and in 1786 one of these converted boats was placed at Bamburgh on the Northumbrian coast, and was used for rescuing lives from shipwreck. In 1789 William Wouldhave, a native of South Shields, invented a model containing his great discovery—the self-righting principle—by placing air-tight compartments fore and aft and making the keel as heavy as possible. This boat was practically certain to right itself in anything over six feet of water. This invention perfected is now in use in more than half our lifeboats, the principal exceptions being those used on the East Coast, where sandbanks abound and the crews prefer boats not self-righting.

The invention of Wouldhave's, together with another invention for emptying a lifeboat in thirty seconds by means of valves in the bottom

of the boat, was embodied in the *Original*, built by Henry Greathead. A few years after, in 1798, Greathead built his second boat, ordered by Hugh, Duke of Northumberland, who placed her at North Shields, and himself provided an endowment for her maintenance; and before the end of 1803 the builder of the *Original* had executed orders for the construction of thirty-one boats—eighteen for England, five for Scotland, and eight for foreign countries. In 1807, Lukin, the coachbuilder, made mankind his debtor by the notable part he took in designing and building the first sailing lifeboat, of the type still most popular on the Norfolk and Suffolk coasts.

Encouraged by Lloyd's and by the Society of Arts, the work of providing lifeboats went on, and by 1824 there were thirty-nine on the coast.

The originator, however, of the idea of making the rescue of life from shipwreck a national duty, and, therefore, the *founder* of the Institution, was Sir William Hillary, one of the most remarkable men of his time—soldier, traveller, author, and philanthropist. What he taught he practised in many brave efforts to save life in the Bay of Douglas.

II.

The many and terrible wrecks which Sir William Hillary saw near his residence in the Isle of Man led him to draw up and publish an appeal to humanity for the foundation of a National Institution to rescue lives from shipwreck. He himself continued to go out in boats to the work of rescue till he was sixty-four, and he was three times awarded the gold medal for gallantry. The official birthday of

the Institution was the 4th of March 1824, when the meeting that called it into existence was held in London. Dr Manners Sutton, Archbishop of Canterbury, was chairman, and William Wilberforce the mover of the resolution. Royal patronage was accorded it from the commencement; Prime Ministers have been its Vice-Presidents, including Peel, Canning, and Lord John Russell. In later years, from 1852, the Dukes of Northumberland have always been its Presidents, and have ever taken great interest in the work.

The next forty years saw great changes. Whereas in 1850 there were only thirty boats on stations, and the Institution's income was only £800, in 1890 there were 300 lifeboats round the coast of Great Britain, and the income of the Institution was £42,000—yet only one-half of the expenditure incurred in building and maintaining the boats!

It was now that Lancashire came to the front. Two lifeboats (Southport and St Anne's) had recently been wrecked, drowning all but three of their crews, in going to the rescue of a German steamer stranded on the sandbanks off St Anne's. A great meeting of men, whose hearts were burning to do something for the dependents of these noble heroes, was summoned, the chairman being Sir Charles Macara of Manchester, and its outcome was the creation of the Saturday Lifeboat Fund. This fund remained in existence until 1910, when its organisation was taken over by the parent Institution. In those twenty years it had collected £287,000 for the lifeboat cause, and a scheme was in working order to provide pensions for the widows and orphans of those of the crews who had sacrificed their lives, and also pensions for those men unable by reason of age or injury to offer any further service.

Surely the least the country can do, when these crews undertake so willingly their dangerous task, is to provide something in the way of pensions for their widows and orphans! The Institution not only now carries this into effect, but also does everything possible to provide the best for the crews in the way of boats and mechanical appliances.

III.

In 1902 the service commenced to convert the rowing lifeboat to motor power, and at the present time there are forty-four motor boats in a fleet of 230, and more are under construction. They are an enormous improvement on the pulling and sailing boat, as they enable the crew to cover much greater distances, and to reach vessels in distress in much quicker time, and so to save life where the older type of boat would be helpless.

The Institution enters now on its second century with a glorious record behind it of nearly 60,000 lives rescued. Eleven lives saved

every week for one hundred years—what a superb record! And these lives, with comparatively few exceptions, have been lives most valuable to the community—the lives of the whole, the fit, and the strong. It is only right here to mention that the lifeboat service costs the nation only 1½d. a head of its population. The Institution was founded as a voluntary service, and such it remains, receiving no financial help whatever from the state. It has often been suggested that the lifeboat service ought to be taken over by the state; therefore it will not be inappropriate to quote here the opinion of the select committee of the House of Commons which investigated the working of the Institution in 1897:

'Your committee see no ground for recommending that the lifeboat service should be taken over by the state, so long as it is maintained as efficiently and successfully as at present. Your committee consider that there are many advantages in committing the control of this service, as now, to the voluntary association of honourable men, who have in many cases devoted years of their lives, without pay or remuneration of any sort, to the cause of life-saving.'

The men who man the lifeboats are, for the most part, drawn from the fishing population. They have faced and fought the sea, in all its moods, whilst earning their daily bread: 'These men see the works of the Lord and His wonders in the deep.' Their wonderful experience, dearly bought in many struggles with storms, they freely give to succour those in peril on the sea. Their courage, endurance, and splendid seamanship have been proved in hundreds of great deeds all round the 5000 miles of the coasts of the British Isles.

The writer had the privilege, some thirty-five years ago, of working among some of these hardy fishermen on the coast of Kent, going out with them in their fishing-boats, and keeping in close touch with them. No words could tell of their many brave deeds, so nobly wrought, and so often in those days unrecorded! This is just what those simple, humble, brave-hearted men desire; nothing is so distasteful to them as anything in the way of publicity for anything they may do, particularly in their efforts to save life.

The spirit of these men was expressed as graphically as it could be by Thomas Haylett of Caister, who was awarded the gold medal for his services in November 1901, when the Caister lifeboat was wrecked and two of Haylett's sons and one of his grandsons were drowned. At the inquest it was suggested to him that the lifeboat had perhaps given up the attempt and turned back. Haylett, who was a man of seventy-eight, replied, 'Caister lifeboatmen never turn back'; and this is true of the whole service. They never give up the struggle if there is life in danger, an illustration

of which, drawn from personal experience, shall conclude this article.

IV.

It was in the early hours of the 11th of November 1891, during a blinding blizzard from the south-east, that distress signals were shown from the Norwegian brigantine *Æolus*, which had been stranded on one of the many sandbanks on the eastern side of Dungeness. The wreck was visible far out on the Kentish coast, and the entire crew had taken to the rigging of the sea-swept vessel. The Lydd (Dungeness) lifeboat put out to the rescue, and for a long time battled with the tempestuous sea in an endeavour to get near the vessel. Imagine the feelings of the ship's crew, in their bitterly exposed position, with death staring them in the face, when they saw the lifeboat capsize, having itself struck a sandbank, and two of its noble crew swept away and drowned. No further attempt could be made to reach the wreck until the turn of the tide, but temporary failure only stirred these coast-dwellers on to further efforts. The great storm still swept o'er land and sea; the day wore on, and still the crew of the Norwegian vessel were huddled together in the rigging, frozen in body and fearful of the coming night, hoping and waiting for the sight of other rescuers. They had been in their perilous position for over twelve hours, when 'Blo Tart,' a fearless member of a notable Dungeness fishing family, called for volunteers to man the Littlestone lifeboat, the then nearest boat to the wreck. The tide was now flowing; Blo Tart had waited for this. No one knew that coast—the tides and currents which make it so dangerous—better than he did. Up went the rocket (a red light), which

in the gathering gloom of a November evening denoted the launch of a lifeboat.

Hope once more filled the breasts of those weary, half-perished, shipwrecked men. Away went the lifeboat; she was in the hands of a fearless skilful pilot. After a terrible buffetting we reached the wreck, seas breaking over her, a fearful and wonderful sight. No human voice could be heard for the noise of the creaking timbers of the sand-locked vessel. It could only be compared to a mighty thundering out of the storm. On approaching as near to the wreck as safety demanded, it was a matter of time and much difficulty getting communication with the men on the mast. In these present days, a specially designed gun fires a line against any wind.

When the rope was made fast between the boat and the mast-head, the poor fellows were brought down in the 'breeches buoy,' the captain, as usual, descending last; and on word being passed that no life, human or animal, remained on board, the lifeboat proceeded for the nearest harbour, there to deliver up into skilled medical hands the almost lifeless sailors, who had been saved from a watery grave.

Such is the determination of the men who man the lifeboats. *Nil desperandum* is the everyday rule of their lives. Let us tell of their deeds, and recount the measure of their bravery, as members of the 'Red Cross of the Sea,' in this centenary year. We have always gloried in the conviction—no idle boast—we teach our children's children that 'Britannia rules the waves.' If this be true, surely it is because of the unflinching courage and devotion to duty which rules the hearts of the maritime population of the British Isles.

THE STRANGE NARRATIVE OF SERGEANT MILLEFEUX.

PART II.

IV.

FOR a whole week I continued to take my ease at the Maison Rouge. I slept well, I dined well, I drank good wine, lounged about the garden, and smoked a vast amount of tobacco. But I got no nearer knowing the Italians. They did not encourage conversation, and, even on such harmless topics as the weather, they were not at all expansive.

Then, at last, one fine day Pietro came to me and said, 'M. Millefeux, you set out to-morrow.'

'That is good news, Pietro,' I replied, 'for though this is a pleasant resting-place, one gets tired soon of too much rest. But where am I to go?'

'Rochefort,' said he. 'The Emperor is there, and expects you. When you arrive at the town you may meet some one who will give you further instructions.'

'That is all right,' I replied. 'Get the priest ready and we will soon be at Rochefort. And, by the way, just before we go, I have a message to give you from the Emperor.'

'Very well,' he replied. 'To-morrow morning at six o'clock you start. You can give me the message then.'

He spoke so lightly and easily that it went to my heart to think what the message was; but it was the Emperor's orders.

Well, next morning, behold the sun shining in its strength as it knows how to shine in France on a July morning; and behold further

two horses saddled at the door, and the mysterious curé, and I with him, ready for mounting, and the two Italians at the doorway to see us off. The moment had come—the first tragic stage of this adventure.

'M. le Curé,' said I to the priest, 'mount your horse, and wait for me, and I will be with you directly.'

Then, turning to the brothers, 'Messieurs,' said I, 'come into the dining-room and I will tell you what the Emperor has charged me to say.'

They accordingly went back with me into the house, and I think they were expecting a word of appreciation for their faithful service. I opened the door for them, and they went in before me. Then I shut the door and stood with my back to it.

'Messieurs,' said I, 'it is my painful duty to inform you that the Emperor has ordered me, before setting out with the priest, to shoot you both.'

There was a dead silence. I had expected expostulation and outcry, and even a vigorous resistance, but there was nothing of the sort. In the faces of the two brothers, in their attitude, was only resignation. They looked at each other.

'He need not have been afraid,' said Pietro.

'No,' said Miliano, 'it was safe with us.' Then—'Monsieur,' said he to me, 'if the Emperor wills us to die, it is enough. He will lose two faithful servants, but he knows best. As for you, you can only do your duty; and as for us, we are ready to die.'

'Messieurs,' I cried, for this attitude of theirs made me feel helpless—'messieurs, this is the hardest task that I have ever undertaken, and how I am to carry it out, I cannot tell.'

'You must do as the Emperor orders,' replied Miliano. 'He is inexorable, and he must be obeyed whether in America or France.'

'America,' I repeated wonderingly; 'what is that?'

'Why, it is no secret,' he replied. 'The Emperor is on board an American ship at Rochefort, and will soon be in America if he can only give the English men-of-war the slip.'

Then an idea flashed into my head. 'America,' I thought to myself—'America. That is a long way off. And, after all, there are limits. A man owes something to himself.'

'Excuse me, messieurs, for a moment,' I said aloud, 'and occupy that moment in preparing for death.'

Then I stepped into the passage, drew the bullets from my pistols, and stepped back again into the room. 'Now, messieurs,' I said, 'are you ready?'

For answer they raised their right hands to heaven and kept shouting '*Vive l'Empereur!*'

Then, pointing a pistol at each of them, I fired, and immediately rushed from the room.

The curé was already mounted; I leaped on my horse and turned to the priest. 'Ride!' I shouted to him. 'Ride like the devil!'

V.

It was on the 15th day of July that we rode into the town of Rochefort. All the way the people were rejoicing, or pretending to rejoice, at the overthrow of the tyrant, as they chose to call the man who had covered France with glory. Of course, he had brought the foreigners twice to Paris; but, then, what would you? A man, even such a man as Napoleon, cannot be always successful.

My companion, the curé, proved a very silent individual. To all my efforts to get him into conversation he replied only 'yes' or 'no.' He sometimes varied this by saying 'perhaps.' With his big hat pulled over his eyes, which, it appeared, were weak, for he wore blue spectacles, and with his big black beard, he was a curious-looking object. But then he was an Italian, and, when a man is a foreigner, it naturally accounts for much.

Well, as I said, we came into Rochefort on the evening of the 15th of July, and, after a little seeking, I found a quiet inn and ordered supper. The inn-parlour was empty as we sat down to our meal, and I noticed that the window looked out on the shipping. While the supper was being served I went towards the window and glanced out at the ships, and, most hateful for a Frenchman, what did I see but an English man-of-war, with the Union Jack flaunting itself at the mast-head? At that sight I had hard work to keep from swearing aloud, but I remembered in time what the Emperor had said about the curs being loose, so I merely turned round to the fat old innkeeper, who came waddling in just then with some part of the supper.

'Well, my friend,' said I, 'and what is the latest news?'

'Have you not heard, monsieur?' he asked, smiling all over his face. 'But, of course, you have just arrived,' he continued. 'Well, that man—that is how they called His Imperial Majesty, the Emperor of France, because the luck was against him—that man is safe and fast now. It is checkmate, monsieur. He has made his last move.'

'And that?' I inquired.

'That, monsieur,' he replied, with a wink of his little black eye, 'that has been to give himself up to His Britannic Majesty's warship, *Bellerophon*.'

I gasped in astonishment. Could it be the truth, or was the old villain lying?

'Ah!' resumed the innkeeper, 'you may well look astonished. It is a great thing, and it is certain that the English won't let him

escape. He will find that warship yonder is not the island of Elba.' And, at the word, he waved his hand towards the window through which I had seen the English ship.

'When did the Emperor give himself up?' I asked.

'The Emperor, monsieur!' cried he. 'We do not call him that now. That man went on board this very afternoon, and everybody is down on the quay watching the ship. And that, monsieur, is the end of the tyrant. I think you will find the chicken tender,' he added, and so departed.

VI.

That was the saddest meal I had ever had. The Emperor a prisoner! But the chicken was indeed tender, and the wine which washed it down was of a good vintage. In all the changes I have seen in France one thing remains constant—you can always get a good dinner if you will pay for it.

I was pouring out my second glass of wine when a man entered the room. He was dressed like a farmer, and, to look at him, you would never have thought he was a colonel of a crack regiment of hussars. Yet so it was, and I knew him at a glance. But then I had looked at him once along the barrel of a pistol at the exact distance of twenty paces—but that is another story. I merely mention it to show how it was that I penetrated so easily a disguise which really was very fair.

He sat down at a table and called for a bottle of wine, drank one glass with great deliberation, examined us both very earnestly, tossed off a second glass, rose to his feet, and, passing close to the table where I and the priest were sitting, he went out of the room. On the table close to my hand lay a note sealed, but with no superscription. I immediately took it up and placed it in my pocket—the priest seemed sunk in his usual reverie, and did not appear to notice anything. We had the room to ourselves again.

I strolled over carelessly to the window, and, after pretending to look out for a moment, I took out the note, broke the seal, and glanced over the contents. After that, I slipped it back into my pocket and returned to the table, just as the innkeeper brought in the lights.

In the morning, immediately after breakfast, in accordance with the instructions of the note which I had received, I marched forth and took M. le Curé with me down to the quay. There a boat from the English ship was waiting for us, for the English were more civil to the Emperor than the French, and they had granted his wish to see the Italian priest.

In a few minutes we were quite close to the English ship, and there, on the deck, was the well-known figure of the Emperor watching us. We stepped on the deck, and, as we stood before

the Emperor, I performed the salute and came to attention.

'My good friend, Millefeux,' said the Emperor, turning to me, 'you will wait here for a while, and I and M. le Curé will have a little private conversation.'

Then the Emperor and the priest disappeared down the stair that led to the cabin, and I was left alone.

In about a quarter of an hour the priest reappeared, with the Emperor following him closely. Napoleon came up to me, and taking the gold cross which hung on his coat, he pinned it on mine. 'That will be a memento of your Emperor, *mon vieux*,' said he. And then he grasped my hand and said, 'Farewell, Millefeux.'

'Farewell, sire!' I gasped, for the honour he had done me and the sudden realisation that I was seeing the very last of the Emperor fairly took my breath away. 'Would I could have died for you!'

'Nay, nay,' he replied cheerfully, 'France still remains—you must live for her.'

Then the priest and I got into the boat, and we were rowed back to land. We returned to our inn, and, shortly after, acting on the instructions of the letter, set out for Brest, where I was to see the priest safely on board the American ship *Lively Polly*, which was loading there for Italy.

VII.

Nothing remarkable happened on our journey, except that my companion seemed in a more lively humour. He often made short remarks, and several times I caught him laughing in that big black beard of his. This surprised me somewhat, but I concluded it was because he had achieved his mission in seeing the Emperor.

In due time we arrived at Brest, found out the captain of the *Lively Polly*, and learned that the ship was just waiting for us and would sail the next day. Accordingly we went on board, and that night the lapping of the water lulled me to sleep.

I woke suddenly at midnight. I did not stir. I lay perfectly still, but my eyes were wide open, and I was as alert as if I had never been asleep. There was a faint light in the cabin, for the moon was shining, though partially obscured by some light clouds.

My companion, the curé, was standing at the head of his bed. He was fumbling with something on his pillow. Presently he came across the room towards me. As he held no weapon I did not feel alarmed, but lay watching, on my guard. Suddenly he stopped and seemed to reflect; then turned towards the porthole, and opened it to its full extent. Then he came back to me. Nearer and nearer he came till he stood over me; then he began to

sprinkle some powdery substance over my face.

Immediately I began to feel my senses leaving me, and understood in a flash the significance of the open porthole.

I had just strength enough to pull out my pistol and fire. At that very instant the moon shone out full and clear, and I saw—the face of the Emperor!

Then all went dark and I lost consciousness.

It took some explaining away, but the American skipper understood at last.

He landed me in the south of France, whence I made my way to my native village.

The man whom I had shot was buried at sea, and I cannot quite make up my mind even yet as to whether it really was the Emperor or the priest. Whichever it was, the resemblance between the two was extraordinary.

But if it was Napoleon, then I am his murderer—that is terrible. But then, why did he want to murder me, his faithful servant? And then again, why did he order me to kill the two Italians, also his faithful servants? Sometimes when I think of these matters I am inclined to follow the example of the Royalists and call him 'that man.'

THE END.

PROSPECTING IN QUEENSLAND.

By ROBERT M. MACDONALD.

PERHAPS the most hopeful sign of a general trade revival is the rising prices of minerals, and the nation which possesses most of the so-called base metals must be the first to regain prosperity, as only from the raw materials can the world be rebuilt and kept going.

The British Empire is rich in all minerals, and in parts of her vast domain the ground has not been more than scratched for them. Indeed in Rhodesia and Queensland great mineral-bearing stretches of country as large as Britain have not yet been prospected. The writer has been a prospector all his life in most parts of the world, but he knows of no country richer in mineral wealth than Queensland. Throughout its almost boundless territory practically every mineral exists, and fortunes lie hidden—often outcropping—just underneath the surface of its sunny tableland beyond the coastal ranges. Here await great chances for any one who desires a life of untrammelled freedom, and certainly, one by his own efforts can, at least, earn more by wresting mineral treasures from Nature's store than he can readily do in most of the vocations of city life.

Any able-bodied man can find minerals in Queensland, especially in the northern part which lies between the Gulf of Carpentaria and the Pacific. In this particular part gold, silver, copper, tin, lead, molybdenite, wolfram, antimony, bismuth, and many other metallic substances abound in a profusion almost unbelievable. Two prospectors here can work together and develop their find profitably, until it becomes too big a proposition for them to continue. They can sell the result of their labour to the nearest Government smelter or reduction works, or to whom they please, and when they have reached the depth at which they require winding machinery and pumping plant they can either sell their mine to a

company or call in the help of their nearest neighbours. Most prospectors in that happy-go-lucky land, however, simply leave their 'shows,' and marking them on their maps as a place to come back to should fortune go against them elsewhere, go off to look for the mineral which then commands the highest price.

In the case of copper, which metal is now on the steady rise that will assuredly attract most prospectors, the seekers after it go out to the lime bluff country on the northern railway, and usually can find a promising outcrop of copper carbonate without much trouble. Beyond Chillagoe, great blows of this substance rear themselves above the surrounding vegetation, and the detached pieces or 'floaters' shot out from the reef sometimes weigh several hundred-weights. The copper carbonate ore, which invariably is the surface ore of copper, is very rich, frequently assaying 35 per cent., and usually rich in silver, and often gold. A shaft is sunk through the heart of the richest-looking part of the reef and the lode followed down on what is termed the 'underlie' or foot wall of the fissure which carries the copper. This is always at a more or less dipping angle. When a sufficient depth for easy working has been reached, 'drives' are then driven to right and left along the bottom, and the ore blasted out from underneath and raised up the shaft by windlass. Many rich patches of azurite, oxide, or other forms of copper ore are often found throughout the lode when the workings are deep enough to be away from the leaching influence of the surface, and these, being easily recognisable, are usually bagged and sent direct to the buying agents without further treatment. The rest of the ore is sent by team to the nearest smelter, where it is bought and paid for on the spot according to the ruling price of copper and the value of the silver and gold it may contain,

less smelting and realisation charges. The men may decide to drive their shaft down into the deep sulphide ore of the mine, but as that means developing a mine in earnest, they usually flood the workings to hide the nature of the ore they have been exploiting, and, marking the spot on their maps, again go after the mineral which meanwhile has become of greater value than copper.

This may be silver-lead, those two metals usually being found together outcropping in a form of galena or sulphide of lead, and one can hardly get away from this material anywhere along the southern bank of the Walsh River. It is mined in the same manner as copper, but the lodes dip more erratically, and an underlie shaft is therefore often impossible. In such cases the ore is simply quarried out in 'pot-holes' and trenches, and the ponderous surface masses of mineral are sent off to the smelter, where its value may be found to be 25 per cent. lead and perhaps 100 ounces of silver per ton.

But tin may now have become attractive—as it is at present—and 'tin scratching' affords a delightful holiday to those who have already been engaged in mining copper or silver-lead. Tin is found everywhere throughout Queensland, but the single miner leaves the big reef-mining propositions to those with capital, and contents himself with washing out the stanniferous sands from the creeks and river beds. This he does easily, and doesn't trouble to peg out a claim, passing on from patch to patch as he collects the richest material. When he locates a particularly rich stretch of sand he may erect a crude inclined plane contrivance of bark to assist in washing out the tin oxide (the concentrates are usually oxide of tin), and after drying his powdery accumulation he bags it carefully in double-lined sacks, which weigh, when full, about a hundred pounds, and transports them to the nearest buying agent, who pays cash on the spot.

But the prospector tires even of tin, soon, for in Queensland the desire to 'move on' is common, whether one is working a good patch of anything or not. Another mark is made on the well-worn map, and hearing perhaps that old friends are doing well with wolfram, he sets out for their camp and starts over again. Wolfram mining is much like that of copper, but as the mineral occurs very erratically in 'pipes,' no trouble is taken in sinking a lasting shaft, and a miner burrows after it wherever it leads. Wolfram recently was of great value for steel-hardening purposes, but it is now out of favour with most prospectors, and will be until the steel trades which cause its demand recover. Some of the prospectors will doubtless now feel they have too much money, and they will go down to some coastal town to spend it. While there they will meet others on a similar mission, and hear of their experiences on a new gold or

molybdenite field. The holiday soon becomes too strenuous for the liking of the average prospector, and, with his chosen mate, he will again depart for the scene of the latest finds in something new.

At present molybdenite is the most recent attraction, its uses having increased so much of late in the steel production trade and the manufacture of rare dyes and high explosives, and other things kept secret. Molybdenite is found chiefly in North Queensland, although it exists in payable quantities all over Australia and in other parts of the world. Only in the great North, however, is it found in well-defined fissure lodes, and its richness here is often 3½ per cent., whereas elsewhere something under 1 per cent. is the average. Molybdenite mining has several advantages over most other minerals from the prospector's point of view. It is found out-cropping in quartz reefs, and a man can break from the surface alone, should he strike a rich patch, sufficient to meet his requirements. The mineral is in flakes disseminated in cracks and holes in the quartz, and a pick-head blow causes the brittle quartz to shed most of the flakes. These are pure, and can be bagged at once and sold to provide funds for sinking. The broken material still contains the smaller fragments of molybdenite, but this can be sent with that obtained from the shaft to the Government reduction works, in bulk, at any time. Prospectors seldom trouble to follow molybdenite under water-level, as the flakes don't crush out so readily in the deeper quartz; hence little is known of the behaviour of this mineral in depth. The writer, however, knows, he being one of the few who have gone deep, that molybdenite, in Queensland at least, tends to become more solid in depth, and in one of the deep mines he worked, pieces of solid molybdenite weighing about twenty pounds were common, while the lode was filled from wall to wall with a quartz formation carrying about 10 per cent. of the magic mineral. This was at the deepest point touched, but still only about twenty feet under water-level. What may be the nature of the ore farther down can only be imagined, as that mine, too, is now marked only on his map. The writer himself is not immune from the 'move on' feeling.

Antimony, bismuth, arsenic, and almost everything else get attention in turn, and all are abandoned probably, also in turn, at the point when they promise most. Thus in Queensland there are hundreds of valuable mines deserted, partly filled with soakage water and overgrown with tropical vegetation. A man might pass within twenty yards of a rich opened-out property and not see it, and even if a bush fire laid its white dump bare he would not know that in its depths, covered with a few feet of water, lay a wealth of mineral awaiting only the advent of those who cared to take it away.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

PORTUGAL, detached in some measure from the general confusions of Europe, overlooked by the newspapers, and even by those who are called the statesmen, disregarded, or for a moment even looked upon disdainfully and reproachfully when she is riven by a revolutionary crisis—this neglected and sorrowful, yet always hopeful Portugal is making a fine and worthy celebration at the present time. She is praising one of her most famous men; she is proclaiming the greatness of her national poet, Luis de Camoens, who was born at Lisbon just about four hundred years ago. In this country those who know anything of Camoens and his work are wont, by way of marking his distinction, to refer to him as the 'Portuguese Shakespeare,' hoping thereby to suggest his great superiority over all other poets of his race, and at the same time the influence he has had, not only upon Portuguese literature, but upon the very life of the nation, its shaping, its effort, and its destiny. Camoens really established the Portuguese language, defined it, registered it. It may not be considered a beautiful tongue. It may be called a much softened Spanish, and though there are some who like it, it seems to many having intimate acquaintance with the languages and dialects of the Peninsula to be a somewhat flabby thing for speech in comparison with anything like pure Castilian. It is, in effect, a standardisation and refinement of the dialect that is spoken in Spanish Galicia, which is immediately to the north of Portugal. I doubt if the Portuguese are really enthusiastic about their own tongue in the way that English, French, Germans, and others are. In Lisbon, in modern times, I have been surprised at the extent to which the educated classes constantly speak French in preference to their own language. Nice people everywhere do that in a measure when the circumstances suit; French here seems so much favoured, that at times one fancies it may rise above the language of the country. The thinness of modern Portuguese literature is a contributory cause. There are good bookshops in Lisbon, but they are stacked from top to bottom with hardly anything but modern French literature. Here the latest things published in Paris are

very soon on sale, and in good demand. New novels and other literary works in the Portuguese language are rare in these times, and excusably they have no such literary sparkle as the yellow and red backed volumes that come from France. Portugal is not in the literary mood. From Madrid and Barcelona also come large quantities of new and classical Spanish works, and these again are largely read. Then the Portuguese press is not brilliant; and the Paris and Madrid newspapers arrive in large bundles and full variety every day, so that in the newsagents' shops they somewhat depress the home productions. People in Lisbon who like newspapers buy a French or a Spanish journal, or both, in addition to one printed in Portuguese, and, though at least a day late, they prefer the foreign one, for all but native news, to their own. I do not like this term of 'Portuguese Shakespeare' as applied to Camoens. Great, indeed, as he was, and noble as is the literature he gave to his country, Portuguese is one of the last languages in which I desire again to hear the translated lines of our immortal recited. One night in Lisbon I went to the chief theatre to witness a performance of *The Merchant of Venice* done in Portuguese. It was interesting in its way; all things were interesting in that earnest theatre, even the gentleman in the roughest clothes with a red tie, who, maintaining his soft hat and overcoat throughout, sat near me in one of the best front seats. But yet, having seen this Shakespearian play produced amid much acclamation in the Portuguese capital, I felt I would like to see no more.

* * *

All Portugal has fallen sadly out of joint. The common politicians on the one hand, and the Communists on the other, with profiteers and other kinds of parasites as well, have brought the country to a sorry pass. Her production is far below its possibilities; and her standard-money, the milreis or escudo, instead of being practically the equivalent of the American dollar, which is its nominal value, is down on the exchange, as I write, to something below two English pennies. The War, naturally, has been a chief contributory cause of Portugal's misfortunes, but no country has suffered more horribly than this from the modern plague of

insincere, incompetent, selfish, and intriguing politicians. Their machinations and rivalries have led to minor revolutions and incessant strikes, and have prevented any proper arrangement of the country's finances, which are in a deplorable state, and have often seemed to be bordering on collapse. Most remarkable events and scenes have been produced in the country in recent times, but one never reads about them in our newspapers, for which circumstance there are two or three effective explanations. Portugal has no desire to advertise her own misfortunes, and we as her 'oldest ally,' and really very much occupied with our own troubles, have not been anxious to make a serial story of her sufferings and disappointments. Again, Portugal in her corner, notwithstanding her great interest and political and commercial importance, has always seemed to be rather off the newspaper intelligence map. But some who understand say that something should be done with this country very soon, or she may do it with herself, and then it may be very bad. Yet this is in many ways a most pleasant land for a traveller to wander in and think about. A shade more sombre and serious than Spain is Portugal. There is a catch-phrase in France and Spain that 'the Portuguese are gay,' but I think it is satirically meant, for I have never been able to appreciate their gaiety. Lisbon, however, shows a bright face to life always; and by that same paradox which is presented in other countries in these economically most distressful times, there seems to be no lack of things, and prices for foreigners at all events are fair, though, of course, the native poor complain. There is much silly and glittering night-life. The Portuguese people have great possibilities, but conditions do not give them a chance. A great national rousing is needed. Advantage has been taken once or twice in recent times, notably on the occasion of the flight of Portuguese aviators to Brazil and elsewhere, to attempt to rouse the patriotic spirit.

* * *

A supreme opportunity is presented now in the celebration of the fourth centenary of the birth of Camoens, who was a great Portuguese, a rare adventurer with a sad and romantic history, and a brilliantly inspired poet, who poured forth noble and enduring lines which have their place in the literature of the world. It is a celebration of which we should take close and affectionate notice, and in human and literary interest it rewards the attention given to it. The Portuguese Government determined to open the remembrance in June, and found a reason in the declared circumstance that June 10 was the date on which he died, but none knows on what day he was born, and it is only by circumstantial evidence that we can fix on 1524 as the year of his nativity. I possess a very rare little book of selections from his poems with some account of his life and writings,

published by Lord Strangford in 1805, and there it says that Luis de Camoens was born at Lisbon 'about the year 1524,' adding in a footnote that the place of his nativity is ascertained by his frequent application of the epithet 'paternal' to the Tagus, and that the time of it is involved in some obscurity; but an entry in the register of the Portuguese India House appears to determine it. The family was originally Spanish, and for a long period had its headquarters at a castle in Galicia, north of Portugal, called Cadmon, some declaring that it was from this that it took its name. But there is another version, very fanciful, telling us that a certain bird with a name like this possessed wonderful powers of indicating the truth in disputes concerning questions of conjugal fidelity, and that one of the ladies of this family, finding herself under suspicion, asked for the verdict of the bird, which favoured her, and all as the result were so happy ever after that the name of the bird was adopted by the family. Once in the 14th century the house of Camoens fell into serious enmity against another, that of De Castera; a knight of Camoens slew a cavalier of De Castera; there was vendetta and persecution; and eventually Ruy de Camoens joined himself to King Ferdinand and moved off with all his family into Portugal, protected by that king. His son was Vasco de Camoens, and in this line, four generations later, Luis de Camoens was born. Simon Vaz de Camoens, father of the poet whose greatness is now being celebrated, was a captain in the Portuguese navy, and himself had an adventurous life. More than once he made the voyage to India, which, naturally, was a tremendous experience in those days. Some say that he perished by shipwreck in the very year that Luis was born, but there is a doubt upon that, although the poet evidently never really knew his father. His mother, anxious for his future, sent him to the national university of Coimbra. There he became a devoted student, absorbed the Latin poets, roamed with his fancy through Greek and Latin mythology, and dreamt dreams. He had a great affection for his university, and often mentioned it in his poems in after years. He seems at this youthful period, from what we can gather, to have been a fine fellow, with much manly grace about him, and to have attracted the attention of the ladies to a considerable extent, yet to have been cold or disdainful towards them. However, this state of sentiment, not unusual among poets, even the youngest, underwent much change a few years later, with results that may have seemed bad for Camoens at the time, but have been poetically good for his posterity. When he left the university he went to Lisbon looking for an occupation. There he began to write verses; they were admired, and a little notice began to be taken of him in high places.

Then on an April morning, in a church in Lisbon, he first saw her with whom he fell overwhelmingly and desperately in love. This was Caterina de Ataide, who was in waiting at court, one of the queen's ladies, and as such under a special obligation for discretion in conduct. Apart from this, the custom of those days in Portugal imposed a long and abject kind of wooing on the part of such a lover. In the same church he was permitted to admire her freely and to fall more and more in love, and it appears that Caterina reciprocated, but she was very, very coy. We learn something of this story from the poet's verses. After some months, when he ventured humbly to beg a ringlet of her hair, she compromised by bestowing upon him one of the silken fillets that encircled her head. Nothing more. Then the trouble began. Lover's zeal being much increased, young Camoens started upon schemes for entering secretly the royal palace, was caught in the intrigue, and the lady's relatives, quite opposed to the intentions of the poet, poor as he was, procured that he should be banished to Santarem. We gather that Caterina, who had not been over-generous in her favours, at last declared her love without any restraint on the day when he was sent away. Not long afterwards he crept back to Lisbon, attempted a renewal of the intrigue, was again detected, and was again sent off to banishment. Restless, covetous of fame and fortune for true love's sake, he appealed to the king to send him with an expedition against the Moors, in the course of which he lost his right eye through the splintering of some timbers on his ship. He did well in the war, his conduct was heroic, and on his return to Portugal he had reasonable expectations of felicity. And then he learned that Caterina was no more—that, so young at twenty, she had just died. The tragedy changed the course of his life.

* * *

The court proved ungrateful to Camoens for the services he had rendered to Portugal; he could never obtain his just dues, and, full of indignation, he determined to leave the country and seek his fortune in India. There is a tale that about the time of this decision he stumbled into new difficulties through falling in love with the wife of a Portuguese of some importance, but that may pass. And he probably served a short term of imprisonment for rowdy conduct in the streets of Lisbon. But he set sail for the East, as so many Portuguese of imagination and spirit in those days liked to do, in the year 1553. Out there he had his fill of adventures and experience. First, he had a place in an expedition against the Pimenta isles, which was conducted by the King of Cochin and his allies, the Portuguese. Then, with Manuel de Vasconcelos, he went off on another expedition to the

Red Sea, and while there turned into Africa and did some exploring, some of the vivid impressions his mind received falling to colourful phrases in his *Lusiads* afterwards. Returning to Goa, he was despatched on an official task to Macao. This is one of the queerest little European settlements in the Far East; and in recent times, as the result of some disturbances there, it has caused a certain political anxiety. A small island off Canton, it is about forty miles from Hong-kong, across the estuary of the Pearl River, and the Portuguese first came into possession of it in 1557, it being a present to them, 'the long-bearded and large-eyed men' as they were called, from the Chinese for assisting them against the river-pirates. It was then the first European settlement in China, and, the Pope of the time being interested, it became known as the Holy City of the Far East. It flourished with the Portuguese; they made money, and they lived lavishly in Macao—which, incidentally, is pronounced 'M'Cow.' But when in the middle of last century Hong-kong, under the British, rose, Macao fell, and it is now little more than a gambling resort, which people visit from across the water at week-ends. They do many things slowly in China, and despite the circumstances in which the Portuguese occupied the place originally, and the fact that they have been in possession all the time, Portuguese sovereignty was not recognised by China until 1887.

* * *

Here at Macao, certainly a scene to assist a poet whose imagination began to trip among imperial fancies, Camoens turned to his muse again and set to work, not upon love songs and laments as previously, but upon his grandest theme, the *Lusiads*, a wonderful epic which the world has accepted as a classic, while imperialist Portugal, as it is said, has regarded it as a national 'Magnificat.' The place where he entered upon this work is still marked at Macao; it is the 'sight' for strangers to see. There is a cave or grotto, still called by his name. Here, through an opening in a bamboo forest, his vision would extend far up the river on one side and out to sea on the other, and here he began to write the greater part of the *Lusiads*. The epic tells of Vasco da Gama's first voyage to India and his return, an event of great consequence to Europe and the world and not to Portugal only, and within the narrative are episodes and interludes so that the poet contrives to tell the story of the history of Portugal. Vasco da Gama himself is relating the history of the Portuguese people to the king of Melinda, and again a nymph murmurs to the great explorer a prophetic history of the achievements of the Portuguese in India. All is told in the great heroic vein; they are heroes all; the spirit of glorious adventure glows, and down to this day every Portuguese feels the better

for the reading of the *Lusiads*, and believes again in his country and hopes for her. Here we have the gods communing upon the interest in Portugal and their various actions and influence towards her in the Homeric way; here are sung many of the great historical stories of old Portugal; and here the noble families find their memorials, all in full name. This is considered a pleasant way of acquiring a considerable historical sense of Portugal; it may even be the best. For the Portuguese the poem is a great national sign and token, admired, and loved by the people at home and beyond the sea. When that is said the time for quotation and example may seem to have come, but how could one quote from such a gigantic work, and in translation, too? Yet for one faint hint of it let us give a stanza from a 'night scene,' as it is called, with the Portuguese navy urging on. Thus it reads in Portuguese:

Em quanto este conselho se fazia,
No fundo aquoso, a leda e lassa frota
Com vento sossegado proseguia
Pelo tranquillo mar, a longa rota:
Era no tempo quando a luz do dia
Do Eoo emisferio está remota
Os do quarto da prima se deitavam
Paro o segundo os outros despertavam.

This is how Lord Strangford translated it:

Meantime as thus below the murmuring deeps
In solemn council meet the watery train,
Her bold career the wearied navy keeps,
Yet cheer'd by Hope, while o'er the tranquil
main,
To silence hush'd, the brooding tempest sleeps:
'Twas at that hour, when long the solar wain
Had roll'd down Heav'n—and rous'd from warm
repose,
Slow at their comrades' call the second watch arose.

Lord Strangford, it may be noted, was for a period secretary to the British legation at Lisbon. It was at his suggestion that in 1807, the French then invading the country, the Portuguese court was transferred to Brazil; and from 1805 to 1815 he was envoy-extraordinary there. Many of his translations of these poems are happy and musical, and though the heroic history is the monument to Camoens' fame, his lyrics and rondeaus, the madrigals and sonnets, are what in good translation will catch most the fancy of a casual reader who is not devoting himself to the grand story of old Portugal. Camoens is telling of himself all the time, and in these verses we readily pick up the main themes of the passionate affair with the ill-fated Caterina. Here is the translated half of a dainty trifle:

Just like love is yonder rose,
Heavenly fragrance round it throws;
Yet tears its dewy leaves disclose,
And in the midst of briars it blows,
Just like Love.

For one more quotation let there be this, a sad one, as his own ending was so sad:

How sprightly were the roundelays
I sang in Love's beginning days;
Now, alas, I but deplore
Death of all that blest before!

Then my heart was in its prime,
'Twas Affection's budding time!
It is broken now—and knows
One sense only—sense of woes!

Joy was whilom dash'd with ill,
Yet my songs were cheerful still;
They were like the captive's strains,
Chaunted to the sound of chains!

* * *

Unhappy Camoens! He was recalled from Macao, and then at Goa was flung into gaol for some charge of peculation that was brought against him. When Constantino de Braganza was appointed Viceroy of India he was released, and thereafter distinguished himself greatly in the military sense. At last, in 1568, he made up his mind that he would return to Portugal. He had nothing to take home with him except his great poem; he had made no fortune; debts had constantly been clinging to him. On his way back the Governor of Mozambique had him imprisoned for a debt, and there he remained until some friends, also returning from India, heard of his ill-fortune and paid the debt for him. At Lisbon he received no welcome from the court. He devoted himself to the final preparation of the *Lusiads*, and at last it was published in 1572. In recognition of the fame it acquired he was granted a pension of 375 reis, only equal to a few pounds a year, and even this soon ceased. Low and low sank Camoens of this rare career. Poor, miserable, neglected, friendless was he. None had sung the greatness of Portugal as he sang it; none may do so any more. None had raised up such a sign for the Portuguese everywhere and in all ages, and for foreigners to admire and wonder at. But in his last days he had not even food enough to eat. Not entirely friendless, though, for there was just one poor soul that was very faithful to him. A slave, a native of Java, whom he called Antonio, had come back with him to Europe, after having once rescued him from the sea at a time of shipwreck, and now Antonio went out with a lantern into the streets of Lisbon by night and begged for bread, which he shared with the broken-hearted poet. But the spirit and the body of Camoens gave way at last, and in poverty and disease he died, some say in an almshouse, others in his wretched apartments near to the church of St Anne of the Franciscans, which gave a final resting-place to that poor frame. Over his grave Gonçalo Coutinho placed an inscription, which, being translated, reads: 'Here lies Luis de Camoens. He excelled all the poets of his time. He lived poor and miserable; and he died so. MDLXXIX.' There are things in the past of Portugal, as with all nations, that she must regret sadly

in the remembrance now. There is some credit in these present celebrations, seeing how they must remind a nation and her friends of a pitiful meanness towards one of her very greatest and noblest children, one who, immortal, is honoured still, and still sings for Portugal, and helps her on when all the little human things that tortured him lie in the limbo of a forgotten past. A story is told that when Camoens was suffering in his last years in Lisbon a rich young gallant, Ruy de Camera by name, called upon him one day with the request that he would finish for him a poetical version of the seven penitential psalms. Camoens lay weak and ill upon his mattress. 'Alas!'

he murmured, 'when I was a poet I was young, and happy, and blest with the love of ladies, but now I am a forlorn, deserted wretch. See, there stands my poor Antonio, vainly supplicating a trifle to purchase coals, and I have nothing to give him!' It is added, mercilessly, that this grandee of Portugal closed his heart and his purse, and in annoyance left the room. From the period of the passing of Camoens Portugal declined. Now, at a low point in her history, seeming neglected among the Powers of the world, torn by anxieties, poor indeed in her national purse, she praises her great Camoens, heaps the laurels on his tomb. It is a fair atonement.

OUR MOTHER OF SORROW.

By PRINCESS BARIATINSKY.

I.

FROM his earliest childhood Petr Soboleff was able to draw—it was instinct with him. Even as a tiny boy his wondering eyes watched the flowers growing, and the first picture he made was a daisy, both asleep and awake. He clutched at the vivid-hued butterflies as they fluttered amongst the summer blossoms, and these also he drew on his little slate. He loved the birds, too, and called to them to stop as they winged their airy flight across the wide heavens.

His first acquaintance with the stern realities of life was due to the behaviour of a large humble-bee which ungratefully stung the baby hand trying to caress the busy worker. Still less could he understand a fortnight's seclusion in a dark room, the result of trying to paint the sun at midday.

Petr's great passion, however, was to steal away unobserved into the dark woods surrounding the small Siberian town where his parents lived. The great forest trees grew so closely together that Petr could hardly force his small person between them, for paths there were none, although here and there he found an open space where he lay on his back and watched the magic clouds building fairy castles in the blue sky above.

His father was an officer in one of the Siberian infantry regiments, so whenever his son disappeared into the forest gloom in quest of romance the soldiers were accustomed to go in search of the runaway child with all speed, as many dangers lurked unseen in the thick brushwood, and wolves were often heard howling to their fellows in the silence of the night.

Petr's mother was the only one who understood the nature of the boy. The last time he was brought safely back to his parents, after many hours of torturing anxiety, she laid a

trembling but restraining hand on the angry father's arm, and said, 'Do not scold him, Serge; he is only a baby, and still lives with the fairies.'

But the stern soldier father replied, 'My dear Masha, we are poor people, and Petr must learn to walk upon the earth—the fairies will not give him his daily bread. You must train him to be a useful man.'

When his father at last went to drill his soldiers, little Petr crept to his mother's side, and showed her a picture he had made in the heart of the forest. It was a beautiful many-hued flower springing up amongst the ferns that spread like a carpet over the green glades.

'The witches dance round it once a year on the night of St John, mother. A great treasure lies hidden under it, but one must pluck the wondrous flower to obtain it, and the witches cast a spell on any one who tries. I wanted to draw it, not to destroy it, so the good fairies came and threw another spell over me. They said I should one day be a famous painter, but that I must go far away into the great world looking ever for my heart's desire. Some day I shall find it, the fairies also told me. Will you help me, mother?'

She laid a protecting hand on the curly head. 'Yes, dear, I will do all that a mother can do to help my little boy to become a great artist, but it will not be an easy task for the son of a poor Russian officer to carve a way to fame. We must ask our dear Lady of Consolation to help us.'

They both looked at the picture of the Madonna that had hung since his babyhood over his bed. Her face was so full of divine understanding that Petr prayed: 'Dear blessed Mother, please make me able to paint you when I grow into a big man.' And the Madonna, whose eyes resembled deep springs, seemed to smile a promise.

II.

Several years passed, and Petr's great artistic talents developed too unmistakably to be entirely overlooked, as was his father's wish. Captain Soboleff desired his son to be trained for a military career, and he gave but a grudging consent when an unexpected opportunity allowed the boy to gain some technical training as a draughtsman. There were no art schools in a town situated in the heart of Siberia; but perhaps the beautiful Madonna, who still watched over Petr when asleep, guided the footsteps of a political exile to this same little Siberian town, where he arranged his home and decided to remain indefinitely. This stranger was an artist of no mean repute, who, struck by the child's genius and helplessness, offered to train him in spite of Captain Soboleff's ceaseless opposition. After several years' tuition he decided to speak strongly to both parents regarding his protégé's future. 'Petr ought to be sent to the Imperial Academy in St Petersburg,' he said.

'My dear friend,' answered the father, 'how can I manage to send my son there? He is only nineteen—and a dreamer,' he added scornfully. 'Besides, there is the money question to be considered. I have only my pay, and you know how slow promotion is in an obscure Siberian regiment. I have no influence to further either his career or my own.'

'You will kill him if you force him to become a soldier,' pleaded the artist.

'It has not killed me,' replied the captain, 'and in real life one must grasp at the substance and not the shadow. I think he will make a great mistake if he gives up the army.'

But Petr's mother listened and said nothing. That night, as the youth lay with a sad heart in his modest bed, he heard her soft footsteps approaching his door. She entered, and said quietly to him, 'Petr, I have a present to give you. See! I have saved some little treasures for you all these long years. Your father does not even know of their existence.' She opened a shabby trinket-box and took out a few antique jewels. 'They belonged to my dear mother; take them, for they will pay for your studies at St Petersburg, and may the good God guide and keep you.'

So Petr went out into the great world to paint Madonnas, carrying with him memories of a sacrificing mother's love and a great teacher's devoted service. These melted into visions of great virgin forests, above which shone the golden stars, sending their mystic gleam through the frozen air of the Arctic night.

III.

On his arrival at St Petersburg, worn out with the long journey, home-sick and stunned with the roar of the great city, he carried his

letter of recommendation from his old master, together with some specimens of his work, to the Director of the Imperial Academy. This gentleman gave a keen glance at the paintings, took another long look at the appealing artistic face before him, and said, 'You have undoubted genius, my dear young friend, but your old master is right in what he confides to me in this letter. He has taught you all the technique he can, but the soul is wanting to make your pictures live.'

Petr gazed at the famous professor with eyes that still gleamed. 'I fear you speak the truth, but tell me how to find the spirit that will give my pictures life!'

The director answered him. 'No artist can put more into his work than he himself feels. You are a visionary who has neither suffered'—here he paused and laid his hand on the boy's arm—'nor loved!'

Again he waited. Petr's eyes met his frankly. 'I have loved my dear mother and the pictures of the Madonna,' he answered simply.

The great man tried to hide a kindly smile as he answered, 'We must hope the right experience will be found in St Petersburg. After you have studied here, we will send you later to Italy for further inspiration. But you must begin now, at once, to look round at life from a more human standpoint. Take a sympathetic interest in your fellow-mortals beside you—try to learn the drama of their existences. Each of us lives in our own little compact world; each of us is trying hard to make the great universe round off into a perfect whole—the broken areas of our own small individual lives.' Once more he paused. 'Out of our failures to accomplish this is born the sympathy and understanding that creates the real artist.'

Petr looked at him with eyes that understood not.

The professor continued. 'Your inspiration may also only come through suffering—love teaches some—but you must step into the arena of life now, and learn to play your allotted part in it as a man should.'

'I think I know what you mean,' replied Petr, 'but I am a fatalist, and destiny leads me.'

His new master interrupted him hastily. 'I allow that destiny is like your shadow, but even that you can lead, and an artist with a great purpose to achieve can make Fate his servant if he struggles hard enough. Now begin your work in our midst, my dear pupil, and be assured of our ever-ready help and guidance in achieving your ideals.'

IV.

A year passed quickly away, during which time the young painter made almost phenomenal advances in his art from a technical standpoint, but his painting still carried the frigid stamp

of his 'northern birth.' The director was not satisfied, and after conferring with his colleagues sent for Petr to discuss his prospects.

'The Imperial Academy has decided to send you to Rome to study at its own expense. I must, however, repeat the same warning I gave you when you first came to us. Your work lacks vital force and fire, and the dreamer's touch is over it all. Perhaps the warmth of the southern sun will melt the cold faces of your too faultless Madonnas into glowing life.'

'I can never find the right expression for their eyes,' answered the young man despondently. 'It seems a hopeless quest.'

'There are beautiful eyes in Italy,' answered the professor, with a smile. 'I advise you to go in search of them. Now, good-bye, and I expect you to return from Rome bringing a masterpiece with you for me to admire and praise. I think so highly of your powers that you must justify my faith in you.'

Petr shook his hand silently and left for Italy.

And the professor's hopes were justified. Rome the Beautiful took Petr indeed unto herself. She cast her wonderful spell over his artist soul, thawed the rigid northern nature with her warmth and glamour, and stirred his pulses with the history of men who had lived and loved in those majestic ruins, every stone of which was eloquent with the deeds of a mighty race whose influence was still a living force amongst us. Finally she guided his footsteps into the little church of Santa Maria, built on the ruins of Minerva's Temple, and there, in its dimness and gloom, he at last stood face to face with the woman of his dreams—the Madonna face that would bring him fame.

A charming young girl, accompanied by an older lady, evidently her mother, was just leaving the church as he entered; but he had a brief glimpse of the most glorious eyes he had ever seen. He stood still and stared at her in rapt amazement. The mother drew her daughter quickly to the door, observing in a voice she made no attempt to lower, 'What a strange man to stare at you like that!'

But the girl's eyes sparkled with amusement, for she had noted his confusion, and she replied lightly, 'I do not think he intended to be rude, mother. Perhaps he thought he knew us. What an artistic face he has; he looks so young and boyish!'

'Doubtless some poor painter,' replied the elder lady. 'Rome abounds with them. Do hurry, Vera!'

As their voices died away, Petr roused himself and looked around the church. The radiant vision had departed, leaving the little sanctuary to its mouldering dimness. He pressed his hands to his eyes and went out into the sunshine.

How wonderful was her face in its radiant

youth! It embodied for him in every detail the type he had sought so long.

'Now I can begin my great picture.'

v.

He hurried away to the Jardin de l'Académie de France, and straightway began his Madonna, the vivid memory of the girl's beauty making the task of depicting it on the canvas an easy one. He worked eagerly and rapidly, and in his deep absorption failed to notice that the lady of his dreams was standing behind him. The same look of playful amusement lit up her laughing eyes as she regarded the earnest artist.

'Monsieur, you are as one inspired.'

She spoke in French, with a pretty foreign intonation. As the soft words fell on his ears Petr raised his head and saw her before him—his heavenly dream no longer a vision, but a living reality. His heart ceased beating, and the entire world stood still. All the pent-up adoration of his life revealed itself in his young face as he looked at her, unable to utter even a word. Her eyes fell for a moment beneath his rapt gaze and she blushed slightly. 'Forgive me, monsieur, for interrupting you. I am trying to copy pictures—see, here is mine—but I know I shall never do work like yours. You are painting a Madonna?'

Petr tried to collect his scattered senses as the half-laughing apology was given, but the heavens seemed to be filled with soft lights, waving shadows, and strange unearthly music, as he stammered impulsively, 'You are the inspiration of my Madonna, mademoiselle.'

The girl regarded him with a sweet, questioning bewilderment. 'I . . . inspired . . . it?' she repeated slowly. 'I do not understand.'

Petr's world was still one where myriads of rainbows gleamed, and great torrents of joy thundered through the universe.

'Yes! You were just now in the church of Santa Maria . . . do you not remember?' His words tumbled over one another in his excitement. 'I saw your beautiful eyes there. . . . I have been looking for them for years. . . . I could not even begin to paint this Madonna until I found them. . . . Look at her. . . . She is thinking . . . she knows her little son will one day be the Light of the World . . . but she has a vision of the Shadow of the Cross that lies between. I shall call her 'Our Lady of Tears.'

He paused in deep emotion, and impulsively the girl clasped his hand. 'You saw all that in my eyes?' she said softly.

'Not the grief, mademoiselle; but you could look like that if sorrow ever comes. Will you not sit for me a few times—I have indeed waited long years to find my model?'

'Yes! I shall be proud to pose for such a wonderful picture,' she replied; then, smiling brightly, added, 'I cannot remain longer to-day,

but I will come to-morrow and help you with the Madonna.'

VI.

And on the morrow, and on many other to-morrows, Petr's enthusiastic fingers transferred the vivid image of the lovely girl to the dead canvas, making it live and glow. Her history was soon told. She was a Russian also, the daughter of a nobleman whose estates had been impoverished by generations of gamblers. She and her mother were living quietly for some months in Rome, as she wished to study painting.

'I know I shall never do anything really worth while,' she confessed with a little sigh, 'but I love pictures. My mother has many friends here, and it bores her to be always in the galleries, so I come alone. That is the reason I have so much liberty.'

The painting made rapid progress, and they worked hard every day. He was also anxious to be better acquainted with the beauties of Rome, and Vera proved an excellent cicerone, and together they explored the immortal sights of the Eternal City.

Petr's adoration for her soon became an overwhelming passion. One day they stole away from the town into the Campagna Romana, and it was there, amidst its solitude and grandeur, that Petr's passionate adoration burst its bonds, and he told her of his great love.

The girl looked at him with startled eyes. 'I do not quite understand you,' she faltered. 'I thought we were just good friends and interested in the same art. Besides'—she paused a moment, and then added resolutely—'I am already engaged to be married.'

Petr's reason seemed to totter for one awful moment as his brain tried to grasp the meaning of her words. 'You are going to marry some one else,' he said hoarsely, gripping her arm until she winced. 'You are not speaking the truth. You are saying this awful thing to test my love for you.'

She wrenched herself out of his grasp. 'Petr, be reasonable, and listen quietly to what I have to say. I had no idea that you cared for me like this. Let me try to make you understand.'

She turned away from the dumb misery in his eyes.

'Vera, I thought you loved me,' was all he said.

The girl remained silent for a moment. 'I am engaged to Count Wassili Werekieff,' she replied at length, trying hard to overcome an ominous tremble in her voice.

Petr covered his face with his hands, and a dull sob broke from him.

She continued passionately, 'I hate being poor. I have known nothing else all my life. The ceaseless longing for all that makes life bright and happy—the pretty clothes, trinkets, and enjoyment. Our love would never stand

the incessant strain of poverty. I should ruin your life and be a burden on you, Petr. I am speaking the truth.'

He rose swiftly and faced her. 'You do not realise what you are saying,' he said hoarsely. 'You say our love would not stand the strain of poverty. Do you realise what you are to me? You are the ideal I have searched for all my life—the beauty that lies veiled behind everything I have ever really cared for in life—the mountains and forests, storm, rain, sunshine—clouds and sunsets—your form has been ever there. Vera, you do not understand how wonderful our lives can be.'

She looked stonily, with unseeing eyes, at the glory of the sunset. 'I cannot face a life of struggle—it is so hard—believe me. I know what it means only too well.'

Petr's arms closed round her. 'But we shall not be poor for long, dearest. I will work for you; you will inspire all the great pictures I shall paint with your beautiful face smiling back at me from the canvas. You cannot break my life and dreams like this. Think what you are giving up. We are both young, with the wondrous gift of life in our hands, and all this beauty around us. Listen, dear—marry me now, and let us face the future together with our faces turned towards the eternal dawn.'

She lay for a moment passive in his strong young arms, and suffered his kisses to rest upon her hair and brow. 'Petr, it cannot be,' she said faintly.

He kissed her eyes and laughed softly. 'You can do what you like, but you will be mine, for you are my inspiration, my genius. If I lose you I lose my all in life.'

She hid her tear-stained face on his arm. 'Believe me,' she said, 'when you are struggling for food, for shelter, for the bare necessities of life, love will disappear, even genius. Think how many poets, painters, musicians, and writers have fallen, broken on the dusty highways of life, with the laurel crown placed too late, not on their brows, but on a desolate, lonely grave. The face of poverty is hideous; it grins at us too often when we hold the joy-cup to our lips. I hate it!'

He looked at the beautiful, passionate young face in amazement. 'How can a young girl feel so deeply on such a subject?' he uttered, deeply moved.

She clung closer to him. 'Petr, I will never leave you in spirit. Behind all your future dreams I shall be there, guiding and helping you. Now let us return home. I can bear no more to-day. We must think it all over in quietness and calm. Perhaps to-morrow—'

VII.

And when to-morrow came, Vera and her mother had left Rome in haste, and were far on their way towards the Russian capital.

After bidding Petr farewell when they returned from the Campagna, Vera had thrown herself on her mother's neck and sobbed, 'Take me home at once, mother. Do not ask me anything now. You have before you only your suffering child. Be just the mother to whom I used to cling when I was small and helpless. If you want to see me the wife of Wassili, take me back to Russia to-night.'

The practical hard-headed mother looked closely at the over-wrought girl. 'Some nonsense with that good-looking artist, I suppose,' she thought, but had the wisdom to keep silent and ask no questions. She hastily packed all their belongings, and they left for St Petersburg by the midnight train.

The morning came, and Petr went joyously to their accustomed place in the Jardin de l'Académie de France, expecting to see Vera at the usual hour. All doubts as to her love for him had disappeared with the dawn, which he watched from his little chamber windows, and as the first pink flush in the gray level sky deepened into a crimson glow, he was certain that his beloved would face the uncertain future with him hand in hand, smiling at poverty and care.

It was a wonderful fresh morning, with little breezes wandering round to greet him, and fairy dewdrops that gave a cheery blink and then dissolved in the sunshine. He was out a little earlier than was his wont, and as Rome, with its great churches and buildings, all so luxurious in their impression, yet so simple in their broad outlines, rose out of the valley mists and assumed form and grandeur in the clear air, he involuntarily exclaimed, '*Rome, la mère de tous les arts, et la créatrice de l'éternel amour*,' as he gazed entranced at the magic scene, and drew in a deep breath of utter contentment.

He worked steadily for several hours, expecting Vera to appear at any moment, and it was not until his midday meal was over that he began to feel any real anxiety at her non-appearance. He hurried away to the small hotel where she and her mother had lived for several months.

The concierge was able to give him precise information regarding both ladies. Madame and her daughter had left unexpectedly for Russia the previous night. They caught the last train. He did not know the reason for such a hurried departure. No! there was no message or letter left for him.

Petr stood as one stunned. 'Left for Russia. No message!' he repeated dully.

The concierge turned away to attend to the postman, and as the two men stood chaffing and talking together they little imagined that a young life lay broken before them, all illusions shattered, and its child-like faith in the justice of God killed at a single stroke.

VIII.

That night the northern express carried Petr, together with his unfinished Madonna and his ruined dreams, back to the frozen north.

The professor received his unexpected pupil in sympathetic silence after one long searching look at the pale, stricken face, and waited patiently for the explanation of his too early return. Petr unburdened his passionate bursting heart. 'I cannot finish my picture. The power and inspiration are no longer there. I never wish to paint again.'

His master put a kindly protecting arm round the shaking shoulders. 'Be patient, my son. Rome has indeed done her work. The artist has found a soul,' was all he said.

He watched Petr very closely, however, during the next few weeks, and offered no opposition to his cessation of all study. The young man spent many days wandering through the chain of silent islands stretching for miles outside the city of St Petersburg. The older man knew that Nature is the great healer, and assured as he was of the boy's genius, he felt convinced that greater, nobler efforts would be resurrected out of the apparently dead ashes of his present despair. Petr learned to love the peace and calmness of the long nights spent on these little isles, where the clear northern light was not dimmed at eve by the shadow of the black pinions of darkness, but shone like noon in that land of the midnight sun. His white face merged into the pale landscape as he crept back to his neglected couch, his aching heart and weary brain stilled by the healing wings of the angel of dawn.

He haunted the dark churches also, remembering his mother's prayers of old. One day, when kneeling before the shrine of the Miraculous Sainte Vierge in the Cathedral of Kasan, and in the act of lighting the pale candles which illuminated the tender look of the Holy Mother for sorrowing mankind, he heard voices in the silence. Lifting his head, he saw a wedding group approaching the altar. There were not many people in attendance, and Petr, impelled by some irresistible instinct, approached in time to see the bride as she passed, like a lily in her white gown.

It was Vera, and his eyes looked for a moment deeply into hers. Such grief and regret he never expected to see in any human countenance, and in the realisation of her suffering he forgot for a moment his own despair. He made an involuntary movement as though to protect her, but she raised a warning hand and he fell back. He watched two large tears well into her beautiful eyes and roll down her cheeks. Then she passed on, no one having noticed the quick, silent drama; but the few spectators were amazed to see a young man

rush blindly from the church, as though pursued by some relentless fury.

Petr took a droshky and hurried home, where he seized his long-neglected brush and began to paint like one inspired on his unfinished Madonna.

He was at last able to depict all the suffering he had ever dreamed as resting in the eyes of the Lady of Sorrow, and unconsciously he depicted two great tears falling on her white cheeks.

IX.

At the autumn exhibition given at the Imperial Academy there was one picture of which all St Petersburg raved. 'Our Lady of Sorrow' was surrounded always by a crowd of ardent admirers, and the name of Petr was on all lips. Suffering and love had at last accomplished all that the professor hoped. Petr was indeed a worthy son of Great Russia; but the gladness had departed, apparently for ever, from the young face, and he remained an

enigma to his public, for in the midst of his great success he hardly spoke, and never smiled.

In two years he became world-famous, and then the clouds of sorrow lifted. He opened his paper one morning to read in the society columns that Count Wassili Werekieff, whose reckless auto-driving was the despair of his friends, had been killed in an accident whilst motoring along the famous Corniche Road between Nice and Monte Carlo, but his young wife, who was with him, had escaped uninjured.

Some time afterwards a second Madonna was exhibited by the famous artist, which created a veritable furore in the art world. This time the Blessed Mother was named 'Our Lady of Joy.' Smiling eyes shone with wonderful hope and love as she gazed at the infant lying in her arms. It was said that the model for the picture was the beautiful wife of the painter, Petr Soboleff.

INTO HUDSON BAY AGAIN.

By AUBREY FULLERTON.

HUDSON BAY, once a travelled highway between England and Canada, but now for many years a neglected sea, is again being talked about, and may presently regain its old-time importance. It will not do so, however, in its old-time capacity. Originally a link in the fur trade between London and Rupert's Land, it will now be a link in the grain-carrying trade between the Western Canadian wheat-fields and Liverpool.

To ascertain whether or not the route is practicable for this new Canada-to-England traffic numerous investigations have been made, and evidence has been taken from experienced navigators and grain shippers. Captain Joseph Bernier, who has been sailing into Arctic waters for several years past, testified before the Royal Grain Commission that Hudson Bay could be safely navigated by specially built ocean-going ships for from four to six months of the year, and that the extra cost of such ships would not be more than 10 per cent. The establishment of such a route, however, will depend entirely upon the completion of the Hudson Bay Railway, with which trans-Atlantic cargo ships will connect at Port Nelson.

The Government of Canada began in 1911 the construction of a rail line from Northern Manitoba to the mid-west coast of Hudson Bay, intending it to be especially a grain-carrying road. Before the War steel was laid on about 330 miles out of a total 424 miles, and \$20,000,000 was spent on the work, including terminal facilities at Port Nelson. To complete the road will cost an additional \$6,000,000, and it has

been a question for the past few years whether the Government should make this further expenditure or abandon the project.

Western interests, particularly in Manitoba, are strongly demanding the completion of the road, and in the city of Winnipeg there is an agitation with 'On to the Bay' as its slogan. The demand from their point of view is that the Government, which is practically committed to the scheme, go on with the undertaking and give effect to the expenditure already made by completing the missing link of railway. In opposition to the entire project it is claimed, more especially by shipping interests in Eastern Canada, that Hudson Bay is open to safe navigation for so short a time each year that to go any further in the attempt to make it a commercial route would be a waste of public money.

If a new Hudson Bay route for cargo ships is opened up, Western Canada will be brought considerably closer to England. From Port Nelson to Liverpool by the proposed route is 2966 miles, as compared with 3007 miles from Montreal, and 3053 miles from New York; but the chief advantage will be the great shortening of the land haul to seaboard, making possible a saving to the exporter of 15 cents on every bushel. This is the main argument for the completion of the railroad and the inauguration of the Nelson-to-Liverpool service.

On the map it looks as though Nature intended some such use to be made of Canada's northern inland sea. With its two straits connecting with the Atlantic and Arctic oceans, Hudson Bay is nearly half as large as the Mediterranean,

and is therefore, in size alone, a factor to reckon with. The bay itself offers no serious navigation problems, being open the year round; but Hudson Strait, 450 miles long and 100 miles wide, is admittedly dangerous because of the floating ice that packs into it on its way to the Atlantic. The strait is not considered safely navigable until 15th July, and from then only until 30th September; but it is claimed that with specially constructed ships the season can be lengthened.

The navigation of Hudson Bay is no new thing. If the opening of the grain route materialises precisely as now expected, it will be, after all, only a remaking of history, for the bay has been a place of adventure and romance ever since Henry Hudson first sailed it in 1610. Only sixty years after its tragic discovery the newly organised Hudson's Bay Company began to traffic in the surrounding wilderness, and for a long time a regular trade-route between Europe and America was maintained *via* this northern waterway. York Factory, on the south-west coast, became an ocean port; sailing ships that for their day were great and fast carried to it rich stores of merchandise, and took from it still more valuable cargoes of raw fur; and in defence of the trade thus established strong forts were built and battles fought.

The most substantially fortified post that the Hudson's Bay Company has ever had in its 250 years of history was Fort Prince of Wales, at the mouth of the Churchill River, a hundred miles or more north of York Factory and Port Nelson. Trading post though it was, and farthest north of all New World fortresses, it had the distinction of being the strongest defence on the whole American continent at the time it was built, and so well and securely were its foundations laid that parts of the great stone walls, thirty-four feet thick, still remain. The

Government of Canada has recently placed the old fort site under the care of the National Parks Branch, and it is now to be preserved, for its history's sake, as a memorial park.

Fort Prince of Wales was built in 1734, and from it, thirty-five years later, Samuel Hearne went out on his famous overland journeys into the North, the first of white men to reach the Arctic coast. Hearne was a better explorer than soldier, however, and his surrender to the French under Admiral La Pérouse in 1782 was in sorry contrast with the massiveness of its defences. The fort was destroyed by the enemy, and has never been rebuilt; but enough of it is still left, in grass-grown outline, to make it one of the most interesting spots, historically, in the New World.

There was no question in pioneer days about the navigability of the bay. Eighteenth-century seamen sailed the northern sea so ably that there were surprisingly few losses on the route, and Hudson Bay became Britain's open doorway into the Canadian North-west. For many years all the coming and going was by that way. Lord Selkirk's Red River colony, for instance, was dependent upon a picturesque ox-cart service from York Factory, which freighted to Fort Garry (the modern Winnipeg) supplies brought overseas by the Hudson Bay packet line. To-day Winnipeg and the West beyond are served by two great transcontinental railways. But there is nevertheless a desire to revive the northern water route, which has possibilities of as great service to the prairie provinces, under modern conditions, as a hundred years ago and more, when it was the only way. Since then, however, cargo ships have grown, and it now remains to be proved whether or not what was practicable for sailing vessels and ox-carts is correspondingly feasible for big steamships and a costly railroad.

'DON QUIXOTE' AND THE ORPHANS.

CHAPTER IV.—*continued.*

III.

WHEN comparatively safe in that broad-leaved wilderness, Juan having returned to watch the *ranchos*, Brooke told the girl that Hugo was with Marshall, and her brother with the horses, where they would speedily join him. Presently Juan of the Spurs came up, grinning with satisfaction.

'It's the best sort of a miracle,' he said. 'All the dogs must also be drunk. All the *malo gente* and the *perros* have been taking advantage of Don Pablo's indisposition. They have had a great *fiesta*. Looted the store—drunk all the *aguardiente*—eaten a whole cow, perhaps two—there are two pairs of fresh horns

—and the *perros*, like their masters, are surfeited and drowsy—dead to the world.'

Finding the girl quite unable to walk in the rough bed of the *arroyo* even when supported—carry her he could not and keep his footing—Brooke bore her into a patch of sugar-canes, whilst Juan went ahead to get horses.

Being some distance from the bandits' village, Brooke felt sufficiently secure to question the girl as to her experiences.

But she could not speak in any detail of what she had endured—of the awful ride up the *arroyo*, tied with raw-hide thongs to her saddle—of the deadly fatigue, the smarts, pains, and aches. It was a horrid nightmare, ever to be remembered with a shudder. She wished to forget it.

She had not seen Don Pablo, and could not understand the talk of her captors. But Hugo had told her that he had overheard one of the brigands say the chief was expected to die, at which all who heard laughed loudly, and seemed very pleased. Although so desperately weary, however, the girl spoke freely on one subject—her rescue and the impossibility of paying the debt she owed to her rescuer.

But on this topic she became silent when Brooke, hesitantly and with compunction, suggested that there were several ways of bestowing a reward, and greatly daring, expressed the hope that some day she would permit him to ask her to seal a contract which would be more than ample recompense for anything he had done or ever could do in her service.

It was scarcely a fitting time or occasion for such a suggestion, and Billy Brooke felt that, being a modest sort of fellow; but she heard him with a smile, if rather a wan one, and to his supreme satisfaction showed no sign of resentment.

IV.

After lying hidden in the sugar-canes for an hour they heard the splashing of horses. Juan had returned, leading two extra mounts and accompanied by Marshall, whose frowning face cleared at sight of the girl. Asked what he had done with little Hugo and his prisoner, he laughed grimly.

'Hugo's all right,' he said. 'So's the brigand. I found him quite intelligent, so set him free and gave him a little job of navvying—digging a hole, anyway. He went at it kindly enough, but I doubt if he'll take the trouble to dig deeper than a coyote's burrow.'

'You're talking Greek, or double Dutch, and I neglected the classics in my youth,' Brooke rejoined.

'So "*no sabe!*" as the Mexicans say? Well, my son, if you must know, Don Pablo's an *aparecido*, and the state of Oaxaca owes me ten thousand *pesos*, which I hope I may collect. Don Pablo's is a most unlovely corpus, but it'll get decenter burial than the scoundrel deserved—if my late prisoner does as he promised.' He turned to the guide.—'Juan, what in the name of all that is villainous and accursed is *El zumo del coralillo?*'

Juan of the Spurs pulled up his horse with a jerk. His face paled, and he shuddered visibly. '*El zumo del coralillo, señor?*' he cried. 'It's the deadliest poison in the world. The Indians get it from the jaws of coral snakes. It will kill at once, like a bullet through the brain or the heart, or in a week, or in a month, or a year. It depends on the strength. But always it kills. If pure, a man drops almost immediately, just as when the coral snake bites. His blood curdles, and he dies on the spot.'

'No such mercy for the Lestranges,' Marshall

commented, in English, half to himself. And his eyes gleamed.

'Oh!' cried the girl, who had correctly interpreted Juan's horrified tones and gathered Marshall's meaning.

He glanced at her in some compunction. 'I didn't intend you to hear,' he said. 'Don't think more about it than you can help. The wretch has paid for his crimes. I killed him. Best deed I ever did, or ever shall do, I expect.'

They rode on, and presently drew near the clearing where the animals had been left with Rupert Lestrangle. He heard them coming, and hastened to meet them. 'My darling Mabelle!' he cried. And there were tears in his eyes as he kissed her. Then he solemnly shook hands with the mining experts and Juan of the Spurs. 'I shall never forget—never,' he said.

Presently, the *arroyo* road being intolerable, Juan struck into the bordering forest, which necessitated the constant use of his *machete*. Even so, progress was painful enough, and all were dead tired when eventually they arrived at the Bluff. The brigand leaders slain, and the band in thrall of the curse of the Mexican Indian—*aguardiente*, a poison almost as deadly as *El zumo del coralillo*, if less speedy in its action—no further attack was anticipated.

V.

Next morning, accompanied by Mabelle and Rupert Lestrangle, and by Hugo, who was not a bit impressed by the millions which lay under his feet, the mining experts resumed their prospecting as if nothing had happened. This, the third examination, confirmed them in the opinions they had previously formed. The mineral contents of the Bluff were enormous.

'We shall have to call the orphans the little plutocrats,' Billy Brooke told the girl. 'The proposition is so huge that I fancy the directors will want to form a special company. As you and your brother are the children's natural guardians, it will be up to you to decide whether they should accept a royalty or shares. And as representing the owners you ought to have a voice in the management.' With a laugh he added, 'In that case, may I ask for your good offices on behalf of Don Quixote de la Mancha and Sancho Panza? Like the unlamented Don Pablo, we have taken a fancy to this place, consider the prospects excellent, and wish to make sure of a permanent job.'

'Of course,' she answered. 'Why, but for you—well—never mind. I really can't tell you just what I think and would like to tell you; but if Rupert and I have any power, and if it would be in order to offer you and Mr Marshall shares in the company—if there is one—'

'Can't be done,' he interrupted. 'That might be called an illegal commission in the city of London. All the same, if of your kind-heartedness you should ever feel disposed to bestow

upon me the only reward I covet, you will make me the happiest man in the world. But as to the owners' interests, we must really hear what the *Juez* has to say. They are under his jurisdiction at present.'

'But British subjects?'

'Oh yes; and if Don Salazar gets the titles extended all right, you should be free to enter into a contract on their behalf either here or at home. I'm awfully keen on contracts,' he went on, 'and like the ghosts in Don Salazar's noddle, there's one that's never out of my mind. As you know, I shall have to stay here for a while, and I'd dearly like to fix it up before you take the children away. Are you going to take them home?'

'Well, you know,' she answered, and the rose showed through the sunburn on her cheeks, 'they must be educated, and I couldn't really ask Rupert to take them alone. But'—smiling—'if I really am very much wanted, and you could convince me that it is my duty to be here—well—to help to safeguard the orphans' interests and—and—enter into a contract—why, I might come back.'

'And you will?' he cried jubilantly.

She laughed. 'Perhaps. But about that we really must hear what the *Juez* has to say. So far as I could tell, his is the only habitable—I didn't say desirable—house in San Pedro Mixtepec. I couldn't really contemplate living in a tent on this Bluff altogether, you know. But if Don Salazar would agree to take me in, that might be an inducement to me to consider seriously the contract you spoke of.'

'I would build a house for you—a real *casa grande*,' said Brooke. But she only laughed.

Such thistle-down encounters were frequent during the next few days, and having gathered an inkling of the state of affairs, Marshall felt it his duty to lecture his colleague on the subject of brazen impudence and various other applicable synonyms, which had no effect whatever.

VI.

On the sixth day after his departure Don Salazar, true to his promise, arrived at the head of a small army—fifty *rurales* and three officers, all splendidly mounted and most picturesque in their gray and silver uniforms. A palaver with the mining experts and Juan of the Spurs followed immediately, when it was decided to attack the bandits' village the next morning.

Then the *Juez*, who had been told the story of the execution of the brigand chief and of *El zumo del coralillo*, with many flourishes produced the new titles of the mine, duly made out in the names of Hugo and Adelaide Lestrangle, *menores*, bearing many stamps and a great seal impressed with the arms of the Republic—an eagle rampant, perched on a spiny cactus, with a snake's tail beneath its talons and with its neck in its beak.

The *Juez* drew special attention to the seal. It was symbolic, he said, of that other serpent who had been so providentially slain by his good friend Don Sancho, and was now an *aparecido*, &c.

At dawn the troopers set out for the bandits' lair, guided by Juan of the Spurs, and accompanied by Marshall, who was determined to see the finish. They defeated the band, killed a great many, and filled the jail at Miahuatlan with the prisoners.

Came the day of the departure of the orphans and their guardians for San Pedro Mixtepec, the city of Oaxaca, Mexico City, and home. Leaving Marshall in charge at Santa Elena, Brooke accompanied them.

There was much to do at San Pedro—the poor cross in the wood to replace with a memorial more lasting; the marriage to attend of Juan of the Spurs and Felipa, the former resplendent in the finest rig to be bought, the tightest possible trousers, the flaringest crimson sash, and real silver spurs weighing some pounds—a present from Rupert Lestrangle. Followed a *fiesta* for the children who had been the orphans' play-fellows when they lived with old Catarina. A last meal in the judge's house, a final serenade by the band, and they rode away.

Billy Brooke went with them as far as the city of Oaxaca, and saw the travellers to the train for the capital. 'You will really come back?' he asked the girl when the time for departure had arrived.

'Rupert has promised to bring me,' she answered. 'But there is one thing I want to know.'

'Yes?'

'When in Mexico shall I really be called "La Señora Doña Mabelle Quijote de la Mancha y Lestrangle"?''

To such a question there could be but one fitting answer.

THE END.

THE MONTH: SCIENCE AND ARTS.

A WICKLESS INCANDESCENT PARAFFIN LAMP.

MANY novel lamps have been described in these notes from time to time, but so far none has been of the wickless paraffin type. In principle such lamps resemble the well-known

Primus stove, in which a high-pressure jet of paraffin vapour, mixed with air, burns with a blue flame of intense heat. In a very simple lamp of this type which has recently come under our notice, a brass container which forms the foot is partly filled with paraffin, leaving an air

space in the top which is charged with air by a pump to a pressure of 30 pounds per square inch. This pressure on the oil forces it up a vertical pipe into a vaporiser. Here the heat of a small quantity of methylated spirit, applied by means of a 'torch' (described below), converts the liquid paraffin into vapour, which issues from an extremely fine jet into an incandescent burner similar to that used with ordinary coal-gas. The vapour mixes with air and burns inside the mantle, making the mantle incandescent. The heat from the mantle keeps the vaporiser hot, and continues to vaporise the paraffin so long as there is oil under air-pressure in the container. In all wickless stoves and lamps particles of carbon are deposited in the vaporiser, and these are liable to reach the fine jet in the burner and choke it. To clear such obstructions, there is provided in the vaporiser a wire with a fine end which can be pushed up through the jet by turning a small screw. This plan is a great improvement on the usual one of pricking these jets from the outside, when, of course, the particles of carbon are pushed back into the vaporiser, where they are liable again to reach the jet. Moreover, the operation is a tedious one compared with the turning of a screw. After a life of about 500 'burning' hours, however, the vaporiser becomes completely choked, and it is then necessary to renew it. The lamp is so designed that this is readily done at a small cost. The air-pump is a permanent fixture in the container, only the handle projecting. Another useful item is a screw which shuts off the paraffin from the vaporiser until the latter has become sufficiently heated by the methylated spirit. The 'torch' consists of two pads of asbestos, which are dipped in the spirit and held by a spring on the vertical pipe just below the vaporiser. After one minute the paraffin can be turned on, and the lamp will light. In addition to clearing the jet the wire in the vaporiser can be used to regulate the size of the flame, and therefore the light of the lamp. By turning the control screw, the lamp may be made to give any amount of light from 50 to 300 candle-power. These lamps are made up in various forms. The capacity of the container of the smallest is $1\frac{1}{4}$ pint, and this quantity will last for 10 hours, making the cost about one penny for 6 hours. The containers are of polished brass, and all other parts are handsomely finished. There is only one drawback, the slight buzzing sound made by the jet. But this feature is more than counterbalanced by the economy and perfect cleanliness of the lamp.

A NEW METHOD OF ELECTRIC HEATING.

If the best results are to be obtained from any form of heat for warming rooms or buildings, a big surface at a comparatively low temperature must be chosen in preference to a small surface at a high temperature. This

fact has been taken advantage of in a new method of warming houses by electricity. The heating elements are embodied in draught-screens, wall-panels, skirting-boards, and mirrors, or they may be fixed under floors. A screen is a particularly effective heater on this system, because of its very big surface. The electric elements are embodied in the screen, which, to all appearances, is unaltered from the ordinary article. Temperatures of about 100° F., i.e. which are comfortably warm to the hand, are found to be quite enough. With these temperatures, of course, there is no risk of fire; neither are the electric elements liable to failure, as is the case with high-temperature electric heating and cooking apparatus. One advantage of the heated looking-glasses or mirrors, especially in bath-rooms, is that they do not become blurred with condensation. Electricity for heating must always be more or less of a luxury, but for those who can afford it no source of heat is so convenient, clean, and healthy. The cost under this new system, however, is comparatively moderate, because of its high efficiency.

A four-fold screen, for instance, consumes one unit of electricity in $1\frac{1}{4}$ to $1\frac{1}{2}$ hours. The cost of electric current for heating seldom exceeds twopence per unit, while in many places it is only a penny. When it is considered that the screen in question will warm quite a large room, it will be understood that the cost is by no means prohibitive. This method of heating should be ideal for the early summer or the autumn, when very small amounts of heat are required. The screens, panels, mirrors, and mats with the heating elements can be made up of any material and in any desired form.

AN UNDER-WATER PLANE.

Conditions necessary for the aeroplane to fly or glide in the air may, with certain modifications, be applied to an under-water glider, and this has been successfully done in a toy which bids fair to become popular. Gravity, the force tending to pull the aeroplane down to earth, is counterbalanced by wings or planes set at an angle of incidence, together with a horizontal thrust applied by an engine. Just as gravity acts downwards, buoyancy acts upwards. If, therefore, a lighter-than-water construction be placed in water it will float, but fitted with a power unit to give a horizontal thrust and planes set at an angle of incidence (negative incidence to that of an aeroplane), a force will be produced opposing the upward buoyancy force, and the lighter-than-water machine will dive to depths in water, just as an aeroplane rises to heights in the air. When the power ceases to operate, the under-water plane will rise to the surface, just as an aeroplane comes to earth when the engine is shut off. In the toy referred to the planes are set at the proper angle, and the power is supplied

by means of elastic or rubber bands acting on an aluminium propeller. When properly adjusted, the appliance can keep a straight horizontal path some few inches below the water if desired, or run along at the bottom by means of the under-carriage provided. It will travel on its side, loop the loop, or, by setting the rudder over, it will make a spiral loop or cork-screw. It will always return to the surface. The toy, it may be added, is made in four sizes.

A NEW FORM OF BOOT-SCRAPER.

We have recently had the opportunity of testing a novel form of boot-scraper which presents several useful features. In general appearance it resembles a spade with a rather short wooden handle. To the lower part of this handle are fixed, one on each side, two thin iron bars, ending in a knob at the bottom to give support and to prevent damage to a floor, and slightly curved at the top, so that the two bars together form a long \cap . Riveted to these bars about half-way down the \cap , and projecting beyond them on each side, is a steel plate, forming the 'scraper'—straight along the top, slightly concave along each side, and more distinctly concave along the middle part of the lower edge. With an instrument like this, held much as one holds a spade, it is easy to remove the mud from the soles of one's boots with the help of the top of the scraper, from the sides with that of the parts projecting beyond the bars, from the uppers and the back of the heels with that of the concave lower edge, and from the welts with that of one of the corners of the scraper. All edges and corners, however, are carefully rounded off so as not to injure the leather. Being portable, the scraper can be kept and used just where required, and should prove very useful in golf-clubs and country houses, and to shooting parties.

A SOLID SUBSTITUTE FOR METHYLATED SPIRIT.

Many of us became familiar during the War with a solid substitute for methylated spirit which liquefied when lit, and burned with a blue flame. This substance was admittedly a makeshift. A new substitute has made its advent recently which has actual advantages over what may be called the 'genuine article.' As sold, it is a white solid substance in the form of round or rectangular tablets or cylindrical blocks. It burns with a blue flame which is said to be hotter than that of a spirit-lamp; has no smell; does not itself become heated; leaves no residue; does not evaporate or deteriorate with storage; is not affected by water; and can be blown out when done with, and the unconsumed portion used at another time. All kinds of utensils suitable for the consumption of this fuel are supplied by the makers. The simplest consists of a three-legged

metal frame, upon the top of which a saucepan or a frying-pan can be placed, while three horizontal projections support the block of fuel. This frame folds up flat. A block of fuel will boil a pint of water in 5 minutes; and it will burn for from 1 to 1½ hours. A more elaborate device for boiling water has a wind-proof stand for the fuel, a saucepan, and an egg-boiler, all of which pack into the saucepan. A smaller edition boils a sufficient quantity of water for shaving or making a cup of tea. In view of the lukewarm water one is often given in hotels or even in private houses, this appliance should be particularly useful to travellers. These boiling devices are all made of aluminium. Another useful appliance is a pocket case about the size of a spirit lighter, which takes a bar of the fuel. This gives a clean blue flame, similar to that from a spirit-lamp, for sealing or for medical purposes. Other ends for which this fuel is used are heating curling-tongs, and lighting wickless pressure stoves. It was carried by the Mount Everest Expedition of 1922, and a larger store was taken by the party which attempted the ascent during the present year. For tea-baskets the new fuel is ideal. It costs more than methylated spirit, heat for heat; but when the loss of the spirit by evaporation is taken into account, there is not much difference between the two, while the solid fuel is, of course, much safer and more convenient.

NOVEL CAMPING-TABLE AND CHAIRS.

For camping out at home and for up-country expeditions abroad a portable table and portable chairs are almost indispensable. A new form of camping-table has recently been brought out which, when closed up, is very similar to a suitcase in form, but with each division of equal depth. This case measures 30 inches in length, 15 inches in width, and 3 inches in depth. When opened out flat it forms the table-top. There is a leg at each corner, which swings on a pivot at the end of the table. Pivoted at one end to each leg is a wooden strut, the other end of which fixes to the side of the table; there is likewise a steel strut, which attaches to the table-end, both struts being at an angle of 45 degrees. These struts stiffen the legs in all directions, and make the table exceedingly rigid, and it is the work of but a few seconds to fix them in position. As a matter of fact, the legs are not actually pivoted to the ends of the table, but to wood strips which go right across the ends and fix on with buttons. These strips keep the table-top fully extended, and they prevent any sagging down at the hinge. The table consists of a hardwood frame with locked corners and a three-ply birch top. Even more unusual than the table, the chairs consist essentially of two A-shaped frames crossing each other in the

middle, where they are secured by a bolt, and capable of being opened out or closed up like a camp-stool. The seat between the tops of the frames is of the hammock variety, and is made of rot-proof canvas. Inserted in sockets on the frames, after the chair is unfolded, are two vertical steel tubes which carry a canvas back between their upper ends, this addition naturally making the chair far more comfortable than the ordinary camp-stool. These chairs fold up into so small a space that four will pack into the table in addition to the end strips and the legs. Birch is used for all the wooden parts, which are varnished and polished, except the table-top, which is painted a navy gray.

ATMOSPHERIC POLLUTION.

Although it is difficult to trace the relation between atmospheric pollution and health from the figures recorded in the ninth report of the Advisory Committee of the Air Ministry for the investigation of this subject, some of the information given is of considerable interest. Three instruments for the study of atmospheric pollution have been developed and standardised, and these are available for interested private individuals and public authorities. They comprise a standard gauge for measuring the amount of impurity which falls upon a measured area in a month; an automatic filter in which a measured quantity of air is drawn through tiny discs of filter paper at rates of two or four per hour; and a jet dust-collector by means of which the particles of dust in a very small amount of air can be examined under a microscope and counted, and their shape and nature noted. It will surprise most people to know that in a thick fog they may be breathing 80,000 particles of dust in each cubic centimetre (a cube measuring about $\frac{3}{4}$ inch each way) of air. No inconsiderable amount of tar is deposited when big areas are considered. The figures are given in metric tons per 100 square kilometres per annum, practically the equivalent of English tons per 40 square miles yearly. Newcastle-on-Tyne leads in this item with 82 tons over such an area for 1922-23, while none is recorded for Rothamsted. Liverpool had the biggest deposit of solid matter of all kinds in 1922-23, with 4717 tons against 444 tons at Southport. A curious feature is that these maximum deposits occur as often in the summer as in the winter months. A characteristic of the dust in some air, of which no satisfactory explanation has been suggested, is the presence of transparent spherical particles. These range in diameter from $1\frac{1}{2}$ microns* downwards, and the number varies considerably. Early in March 1922 the number in London air began to increase, and reached something like 50 per cent. of the total dust-count before the end of the month.

* A micron is the millionth part of a metre, approximately $\frac{1}{254000}$ of an inch.

Every kind of test has been tried on these spheres, but the results have been mostly of a negative character. The most likely explanation seems to be that they are volcanic dust, as for some time before March 1922 there was great volcanic activity in Europe. Future lines of research, when means become available, are the relation of the bacterial contents of the air to smoke contents, and the reduction of daylight due to suspended impurity.

AN EVERLASTING GRAMOPHONE NEEDLE.

Notwithstanding a certain amount of popularity gained by the fibre variety, the steel gramophone needle still holds the field. In both cases the points wear so rapidly that the needles have frequently to be renewed. A new type of needle has been recently brought out which is practically everlasting. It consists of a very fine wire, the end of which projects from a metal socket to the extent of about $\frac{1}{16}$ th inch. The socket is formed of a piece of $\frac{1}{16}$ th inch brass wire having one end bent double, so as to make a U-shape with one long and one short leg. A hole is drilled down the long leg, and comes out at the bottom of the U. Near the top of the U is a tiny spindle carrying a minute reel, with a star-wheel by which to turn it. On this reel is wound 9 inches of the fine wire that acts as the needle. The end of this wire passes through a hole in the long leg and comes out through the hole at the bottom of the U. When the star-wheel is turned the wire is pushed farther out. Made of comparatively soft metal, this wire gradually wears away without wearing the record; and, as the end wears so as to fit the grooves, the tone is always good. The tone can be varied by altering the amount of projection, a short point giving a loud tone, while a long one softens the music. So slow is the wear on the wire that there is enough to play 27,000 records. Finally, the long leg of the U will fit any needle-holder. This needle gives a better tone with less scratching than either steel or fibre needles, while its advantages in other directions are obvious.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

THE SENSIBLE MR SANDERS.

By J. FREDERICK TILSLEY, Author of *Cheerio!* &c.

PART I.

I.

MR WILLIAM SANDERS, draper and general warehouseman, was very angry indeed, and Mr Sanders angry was quite a different person from the big, handsome, debonair traveller who discussed blouse and jumper fashions so charmingly with retail shopkeepers from (as he himself boasted) Land's End to John o' Groats. Mr Sanders angry was inclined to bang doors and throw things at the office cat, but it was only on rare occasions that he permitted himself to become as angry as he was at this moment. Bad temper, he knew, completely ruined one's dignity, and, as might be expected from one of his vocation, Mr Sanders had an almost pathetic desire to be looked upon as a dignified man. His emotions, therefore, were usually controlled with an iron discipline.

He now stood half in and half out of his little general office, visibly swelling with indignation. 'I never heard of such a thing in all my life!' he gasped. 'I—I——' Words failed him. He pushed his hard black felt hat a little farther back on his round sleek head and trembled violently.

In the centre of the office, their hands still clasped, stood an extremely pretty girl of something under twenty and an extremely commonplace-looking young man of something under thirty. The girl, who had coloured brilliantly and then grown quite white, seemed undecided whether to laugh hysterically or whether to burst into tears. She was a small, sturdy girl, with dark golden hair, great brown eyes, and a small red mouth. The young man, who was also flushed, stood staring at William Sanders with bulging eyes and drooping lower lip; he was slim and freckled, his hair was sandy, and his hands and feet were unusually large. The two young people were thoroughly and obviously ashamed of themselves.

The little office, with its business-like roll-top desk, its typewriter, and shelves, containing more rolls of brightly coloured crêpe-de-chine and stockinet (overflow from the warehouse) than ledgers, made a strange setting for such a picture.

No. 719.—VOL. XIV.

'Never heard of such a thing,' repeated William Sanders. Closing the office door with considerable violence, he strode across the room and set his heavy sample case down on the desk with a bang. 'How long has this sort of thing been going on?'

Blushing, the girl raised her head proudly and looked him in the eyes. 'It hasn't been going on at all,' she answered, keeping her voice steady with an obvious effort. 'This is the very first time such a thing has ever happened. Only a few minutes ago I was sitting at my machine as usual. Ev-ev-everything happened at w-w-once.'

'That's right, sir,' broke in the young man in hoarse, eager tones. 'Every blessed thing happened at once. I—I was to blame, sir. She—Miss Hale didn't know anything about it. I—I took her by surprise.'

'Then you ought——'

'Yes, sir,' the other interrupted promptly, 'I ought to be kicked, and I'm thoroughly ashamed of myself.' He attempted surreptitiously to disengage his hand, but the girl clung to him determinedly.

'He—Mr Smith was no more to blame than I,' she said quickly. 'We were both foolish, but—but——'

William Sanders thrust his hat a little farther back. 'Go on, Miss Hale,' he said grimly, 'but——?'

'Oh nothing!' She burst into tears suddenly.

'She means to say,' Mr Smith broke in again, 'that it couldn't be helped; it was one of those things that—er—that—that—well, that just happen, if you understand me, sir—without your being able to help it. You know I went into the office to get the special letter for that big mail order, and—and—well—I don't know how it happened, but—it did.'

'Yes,' answered William Sanders, even more grimly, 'and now something else is going to happen.'

II.

A little later two dejected figures crept silently out of the office, and William Sanders, his expression still stern but his anger quite gone,

[All Rights Reserved.]

SEPTEMBER 6, 1924.

rose to his feet and examined himself in the little square of mirror which Miss Hale had hung above the desk months before.

Trouble affects people in different ways: some resort to tears and some take to drink. When things went wrong with William Sanders he looked round instinctively for a mirror. There was something about the reflection of his own heavy, undeniably handsome face, with its rather hard blue eyes and black moustache, which soothed him and reinforced confidence. The more William Sanders saw of himself the more convinced he became of his own essential worthiness. He stared fixedly into the mirror for a few moments, gently passing a large white hand over his smooth, shining hair, which, although he refused to admit it, was obviously thinning on top. Giving the points of his moustache a twirl, he turned abruptly from the mirror and strode from the office.

The general office was at the entrance to the warehouse. William Sanders hesitated for a moment, and then, turning his back on the warehouse, he descended to the floor below, grumbling inwardly because the lift was out of order. Reaching the editorial office of the *Advertiser*, which was immediately below the warehouse, he rapped perfunctorily on the glass panel of the door, and entered without waiting for an invitation.

Thomas Keith Chalmers, editor of the *Advertiser*, was standing at the far end of a large writing-table examining some typewritten sheets. He was a tall man with a thin, lined, austere face, surmounted by a shock of grayish hair. The severity of his expression was somewhat relieved by the humour of his small mouth, which curved into an affectionate but slightly mocking smile at the sight of William Sanders. In the ordinary way there was nothing sensitive about Mr Sanders, but that smile never failed to disconcert him a little.

'Well, William, how did you find business this trip?' asked the editor, speaking with a pronounced northern accent, which it is quite unnecessary, even if it were possible, to set down here. 'I thought you were going to be away for some time?'

'Can't grumble, Tommy,' answered Mr Sanders, moving a batch of current daily journals to one side and seating himself on a corner of the writing-table. 'Things are bad, but they might be worse.' He swung a neatly spatted boot contentedly.

'That's the most optimistic remark I've heard for months,' answered the other, with a sad shake of his gray head. 'Trade seems to be getting worse and worse.'

William Sanders gestured largely. 'There's always business to be done by the man with enough energy to go out and seek it. Look at me'—this was his favourite expression—'I don't let the grass grow under my feet.' Mr Sanders

launched out into a detailed account of several large orders he had taken during his recent journey to the Midlands. The other listened with that mocking, appreciative smile.

'Ah, you are an energetic man, William—a wonderfully energetic man.'

'I'm a practical man,' admitted Mr Sanders; 'there's no nonsense about me.'

'I can never understand why you never married,' observed the editor irrelevantly.

William Sanders's face became a shade more florid; he shook his head vigorously. 'Never had time to cultivate the acquaintance of girls, except in the way of business,' he said, with an air of finality. 'Women—young women are a nuisance; they demand continual amusement, and I've no time to waste in picture theatres—besides, I'm too old.'

'I can see,' observed Thomas Keith Chalmers dryly, 'that you know all about women, and there's no doubt whatever that you are a very old man—you must be thirty-eight?'

'Thirty-seven,' quickly corrected Mr Sanders.

'All the same,' murmured the other, 'I should certainly consider marriage seriously.'

William Sanders shook his head again, but more emphatically.

'I'm not the sort of man who appeals to women. I've been too busy all my life to cultivate the airs and graces. You see, Tommy, my dad was a coal miner; he went without a lot of things he needed to give me a decent education, and when I feel inclined to waste time foolishly, the memory of his sacrifices always sends me back to work. Perhaps some day I shall meet a sensible woman who understands the drapery; not a silly girl looking for some one to keep her amused, but a practical woman who will be able to assist me with the business.'

'In that event you might be prepared to consider marriage favourably, eh, William?'

Mr Sanders nodded. 'If she would be prepared to get married in a business-like fashion—meet me at the church, say "I will," and then catch the first tram for the warehouse. I've no time to waste honeymooning at the seaside or in the country; I hate the country, with its lazy cattle and sleepy farms. Give me the town, where there's energy and movement. However, I'm here on business, really. I want two small ads. inserted in your next issue, one for a male clerk, must be a good typist, and the other for a capable warehouseman. I'll leave the wording to you.'

The editor stared at him round-eyed. 'But what about Miss Hale and Mr Smith?'

William Sanders waved his hand. 'Just discharged 'em,' he announced concisely; 'they leave at the week-end.'

'Both?'

Mr Sanders nodded.

'God bless us! I never heard of such a thing! Whatever have they been doing?'

'I walked into the general office a short time ago and found them in each other's arms. He—he was kissing her—during business hours.' A note of great bitterness had crept into Mr Sanders's voice.

'I'm only surprised that it hasn't happened before,' observed Thomas Keith Chalmers, with a sigh. 'They've been in love with each other long enough.'

'No doubt,' answered the other with increasing bitterness; 'that's what's annoying me; there's no knowing how much time has been wasted. My place is a warehouse, not a matrimonial agency.'

'Oh, for goodness' sake, William, try and forget you are a business man long enough to be a human being!' requested the editor with sudden animation. 'Don't you see what's occurred? These children have been in love with each other for months. After long weeks of fears and doubts each reads the truth in the other's eyes, and the inevitable happens.'

'During business hours,' repeated Mr Sanders. 'They might have left it till lunch time.'

'If you had been a real business man,' went on the editor, restraining himself with a great effort, 'you would have turned this affair to your own account. Do you know what I should have done in your place?'

Mr Sanders shook his head.

'I should have congratulated them, then I should have taken them out to lunch, and pointed out to them that in working for me they were also working for themselves. Think how they would have guarded your interests. Man, you've let slip a glorious opportunity.'

William Sanders was unimpressed; he shook his head. 'They would have turned the office into a dove-cote every time I turned my back.' He stood upright and moved to the door. 'Don't forget, Tommy, a male clerk.'

III.

William Sanders was worried; business was good, his digestion was good, but as he himself expressed it, he felt out of sorts.

With hands thrust deeply into his pockets, he moved out of the warehouse into the general office and wished the bespectacled and highly efficient new clerk a perfunctory 'Good-morning.'

'Good-morning, sir,' answered the clerk politely, and then went on with his work.

William Sanders muttered something under his breath. The general office, like the warehouse (now in charge of an elderly spinster of uncertain age but irreproachable credentials), was in perfect order; not the least fault could be found with either; but although the wheels were running smoothly enough, it seemed to

William Sanders that there was something missing. With the passing of the Hale-Smith régime the whole place had lost some vital part of its character. Customers noted it too. Many of his oldest customers seemed ill at ease of late, as Mr Sanders was not slow to notice. He stared resentfully at the blue serge shoulders of the efficient new clerk, then his gaze moved instinctively to a spot above the big roll-top desk, but the mirror had gone. Again William Sanders said something under his breath, and wandered disconsolately from the office.

About to return to the warehouse, he changed his mind suddenly, and leaving his own premises, descended on the editorial offices of the *Advertiser*. Mr Sanders opened the office door gently and glanced into the room; there was a reason for this. Partly because he was a kind-hearted man and partly because he required a good typist, Thomas Keith Chalmers had found a place for Miss Hale in the offices of the *Advertiser*. For some reason which he was quite unable to define, Mr Sanders preferred to meet his friend when his late employee was not present. This reluctance had nothing either of shame or of regret in it. In discharging the love-sick culprits he was quite convinced that he had adopted the only possible course. All the same, he preferred not to meet Miss Hale face to face for the present.

The editor, seated at the head of his writing-table, was alone; a faint, rapid tapping from an inside office indicated the probable whereabouts of Miss Hale. Mr Sanders straightened himself and entered the office with dignity. 'Hello, Tommy,' he greeted with a smile which affected patronage. 'How's the circulation?'

Thomas Keith Chalmers eyed his visitor without enthusiasm. Ever since the Hale-Smith incident relations between the two had been a trifle strained. William Sanders's harshness had surprised and disgusted the kind-hearted journalist. He had always thought his friend's bark worse than his bite. The estrangement had quite a different effect on William Sanders. Always a little in awe of the editor, the fact that he had at last forced him to discard his attitude of friendly toleration secretly gratified him, and he added to his original offence by pretending to regard Thomas Keith Chalmers—who was in reality a far shrewder business man than himself—as an impractical sentimentalist.

Now, however, he dropped his practical-man-of-the-world pose, and after the first frivolous greeting something of the old deference crept back into his manner. 'I want some advice, Tommy.'

'What seems to be the matter?' asked the other, all solicitude at once. 'Losing sleep? Missing meals?'

Mr Sanders waved a large hand impatiently.

'If it was anything of that sort I'd go to a doctor—not you. To tell you the truth, Tommy, it's difficult to explain. I feel out of sorts, see? Life doesn't seem to be as much worth while; somehow, I'm sort of losing interest.'

Thomas Keith Chalmers considered these symptoms in silence for a few moments, and then pointed an impressive finger at William Sanders. 'There are only three remedies for your complaint,' he declared at last. 'Fortunately I know them all. Either you can get married or take a holiday.'

Mr Sanders was not impressed. 'What about the third remedy?' he asked dubiously.

'The surest of the three,' promptly answered his friend; 'get married *and* take a holiday.'

'I suppose you're a pretty good editor,' observed Mr Sanders, moving to the door, 'but you're a rotten doctor.'

'Sandypool's the place for you,' the editor called after him; 'five miles from Seacombe, the popular seaside resort. There's one single building in Sandypool, The Lodge, a sort of a boarding-house, which is mainly used by people of moderate means in search of peace and quiet. Great place—no promenade, no pier, no nigger minstrels, no tennis, no golf; nothing but a boredom so complete that after two weeks of it you'll find your interest in work completely revived. Of the two, getting married is a much less drastic remedy—I once passed through Sandypool.'

(Continued on page 660.)

TWENTY YEARS AS A FREE-LANCE.

By 'JOURNALIST.'

I.

FLEET STREET familiarly describes the contributor by the phrase derived from ancient chivalry—'a free-lance.' When a journalist happens to fall out of a salaried niche on the staff of any newspaper, he falls back, it is said, on 'free-lancing,' while waiting for a new 'inside job,' which may never arrive. At no time is Fleet Street without a contingent of ex-editors, ex-leader-writers, ex-reporters, who have somehow been dropped out of responsible positions in the profession, and are compelled by untoward circumstances to adopt the free-lance. Few of them continue in this capacity for many months. They mostly disappear into a niche somewhere, with a salary attached. Yet there are some journalists who have survived into old age and comfort, after pursuing for half a lifetime the precarious vocation of the unsalaried contributor, a workman generally at the mercy of editors and sub-editors, who reject his 'copy,' when it is judged unsuitable, without a thought of his hunger or of his responsibility for rent and rates.

Incomes of contributors are amazingly exaggerated in Fleet Street and in the public imagination. Twenty years ago, after coming to London from an editorship in the provinces and commencing business as a free-lance, the writer happened to meet a contributor previously known, who boasted that he could earn £900 a year. I communicated this encouraging statement subsequently to an old hand in Fleet Street, who was pessimistic and hinted seriously the danger of a leap from Waterloo Bridge. As to my friend's £900 a year, this old hand dryly remarked, 'Divide it by three!'

There are some popular writers, who have

acquired a book-stall reputation, who can command special fees for their work, and enjoy incomes sometimes mounting into four figures. They are few, and could be counted on the fingers of both hands. As a rule, they have earlier won their spurs as novelists, or in some branch of literature. They may never have been working journalists, never inside a newspaper office. After twenty years of this work, I should say that the contributor who cannot sell his name at a big price, but must accept the fees sent to him, may count himself happy if he can earn, on the average, £300 a year in normal times. The boast of huge incomes from contributions is not made to the Inland Revenue. In truth, the bit of brag in itself casts doubt upon the figures.

II.

The free-lance must cultivate versatility. For him a little learning is not a dangerous thing. He must endeavour to acquire a reputation as an authority on the subjects which he selects for his articles. Nor can he afford, as a rule, to devote his gifts exclusively to a single isolated branch of newspaper enterprise. The more nimble his pen is in running, like the squirrel among the boughs of the tree, from one subject to a contrasted topic, the more likely he will be to keep himself employed all the year round. A solitary and isolated subject will be insufficient for his economic wants. He may cultivate art, and blossom into an art critic. But art of itself will not boil the pot or educate the children. The Royal Academy is one of the hardy annuals available to the free-lance. He may secure commissions for notices of the Academy from several newspapers, but the week's pay obtained is not an income. The

small galleries do not yield him much 'copy,' and even with Christie's sales thrown in, art by itself is not enough. It is not impracticable for the same general writer to acquire a reputation of a sort for special knowledge of many subjects—art, the contemporary drama, literature, as dealt with in newspaper notices and reviews, Imperial politics, the statesmen and politicians of the time at home and in the Dominions, foreign affairs from Moscow to Washington, and even the various breeds of pedigreed cattle to be seen at the annual show of the Smithfield Club, and the breeding of blood-stock for flat-racing and the popular steeplechase. Out of the host of subjects so apparently incongruous, as each becomes topical in its turn, the versatile free-lance may earn a comfortable income.

Promoters of schools, classes, lectures, out of which clever journalists are promised, are prone to exaggerate the chances in the profession. After surviving for twenty years in Fleet Street as a free-lance, I should count it a criminal procedure to conceal from youth the bitter trials and disappointments inseparable from the vocation. I can recollect having a conversation with the late Sir E. T. Cook on the conditions and prospect of success as contributor unattached and unsalaried. He looked at me with the expression of intense kindness known to his friends, and remarked, 'There is so much waste!' The rejected manuscript is the contributor's inevitable lot. He must keep ringing in his ears the forewarning lines of Robert Burns's 'Epistle to a Young Friend':

'For care and trouble set your thought,
Ev'n when your end's attained;
And a' your views may come to naught,
When ev'ry nerve is strained.'

No matter how skilful his work may be, editors will turn it down frequently as unsuitable for publication and pay, returning to him the product of strenuous hours, with polite 'regret' and 'thanks' darkly visible on the conventional circular, of which the free-lance has horrid dreams.

Not impossible is it for the contributor to commit the blunder of imagining that the literary quality of his proffered article will make acceptance and publication secure in advance. In my nonage as a free-lance, I happened to come upon the raw material of a promising 'special,' which concerned historically a certain family in the aristocracy. I forwarded the 'copy' to the editor, who was also the proprietor, of a paper which covered the district where this particular family had held sway from of old. When an editor of a country paper myself, I had set store upon literary form in the articles appearing in my columns. It never occurred to me in those remote years that any editor would reject an article, otherwise topical, because

it was carefully composed and displayed a moderate measure of literary style. To my amazement, the proprietor-editor returned my manuscript with a most kind covering-letter, in which he expressed his surprise that a journalist who could produce such a manuscript should condescend to offer his work to an ordinary newspaper. Apparently the good man had visions of my capacity to command space at my need in the heavy magazines, and ascend among the favourites of fortune who, out of literature, can rent a noble mansion and ride to hounds! The literary quality of the proffered 'special' may, indeed, hinder its acceptance. The most memorable instance to the contrary in my experience was supplied nearly twenty years ago by the original *Evening Standard*, in which unsigned articles appeared daily in the first column of the front page. The late Mr Samuel Jeyes controlled the series, and some of us, who were fortunate enough to satisfy his requirements and rejoice in his cheques, discovered that the literary quality of the articles was a *sine quâ non*. But nowadays the sensational thrill of the story counts for more than style. Nor do editors and sub-editors always appreciate literary allusions in any manuscript sent in by the free-lance. The editor, in truth, does not belong to fiction who has been mysteriously offended by a quotation from some poet with which he was not acquainted.

III.

The free-lance has all Fleet Street before him, and Fleet Street comprehends the English-speaking section of the earth—America, and the British dominions, in addition to the United Kingdom. Of scope and range he has no lack. He can select his market, if only he has found his métier. Editors are seeking for 'copy,' and he is in search of their 'space.' But how can the nexus be established? there's the rub! Commissioned contributions are infinitely more satisfactory to the free-lance than work produced on speculation. Commissions can be obtained by approaching known editors with a suggestion or a proposal, or with a synopsis of the subject suggested. Few editors can afford the time needful to read with care full-fledged articles offered to them by outside writers. In many cases a glance across the first page of the manuscript is sufficient. Every year the number of writers increases. They approach Fleet Street by post from all parts of the earth. Who can tell the number of women now convinced they possess a literary gift, and besieging the editorial dens with prose and verse? Some editors in London have told me that they receive, on the average, about two hundred proffered manuscripts weekly. To return rejections promptly is the next best thing to acceptance, from the point of view of the free-lance. When I made this remark to an editor with a reputation for

immediate return of 'specials' which he rejects, he modestly explained that, if he did not deal with them immediately, he would never get through—he got so many!

Wide as his world-market may be, the free-lance is subject to unequal and increasing competition. Articles for the magazines and the daily and weekly newspapers are nowadays written extensively by people with private means or holding salaried posts in the Civil Service or in commerce. Charles Lamb, as a clerk in the India Office, in his day, had few competitors among men of his calling. There are hundreds, perhaps thousands, of aspirants to literary or newspaper fame in the Civil Service of our time. The woman with a niche in the aristocracy, who would bribe the editor, if she could, to publish signed articles from her pen, is by no means unknown in Fleet Street. Clergymen who are university men and scholars, from Dean Inge down to the country curate, are thick as blackberries in September among competitors for space in newspapers and periodicals. By many of them a signed article in a newspaper is preferred to a full church on Sundays. It goes without saying that the writer of independent means, or enjoying a secure income in a profession or in business, can afford to smile at the rejected manuscript, or to wait for months, or a full year, for publication of his article, the subject of which is of permanent interest. To their honour be it said, most editors, being journalists themselves, other things being equal, take pleasure in accepting 'copy' from the free-lance. Unfortunately, it too often happens that the other things are unequal, for the preponderance of advantage from the editorial point of view is on the side of the competing manuscript produced by some writer known to be indifferent respecting fees. The free-lance, who must live exclusively by his industry, is at a heavy disadvantage as compared with his competitors rejoicing in large incomes of the fixed order. He must earn his living. He could not get a start and survive, it is true, wanting a limited reserve of cash. I confess that, on my coming to Fleet Street as a free-lance twenty years ago, the material and moral help of a balance of from £250 to £300 at the bank proved indispensable. This is necessary in view of inevitable delays in the publication of accepted articles, and the practical impossibility of equalising returns month by month. In American journalism fees are mostly paid on acceptance. This is rarely done in London or the provinces. No doubt, if the free-lance was weeping by the grave of his last sixpence, and appealed *ad misericordiam* to any humane editor for payment in advance of publication, his appeal would not be in vain. But the impecunious free-lance comes and goes with the cuckoo, and drags after him an embittered experience.

IV.

Slow progress in the department of producing books which publishers will buy, or articles which editors will accept, in some instances throws the free-lance back upon 'paragraphing,' perhaps upon items of news, but more frequently upon paragraphs designed for the London correspondence in provincial newspapers, or for the columns of notes daily appearing in most of the London newspapers, and in such higher weeklies as *The Saturday Review* and the *Spectator*. Successful authors and journalists may condemn this class of work as done by the free-lance, and pass the humble paragraphist by on the other side for an unfortunate who has fallen somehow among thieves in his earthly pilgrimage, and not yet been relieved by any Good Samaritan. But the competent brief notes are really the parts of the modern newspaper most widely read.

It is absurd to argue for a greater professional dignity in a signed 'special' than in a note of forty lines or less paid for at as high a rate as the 'special.' Nor are the two forms of journalistic effort and enterprise incompatible. Some of us could not have survived as free-lances so long, or succeeded so far in keeping away from that admirable institution, the Newspaper Press Fund, if we had raised our wigs high in the air and scorned to undertake systematic 'paragraphing.' It is a mistake of ignorance to infer that the writer of paragraphs is fit for no superior work, or that the same pen cannot produce a competent leader or 'special,' or a review. The free-lance who, in the morning hours, produces a book, or a 'special,' or a review at home, may be collecting material in the afternoon for paragraphs which he can dispose of in the evening in Fleet Street. Disappointments are common to both branches of journalistic industry. But the old proverb applies here about the going foot always getting, and the gains of the humble task of paragraphing often compensate the free-lance for his waste and loss suffered in consequence of the rejected manuscript. Such, at least, has been the writer's experience for twenty years, which included the four or five dark and testing years of the War.

The free-lance must stoop to conquer. Florence Nightingale praised her friend, A. H. Clough, because, although he was the poet of the 'Bothie,' he never hesitated to do 'plain work.' When the free-lance cannot get the class of work he would like, he must discipline himself to like the class of work he can get. This is the royal road to success in the long run; the success of the stoic mind inured to disappointment, and filled with the energising glow inherent in the conviction that all honest work is honourable, and cultivating the pride of Stradivarius, who 'has an eye that winces at false work, and loves the true.'

Probably the strong foundation upon which the free-lance can build is a regular article in some first-class daily or weekly newspaper, or a syndicated weekly article in some of the popular weekly or Sunday papers. In this branch of journalism the gift of the essayist has generous scope. Success in this department often secures the free-lance against serious losses among his other work. Indeed, some contributors have made the weekly article so popular as to yield them an income in itself. One of the striking successes in this direction was achieved by the late 'J.B.,' whose essays for so many years enhanced the literary reputation of the *Christian World*. Another example has been that of 'Claudius Clear' in the *British Weekly*, although the original in this case could scarcely be called a free-lance. The regular 'special' affords the contributor the opportunity of attracting readers on the principle of *similis simili*, or like to like. In time an intellectual bond is formed between the readers and the writer of the column, which is all the deeper, all the stronger, through the mystery of the pseudonym, or because most of the readers can only speculate about the name and identity of the writer. Probably at no antecedent period in the history of British journalism was the didactic essay more widely appreciated than is the case in our time. Readers look forward to the day when the article is due, if not with the delight of the invalid who, when told he was dying, consoled himself by saying that 'Pickwick will be out next week at anyrate,' at least with interest and wonder. And yet the prudent free-lance will take pains to distribute his energy, and avoid putting all his eggs in one basket. Changes for the worse economically in newspapers and periodicals sometimes arrive with the suddenness of an earthquake, changes not less alarming to the contributors.

V.

The free-lance, like the poet, is a creature rather born than made. He is made for freedom of action. For the advantage of personal liberty, of the free mind, he will make heaps of sacrifices. He loves money like all his tribe, but he loves more dearly still than heavy cheques immunity from the frown of the managing director, and the threat communicated to him from some avaricious shareholder in the company, that unless as editor he can produce an improved dividend steps will be taken to bring about his resignation. He is his own master. Rejection of his 'copy' is the worst that any other person in authority can do to his grief and loss. Nor is he obliged to practise a base opportunism in politics. By selecting subjects outside the policy of the political party with which his newspapers are associated, he can keep his secret, vote accord-

ing to his conscience, and escape the loss of self-respect accruing from the necessity to defend or advocate any cause in which he does not believe. It is even possible for him to be of the politics as well as the religion of all sensible men, which, according to the hoary old epigram, all sensible men keep to themselves.

Probably, however, the member of the salaried staff is, upon the whole, vastly more comfortable, perennially, more happy in his work, than any free-lance. When I began work in London twenty years ago, a journalist who was then at the top of the profession remarked—for my encouragement, of course—that, if he could write a novel, he would select for his subject what he described as 'the tragedy of the literary life in London.' By the phrase, 'the literary life,' he covered the business of the free-lance in journalism, as well as the ambition of the author to succeed among the publishers. Conditions have improved a little, not much, since in the year 1823 Charles Lamb advised his friend, Bernard Barton, to 'come not within the grasp' of the publishers. 'I have known many authors want for bread,' said Lamb, 'some repining, others envying the blessed security of a counting-house, all agreeing they had rather have been tailors, weavers—what not? rather than the things they were. I have known some starved, some go mad, one dear friend literally dying in a workhouse.' The tragedy persists only in a minor degree. A certain chivalrous comradeship prevails in the profession, and few capable workmen who can show a clean record are denied the opportunity to earn their bread.

The experience of twenty years as a free-lance has left me an optimist respecting the future of the profession of journalism, viewed as a branch of literature. As a profession it is still pregnant with promise, even for the impecunious free-lance. But he must be effectually called. Lord Jeffrey, in his day, joined the family of his host on one occasion, when the parish minister came round to examine all members of the household in the Shorter Catechism of Scottish Presbyterianism. 'What is Effectual Calling?' was the question put to Jeffrey. He could not remember the literal text, and ventured upon a definition of his own manufacture. 'I should say,' he answered, 'that a man is effectually called when he discharges his duties with ability and success.' In that sense the free-lance should be effectually called. Even then his success may be unequal to his industry. But love for the work, operating from within as a secret passion not to be exhausted, as a flame not to be extinguished by unnumbered failures, will magnify successes, and make him by compulsion of temperament a quill-driver until his life's last breath.

THE SILKWORM INDUSTRY IN PIEDMONT.

By EUSTACE REYNOLDS-BALL, F.R.G.S.

I.

THE culture of silkworms is no doubt the most important home industry in this part of North Italy. The rearing of silkworms, as will be seen, is a very laborious and tiresome business, but certainly remunerative, in spite of the pecuniary risks attaching to it. Immemorial custom has decreed that the profits from the sale of the cocoons should rank as the wife's perquisite—it is a kind of pin-money. In fact, what the housewife can earn from the sale of poultry, eggs, and the silkworm cocoons constitutes her sole independent income. This accounts for the culture of silkworms being a popular home industry in this part of Italy; and nearly every *contadina* is attracted by the chance of a big profit. But it takes up a great deal of her time, and is not regarded with much favour by her men-folk. Silkworms are particularly susceptible to changes of temperature (which is kept at 65 to 70 degrees Fahrenheit), and have to be carefully nursed. The housewife, indeed, often finds it necessary to sit up the greater part of the night, to keep the stove going. Then, every now and then the room has to be disinfected by burning sulphur, for a whole room has to be reserved for these exigent little insects.

The process is very complicated. In the first place, a little capital has to be sunk in the purchase of eggs (mostly imported from China), costing from 40 to 60 lire an ounce. Probably one ounce worth is as much as she can speculate with, for the silkworm industry is a risky undertaking. Half-an-ounce of eggs should produce 50 to 60 kilograms of cocoons, supposing the hatching is satisfactory; and the average number of cocoons to the kilo. is about 400. Enough mulberry leaves will probably be obtained from the trees on the farm, but if the supply is insufficient, they must be bought at the weekly market, where they cost from 30 to 45 centesimi per kilo.

The risk attaching to the cultivation of silkworms is considerable. I have known a case where, owing to the silkworms, after hatching, falling victims to one of the many diseases to which they are liable, half-an-ounce of eggs did not yield a single cocoon! This total failure of the crop did not, however, seem to disturb the equanimity of the cultivator, who, with a praiseworthy fatalism, merely observed, '*Pazienza, e il destino!*'

Owing to the hazardous nature of the enterprise and the heavy initial costs, a co-partnership arrangement is sometimes preferred, the capitalist partner (usually a prosperous farmer) providing

the eggs and the mulberry leaves, while the *contadina* (the working partner) provides the labour and the accommodation. Then the proceeds of the sale of the cocoons are shared equally. In short, the *métayer* principle of farming is applied to silkworm culture.

II.

The eggs are usually bought about the beginning of May. They take some fourteen days to hatch, and they are kept in bags hanging up in the stable or the living room. If the hatching seems delayed, the eggs are placed on blankets spread in the sun. Occasionally the *contadina* will hatch them on her person, literally warming them in her bosom! When the hatching begins they are transferred to long flat baskets (*ceste*), on which young mulberry leaves are laid.

The next stage begins after eight days, when the young worms are removed to wide wooden shelves lined with thick wrapping-paper, on which layers of mulberry leaves are strewn.

Here the silkworms are fed for a day or two, the bedding being carefully changed. The feeding in the early stages is the most troublesome, as the leaves have to be chopped up fine and the stalks removed. They then sleep for a few days, when they are left severely alone, this period being known as the *covatore*. This first sleep lasts eight days. There are four separate sleeping stages, each having its distinctive name—for instance, the third sleep is known as *la grossa*.

Between the sleeping periods they are fed, and the amount of leaves consumed is extraordinary. After the fourth sleep they 'get busy,' and start climbing the branches of broom which have been placed for that purpose, in order to fix their cocoons. During this critical period, which lasts three days, they are not fed. Certain changes, which every *contadina* seems to understand intuitively, in the appearance of the silkworm, show that it is ready to start climbing. It takes on a yellowish tinge, and becomes semi-transparent, while from its mouth exudes a little silken thread. Altogether, with its curious pig-like snout and slimy-looking body, the silkworm to most people is a repulsive little creature.

Forming the cocoon takes about a week. The cocoons (with the chrysalis inside) are then picked off the branches of the broom and put into a kind of spinning machine, which removes the coarser outside threads of silk and leaves the cocoon clean and neat. This silk is kept for spinning at home, dyed, and spun into stockings.

The cocoons are then taken to market for sale to middlemen, or to the proprietors of the silk factories directly. The price varies, sometimes as much as 30 or even 35 lire per kilo. being obtained for the best qualities, but the price seldom drops below 25 lire the kilo. The market at this season has an unusually decorative effect, with the rows upon rows of large flat baskets filled to the brim with yellow cocoons, looking like golden pigeons' eggs.

III.

In order to kill the chrysalis the cocoons are baked in ovens, for if the young moth succeeded in perforating the cocoon, the silk thread would be cut, and could not be spun. This process may sound rather cruel, but it is no worse than the English cook's custom of plunging live lobsters into boiling water. But this operation does not take place till the cocoons reach the factory. After this baking the cocoon is ready for spinning, and this is a process which requires a considerable amount of skill and knack.

The home culture ends with the selling of the cocoons. The next stage is the actual manufacture of the silk in the silk factory (*filatura*). These are to be found in many towns in Piedmont, and a visit is an interesting experience.

From end to end of the long factory are rows of small earthenware tanks full of almost boiling water, and behind each tank sits a work-girl (*filanda*). Just above the tanks, and running the whole length of the factory, is a revolving steel shaft. Attached to this shaft are winders, one above each tank.

In each tank has been placed a handful of cocoons, and the work-girl in charge manipulates them in such a way as to soften the husk of the cocoon. Four threads are drawn from four cocoons, two are inserted through a hole in a little disc fitted on to the tank, and then each pair of threads is inserted in a hole in another disc, and caught up by the winder, the four threads being now joined into one. The revolving winder continues to draw out the thread from the cocoon till it is completely stripped. This process, which sounds so complicated, is actually the work of a few seconds; indeed, it is difficult to follow the deft manipulation of the *filanda*.

The process of fixing the thread from four other cocoons is continued in the same way. It is extraordinary to see the quickness with which the threads of the new cocoon are attached to the winder; the girl seems to effect this without a pause. But to facilitate the winding, after the husk has been softened by the hot water, the threads are extracted in advance.

Though the work is not exactly hard, considerable skill is required. The great drawback is that the continuous dabbling in the hot water spoils the appearance of the hands, which have

that dead and sodden look peculiar to the hands of washerwomen. Consequently the silk factories are not so popular with the young women of the district as the ordinary *fabbrica*, in spite of the relatively high pay—from 10 lire a day. But, all the same, the proprietors of the factories seem to find the supply of labour equal to the demand. This is no doubt due to the fact that the only alternative means of earning a livelihood are farm-work and domestic service, and the latter seems as unpopular with girls of the peasant class as with us at home.

The hours are usually from 7 A.M. to 5 P.M., but vary according to the season. The factories are generally closed in the winter, the busiest time being the early summer. A good many of the workers 'live in.' They live in what we should describe as a hostel, under the charge of a housekeeper.

Curiously enough, while talking is forbidden during working hours—a rule 'more honoured in the breach than in the observance'—and the visitor is not confronted with the overpowering din he will meet with in a Seville cigarette factory, for instance, singing is actually encouraged. It is supposed to help the work. To any one knowing the Piedmontese dialect, here would be an opportunity for picking up local ballads and folk-songs.

FLOW'R O' THE HEATHER.

Sweet flow'r o' the heather, that blooms on the hill,

Beloved of our childhood, and dear to us still,
Oh, rare is thy purple, and kingly 'tis worn,
Sweet flow'r o' the heather, in solitude born.
On far-spreading moorlands, in clefts of the rock,
Assailed by the tempest, yet proof to its shock,
Thy glamour enthalls us when autumn suns
shine;

The shy things of Nature are comrades of thine.

Sweet flow'r o' the heather, till life's day may
end,

True badge of affection to link friend with friend.
The exile, afar from his own native streams,
Finds balm in thy beauty and solace in dreams.
When red suns of August are gilding the bens,
And shimmer of white mist enwraps all the glens,
Afar from the city 'tis then I would fare
To breathe the delight of thy scent-laden air.

Sweet flow'r o' the heather when evening is by
And lonely stars beacon the paths of the sky,
The call of the night-bird seems ghostly and
drear,

Oh, surely the bliss of enchantment is here?
Those shadows are clansmen, all girded for war,
They march down to battle from mountains afar,
Their lone graves are watered with tears of the
dew—

Sweet flow'r o' the heather, *their blood is in you!*

ALEXANDER MCLEISH.

THE PRODIGAL GARDENER

By D. E. STEVENSON, Author of *Peter West*.

I.

JOHN MOURY had worked in Mr Peddie's garden for a matter of thirty years. He knew every flower in it by heart, and it is easily to be believed that every flower in the garden knew him. He and Mr Peddie had grown old together, and had come to a good understanding of one another, as only fellow-workers can. They watched the garden blossom beneath their care, and tended it with a yearly increasing knowledge of its needs. This and that plant did not thrive, owing to some peculiarity of soil or climate, while another plant, supposed to be less hardy, would grow like a weed and flourish incredibly well.

It was a sheltered garden in that land of storms, walled round cosily, and facing south upon the hill-side. Moury laboured there all day long, and at dusk he returned to the little cottage—which belonged to his employer—where his wife awaited him in the glow of the oil lamp. It was a good life, not demanding great brain power, yet satisfying to the primitive instincts of the race, and Moury was well content with it. He was strong and sturdy, with grizzled hair and beard, and large horny hands ingrained with the good Scots soil in which he worked.

Sometimes when Mr Peddie looked out of his study window and saw John Moury toiling happily in the hot sun or slanting rain he felt a wave of jealousy overwhelm him. What would he not give for the physique of the man, and for his peaceful and phlegmatic temperament which seemed so wholly satisfied with the daily round of work?

Mr Peddie was a dreamer and a scholar—somewhat of a philosopher into the bargain. He had made himself the last, with infinite patience and self-discipline (discipline of thought and mind, which is so much the more difficult to exercise), when he found that the world had become too strenuous for his health. His was not a sedentary nature; he had *schooled* it to accept sedentary occupations in lieu of those pursuits which satisfied his soul but for which he was now unfitted by age and infirmity. An hour a day, usually after tea, was the most he allowed himself for gardening, and even that small measure of manual work was beginning to be too much for him.

Life drifted by very peacefully in the walled garden, where the sound of the sea could be heard teasing the gravelled beach, and the birds sang sweetly all the year round. The view was vast, over sands, bents, and ever-changing sea, dotted as a rule with the fishing-boats of Port

Andrew at their ancient toil. Sometimes for weeks on end Mr Peddie never went outside the garden, and John Moury and his wife were the only creatures that shared his solitude. They did not speak very much—he and Moury—for they were neither of them glib-tongued, but the companionship was real, and the nearer to Nature you get the less do words matter. Mrs Moury was more conversational, and Mr Peddie often strolled down to the cottage for a crack with her. On these occasions words flowed from her in a constant stream as she busied herself about the shining kitchen. There was always tea made, or in the making, in Mrs Moury's kitchen, and Mr Peddie was wont to declare that no tea ever tasted so good.

II.

One day, about the end of March, when the wind was blowing strongly from the west and the sea-scent was strong in the sleeping garden, Mr Peddie walked down to watch Moury planting out the first seedlings in sheltered beds. He had been ill for some days and had no business, he well knew, to be out in the cold wind, but the house had become unbearable, and he craved for some society other than his own. Moury was in the midst of his job, and a jumble of empty pots and boxes littered the ground.

'Well, Moury, how are you getting on?'

The man rose from his knees and dusted his hands together before speaking; then, 'Ah'll be givin' ye a week's notice, Maister Peddie,' he said slowly.

If a thunder-clap had broken in the garden Mr Peddie could not have been more astonished. He gazed at Moury in a bewildered manner. 'You're leaving—the garden?' It was so incomprehensible that he felt he could not have heard aright.

'Aye—Ah'm leavin',' replied the man; he straightened himself as he spoke, and looked round upon the scene of his labours for thirty years. He had made the garden with his own hands, tended it faithfully in rain and sunshine, and despite the dead time of year it looked very good. The empty beds were not dead to him; they were merely as children asleep to awake in due course with renewed gaiety. The dry sticks were, in his eyes, full of the promise of roses; they were to him almost more beautiful than the actual bourgeoning of the flowers themselves. Just for a moment Moury's heart failed him. Was he right to give it all up to pursue the will-o'-the-wisp of fortune and success; were they right, those men who spoke so glibly at the Red Lion Inn, assuring him and others that they

were wasting their powers in this one-horse place (as they called Port Andrew) and boasting of the bigger, freer, and more lucrative jobs to be found in towns?

Mr Peddie tried to follow the flight of Moury's thoughts by the expression on his face—what could be the meaning of his sudden discontent? The man had got his wages raised a few weeks before and was being well paid—it was not that. He did not even suspect Moury of bluff to gain a 'rise'—the man was too simple, too honest for that.

The mere idea of Moury leaving the garden made Mr Peddie feel ill and wretched. They were comrades-in-arms against slugs and caterpillars and other enemies of gardens—why, he had often felt that the garden belonged to Moury more than to himself! In spite of the weekly money which passed from hand to hand he had never thought of Moury as his servant. It was, therefore, with a sense of personal grievance, as at the unfaithfulness of a friend, that he heard Moury announcing calmly that he was going away.

What was the man really like—what was his mouth like beneath the tangle of grizzled beard which hid it so effectually? It was strange and rather awe-inspiring to reflect how little one knew about one's fellow-creatures, Mr Peddie decided. He had imagined that he knew John Moury—a simple soul, primitive, in a way, as Adam, whose trade he followed, and with scarcely more erudition than that primeval ancestor can have possessed. This man who stood before him, half-defiant, half-abashed, was not the John Moury whom Mr Peddie knew—or thought he knew—so well. It was a changeling, a creature imbued with an Idea.

'Well, well!' Mr Peddie said at last. 'Well, well! So you're going off to make your fortune, Moury? Get on with the bedding-out before you go, will you?'

Moury should not guess that he had hurt his employer by his desertion at the most critical time of year; such feelings must be hidden beneath an off-hand manner. This is one of the most important rules of that game of life which we all play more or less assiduously.

During the week in which Moury 'worked out his notice,' Mr Peddie often watched him from the window and wondered if Moury was looking back. Was it possible for a man to leave his life's work at the bidding of a whim without any backward glances? Judging by himself (and this is in reality the only way we can judge others), Mr Peddie thought that Moury would shirk the final plunge; but he reckoned without taking into consideration the man's simplicity of outlook—there was only one idea at a time in Moury's head to the exclusion of all others.

Mr Peddie had no further talk with his gardener; neither did he discuss the subject

with Mrs Moury. Whether she agreed with her husband or disagreed did not concern Mr Peddie; he desired neither to listen to a dissertation nor to become a buffer between husband and wife. If they had come to him for help or advice he would have given it to them ungrudgingly, but they never came; and when the week was up they departed, and the garden knew them no more.

From his housekeeper, Mr Peddie learned that the Mourys had gone to Glasgow; they had 'plenty siller,' and the ex-gardener hoped to find work. 'He'll no' be long afore he's in Parlyment,' added Mistress Brown comfortingly.

Some days after their departure Mr Peddie went down to the cottage; it was spotlessly clean and the furniture shone like new in the spring sunshine, but it seemed empty and forlorn without its busy mistress.

Mr Peddie swung the door-key on his finger and looked out of the window at the trim little vegetable plot where the Mourys had grown their own produce, and beyond to the hen-houses, swept and clean as the house. 'It's a pity to do anything in a hurry,' he said slowly. 'I'll just "bide a wee," as they say—I can get a daily man in the meanwhile.' And so saying, he locked up the little empty house securely, and walked home sadly through the deserted garden.

III.

You are to imagine a year passing in that garden—spring coming late but swiftly, with summer following close upon her heels; autumn dallying a little, as she does in these parts, till the nip of Jack Frost's fingers ushers her in with the first scarlet leaves, and then hurries her off with impatient storms to make way for the grim dead winter of the north.

The daily man who now worked the garden did well enough, but Mr Peddie could not help thinking that the flowers were not so fine as usual that summer—not so large and brilliant in colour. He was sure that they missed Moury, and, being what he was, he was equally sure that Moury must miss them. There was nothing in town to fill the heart of a simple countryman who had lived all his life amongst the flowers and fruits of the earth.

It bothered Mr Peddie that he had had no word from the Mourys as to how they were faring. He had parted from them quite amicably, and he feared that their silence betokened failure and disappointment; if they had made good he would have heard of their success. When people asked Mr Peddie for news of his gardener it was annoying to have none to give; unpleasant not to be able to answer questions as to where the man was or what he was doing. It almost made Mr Peddie feel as if *he* were at fault; yet he knew quite well that it was Moury who had been

ungrateful—who had left him in the lurch with half the seedlings to plant out.

It was odd, that!

Autumn saw Mr Peddie very busy in his garden, exceeding his daily limit of work and paying for it in over-fatigue. But the daily man was not to be trusted with the pruning-knife—he had been discovered cutting off some of the most promising shoots of Lady Gay; a man without imagination who, looking at the empty rose-tree, saw only the bare sticks!

Snow came early that winter and lay for long in ugly sordid heaps against walls and in crevices and shady hollows where the sun could not penetrate. The ground was like iron, and did not soften even at midday, when the sun was strongest. There was nothing to do in the garden till the thaw came, and the daily man found other employment and was seen no more. A few robins pecked jauntily at the crumbs which were scattered daily for their benefit; a stray cat sometimes wandered disconsolately round the empty hen-houses; but apart from these casual manifestations of life the garden was deserted.

Mr Peddie walked in the garden himself when the weather permitted. But he found little pleasure there in winter; it was too sad with its empty beds and leafless trees—the long winter-sleep of Nature was too like death.

The first flowers of spring had barely showed above the ground when Mr Peddie fell ill. He was ill for weeks, too near to the Gates to bother himself about the tending of his garden, too deeply engrossed in all the hateful paraphernalia of illness to care whether or not the weeds crept in and choked the rockeries and entangled themselves insidiously among the herbaceous borders. That spring the weeds and the slugs and all the other enemies which had been kept at bay for so many years held high revel in the sheltered places of the garden, and the flowers bloomed unseen, wilting unwatered in the dry light soil.

It was late June before Mr Peddie escaped from the tyranny of his nurses and walked with trembling knees down the overgrown paths. The sea breeze whispered softly through the unshaven grass, and the roses struggled manfully in the embrace of speedwell and ragged robin. Most of the borders which should have shown a brave array of bedded-out plants or healthy seedlings were bare, save for a few tufts of coarse grass and a sprinkling of golden dandelions. A dead blackbird lay in the middle of the path with outstretched wings.

Mr Peddie knew that he ought to care terribly about this scene of desolation. He should have been angry, or heartbroken, but, strangely enough, he was neither. He sat down on the iron seat and gazed about him with infinite content—the sea was blue, and a fleet of fishing-

boats manoeuvred skilfully in the bay; the sun shone warmly on his back.

It was good to be alive; good to smell the salt in the sea-breeze; even the smell of fish from the little harbour was pleasant after that eternal odour of lysol. . . .

He was still sitting there, revelling in life, when his housekeeper came to tell him that some one had called to see him and was waiting in the library. It was somebody 'on business.' He rose stiffly, and went back to the house without wondering very much who it could be. These last months of illness had made a big gap in his life—he felt cut off from all the outer world in a small world of his own where his body was the one subject of paramount importance.

It was a moment or two before he recognised his visitor, for the room was dark after the brilliant sunshine of the garden and the man had changed greatly—and then he saw that it was John Moury.

The year of independence had not been good to John. He was older in body and in spirit. Mrs Moury was there too, shrinking into the shadows—one with them in her dark clothes—her pinched face shining luminously in the darkening room.

Moury had seen the look of indecision on the face of his former employer and had mistaken it for unfriendliness, but their situation was too desperate to give up hope without a struggle. 'Ah was wondering if ye could get me a job, sir,' he said huskily.

For a moment it almost seemed to the two anxious people that Mr Peddie had not heard, and then he smiled faintly, for he was very tired after his walk. 'You'll find the keys in the usual place, Moury—and, Moury, that old apple-tree at the east corner will need props before the fruit forms.'

IV.

There was not much more to be said between people who understood each other. Moury showed his gratitude to Mr Peddie by his work in the garden; it was too big a thing to be expressed in mere words. He had been re-established for weeks before Mr Peddie heard the story of the year, and it was Mrs Moury who, womanlike, filled in the blanks.

He had walked down to the cottage in the old familiar manner, and found Mrs Moury as usual in the throes of making tea. She paused in her task to make him welcome and to wheel the arm-chair nearer the fire, for the day was damp and chilly despite the season of the year.

'Eh, Maister Peddie, Ah'm aye wonderin' what ye can think o' us,' she said to him in a low voice. 'Efter thurty year tae gang aff like yon. Ah couldna haud him back, ye ken; he wus jist fair daft. Ah dinna ken what took him.' She measured out the tea and shut up the caddy before continuing. 'Yon toons is

awfi', Maister Peddie—yon Glasgie! It wisnae bad while the siller lasted, but siller disna last long in toons; it jist melts. Ah couldna hae believed. An' when the siller was gone there wus nae jobs for Moury. Folks was kindly enouch at first, but they gey soon grew tired o' us simple country-folk. Ah could see they laughed at Moury. Ah wus that vexed, for he wus waur' a dizen o' them.' She paused, and added in a higher tone which did not disguise the poignancy of her words, 'Moury wus washin' the streets for a while.'

Mr Peddie looked up, and their eyes met; he did not speak, but his glance spelt sympathy.

'It wus bad enouch for Moury, but someway it was waur for me. Ah wisna weel, ye ken, an' at last Ah couldna stan' it ony mair, an' Ah up an' gied Moury a piece o' ma mind. "We'll gang awa' hame, Moury," Ah ses tae him. "We'll gang awa' hame tae Maister Peddie—he'll get ye a job—aiblins he'll tak' ye back his nainssel." But Moury wus ill tae move. "He'll no' tak' me back, Lizzie," he ses; "Ah'm no desairvin' o't. Ah left him when the seedlings wus tae plant, an' Ah'd no' tak' back ony man that did the like tae me." Weel, Ah jist kept on at him, for Ah kenned fine ye wud tak' him back or speak for him tae a freen'. Ah kenned ye wouldna bear him ony ill-will. An' Ah wus richt—aye, Ah wus richt; but Moury wouldna believe me till he keeked ower the wa' an' saw the gairden. An' when he saw the weeds, an' the grass unshaved, it wus a' Ah could dae tae haud him. He wus for stairtin' at it there and then; he fair itched tae be at it.'

'He is working very hard to get it right,' said Mr Peddie. 'It had got into a dreadful state when I was ill.'

'It'll dae him guid,' replied Moury's wife wisely. 'There's no' mony folks in this worl' gets a second chance of they throw away their first. An' Moury wus unco auld tae get ideas.'

Mr Peddie laughed. 'Ideas are like dis-temper,' he told her. 'It's better for men and dogs to get them over early.'

This was rather beyond Mrs Moury, but she nodded sympathetically. 'That's so,' as she busied herself with the final preparations for tea. There was something more which she wanted to say to Mr Peddie, but she hardly knew how to begin.

'Ah wish there wus summat Ah could dae for ye,' she said at last, rather shamefacedly. 'Moury dis the gairden for ye, but Ah hae naethin' tae dae for ye.'

'You look after Moury, and keep the cottage beautifully clean.'

She brightened a little. 'That's true; but it's easy wurk that, for Ah love the wee hoose. Eh, Maister Peddie, ye've no idea hoo Ah longed for ma wee hoose an' ma washin'-green when Ah wus pent up in Glasgie. An' when Ah pit the key in the door and saw it jist as Ah'd left it—no' a chair oot o' place, but a' thick o' dust—Ah jist sat doon an' grat like a bairn.'

'Very foolish of you!' said Mr Peddie a trifle hoarsely, and he blew his nose firmly to show that the embarrassing conversation was at an end.

KASHGAR AND ANCIENT TARTARY.

By Lieut.-Colonel P. T. ETHERTON, H.M. Consul-General at Kashgar.

I.

FAR away in the heart of Asia, on the western confines of the Chinese dominions, lie Kashgar and the country of ancient Tartary, a land of absorbing interest, for it can tell us more of the world's history than is obtainable from any other source. The Greeks under Alexander traversed it, the Huns followed in their wake, whilst the sway of the Persians extended from the Oxus right across Asia to the Danube. In 433 Attila became the leader of the Huns and, asserting that he had discovered the sword of Mars, claimed dominion over the whole world. Centuries rolled on, and in 1206 came the Mongols, who overran Asia from the Sea of Japan to the German frontier, from the Arctic Ocean in the far north to the plains of India and Mesopotamia in the south. In the fourteenth century appeared Timurlane, another mighty leader of the Mongols, whose hosts carried fire and sword

through two continents, and who in the course of his remarkable career dethroned no fewer than twenty-seven kings, and was reputed to have worn the armour of King David.

With the collapse of the Mongols an era of comparative peace settled over Asia, broken only by occasional revolution and internecine warfare. In 1750 the Chinese conquered Kashgar, and ancient Tartary became an integral part of the Celestial Empire. After the establishment of Chinese rule matters assumed a more or less normal course until the rebellion of 1865, and the accession to power of Yakub Beg. But he, too, was finally overcome, and the Chinese again assumed possession of the country. They styled it the New Dominion, for it was a part of their empire of first-class importance, its frontiers marching with those of Russia, British India, and Afghanistan, whilst its southern borders were marked by the mysterious land of Tibet.

Chinese Turkistan, as it is now known to us,

lies to the north of India, and, speaking generally, it is a land of deserts and sand dunes, rivers and streams rendering cultivation possible by means of irrigation channels. Only in the vicinity of these waterways is cultivation met with, the rainfall being a negligible quantity, and successful exploitation of the land depends entirely upon irrigation. The soil is to some extent brackish, but extensive oases afford tracts of fertile land, on which crops of wheat, maize, barley, rye, and lucerne are raised. Briefly, the system of irrigation is to take the rivers as they issue from the mountains and divide them into main streams, which are in turn divided into canals at the different villages and hamlets, whence the water is diverted on to the land. The water question is the leading feature in the economic life of the people, for it is only by irrigation that Chinese Turkistan has been made a habitable land. Disputes over the allocation of water, and the settlement of local rights in connection therewith, form the majority of cases dealt with by the Chinese justiciary, and nothing gives rise to more frequent quarrels, which occasionally culminate in the death of, or serious injury to, one of the parties.

Chinese Turkistan is in some respects comparable with Northern India, but from the presence of its rivers it has the advantage of being free from famine, that menace of all lands whose food-supply is dependent upon the rainfall. This difference accounts for the characteristic feature of the physical aspect of Central Asia in general, for as a whole it is a desert broken up by river beds, and only where they occur is cultivation carried on; wherever we find rivers there will be a fertile and populous oasis.

The bulk of the people of this region are Turkis; the Chinese element forms only a small percentage of the population, and is either official or commercial. The Turkis are engaged chiefly in agriculture and commerce, and they are Muhammadans of the Sunni order, many of them belonging to the Sufi sect. Islam was brought into Kashgar and ancient Tartary in the tenth century, but it did not spread among the masses until four hundred years later, and it is known that in the twelfth and thirteenth centuries Christianity, especially Nestorian Christianity, was a strong rival of Islam throughout Central Asia.

II.

Some sixty miles south-east of Kashgar lies one of the most interesting spots in the world, that has been visited by only four Europeans, of whom the writer has the distinction of being one. It is the spot marking the scene of the final struggle between Islam and Buddhism when the former was introduced as a rival to the religion of the Lamas. Ordam Padshah—for such is the name of this Mecca in the heart of

Asia—is annually visited by many thousands of pilgrims from all parts of the Asiatic continent. It is now nine centuries ago that Ali Arslan Khan, the Muhammadan champion, met the Buddhist host, he, with many of his followers, being killed in the battle which ensued. It was, however, the final blow to Buddhism in Turkistan, and the spot where the hero, Ali Arslan, fell is crowned by the most curious religious monument extant. It consists of a sheaf of sticks and poles more than one hundred feet in circumference at the base, and towering to a height of upwards of fifty feet. Each pilgrim contributes a stick to the sacred pile, many of them with little pennons attached.

Amongst the religious buildings is one set apart for the reception of offerings brought by the pilgrims, these consisting of horses, cattle and sheep, cloths, carpets, brocades, fruits, precious stones, &c., all gifts of an inanimate nature being placed in two huge bowls—one of bronze, measuring nearly six feet across at the top and five feet in depth, said to date from the time of Ali Arslan himself, and the second presented by Yakub Beg, who conducted the last revolution in Chinese Turkistan, and was for a few years ruler in ancient Tartary. Yakub Beg made no fewer than three pilgrimages to Ordam Padshah, and caused endowments to be made in its favour.

The Chinese in Turkistan, who account for only four per cent of the population, profess the Confucian religion with an admixture of Buddhism and Taoism. Amongst officials of the educated classes the teachings and writings of Confucius are a constant study; at certain festivals during the year services are held in the temples in honour of the sage. So far as Chinese Turkistan is concerned, the creeds have, as a whole, lost their distinctive features, and the decay which has been going on for so long has tended to merge the three into one, so that they may be treated as the foundations of a common faith. Here there appears to be little or no religion amongst the Chinese; the temples are in ruins, the idols are exposed to the weather, and individuals seem to follow the dictates of their own corrupt and depraved instincts.

In Chinese Turkistan one meets with that interesting section of the Asiatic population, the Tungsans, who are Muhammadans, but whose origin is uncertain; even the term Tungan lacks scientific determination. They are said by some authorities to have originated from the Uighurs, who were settled in the provinces of Shansi and Kansu of China proper many centuries ago. They assumed the Chinese dress, language, and customs, but preserved the Muhammadan religion, of which they have ever been adherents, albeit not very strict ones. The Tungsans form the bulk of the inhabitants around Karashahr and Urumchi in the north-east.

III.

Generally speaking, the people are light-hearted and cheerful, easy to govern, and without any tendency towards advancement either educationally or in any other sense. They rest content in their present condition, and exhibit no desire to improve it. All, both men and women, are good riders, and if a horse be not available, they are equally at home astride the lumbering ox. There is no national game in the strict sense of the term, but dancing is very popular amongst them. In this men take the leading part, the women being veiled, as in all Muhammadan countries, and not appearing at public functions. The music is provided by an orchestra consisting of three performers—a drum, a dulcimer, and a flute corresponding to our clarinet. The Turkoman has, however, but scant idea of music, and there is no accounting for taste in that direction, even in Central Asia. An amusing example of this was afforded during a tour carried out by the writer, when a selection of operatic music on the gramophone was given to a native audience. The first piece chosen was a song by Melba, and at the conclusion thereof the gathering, on being asked to express an opinion, declared that they thought it to be an old woman crying.

A prominent feature of the social life of the people is the marriage system, and the customs appertaining thereto. In Chinese Turkistan marriages are contracted for both long and short periods; it is a custom referred to in the Quran as the 'temporary marriage.' A man may take the lady of his choice and divorce her whenever it is convenient for him to do so. For the woman matters are not so easy, as although the man may re-marry at once, the woman must perforce allow one hundred days to elapse before again taking on the joys or sorrows of 'connubial bliss.' The system has its advantages for the girl possessed of physical beauty, and she may contract any number of marriages with the accompanying dowry; thus life, so long as her good looks hold out, is one constant honeymoon—but for that she needs the form, complexion, and carriage of those beauties of Kashgar of whom the Persian poets sang in such eulogistic terms.

The punishment for adultery on the part of the woman is in keeping with the ancient and conservative nature of the country and its people. Her face is blackened, and she is placed upon a donkey with her face towards its tail. She is then led through the bazaars, the procession being headed by criers announcing her crime to the crowds, who may occasionally exhibit their disapproval by making her the target for various missiles.

For the crime of murder the Chinese dispose of the criminal by shooting in the back, whilst for burglary and offences of a less serious nature

there are several forms of punishment, the principal one of which is the cangue—a wooden frame, usually about three feet square and weighing from twenty to sixty pounds. It has a hole in the centre, and the culprit is forced to wear this contrivance round his neck for a period varying from seven to fourteen days. He cannot lie down, as the board has then a tendency to force the neck to one side and set up a strain, whilst to stand up for any length of time becomes unbearable, so that he must endeavour to strike the happy mean between a lying and a sitting posture.

To force a criminal to confess, or to implicate others, as well as to disclose information which may lead to a clue in any particular case, he is, amongst other things, compelled to kneel on maize which has been lightly sprinkled on the ground, an agonising form of torture not apparent until it is actually tried. The arms are also secured behind the back, a rope is attached to them, and the victim is then suspended from a bar with his toes just clear of the ground; he may have the wrists fastened together by cords which are damped and then allowed to shrink until they bite into the flesh.

IV.

With regard to the maintenance of law and order in the cities and towns of modern Tartary and Kashgar, we will take the city of Kashgar as an example, it being, as in the case of all others, surrounded by a wall with four gateways corresponding to the several points of the compass. It is divided into four quarters, in each of which there are thirty wards under a thanadar, an official similar to a sub-inspector of police in India. The thanadar is assisted by police sergeants, under whom are watchmen perambulating the streets at night. None of these individuals is paid by the state, but they are authorised to collect a small given sum from every shopkeeper in their wards on the weekly bazaar days. Each householder must also pay a sum monthly to the watchman, whilst in addition to this he receives a commission when a house or any immovable property is disposed of in his ward. It will be seen that the police and the watchmen are paid by the people, but they are also paid by the thieves and the gambling community, so that we have the two forces of light and darkness in league against the public.

The method of taxation throws some interesting sidelights on Chinese administration, and the extent to which the former may be perverted. The authorities derive the bulk of their revenue from the land-tax, and the assessment is still carried out in accordance with land classification made more than forty years ago. This specified the land as first, second, and third grades, and was more or less accurate in proportion to the amount of silver dust cast in the eyes of the surveyors.

In addition to the land-tax there are means by which an official may acquire wealth. For instance, the military authorities lodge a demand for wood to meet the requirements of the local garrisons. The district magistrate, to whom the collection of this fuel is confided, summons his subordinates, who are sent forth to arrange for the supply at the existing market rate. The requisitioning proceeds apace, and to such an extent is the area swept of wood, that the price has risen to three or four times its original figure. The people then represent to the Amban, or local magistrate, that any further requisitions can only result in hardship; so the latter assumes a benevolent air and notifies that, such being the case, he does not propose to insist upon the full amount being delivered, but will accept the remainder in cash at the prevailing market price, now four times higher than it stood when the requisitioning commenced.

Formerly appointments to the Civil Service in Turkistan, as elsewhere within the Chinese dominions, were determined by examination; candidates entered the ranks by competition, the system forming the leading feature of Chinese polity. No part of the administration was so carefully organised, and the prize of a literary degree was not only a mark of honour but the passport to official recognition. The system may have had its demerits, but it at least ensured that a man should be a scholar and an expert in style and penmanship. It is curious to note that a Chinese official is much more influenced by the way in which a case is presented to him than in the case itself, and an indifferently-worded letter or despatch at once prejudices the recipient against the writer.

The revolution in China of 1912, however, brought in a lower standard of general capability and integrity, and many of the precautions formerly in vogue to obviate malfeasance have been swept away. For instance, the term of office in one post was limited to three years, but there are now men who have held office for upwards of seven years. Moreover, in the old days no one could serve in the province of his birth. All this was intended as a guard against local interests arising to compete with duty, and especially against territorial attachment, which might become the basis of disloyalty. Obviously the system had drawbacks, for the lack of local and territorial attachment encourages many of the worst official abuses. Moreover, an official who is holding office for a brief period is scarcely likely to interest himself in, still less to spend money on, local improvements in a place which may know him no more during his career.

V.

Intimately connected with the every-day life of the people of Turkistan, and forming an

integral part of the administration, taking us back to patriarchal days, is the position of the Shariat, or Muhammadan Law Council, composed of the Qazis and Muftis, who hold a strong position in the Islamic world generally. There are three Qazis and one Mufti in all the large towns, and they are appointed by the Chinese, usually on the recommendation of prominent local residents. The Qazi exercises his office in a public place, the chief mosque or its vicinity being preferred, or it may be his own house, to which the public are allowed free access. A Mufti is one who expounds the Muhammadan law, and assists the Qazis, supplying them with fatwas or decisions. The people of Kashgar and Turkistan are conservative, and they have great respect for the priesthood, usually preferring to have their cases settled in the Qazi's court rather than take them to the Yamen, where so much silver dust has to be cast before an applicant can obtain a hearing.

Chinese Turkistan is noteworthy for the mixed nature of its inhabitants, and of these no section is more interesting than the Mongols, the descendants of Jenghiz Khan and Timurlane, the great chieftains who once carried the Mongol barrier to the shores of the Adriatic. In religion the Mongols are Buddhist, and their hair is worn in short pigtails. In stature they are above middle height, and they are expert horsemen and hunters. They have retained their own language despite the Chinese influence, as well as their national customs, some of which are remarkably interesting, more particularly with regard to the disposal of the dead. The body is not buried in the ordinary way, but is placed out on a hillock to be disposed of by dogs or birds of prey. If, after the lapse of a few days, the corpse remains untouched, it is assumed that the deceased had led a wicked and wayward life, and to obviate his relatives following suit, they are treated to a severe beating all round. The sins of the father visited upon the children indeed!

Finally, mention should be made of the Dolans, a poor and illiterate people, settled along the Yarkand River, in the centre of what was formerly old Tartary. They are mostly herdsmen, trappers, and collectors of fuel and desert salt for the local markets. Their religion is a form of Muhammadanism, and they are reputed to be descendants of prisoners brought from Trans-Oxiana in the eleventh century, and forcibly settled in their present domain. They are fond of dancing, and it is the women who are the best exponents of the art. Altogether the Dolans furnish material for unusually interesting studies in ethnography and folklore, for in many respects they differ entirely from any of the races to be met with in the heart of Asia.

Chambers's Journal

SEVENTH SERIES

THE PARADOX OF PROTECTIVE COLOURING.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

I.

ONE standard rule has for many years been accepted by naturalists with regard to the colouring of birds and animals, namely, that every creature has developed on lines for the advancement and betterment of its species, and that no wild creature has any attribute which was not acquired for its own advantage during the process of evolution. By this reasoning evolution has followed along fixed channels; each bird and beast has proceeded on its own lines, and throughout the course of its evolution its own good only has been taken into account—how it could best escape its foes, and so on.

Now it would seem to the present writer that this view-point, though indisputable up to a certain point, is open to very considerable modification, though a hint to that effect made in these pages some months ago resulted in a storm of protest and a good deal of scathing criticism.

The theory to be advanced in the following notes is that, while certainly most birds and beasts have progressed with their own betterment of foremost account, nevertheless, in the evolution of each, those alongside it have been taken into account—in the end for its own betterment, but by indirect methods. It is by following this process that the balance of Nature is retained, whereas had each individual species been evolved solely with regard to increasing its powers, and quite heedless of the general effect among those evolved alongside it, certain races would have flourished to the exclusion of all others. My own theory does not detract one atom from the beauty and wisdom of Nature's workings, as certain writers have suggested. On the contrary, it opens up new and promising fields for exploration.

Let us pick out certain birds and beasts which best lend themselves to illustration, taking those—since space is limited—which are well known.

II.

It will be observed that practically every bird or beast which acquires a protective coat to match the snows of winter retains some glaringly con-

spicuous marking, as though to offset the otherwise complete protectiveness of its dress; so we have the black feathers of the snow-bunting and the ptarmigan, the black ear-tips of the mountain hare, the black tail-tip of the ermine, the black noses of the white fox and the polar bears.

In the case of the first three of these—the ptarmigan, the bunting, and the mountain hare—the black markings, if they serve any useful purpose at all—and we know that they must—are protective. They are creatures which merely wish to escape others, not to locate others, as do the predatory birds and beasts. In what ways, therefore, are the conspicuous markings of value to these creatures in helping them to hold on to existence?

It has been said over and over again that any distinctive marking, such as the white tail of the rabbit, serves to bewilder the eye, but it is time this time-honoured argument went the way of a good many others. One critic remarks that if one watches a dog pursuing a rabbit in the dusk of evening, and observes its bewilderment caused by the white tail, there is no longer any doubt as to the value of that conspicuous marking.

Well, I certainly have watched a dog pursuing a rabbit in the dusk of evening, but his bewilderment was caused not by the erratic appearances of the white tail, but by its erratic disappearances. Had there been no white tail there would have been no chase, for it was the white tail that caught the dog's eye—the sign for which he knew well to look—and had he not been thus adorned the rabbit would simply have slipped away unobserved.

This idea of baffling and deceiving the eye is the utmost nonsense, for these conspicuous markings do nothing of the kind. We shall come to the tail of the rabbit later, but let us for the moment consider the creatures of the snows. Of what value are the black ear-tips of the mountain hare to their wearer? Years of intimacy with this creature have failed to convince me that they are of any value whatever for the protection of the individual, but of this I am certain, that I have shot literally scores of mountain hares which would have escaped

me but for their black ear-tips, and that there have been days when I could have struck down in their formes more white hares than I could carry, and all because their ears betrayed their presence.

When hunting hares in the snow, for what would the primitive hunter look? Not for a white outline against the whiteness, for that is practically invisible, but for black ear-tips. That also is what the eagle in the sky and the hunting fox look for; that is what they see; that is what, in nine cases out of ten, brings about the death of the hare. How, then, can it be argued that such a marking is protective? It simply is not; and would it not be better to escape the eye entirely than to attract it merely for the purpose of bewilderment? The fact that these markings survive from another era does not alter the course of evolution.

One prominent naturalist, firmly wedded for life to the Darwinian theories, resorts to the argument that these distinctive markings are to cause a pause, during which the wearer of them has his chance to escape. The pause is momentary, but it gives him his chance—now or never. So the hunting fox sees two black tips. Up goes his head, he raises one paw as he asks himself, 'Is that a hare crouching in its forme?' And ere he can realise that 'Yes, it is,' the hare, if he is among the fittest which are to survive and breed their kind, is up and away.

This is a very pretty theory, but as an explanation it strikes me as being too much of a makeshift. Does the fox pause in doubt or surprise on seeing those black tips? Once in his life, perhaps, but never again. Had the originator of this theory ever been hungry and hunting for his next meal, if not to save his life, he would realise the futility of it. The mountain fox, the hare's chief foe, which, if any, will have gone to mould the race, is no dull-witted sluggard. He has killed scores of hares, and seeing those black ears, he does not pause to ask himself any questions. Why, indeed, should the sight of a conspicuous marking cause longer delay than the sight of an inconspicuous outline? Common-sense would seem to suggest that the reverse might apply.

We must admit, then, that the markings of such creatures as hares, ptarmigan, and the snow-bunting are not protective; so of what use can they be to the individual? Are they of value in bringing the creatures together? Not a bit of it. Hares are solitary, and in any case they are provided with a scent apparatus which is one of the most wonderful wireless systems in the world. By means of it hares are able to find each other across miles of country, and, each hare living its own life, independently of the rest of its race, this system comes into use for the purpose of bringing the sexes together, which is the only time when one hare wishes

or needs to meet another. With so wonderful and successful a scheme, the small black markings, effective for only a few yards at the most, would obviously be superfluous so far as one hare finding another is concerned.

Ptarmigan have their call-notes, and certainly they do not need their black feathers as a means of locating each other. Look at it which way we will, these markings serve but one purpose. The hare could flourish exceedingly without his black ear-tips; the ptarmigan would be in no way inconvenienced if he shed his black feathers; and as for the snow-bunting, he too has his call-notes.

The snow-bunting affords the most startling example of protective colouring run riot that I have come across. In the glaring whiteness of a land which is really white, thousands of these little birds break the long silence as they rise from the snow. One hears their voices, and one sees a great host of black butterflies rising and falling ahead. But for those black markings one would see nothing at all, and the effect would be uncanny—incongruous bird voices all about in the desolation, but not a bird to be seen. Imagine what those markings must mean to the swift and hungry hunter of the same environment.

III.

We have shown, then, at any rate up to a reasonable point, that these markings are not protective; but according to accepted theories, by which each race, regardless of all others, has developed for its own betterment and increase, they must be.

Let us, for the moment, shift the scenes. We know that Dame Nature attains her ends by wheels within wheels, by complex and diverse methods. She is ever striving to keep an even keel, and it is with this purpose in view that, for example, she endows the short-eared owl with the most extraordinary powers by which he crosses seas and continents to visit an area of mouse plague, such as infested the Borders about thirty years ago. When one creature is so far favoured as this, we must admit that it serves a purpose in Nature's scheme, which takes account of factors over and above its own existence. In other words, the bird has developed on lines which have taken into account the general balance of Nature; and, in the same way, some are given protective colouring, but not so protective that those evolved alongside them, and dependent upon them, must die in hard times. To all the course of evolution has been just so generous and no farther, and so no one species comes to possess the earth.

Let us imagine what might happen if these creatures of the snow had no conspicuous marking. We know that mountain foxes and the like are hard put to it during wintry spells to keep alive. Sound-bodied foxes have been

known to become so weak with hunger that, dragging hither and thither in search of food, they have been unable to rid their tails of the clotted snow and ice which collected in the long hair, and thus, becoming more and more heavily burdened, they have sunk in their tracks, the helpless prey of any that might descend upon them. But it takes extreme conditions to reduce the fox population to this. Normally their prey, even during the leanest times, is just sufficiently accessible for them to remain alive; and what applies to the foxes applies to many carnivorous beasts and birds.

Presuming that they are able to live, because, whatever the conditions, the fittest can circumvent their quarry, since the latter are just sufficiently visible to make that possible, we have next to consider how, one phase reflecting upon another, the distinctive markings are finally and in the end a benefit to the helpless folk who wear them. We may take it that if the helpless birds and beasts of the snows (the ptarmigan, hare, bunting, &c.) had no conspicuous markings, the beasts which naturally prey upon them would have died out of existence. There would be no mountain foxes, no alpine stoats, or birds of prey. They as a race—and one must widen one's views now to greater lands than our own—would have died out. What then?—Mice, millions of mice! Mice—and other things which are the staple food of flesh-eating birds and beasts—would have developed unchecked. The fox and the ermine and the buzzard and the hawk may kill a hare or a ptarmigan now and then, but they kill thousands of mice. And if throughout the course of evolution the foes of the mouse had been destroyed, the mouse millions would to-day possess the hillsides, and from the valleys to the topmost summits there would be no food for hares, ptarmigan, or anything else.

The mouse itself, like the hare and the ptarmigan, is protected just so far and no farther. I believe that in one of my original statements which provoked criticism I said, 'Some creatures seem to exist as a natural prey for others. For instance, the mouse millions. The mouse is Nature's stock-in-trade.' So he is, but he is preserved from extermination, and simultaneously the creatures mainly dependent upon him are saved from extermination, by reason of the fact that during extreme periods ice locks the mouse in, and it is then that those who hunt search the hillsides for black feathers or black ear-tips. So no creature is permitted totally to destroy its own means of sustenance.

IV.

But in what manner does all this bear upon the black tail-tip of the ermine, the black nose and eyes of the white fox, and the black nose of polar bears? Are those features protective? No; as in the other cases they are of no benefit

to their wearers save that they prevent them from exterminating the foods on which they are at times totally dependent. Just as there are times when the mountain foxes might starve but that the ptarmigan, &c., wear their black markings, so there are times when the fox would kill too well, but that he himself possesses his betraying sign. It is in these ways that the course of evolution has kept the keel of Nature even by adopting the best methods available, so that, no matter what the weather conditions, no one species is exterminated by its foes, and no one species is left to starve miserably.

The polar bear, as a matter of fact, is under rather a different heading. His massive bulk alone is sufficient advertisement, and he needs no betraying marking. His black nose is immediately beneficial to his own requirements, because he often approaches his quarry with his great body resembling a sodden mass of snow below the surface and only his dark nose above the dark waters.

The white tail of the rabbit is another compromise. Certainly it attracts the eye of his foes, which are so many that his powers of multiplication have risen in accordance; but though the individual rabbit derives no benefit from the white tail he wears, it is of use to his fellow-colonists, just as their white tails are of use to him. For, rising in flight, he sets the semaphore signals going on every side of him, and down the wood edge the warning spreads ahead of the hunter, those bobbing white signals which convey from one to the next the news of danger's approach.

That, then, is its first use. Its second is that creatures evolved alongside the rabbit, creatures which, though his foes, are nevertheless necessary for his welfare, may live. The strength of the wild rabbit is dependent upon its colonies, and the tail is protective to the members of the colony, but it is the reverse to the individual who, old enough to guard his own interests, yet having no family responsibilities, is living an outlying life. What if the rabbit had no foes at all? Within five years his numbers would have increased so enormously that our domestic animals of the fields would be starved out. Disease would follow, leaving in its wake a stark and lifeless land. This is what has happened in America and elsewhere where man has upset the balance by killing off the rabbit's natural foes. Abundance, superabundance, death and disease on every side, even to the extermination of the species involved, over thousands of miles of territory. Nature sets her face against such appalling loss and wastage. It is against the first and fundamental principles of the whole system of balance, and so we see that if the rabbit had developed solely with a view to avoiding its foes, a state of utter chaos would ensue, and assuredly the extermination

of the rabbit itself would be among the results achieved.*

But the rabbit, like the mouse, is part of Nature's stock-in-trade; he is a creature born to be hunted, and like ten thousand others he carries his betraying sign.

In these brief notes I have touched upon but one phase of a theory which can be traced into every aspect of natural history to which the problem of preservation has been applied. Certain birds and beasts are most certainly Nature's stock-in-trade. They have their own adequate means of protection; but in every case, if we can lay our finger upon it, there is some flaw in their protective colouring, some hitch in their armour of defence, which enables the fittest of those evolved alongside them and dependent upon them to survive and retain the balance.

Following this reasoning to the fishes of the sea, we find evidence on all sides of so glaring and brutal a kind that it becomes clear that the whole Law of Balance is maintained not by evolving each species as a paramount individual, but by evolving one species interlinked with another, much as a many-coloured fabric is interwoven.

I realise that to run counter to existing theories which, founded on the highest authority, have stood the test of time is to presume a great deal, and, further, that it is not for the field naturalist to take this upon himself; but the problem hinted at is, at any rate, an interesting one, though lack of space has prevented my using many of the most marked examples of what we might term 'destructive colouring.'

THE SENSIBLE MR SANDERS.

PART II.

IV.

EXACTLY one week later William Sanders was on his way to Sandypool.

Sandypool Lodge, a rambling farm-like building about half a mile from the sea, was managed by an alert, middle-aged couple named Davies. They were assisted by a widowed daughter and a much younger girl, who also appeared to be a family connection. Long experience in catering for semi-invalids had taught the Davies family the value of constant cheerfulness mellowed by tact.

Mr Sanders's first night at the Lodge was followed by a stormy morning. He stood at the bedroom window in his pyjamas and gazed out. To his right and left he saw green wet fields relieved by narrow sandy paths, and far away to the right the dim outline of a windmill, the first he had ever seen. Below him the muddy sea rolled turbulently under a gray sky.

'I must have been mad to come here,' reflected Mr Sanders. He dressed resentfully, and, making his way downstairs, put on his raincoat and a cloth cap. As he was about to leave the house Mrs Davies came out of the dining-room. She was a brisk little woman, who always managed to give the impression that looking after the great house was a relaxation rather than a necessity.

'Not a very pleasant day, Mr Sanders; but perhaps you like walking in the rain?'

Mr Sanders, who hated walking in the rain, nodded.

'When would you like breakfast? About nine? That will give you three-quarters of an hour.'

'That will do nicely,' answered Mr Sanders, wondering what he was going to do with three-quarters of an hour in such a place on a wet morning.

'We are expecting another arrival this morning, so you will have company. Miss Jennings usually gets here about nine.'

'A regular visitor, eh?' murmured Mr Sanders politely.

'Oh, she always comes here—but usually in the season, you know. She isn't very strong, and the air suits her. Miss Jennings is a school-teacher; she has just sat some examination or other—quite successfully—but the strain has been too much for the poor girl.'

Mr Sanders went on his way thinking about Miss Jennings, not because he was interested in school-teachers, but merely because he had nothing else to think about.

A fairly wide road, unpaved and sandy, sloped gently past the Lodge on its way to the sea. A few minutes' walk brought Mr Sanders to the tramway track, which was used only in the season. Crossing this, he picked his way over a narrow belt of sand-dunes till he reached the sea. The place was so deserted that it seemed to him he must be the first man ever to set foot there. He glanced down at his unsuitable city boots, wet with the clinging sand, and swore under his breath.

'In all this dreary place there are just three things which are moving,' he reflected, 'the wind, the sea, and the seagulls. Well, this time to-morrow there'll be four. I'm moving back to town first train.' Glancing at his watch, he decided to stroll a little way along

* The rabbit was introduced into Australia, where it has few or no natural foes. We have here an excellent illustration of what is meant by the Laws of Balance, the rabbit millions rendering other life impossible, till starvation and disease devastate vast areas.

H. M. B.

the beach. The pebbles made this an uncomfortable and even adventurous undertaking. The wind and rain lashed his face, and flung his breath back into his throat. After a time he discovered that by expanding his chest and breathing deeply he was able to combat successfully the efforts of the wind to choke him.

'By Jove!' he gasped at the end of five minutes, 'I wish I'd thought to bring a pair of sensible shoes with me.' He continued his stumbling walk a little farther, and then decided to return to the Lodge.

Reaching the house, he noticed two small travelling-cases in the wide hall. Each case bore the initials 'M. J.' 'Evidently Miss Jennings has arrived,' thought Mr Sanders. 'Fancy bringing disordered nerves to this cemetery of a place! A week of it would drive me raving mad.'

He went up to his room, and, crossing to the mirror, received something of a shock. This walk, short as it had been, had given the rain and the wind and that indefinable something for which the air of Seacombe and environs is justly famed sufficient time to soften his normally florid countenance to a rich brick-red. 'I look ten years younger,' he said aloud, 'and I feel ten years younger too. Wonderful thing the sea air—wonderful!' Mr Sanders changed quickly, and then ran lightly downstairs.

As it still wanted a few minutes to the hour, he pushed open the drawing-room door and entered humming. A pleasant fire dispelled somewhat the normal gloom of this chamber. Mrs Davies, looking extremely pleased with herself and a little excited, was talking vivaciously to a green plush Chesterfield chair. Mr Sanders's second glance showed the chair to be occupied by a slim dark girl with a pale flower-like face. Mr Sanders stared openly for a moment, and then, recovering his good manners, closed the door abruptly.

He felt quite sure that this girl in the chair was not as other girls. 'Margaret, my dear, this is Mr Sanderson—er—Saunders?'

'Sanders,' corrected Mr Sanders apologetically, and advanced nervously. 'Pleased to meet you.'

The slim girl rose and looked at him with cool, friendly eyes which were either blue or deep gray, he was never quite sure about it. He heard a voice as cool as the eyes utter a few words of greeting, and was overwhelmed with a desire to say something brilliant, something as far removed from the set phrases of a formal introduction as the stars from the earth. He felt instinctively that their meeting would change the whole destiny of William Sanders; but for once in a way the ready tongue of the successful traveller failed him. He hoped that Miss Jennings had had a pleasant journey.

'Now that you two know each other, I will leave you; breakfast will be only a few moments.'

Mr Sanders seated himself on the other side of the fireplace. Miss Jennings was the first to break a short but awkward silence. 'Did you enjoy your walk, Mr—er—?'

'Sanders—immensely, thank you.'

'Mrs Davies happened to mention that you had gone for a stroll. I mean to do a lot of walking while I am here.'

'How long are you here for, Miss Jennings?'

'Two weeks. I understand you are only here for a few days?'

Mr Sanders raised his eyebrows and shook his head in a surprised fashion. 'Two weeks, unless something unexpected happens. I—I suppose the rain will prevent you from taking a walk after breakfast?'

Miss Jennings smiled. 'Oh, I don't mind the rain so long as I am wearing nothing that will spoil, but I shall be obliged to remain indoors until lunch time, because I have some correspondence to attend to.'

V.

Immediately after breakfast Mr Sanders left the Lodge, but instead of turning to his left, as previously, took the opposite direction, and, with the sea at his back, followed the path until the tiny village of Sandypool was reached. The path, describing a half-circle, now gradually approached the sea again, broadening out into a well-paved thoroughfare. Mr Sanders entered the popular (in the season) holiday resort of Seacombe. Although practically deserted by visitors at this period of the year, Seacombe has a very considerable population, and most of the shops were open.

Mr Sanders soon found a shop which stocked the excellent brand of footwear which he habitually used, a brand which could be relied upon to give comfort from the first. From the same shop he procured two pairs of thick woollen socks. Thus equipped he started on the return journey.

The rain was still falling when he again reached the Lodge.

After lunch he appeared in the drawing-room dressed in a gray tweed suit and strong tan shoes, the newness of which had been carefully toned down by a judicious use of polish. Miss Jennings, who again occupied the Chesterfield, was glancing through the pages of an old magazine. She looked up with her quiet smile. 'I feel disgustingly lazy,' she said contentedly.

Mr Sanders made some polite but quite unintelligible reply, and strolled over to the window. 'The rain has ceased,' he observed in a casual tone.

She sighed, and returned the magazine to the table. 'It seems a shame to spend a single moment of a holiday loafing about indoors.'

Mr Sanders, watching her from the corners of his eyes, nodded. 'It does indeed,' he

agreed eagerly. 'Shouldn't be surprised if the sun comes out shortly.' It would have been difficult to discover from the leaden sky the faintest excuse for this optimistic prophecy, but the girl was not disposed to be too critical. She rose to her feet. 'Were you thinking of going for a walk, Mr Sanders?'

He stared fixedly through the window. 'Er—yes.'

'Well, suppose we go together?' she suggested, with her frank smile. 'I know the place quite well; you, I believe, are a complete stranger.'

'You are very kind,' he answered fervently. 'I shall be very glad to come.'

'Good—I won't keep you long.'

When she had gone to her room the elation died out of his heart. 'She would not have wanted me if I had been a younger man; she thinks I am so old it doesn't matter—probably thinks I'm married, too.' He walked moodily from the room.

Miss Jennings was ready almost as soon as he. She wore a navy-blue raincoat, a small hat made of soft brown leather trimmed with red, sensible tan shoes and gloves to match. Mr Sanders thought her adorable. 'Are you not taking an umbrella?' he asked, pulling rather nervously at the peak of his cap.

The girl laughed. 'I never carry one,' she admitted. 'I'm rather clumsy with them, you see.'

'Clumsy!' repeated Mr Sanders, whose carefully rolled and prosperous-looking gamp was his constant companion throughout the business day. To picture this slim dark girl as being clumsy in any circumstances was for him at least too great an effort of the imagination.

'Yes, I'm inclined to forget about umbrellas when it isn't actually raining. I swing them about and—and hit people.' A little embarrassed laugh concluded her words. She flushed slightly.

Mr Sanders realised with sudden amazement that she was quite serious. Evidently Miss Jennings was not given to humorous exaggeration, but was one of those downright people who mean most of everything they say. 'If you could lend me a walking-stick, I should be greatly obliged. I—I rather like a walking-stick.'

'Hang it!' said William Sanders; 'I knew I had forgotten something.'

It is to be feared that the walk did not greatly improve Mr Sanders's geography. Miss Jennings occupied his attention to the exclusion of everything else. The reverse of vivacious, she said very little, but there was nothing discomfiting about her silence. She was one of those rare people who can go on contentedly for miles without uttering a word, and at the same time be perfectly at ease, one

who asks but little of life and is prepared to give much in return. Mr Sanders discovered that she was not afraid either of rain, frogs, mud, dogs, or tramps.

During that walk through wet, silent fields and along deserted lanes he learned that his companion loved children, and was keenly interested in all branches of education, considering, in all modesty, her own vocation the highest to which man or woman could be called. He was genuinely amazed; all his life he had been reading and hearing of 'underpaid teachers,' and vaguely supposed them to be persons who were incapable of following more remunerative professions—clever enough, but lacking in energy, and perhaps courage. Yet here was a young woman who quite obviously expended as much mental and physical energy during the course of her working day as he did himself; one, moreover, who was both steadfast and resolute. Never once had she mentioned the pecuniary side of her work.

'There doesn't appear to be much money in teaching,' he ventured to remark.

'No, there does not appear to be much money in anything that really matters,' she answered without bitterness.

Mr Sanders lapsed into silence. For the first time in his life he was wondering just how much his warehouse mattered in the scheme of things.

When they were half-way home the sun came out for a few moments. Mr Sanders stroked his moustache complacently, as though he regarded this amazing appearance as a personal compliment.

VI.

It was the first of many such walks.

William Sanders became a changed man. He was a trifle less sure of himself, and many of his most cherished convictions were severely overhauled. This mental stocktaking did not at once result in a complete new set of up-to-date ideas. Mental gymnastics are not easily achieved by men of his age and type. He became irritable; he began to quarrel with his reflection. In a panic he felt sure he was becoming stouter, and decided to buy a skipping-rope. Then, with horror, he became obsessed with the fear that he was fading away, and sent for a free sample of a patent fattening food. One black morning he discovered two gray hairs, which convinced him that he already had one foot in the grave. Sometimes he was irritable, sometimes cheerful; and constant walking made his feet increasingly tender.

Mr Sanders was very much in love.

There was no outward indication to show that his continued company had any particular effect on Miss Jennings. Whether she looked forward to their walks, or whether she thought

of them bored her, it was impossible for him to judge from her manner. She remained the same friendly, rather quiet girl he had first met.

Familiarity strengthened his first conviction that Margaret Jennings was the most wonderful girl in all the world, and also dissipated somewhat his first awe of her. The friendly silence usually maintained by the girl had the natural effect of encouraging him to talk. At first he chose his subjects carefully, keeping away from *crêpe-de-chine* and confining his remarks to topics of general interest. Gradually, however, caution was flung to one side as he gained confidence. He stroked his moustache, and, in spite of the condition of his feet, strutted a little.

He talked of William Sanders.

And the warehouse of William Sanders.

It all came out. That which had been pent up for more than a week.

The Opinions of William Sanders. The Ambitions of William Sanders. The Achievements of William Sanders. The Business Acumen of William Sanders. The General Superiority of William Sanders. After more than two hours of William Sanders, he felt that the eyes of the girl were fixed on him with more than usual intentness. He paused with his hand half-way to his moustache and glanced down at her. She was watching him with precisely the same expression which he had seen so often in the eyes of Thomas Keith Chalmers. . . .

On the evening of the last day of their stay

at Sandypool Margaret Jennings and William Sanders went on a last pilgrimage to the sea. Both were leaving first thing on the following morning. In moonlit silence they walked down to the beach. Reaching the highest point of the sand-dunes, they stopped as if by common consent and gazed over the dark, sighing waters. Without the least warning Mr Sanders turned to the girl and said in a deep hoarse voice, 'I love you! Will you marry me?'

Miss Jennings was so startled that she lost her footing in the treacherous sand and slid quite gracefully to her knees. Mr Sanders permitted this incident to perturb him unduly. He felt resentfully that the Fates were conspiring to make him ridiculous. 'Will you?' he repeated, when he had helped her safely to her feet again.

She gasped a little, and then shook her head gently. 'No,' she answered.

'I hardly expected you would,' he admitted sadly. 'I—I am so much older than you.'

She took his hand impulsively. 'Please don't say that,' she answered quickly. 'You are one of the youngest men I have ever known. I'm years older than you in many ways.'

William Sanders took fresh hope. 'Is there the least possibility of your ever changing—your answer?' he ventured diffidently. 'Do—do you care to continue our friendship?'

She smiled enigmatically. 'Please do not write, but if ever business brings you to Northtowers, I shall be glad to see you.'

(Continued on page 685.)

ADAT.

By Captain A. R. DUNLOP.

PART I.

I.

THE popular idea of a Malay is that of a small brown man, armed with a wavy *kris*, and marked by a propensity to run *amok*. As a matter of fact he is a sturdy fellow, with a great fund of humour, but independent and intolerant of discipline. He is clean both as to body and mind, contrasting very strongly with some of his neighbours. He can be a delightful companion, loves a joke, is a keen sportsman and fond of games, while his manners are quiet and dignified.

He would probably have taken a much higher and more important position among the nations of the East if Nature had not overwhelmed him with her generosity. With the sea, the land, and the forest always ready and waiting to yield of their abundance for the mere taking, he has never felt the driving-force

of necessity. With so much idle time thrown upon his hands it followed, as a natural sequence, that the devil should find something for them to do. His sins, however, are very human. He is a great lover, and his women do not lack in either charm or wit; but, while giving free vent to the desires of the flesh, he does not indulge in the bestialities so often found in Eastern countries. When intrigue palled, or it may have been to gain glory in the eyes of his mistress, there was always the excitement of the chase, enhanced when the quarry was a fellow-being, and his lair in the settlements of some distant tribe.

He is not naturally cruel, and when he kills does it quickly. Torturing a captive, after the style of the Chinaman or the North American Indian, does not appeal to him.

Adat, or custom, is a fetish to him. In Borneo a human head was a trophy which

every youth had to obtain before he could lay claim to manhood or aspire to the leve of a maid.

Perhaps the most savage tribes were those who lived on the coasts and made a profession of piracy. Yet they were a manly people, with many fine traits in their character. One of the most loyal and intelligent chiefs that any government ever had was old Hadji Drahime, of Lima Limoang, in North Borneo. He was an ex-pirate, and could tell how he once attacked an English sailing-vessel. That the result was unfortunate for him and his followers did not detract from the pride with which he related the story. That these pirates were not mere blood-thirsty murderers I learned by experience when at one time I found myself a helpless victim of circumstances in their hands.

II.

I was at the time magistrate in charge of the Darvel Bay district in British North Borneo. It was in the pioneering days, and the district was considered so insalubrious generally that a special allowance was granted to the officer who had charge of it. Although a large district, with a coast-line of over 180 miles, it had, comparatively, a small population. A sea-faring people frequented the many islands and coral reefs that clustered round the southern lip of the bay. A few small villages were scattered along the coast and up the rivers and creeks of the northern lip. Some forty miles up the bay there was a fairly large tribe, the hereditary owners of extensive limestone caves, from which they collected large and valuable crops of edible birds'-nests.

This constituted the entire native population when the Chartered Company acquired the territory some ten years prior to the time of which I write. Since then several tobacco estates had been started with European capital, and were carrying on operations, employing hundreds of Chinese and Javanese coolies. The government station, my headquarters, was at the head of the bay, nestling under Mount Silam, a great forest-clad cone rising 3000 feet above the sea.

Under the protection of the Chartered Company's government the ubiquitous Chinaman had come to ply his trade, building palm-leaf booths in the villages, and travelling from place to place in a native boat, disposing of his stock of cheap Brummagem and German goods in exchange for gutta-percha, bêche-de-mer, and other natural products of the jungle and coral reef.

The sea-faring people of the islands were Bajows, locally known as 'Sea-gypsies,' the majority of whom were born and spent all their lives in their boats, of which the largest was barely the size of a Loch Fyne herring-boat. They were a turbulent people, having all been—and when opportunity arose still were—

pirates. The inhabitants of the northern lip of the bay were of a similar character, descendants of the once dreaded Ballanini and Illanuns. In former days it had been their practice to make annual raids on the coast of Borneo, circumnavigating the island in large fleets, burning villages, killing the men, and carrying off the women and children to be sold as slaves. Originally they came from the island of Palawan, but intertribal quarrelling had caused some of them to settle on the coast of Borneo. At the time of which I write the numbers of those who had chosen Darvel Bay had dwindled, and the people themselves, owing probably to intermarriage, had deteriorated both physically and morally, the majority of the men being undersized, while their manners were sly and shift. That these people did not welcome the advent of the white man's rule can be understood, and what they resented most were the laws regulating the possession of, and prohibiting the dealing in, slaves. While owners were allowed to retain those who had been in their possession when the Chartered Company took over control, all children born after that were declared free; the slaves themselves had the right to complain if ill-treated, and, if able to find the means, could purchase their freedom.

It is only fair to point out that slavery under these people was very different from what it used to be under the white man in the bad old days. There were different grades of slavery. The *ulan mas*, or slave born in captivity or inherited, was treated very much as one of the family. He was allowed to have property of his own, and even to trade on his own account. Although, in time of stress, he was liable to be called upon to surrender his all to his master, it was an emergency that did not often occur, and, when it did, was never resented, as friends and relatives voluntarily did the same. He was rarely, if ever, sold. Even the newly captured or purchased slave led a life which differed very little from that of his master. He slept in the same house, and had practically the same food. If his raiment consisted of only a waistcloth and an old sarong, it was not a material hardship in a climate where a waistcloth is the most comfortable form of dress. The work required of him was never too onerous, comparing favourably with that of a coolie on a plantation or in the settlements.

III.

At the time of which I write the military forces of the Chartered Company were very small, and a district officer was expected to assert his authority, and to gain and maintain the confidence, respect, and allegiance of the natives by the exertion of his own personal influence, backed up by the very minimum of physical force.

With the real natives of the country I had never experienced any difficulty. With the more turbulent Bajows I knew that if I had not their affection I, at any rate, had their respect; but with the Illanuns and Ballanini I did not seem to make any headway. When I visited their villages the head-men avoided me, the usual excuse being that they were away, in the jungle or on some distant coral reef, collecting produce. When I did meet them, they made a pretence of exaggerated humility. They were never sincere, and the people never came to me with their troubles or to seek advice about their little private worries in the way the other natives were only too prone to do. That their hostility was so acute that they were prepared to attempt extreme measures I was soon to find out.

I had been in the district some little time when I had occasion to visit their country, accompanying an officer who had been detailed to report on the mineral prospects. We were in a large native-built sailing-boat with my usual crew of six Dyak police, and had brought as interpreter the son of a friendly Bajow chief. We had ascended one of the small rivers, and anchored in the stream. Scattered along the banks, on both sides, were Illanun houses, each with its own ill-cared-for garden of bananas, sugar-cane, sweet potatoes, and yams. From the first the people had avoided us, and it was particularly noticeable that the women did not come off to sell their fruit and vegetables to the crew.

Owing to the shallowness of the water we had to leave our boat each day and proceed up-stream in small dugouts.

The third day the interpreter followed us to where we were prospecting, and said he had important news to tell me. He reported that the attitude of the Illanuns had made him so suspicious that, in the hope of ascertaining what they were up to, he had concealed himself at night near the head-man's house, with the result that he had overheard a good deal of the conversation that went on inside. His suspicions were confirmed. It was evident that an attack upon us was being arranged. It was to be a treacherous affair.

So far as he could make out it was to take place when we were leaving, as he heard them speak of felling a tree across the stream to block the passage, and of men being in ambush there; also of boats to guard the mouth of the river, evidently to make sure that no one escaped.

My companion and I agreed that it would be wisest to get away at once. We had let it be known that we should be engaged on our work for a week or ten days, and it was not likely that they would block the stream until the last moment.

Having finished what we were doing, we

returned to the boat. Calling the men together, I told them what the interpreter had discovered, and warned them to go about their duties as though nothing was known. The anchor was hauled in, the boat's head turned down-stream, and, with the men at the sweeps, we set off.

As soon as our departure was noticed there was quite a commotion on shore. Men could be seen running from house to house, a gong was beaten, and women scampered for the jungle. As we proceeded we caught occasional glimpses of dark figures following us along the bank under cover of the bush. My companion and I sat on the deck, our rifles in our hands, watching anxiously as we rounded each bend to see if any obstruction had been placed in the stream; but there was none, and we got out to sea without any interference.

IV.

I reported the affair to headquarters, with the result that a small force of military police were sent into camp on the river for their annual training as a demonstration.

This impressed the natives for a time, but it soon wore off. While I knew that I had not much to fear when with these people so long as I kept on my guard, I had no doubt that if I could be led into a trap, or be taken at a disadvantage, the opportunity would not be lost.

It was some months after the demonstration that, in the course of my rounds, I was paying one of my usual visits to the Illanuns.

There had recently been cases of traders being relieved of their goods while travelling along the coast, under circumstances which pointed to the Illanuns as being the offenders. One victim, a Chinaman, had traded in the district for years. When making his complaint he claimed that he had recognised, and named, certain of the Illanuns as concerned; but when the inquiry was held, he persisted that he had been mistaken, evidently thinking that it was better policy to cut his loss in the hope of retaining a very lucrative trade. Some Malays trading in native tobacco had also been relieved of their goods under similar conditions, but, being comparative strangers, were unable to identify their assailants. Although there was little room for doubt, there was not sufficient evidence to secure a verdict, so I had to content myself with some very straight talk to the chiefs and those present, and we had parted with anything but friendly feelings towards each other.

It was a glorious evening when we set sail for home, with a light but favourable breeze to help us on our way. There was only a slight ripple on the water; the heat of the day was over; and the sun, setting behind the distant cone of Mount Silam, caused a perfect glory of colours to spread across the western sky. Shoals of flying-fish darted out of the water, and, spreading fan-wise, sped just above the surface, their wing-

like fins reflecting iridescent to the colours of the sunset. Garfish, their bodies gleaming silver-white, sprang out from under our bows and ricocheted away at tremendous speed. Gray mullet would hurl themselves high out of the water, a great surge on the water immediately behind them explaining why they left their natural element in such haste. A short distance off a patch of violently broken water marked where a shoal of small fish were being attacked by larger ones, an opportunity that was being made the most of by a crowd of screaming seagulls and frigate birds.

Very soon the breeze died entirely away and the surface of the bay became as smooth as glass, reflecting the colours of the sky, so that the boat seemed to be suspended in the very sunset itself. As the sun slowly dipped farther and farther behind the mountain ranges of the interior the colours changed, or, rather, melted imperceptibly, from crimson and gold to orange and the most delicate of greens; then, concentrating into a great flare of fire in the west, it quickly contracted and went out. Night had come, but not darkness; the moon, already above the horizon, was throwing a broad track of silver across the sea.

We had travelled only a short distance when the wind died down and we had to drop anchor. We lay about a mile off the shore, which was low-lying, with a broad stretch of sandy beach shelving very gradually out to sea, so that where we lay we had less than three fathoms of water under us.

The land breeze soon set in, and we settled down to enjoy the repose and restfulness of what looked like being a perfect night. There were no mosquitoes or other obnoxious insects to worry us. The glaring heat had gone, and the gentle breeze, bringing with it the mingled scents of forest and ocean, was both exhilarating and refreshing, while the lap-lap of the tiny waves against the sides of the boat made a soothing lullaby. Some of the men got out their fishing-lines, and the flapping of finny victims on the deck proclaimed their success. Borne to us across the water, and rendered more musical by the distance, were the rhythmic notes of a native *kulintangan*. Occasionally the raucous cry of a startled Argus pheasant would reach us, its rest in the distant forest disturbed by some prowling night marauder. Large turtles puffed as they came to the surface on their way to the beach.

In the stern of the boat, on the overhanging counter, my boy prepared my dinner, his fire-place a whisky-case filled with earth. In the forepart the Dyaks, having prepared and consumed their evening meal, spread their sleeping-mats and stretched themselves out on the open deck. One crooned a song, improvising, to which the others joined in a set chorus. They all sang in an undertone except when the impro-

viser introduced something which especially pleased them, when they would show their appreciation by adding gusto to the chorus. Under the conditions the effect was not displeasing; but as early to rest and early to rise is the order in those parts, the men gradually dropped off to sleep, and by nine o'clock all was silent.

v.

Somewhere about midnight I was awakened by the tossing of the boat, and on looking out saw that quite a sea was running. The sky was cloudless, and the moon looked brighter than usual. Giving orders to the sleepy Dyaks to pay out more rope to the anchor I turned in again.

With the first streak of daylight we were all up and looking with unmixed feelings of disgust upon a storm-tossed sea, with the wind blowing hard from the direction we wished to go. As the sky was quite clear, it was evident that it was no short-lived squall that we had to face. We could not run back to the river from which we had come, as a long sand-bank, projecting far out to sea, cut us off. There was no break in the shore where we could take shelter, and we could not beat out to sea, as our native-built boat was without keel, and unable to make any sailing to windward.

The day seemed interminable. The wind increased steadily, and with nearly every wave the boat was drenched from stem to stern. There was only one alleviation, which in a colder clime would be unknown—the sea-water was warm, so that, although everything was soon wet through, there was not the misery of cold to contend with.

There was not much sleep that night, and the next morning brought no improvement. There was no sign of the wind going down, and the seas were higher than ever. The boat was beginning to feel the strain, and it was evident that more water was entering than that which came over the top.

Had we been on any other part of the coast I should not have hesitated to run the boat up through the surf. We were all strong swimmers, and should have been able to make our way to the shore. The boat would, of course, be badly damaged, if not entirely wrecked, and we certainly could not take anything with us. In our present case, therefore, even if we could recover most of our belongings when the wind and sea had gone down, we should find ourselves when we landed, unarmed and helpless, at the mercy of the Illanuns, a situation which none of us was anxious to experience. However, it was soon made evident that something had to be done, as more water was entering the boat than we could cope with, and we were in danger of the craft sinking under us. Although having little doubt as to the result, I decided on an attempt to beat out to sea far

enough to enable us to get round the sand-spit, and enter the creek which lay beyond it. Improvising a small sail out of my tartan rug, to help keep her up to the wind, we waited until the ebb had set in, and then, weighing anchor, we got out the sweeps and set off. While the ebb lasted we made a little headway, but it soon became obvious that we could not succeed. Our only remaining hope was that the wind would ease up, and anxiously we watched each slight fluctuation. But it was not to be—our luck was out. The Dyaks struggled manfully at the sweeps, while my 'boy' and I worked incessantly bailing out the water; but with the setting in of the flood-tide we quickly lost all the way we had made, and shortly before sunset were not only back to where we had set out from, but were fast approaching the first line of

great breakers that for nearly a mile crashed shorewards. Come what might, we had to face it now; first the passage through those waters, and then the mercy of the Illanuns. Fortunately there was no time for meditation. The extemporised sail was lowered, and the boat's head turned to the shore. While doing this we very nearly capsized, and we certainly should have, had the Dyaks not been expert boatmen. As it was, every movable article was dislodged from its place. The decking, which was mostly loose boards for convenience in stowing things below, was all washed overboard, and all my possessions and those of the men were hurled together—food, kit, cooking utensils, rifles, and ammunition—under three feet of water in the bottom of the boat.

(Continued on page 679.)

HUMAN HAIR IN COMMERCE.

I.

WHILST passing a hairdresser's shop-window some of my readers may perhaps have glanced coyly at its patent 'indiscretions' and casually wondered whence may have come the luxuriant tresses exhibited therein. Those who have done so will therefore be interested to know that the supply of these aids of art to nature is in the hands of a very few highly-specialised individuals known as 'human hair merchants.' Such an occupation is a profitable one, but cannot be embarked upon with success without a long apprenticeship, because much expert knowledge of markets, qualities, and prices, resulting only from long experience, is requisite.

The human hair merchant must of necessity know all about what may be called the national characteristics of hair. The hair of a Frenchwoman differs in structure from that of an Englishwoman, for example, though to all outward appearance it may seem exactly the same. The hair merchant must be able to take a strand of hair between his fingers and tell simply by touch what country it comes from. Expertness of the kind is not a matter of weeks or months, but of years. Then, of course, he has also to know all there is to learn—and it is much—about hair qualities and values. He will tell you that of all kinds of hair the pure white is the most rare and costly. A very high price can be obtained for a really good head of white hair, the drawback to most white hair offered being its comparative shortness.

The races and nations have varying hair characteristics. Jewish women, for instance, have curly hair in a larger proportion than is found with any other race. It is gratifying to

our sense of patriotism to know that the women of Britain have the best coloured and the finest quality of hair, whilst the Americans are a good second. The Germanic type tends to over-production of straw-coloured tresses. A curious phenomenon is seen in the case of Frenchwomen, whose hair in general seems slowly getting darker and darker. The Swedes have nice light hair, but it is almost invariably distressingly straight. Some of the finest whole heads of hair are found in the mountainous regions of the north of Italy. Right at the bottom of the scale come the Chinese, whose hair is the coarsest and least valuable of any. From time to time scares about the dissemination of various diseases arise in connection with Chinese hair, so it has always to be thoroughly sterilised and used with great discretion, if at all.

II.

The hair merchant handling the best grades of hair to-day draws most of his supplies from Italy and the south of France. In those regions periodical markets are held at which the local dealers buy what is offered and what has been procured by the collectors who tour the best hair-producing regions and cut the hair from the heads of the women and girls in the villages. In some Italian peasant families where there are several girls the hair is looked upon as quite a regular source of income. This periodical shearing of locks has become almost a ceremony. The collector takes up a position in the village market-place and erects a big umbrella with his name on it, and, after a price has been arranged according to the value of each head of hair, the girls take their seat beneath it in succession whilst he plies his shears. Englishwomen rarely offer their hair

for sale; they seem to have some sentimental objection to parting with it, and the Continent has therefore to be the supply-base for the trade. In ante-war times Germany—particularly Saxony and Bavaria—and Russia supplied quantities of the hair used in this country, but it never seriously competed with the French and Italian products, as its shades were often unsuitable for general use, and it had to be dyed before sold.

Usually the hair dealers from the producing countries come over here with their assorted supplies in large sacking bales and call on our merchants, touring the various warehouses in succession. They show what they have got, purchases are made and weighed out on the spot, and payment often follows right away. The visitors are generally inclined to stand out for somewhat exaggerated prices—particularly the Italians, with whom bargaining is an exact science—but they find the merchants here able to hold their own at this game and never eager to pay what is asked. Thus a compromise over prices is the usual result.

III.

When the hair merchant has got his hair he has to deal with it. He knows it as 'raw' hair, and he has to prepare it for sale. Perhaps this is the reason why he sometimes calls himself a 'hair manufacturer,' which seems rather a curious title. The hair he buys from the dealers is known as 'cuttings,' to distinguish it from 'combing,' which latter are sometimes collected and sold, though there is little trade in them in this country. The 'cuttings' are bought graded as regards quality and shade, and the hair merchant's first object is to clean them to get rid of the grease and other foreign matter which may be attached to them. This cleansing is done by washing the hair in hot water and special soap, and much care has to be taken regarding the latter, because, if a soap containing too large a proportion of alkali is used, there is always the risk of some of the 'cuttings' altering their shade a little. When the hair is perfectly clean he proceeds to turn it, that is, he requires to get all the points together and all the root ends together. This is done very curiously by a method which gives results the scientific reason for which nobody in the trade seems able to explain. Hair kept in soapy water for a little time exhibits a very singular phenomenon—the point ends come to the surface while the root ends remain below. The operator, therefore, grips a strand of hair tightly, usually in several separate portions, between his fingers, though other grips are practised, plunges it under water, and moves it to and fro. After about five minutes of such treatment it will be observed that the points begin to rise. When the hair is thought to be successfully 'turned' it is removed from

the water, all the root ends being drawn away with the other hand in a bunch. It is then carefully laid on a table, and a fresh handful of hair is subjected to the same process. After the hair so treated has been dried it is drawn through hackles and arranged in approximate lengths. It is then tied together at the root ends, in which state it is said to be 'clubbed.'

IV.

Possibly the hair merchant may have bought some hair of a shade which he desires to change to another colour. He is skilled in the use of dyes and mordants, and can change light colours to dark with little trouble. The process of changing dark hair to a light shade is more difficult, however, as the hair will first have to be bleached and then coloured again, which is not always easy to do accurately. Still there is a good deal of 'faking' which takes place, and much of the hair so treated is used for mixing purposes, that is to say, it is worked in with natural colours and sold under the description of the latter by merchants who are not too scrupulous. The expert will easily detect such tricks, but there are some ladies' hairdressers who have not enough knowledge to be able to say whether the colour is natural or not.

Natural wavy hair fetches a higher price than other hair, and is much sought after in the trade. It may cost up to 160s. the pound, but much of what is sold as 'natural wavy' can be made artificially. *Frisure forcée* it is called when straight hair is made curly or wavy. To get this effect wooden sticks of willow, or glass sticks somewhat in the shape of an exaggerated but very thin hour-glass, have the hair wound round them tightly, beginning at the point ends, and the root ends are finally firmly secured to the stick. The sticks are then boiled in water for a period which may vary from one to three hours. After this boiling the hair is dried in a very hot oven. It is then wound round the sticks again, but reversed, the root ends being first this time. Boiled and dried once again, the hair when removed will be found to have a permanent wave or curl. The process flattens the almost spherical hairshaft and causes it to lean inwards. It was this process that gave to the inventor of permanent waving the idea which is made so much use of to-day for waving hair on the living head by means of electricity. Permanent waving is nothing but a modification of the principles which result in *frisure forcée* being obtained. The hair is wound tightly round a metal curler, moistened by some more or less secret liquid containing a borax preparation or an oil, and subjected to the heating action of the electrical current whilst encased in a cylindrical heater. The action of the steam induced and the baking of the hair combine to form the so-called permanent wave.

V.

As previously mentioned, the hair merchants in this country do but little trade in combings, but sometimes they will receive from a hairdresser a parcel of a lady's own combings which it is desired to make up into a switch or tail of hair. The hair merchant will undertake this work, because he usually has a staff of skilled hair-workers who will make up wigs, scalpettes, &c., to measurements and shades of hair desired. Combings are not without their value, though this is nothing like that of cut hair. This is because they are dead and lack the silky gloss of the healthy living hair, whilst there is always a very great deal of waste in treating them, as from three pounds of combings it is possible on an average to obtain only about one pound of the commercial article. However, in continental countries women keep their combings until they have collected a sufficient quantity to sell. Here combings seem usually to be thrown away, and it is safe to say that every year many thousands of pounds' worth find a

resting-place in the dustbin. The more combings kept and brought into use the less would be the demand for cut hair.

The importance of this trade will be better appreciated when it is mentioned that in pre-war days the value of the 'cuttings' collected and sold in Italy alone each year was approximately £120,000, whilst Germany and France had even larger markets, with the figure of about £200,000 each.

In conclusion, it may be set down that what the hair merchant most desires to obtain are pale, pure, clear colours. Neither golden nor black hair is worth very much to him, because he can produce as much hair of these shades as he is likely to require by the respective uses of peroxide of hydrogen and dyes. If you talk to the average hair merchant he will lament the days that are gone, and it is certain that his trade is not now what it once was. The bobbed hair vogue and the simple styles of hairdressing of to-day have restricted the use of 'false' hair greatly, and sales are undoubtedly very much less than they were in 1914 and the preceding years.

THE PHANTOM SHIP.

By ROLF BENNETT.

PART I.

I.

JOHN MARKS, chief mate of the *Harpenden*, sat on the edge of his bunk trying to pull on a refractory sea-boot and swearing under his breath. Apart from the trouble he was having with his boots, there were others. For instance, he was not on the best of terms with the skipper, having been ill-advised enough to protest when the latter, during the height of an easterly gale, had shut himself up in his cabin with a bottle of rum. And now, to make matters worse, the *Harpenden*, having run her 'easting' from Sydney, had hit a gale which threatened to equal anything in the way of weather which these latitudes could produce.

He had pulled on the second boot and was stamping it well home, when the cabin door opened to admit a man clad in dripping oilskins.

'By the powers, it's cold!' exclaimed the newcomer, blowing on his fingers and at the same time executing a double-shuffle in his sea-boots. 'Oh, mommer, but it's cold!'

'And leaving the door open won't make it any warmer,' growled Marks, shivering as an icy blast swept in.

'Sorry, old bird,' said the other, giving the door a kick. 'But as you're turning out, I thought you'd like to get used to it by degrees.'

The chief mate grunted, wound a woollen muffler round his neck, and then donned an oilskin jacket and a sou'-wester.

'Any ice about yet, Sims?' he inquired.

'I've not seen any.'

II.

Marks drew on a pair of woollen gauntlets and stepped out on deck, where a gust of ice-laden wind nearly took his breath away. It was pitch-dark, the decks were slippery with ice, and squalls of powdery snow, hard and stinging, swept through the rigging. The mate stopped for a moment near the wheel and looked at the compass.

'Captain on deck?' he inquired of the quartermaster.

'No, sir,' answered the man.

With a contemptuous shrug of the shoulders Marks fought his way forward through the driving snow to the knight-heads, where he took up his position to watch for ice. There he remained throughout the watch, continually drenched by the clouds of spray that swept over the bows, his face raw with the biting, knife-edged wind, his hands and feet so benumbed that they had lost all feeling. Added to the physical was the mental strain of peering into the darkness in an effort to discern suspected but invisible shapes, for he well knew that a moment's lack of vigilance might mean

sudden and complete disaster. It was small wonder, therefore, that when Marks came off watch just as dawn was breaking his nerves were on edge, and that the sight of the skipper, fresh from his warm, comfortable cabin, filled him with savage resentment.

'Good-morning, Marks,' said the elder man, with a geniality that owed something to stimulants. 'Been a pretty rough night, eh?'

'Yes, sir, for those who were out in it,' answered the mate.

Captain Quinn's face darkened. 'What d' you mean by that, Mr Marks?' he blustered.

Before the other had time to reply there came a shout from the look-out. 'Ship on the star-board bow!'

Both men turned and gazed in the direction indicated. For a moment they could see nothing, and then through the curtain of driving wet mist they caught a fleeting glimpse of what, had they been put upon oath, they would have hesitated to declare was a ship. It was more like a wraith—an intangible, swiftly-moving shadow, or a fragment of mist contorted by the wind into a semblance of masts and sails. And it dissolved and vanished before their eyes, just as mist might do.

'Now was that a ship or wasn't it?' demanded the skipper.

'It looked more like a cloud reflection to me, sir,' answered the mate. 'But if it is a ship, we ought to sight her again as soon as these squalls pass.'

He turned away, anxious to change out of his frozen garments and crawl into the warm bunk that awaited him. But as he was leaving the skipper gripped him by the arm. 'There she is again!'

This time, however, Marks could see nothing save jagged masses of low-trailing cloud torn into fantastic and ever-changing shapes. 'No ship there,' he said. 'It's just an atmospheric effect. In these latitudes——'

'I know all about these latitudes,' broke in the other irritably. 'You don't need to lecture me on them. I say that was a ship.'

'Have it your own way, sir,' replied Marks, and, leaving the captain still staring into the gray murk, he sought the cabin where the second mate lay snoring peacefully in the lower bunk.

'Now then, Sims, show a leg!' he bawled.

Sims opened his eyes and groaned. 'Oh Lord, is it my watch again?'

'Yes, it is, and you'd better look nippy. The old man's on deck, and he's in a rotten temper.'

'A bit peeved, I take it,' remarked the second, as he climbed out of his bunk. 'What's it like outside?'

'About as beastly as it can be. I sighted an iceberg this morning, so keep a bright look-out.'

'We'll be right among the ice soon if I know anything about the jolly old Horn,' said Sims, struggling into his oilers.

'I say,' called Marks, as the other was about to open the door, 'the look-out reported a ship on the starboard bow just now, and the old man and I both thought we saw it. But she disappeared so suddenly that I'm inclined to think it was an optical illusion or something of that sort.'

'Perhaps it's the *Cape Dutchman*,' laughed Sims. 'I'll keep an eye lifted.' And he went out, leaving the mate to snuggle down gratefully under the warm blankets.

III.

During the morning the mysterious ship was seen by several persons. Some said she was under storm canvas, others that she was scudding under bare poles; and one man, more imaginative than the rest, declared that she was under full sail, with every stitch of canvas set, despite the gale. The older members of the crew began to look grave, and to whisper half-forgotten stories of phantom ships and other presages of evil. The younger men, though they pretended to laugh at these tales, did so uneasily, and with many a sidelong glance in the direction where the strange craft had last been sighted.

'She's the *Cape Dutchman*; that's what she is,' declared the carpenter, who, with two or three other privileged individuals, was sitting in the cuddy.

'Ah, come off it, Chips, you and your *Cape Dutchman*. She cruises off the Cape of Good Hope, not the Horn,' said the bos'n's mate, who rather prided himself on being a sceptic.

'Good Hope or the Horn, what's the odds?' demanded the carpenter. 'She ain't bound to stick in one latitude. She goes where the devil sends her—as a warning. She's been seen off Cape Race and in the China seas, and on the same day, too. What about the *Welsh Bard*? Didn't she sight the *Dutchman* in the Pacific, twenty north of the line, and didn't she foundered with all hands? Tell me that.'

'But if she foundered with all hands, how did you come to know that she sighted the *Dutchman*?' asked the bos'n's mate.

'I ain't going to argy with you,' replied the carpenter, rising majestically from the locker; 'you're too young. When you've been at sea a bit longer you'll know more; that is, if you ever live to see another trip, which I doubt. The *Dutchman* don't happen along for nothing, you can take my word for it.' And leaving his adversary to make what he liked of this, he left the cuddy.

But even among the younger members of the crew a feeling of dread began to manifest itself. They had no heart for their work, and, when unobserved by the officers, gathered in little

groups to exchange furtive whispers, their eyes strained to catch sight of the wraith. In the foc's'le the watch below listened, awe-stricken, to grisly yarns of omen ships and spectres of the sea. It was pointed out that many and many a good ship had vanished suddenly and mysteriously when off the Horn, and in fair weather as well as foul.

When Marks came on deck he noticed the crew's attitude, and at once guessed the cause. If, he reflected bitterly, the captain had been worth his salt he would have stirred the men up, set them on some heavy job, and seen that they did it, briskly too. But the mischief was done now; all hands were obsessed by a sense of foreboding, and their energy was sapped. This was the way mutinies were bred. Presently he sent a message to the captain suggesting the advisability of still further shortening sail. A few moments later Captain Quinn staggered onto the poop, his face flushed, and his eyes bleared with drink.

'What's the matter now, Mr Marks?' he demanded thickly.

The mate repeated his suggestion.

'Take in sail! What in blazes for?' roared the other. 'She can carry every stitch she's got, and more. More, d'you hear? You're not mate of a Thames barge now.'

Marks flushed at the insult, but quietly pointed out that if they did not shorten sail now it might presently be too late.

'When I want to be told how to sail my ship I'll come to you, Mr Marks,' sneered the skipper. 'Meanwhile, we'll carry on as we are. If the weather freshens, send for me, and I'll say what's to be done.'

Marks, realising the hopelessness of the situation, was leaving the poop when he happened to glance to windward. Through the mist and eddying spindrift he once more caught sight of the strange ship. He had no doubt about it this time, and was even able to make out several details, such as her being under close-reefed fore-and-main courses and jib, though the jib hal-yards had gone, and the canvas hung in loose folds over the bowsprit. Then the vaporous clouds hid her from view again, and he turned away to find a group of men, who should have been at work, lounging under the lee of the foc's'le, and evidently discussing the 'spectre.' He realised what that meant, and knew he must act promptly.

'Hi, you bunch of idle, ill-conditioned swabs, get to work! Rouse about, or I'll set to and massacre the lot of you!' he yelled.

When the mate used what the men called his 'topsail-yard-ahoy voice' they knew he meant business. But though they resumed their tasks, it was with an ill grace and sullen looks. Marks explained the gravity of the situation to Sims when the latter came on deck to relieve him. The second mate looked doubtful. The

crew of the *Harpenden* were admittedly a rough crowd, shipped in haste from the water-front in San Francisco, and he was not used to handling their kind. The other saw his misgiving.

'If there's any trouble, send for me,' he said. 'I'm reckoned pretty handy with a belaying-pin.'

IV.

Some two hours later Marks was awakened from a sound sleep by a terrific jolt, which very nearly threw him out of his bunk. Hastily clawing on his sea-boots he rushed on deck, to find the bos'n and several hands struggling with a confusion of rebellious, flapping canvas and broken gear on the foc's'le-head.

'Hit a berg,' Sims shouted in his ear. 'Sheered off all right, but smashed the bowsprit.'

Marks thrust him aside. 'All hands on deck!' he yelled, and as the first man appeared, sullen and reluctant, he promptly knocked him down as an example to the others.

'Get a move on; hump around, you dogs!' he roared, and as some of the men seemed inclined to disobey, Marks snatched at a belaying-pin, and slipped inside the foc's'le.

One determined man can often rule a crowd that is hesitating, and this proved to be the case now. The belaying-pin lashed out, two men went down, and the rest scuttled out of the foc's'le with astonishing celerity. In a jiffy they were aloft taking in sail, and while the wreckage was being cleared away, the foremast and fore-and-main topmasts were made as secure as conditions permitted. While this was being done the mate went below and found Captain Quinn struggling ineffectually to get into his oilers.

'Much damage done, Marks?' he inquired.

'Shaved an iceberg and left the bowsprit behind, sir.'

The captain suddenly burst into one of those uncontrollable fits of rage which invariably accompanied his drinking bouts. 'Then why in blazes wasn't I sent for?' he bellowed, bringing his fist down with a crash on the cabin table. 'Why wasn't I told? I won't be treated like a cipher on my own ship. No, by thunder, I won't! D'you hear me, Mr Marks? You're not skipper yet, though you carry on as though you thought you were.'

'There was no time to send messages, sir, and——'

'And you thought I wasn't to be trusted on deck, eh? That was your notion, wasn't it? Well, I'll put up with your infernal impudence no longer. To-morrow you can go for'ard with the men. You're disgraced, see? I'll show you who's skipper aboard this packet, my lad. Got that, have you?'

'Yes, sir.'

'Right. And now you can clear out.'

As Marks was leaving the cabin the captain called after him, 'You'll leave this ship as soon

as we reach Liverpool. And it won't be my fault if you get another job.'

v.

The next morning Marks removed his gear to the foc's'le, and Sims was promoted to mate. The disgraced man knew that his career as a sea officer was at an end; that he was, in fact, ruined. No company worth serving with would employ an officer who had been degraded at sea for insolence and insubordination—as, without doubt, the captain would affirm in his report. And, since he had no other profession, he could look forward to spending the rest of his days before the mast.

He was helping to rig a spare topmast as a jury bowsprit, when he heard the look-out report a ship to starboard. It was the mystery ship again, and this time she was much closer—so close that Marks could see a Union Jack flying upside down. He noticed, too, that the fore course had been torn to ribbons, and that the ship herself seemed completely out of control. Captain Quinn also had noticed these things, particularly the signal of distress, and it annoyed him. For, although the ship appeared to be deserted, there was just the chance that she might not be. Supposing she were not, if it came out afterwards that he had passed without investigating, unpleasant things might be said, and awkward questions asked. 'What do you make of her, Mr Sims?' he inquired.

'Looks to me as if she'd been abandoned, sir,' answered the new mate. Then, seeing the other's reluctance, he added, 'You might safely call for volunteers to board her, sir. You're not likely to get any, for all hands swear she's the *Flying Dutchman*.'

'That's the most sensible remark I've heard this voyage, Sims,' exclaimed the skipper, seeing his way out of the difficulty. 'I certainly can't force the men to risk their lives against their will.'

He stepped up to the poop-rail, and, pointing to the derelict, called for volunteers to board her.

There was silence for a moment, and then a voice said, 'I will.' It was Marks, who had just come off the foc's'le-head.

Captain Quinn frowned at first, but, as he gazed at the man he hated, a look of cunning satisfaction appeared on his face. 'Any more?'

The bos'n stepped forward. 'I'll go, sir.'

No one else volunteered, but eventually the bos'n persuaded two of the younger men to come. The others, still held by superstitious terror, would as soon have jumped into the mouth of a live volcano as ventured aboard the ghostly ship.

After much difficulty and no little risk a boat was lowered on the lee-quarter, and got away without being smashed to splinters against the ship's side. As they pulled away, Marks,

who was at the tiller, called to Captain Quinn on the poop of the *Harpender*, 'Give us all the lee you can, sir, please!'

The captain made no reply audible to those in the boat, but his lips moved. 'If this is the last I see of you, Mr Marks, it won't worry me any,' he had muttered.

(Continued on page 676.)

WHERE THE GUMS AND WATTLES GROW.

O the joy and rest and sweetness, O the full and glad completeness

Of a south-wind summer day spent where the gums and wattles grow;

With a blue-flecked sky above me, and a breeze that seems to love me,

So persistently it kisses me on lips, and hair, and brow!

O the many tuneful voices of a morning that rejoices

When the sun has newly risen on such fair and beauteous scene,

As though day had fled with laughter from the night hard following after

And, triumphant, donned her brightest robes of golden, dewy sheen!

O the splendour of the noontide, and the beauty of the hillside,

With its wide expanse of country; and the mountains stretching far,

In the sunset purple glowing; while the river, quiet flowing,

Lies across the verdant valley like a silver gleaming bar!

And I joyously surrender self to Nature's mood so tender,

As I lie upon the grass and watch the distant mountains grand:

There come o'er my spirit stealing harmonies of God's revealing,

While I listen in the silence sweet of this enchanted land.

Now the day wanes slowly, slowly, and the cattle patient, lowly,

Slow wend along the shadowed roads their sleepy, plodding way;

And the stately, leafy trees bow beneath the evening breeze,

As they hear the passing footsteps of that lovely summer day.

But my tongue and pen must falter as I gaze upon that altar

Where Nature kneels in twilight hour to say her evening prayer,

All gorgeous in her robes of gold, while purple mists the hills enfold,

And hushed the rustle of the leaves, and calm and still the air.

O the joy and rest and sweetness, O the full and glad completeness

Of a south-wind summer day spent where the mountain breezes blow;

O the pure exhilaration, O the wondrous inspiration

Of God's radiant, beauteous sunshine where the gums and wattles grow!

MARION DOWNES.

Chambers's Journal

SEVENTH SERIES

PILCHARDS.

By C. K. C. ANDREW.

I.

"Pilchards is like wimmin: when they'm bad they'm a'ful, and when they'm good they'm only middlin'."

THIS saying, which is now so often thrown at one upon mention of the fish in question, no doubt originated from the tongue of some hen-pecked old Cornish fisherman of a past generation who was tired of eating salt pilchards at every meal. For in days gone by all the West Country seems to have lived largely upon these estimable fish preserved in salt, which, when required for use, were simply given a preparatory soaking in fresh water and boiled up with potatoes *en robe de chambre*, as the Frenchman says.

'Pilchards-and-Potatoes' was the Cornish peasant's meal at breakfast, dinner, and tea for centuries, and doubtless some Cornishmen became heartily sick of the fish, as one may of any article of diet that is permitted to become monotonous; but it is a thousand pities that such wide publicity should have been given to a disgruntled old man's ill-considered condemnation of a fish that has so much to recommend it as a food.

Its name has become indissolubly associated with that of Cornwall by the usage of centuries. Before the era of written histories, visiting foreigners praised the Cornishman's ability as a fisherman, and we may perhaps be permitted to imagine that the object of that dusky fisher's pursuit in his wicker coracle was this same representative of the herring tribe, which Linnæus has named *Clupea pilchardus*.

Down the ages, the pilchard has come to be regarded in England as an exclusively Cornish fish. In the writings of the 'popular authors' of the last three hundred years it is possible to find a succession of accounts, more or less extensive, of the Cornish peculiar—the capture of vast numbers of pilchards by means of seine nets. The pilchard seine fishery very closely resembled the present-day mackerel seining, save that the former was on a considerably larger scale, and where the mackerel-seiner may catch only thousands, the old-time pilchard fisher obtained millions.* After a

successful 'shot,' when the ends of the net had been sewn together, the seine was sometimes secured by anchors at a number of points and allowed to remain in the sea for several days, while the fish were gradually removed as convenient. When brought on shore, the fish were shovelled from boats to barrows, and thus conveyed to a salting-house, where, on a stone floor, with a slope and drain to a central pit, they were 'bulked' into piles some 6 feet high and 20 feet long, in alternate layers of salt and neatly arranged fish, head to tail.

The fish remained 'in bulk' for about a month, while a considerable volume of oil, which was and is commercially valuable, drained into the pit. At the end of that time 'bulk was broken,' the salt being preserved; the fish were washed, packed into barrels, and there pressed, an additional amount of oil being obtained through holes in the bottoms of the casks, after which they were headed up and awaited shipment to the Latin countries of Southern Europe.

This procedure is, in all essentials save two, followed out to the present day along the whole Cornish coast. The exceptions are, that the pilchards are now taken almost exclusively in drift-nets, and that, instead of being bulked in piles on a flat surface, they are now placed in cemented pits.

A pit measures perhaps 10 or 12 feet square by 20 feet in depth, and is sunk in the floor of the curing-house. At its brink is placed a wooden platform, upon which stand two stalwart fellows armed with wooden shovels. Behind them rises a mountain of coarse Spanish salt (brought, even in these days, by sailing vessels); on to the platform before them, two maunfuls at a time, the pilchards are tipped out of the baskets in which they are carried from the boats. Four great shovelfuls of salt are thrown on the fish; the heap is turned over and over with the shovels until thoroughly mixed, and then, with two long effortless strokes, shot into the pit. This goes on, hour after hour, until the pit is completely filled. It is a striking contemplation to regard an empty pit, vast and cavernous, and another beside it brimming with its mixture of fish and harsh granules of salt—to recollect that there are ten, twenty, or

* It was no unexampled 'record' for 1,000,000, or even 2,000,000, fish to be taken at one enclosure.

more such pits in every small town. It brings to the mind an appreciation of the quantity of fish available, from this source alone, to feed our people should need be.

To the uninitiated it should be mentioned that in these processes, whether ancient or modern, there is no question of gutting or cleaning the fish. This circumstance, of course, is not one to recommend the product to an English palate; but, in fact, there is surprisingly little that is objectionable in the abdominal cavity of the pilchard at the time of year when these fish are taken, and the omission causes no offence when the curing is completed. The foreigner, so a Cornishman will tell you, 'prefers 'em wi' the guts in,' and one is told, as an instance of Continental depravity, that a French luggerman, eating a fresh mackerel, will devour the fish entire, with the bare exception of the head and the tail.

The fish that were formerly used to such an enormous extent in this part of England—and still are, to a very considerable degree—for domestic consumption, were (and are) generally cured at home by the consumers, and, of course, gutted and dressed first.

A number of devices are employed to preserve them, but the commonest is simple salting in large stone jars called 'kieves' and 'steins,' after which they are used as described in the first paragraph. Some housewives employ bay leaves, vinegar, butter, cloves, lard, and a variety of other agents, but the details of these epicurean contrivances cannot be dealt with here.

Mention must not be omitted of the fact that formerly pilchards were smoked in great quantities, and, being described by the Latins as 'Fumades' and 'Fumados,' soon acquired from the Cornish the corrupted nickname of 'Fair-maids.'

The smoked pilchard is no longer to be met with, but some fishermen still apply the name to the fish in general.

II.

At this point the reader will probably inquire, in best judicial style: 'What is a pilchard?'

The pilchard is a member of the herring family, and resembles his better-known cousin in many respects. He is shorter, though not so much as is sometimes stated—the adult pilchard is from 8 to 11 inches long, and British herrings are rarely more than a little over 12 inches; he has a body less deep and more rounded in form than that of the herring. In colour, his back appears a deep olive-green (easily distinguished from the herring's blue), and his sides and belly silvery. He has, however, a covering of scales which, although very easily detachable, are larger than those of any other British specimen of his kind, and

much stouter than those of the herring; and when this armour is removed, the skin of his back is revealed as a dull blue, not so very dissimilar from that of his much-kippered relative.

The distinction between pilchard and herring is quickly learnt by familiarity, but cannot be explained with great force in words. There is, however, one feature which clearly distinguishes the two fish: on the gill-covers of a pilchard will be observed a series of fine lines, or creases, radiating fanwise, backward and downward from the edge of the eye, while in the herring no mark will be found but a few slight protuberances of a rounded form.

Visitors to the Duchy are always told by the fishermen to pick up a fish of each kind by the dorsal fin and observe how the body hangs. In the herring this fin is midway between snout and tail, causing the head to hang lower than the tail; while in the pilchard it is nearer to the snout, so that the body balances in a horizontal position.

The pilchard ranges from Madeira to the southern coasts of Ireland, and is found in the Mediterranean, though it is there a smaller fish when mature.

This fish, like the mackerel, appears to spend the coldest part of the winter in the ocean depths. It is known to spawn in deep water at the mouth of the Channel from June onward, though the old-time seining inshore did not reach its height until August or September. This latter appearance is now slight, and little seining for pilchards is done in any part of Cornwall; though that this does not necessarily mean the permanent abolition of Cornwall's picturesque old practice is evidenced by the fact that, until they reappeared in 1883, nothing had been seen of pilchards on the west coast of Ireland for two hundred years. The fish, like others, is subject to vagaries of conduct which do not at first appear to be in accordance with rule, and it is only possible, therefore, in such respects, to give indications of a somewhat elastic nature.

The pilchard shoals out at sea, which supply the drift-net fishery, are most numerous in late August or September, and remain on the coast until about Christmas, after which they are found rarely, and at too great a distance from land.

In general, pilchards are never looked for east of the longitude of Start Point; but one still hears the story of a Cornish fisherman of the old time who, returning through the Strait of Dover from a circular voyage in pursuit of the herring, found a 'skole' of pilchards 'stoiting' off the North Foreland, and how it 'made him feel he were home before 'un were half-way.'

A pilchard shoal on the surface, or near it, produces a curious reddish tinge in the water.

This is also caused by a herring shoal; but as the latter is less often seen at the surface, the sign has come to be regarded as a peculiarity of the pilchard.

These shoals travel through the sea at a considerable speed, and in a manner that can only be likened to the advance of a well-disciplined army, so steady, so resistless does it seem, so closely massed the ranks. It is quite stirring, on a calm night at sea, miles from land, to hear the thrashing roar of the advancing shoal rise from a distant whisper, and die away again as it passes on.

A straight-stretched fleet of nets in the sea often shows very clearly from above by a semi-circular curve in the line of buoys, where it has been struck by a heavy shoal.

III.

The pilchard is a fish that should be sampled by every person in this country—more particularly at the present time, when the European market has been adversely affected by protective duties levied upon imported fish by the countries concerned. The Englishman should now be induced to give the pilchard a fair trial—if it is only to help his deserving fellow-countrymen. There is no shadow of reason why the fresh pilchard, once the demand were instituted, should not become as popular a table fish as the sole. Its flavour is admirable; its flesh is firm and attractive; it is rich and nourishing in the highest degree. And yet this excellent little fish cannot find an English market under its proper name, and must be sold at the rate of ten shillings for 1260, to be salted and packed for export.

The expression 'proper name' is used advisedly, for the pilchard is, of course, identical with the 'sardine.' Many people still believe that the sardine is, in some subtle way, different from the pilchard, and that in insisting upon sardines from the Morbihan, from Finistère, or from Marseilles, they display great perspicacity and obtain 'the genuine article'; but there is, in fact, no slightest foundation for this assumption.

The sardine of France is no more than the yearling of the identical fish that visits the south-western extremities of our islands, and that of the Mediterranean is actually inferior to our Cornish fish. The Frenchman uses specially small-meshed nets to capture his sardines for canning, which the Cornishman does not imitate for one very good reason: he has no reason to suppose that if he went to the additional expense he would be able to sell his catch at all. The small pilchards visit our shores, and if England gave definite expression to a desire for a home product, and promise of a market, enough English sardines could be prepared in the short season to supply the country with table dainties for the whole year.

As long ago as 1875 a company was formed to prepare Cornish sardines in imitation of the French, and numerous efforts have been made since—some of the ventures, in fact, are still alive—but, generally speaking, they have failed because the length of the season does not enable a factory which deals only with this one fish to run all the year round, and because of indifference or bias on the part of the public.

The writer is, however, less concerned with the little canned fish generally recognised under the name of *sardine* than with the prospects of the fresh adult pilchard in the market.

The fact that this fish has for centuries been thus neglected, either because of ignorance, apathy, groundless prejudice, or because of a foolish apothegm, is not at all creditable to the Englishman's proverbial character for sound common-sense.

Originally, of course, owing to the inaccessibility of this part of the country, none but the salted fish could be offered to Midland towns, but this obstacle has long since disappeared.

It is said by the quayside fish-buyers that pilchards sent to inland markets are not at all well received. It is a fact that, owing to their somewhat dull coloration, the fish are not quite so brightly fresh-looking, even when taken from the sea, as others, and, moreover, this dingy appearance is intensified by being kept for a few days. The flesh, however, remains unexceptionable, and housewives should learn that, in the case of the pilchard, appearance is no index to quality.

Of the unduly biased, who rejects the pilchard without a fair trial, or determines to dislike it at the first mouthful, the writer would ask that he try to carry his mind back to the first occasion when he tasted oysters—caviare—olives—anchovies, and many other delicacies that to the adult palate offer the greatest gastronomic pleasure, and consider whether he was inclined to favour such articles by mere hearsay, or whether he really enjoyed his first experience. Not that pilchards need such arguments; the majority of those who taste them for the first time vote them excellent at once, and a vast improvement upon fresh herrings.

This has been written with entirely disinterested motives by one who, coming to Cornwall first from the North Midlands, was and has since remained completely mystified, and somewhat irritated, by the utter lack of interest shown by the country generally in a delightful and valuable article of food which is thus available for the delectation of all classes at a price that would defeat most competition, and which, for lack of a home market, and by reason of a protected foreign market, may shortly cease to be worth the fisherman's while to catch at all.

The fresh pilchard went all over the country

during the War, and was evidently appreciated then; but because it was offered as though *faute de mieux*, instead of as a delicacy, the people have failed to remember it and demand its continued supply.

Let Britons cultivate a taste for pilchards to-day, and a brave, honest, and hard-working set of men will profit, Britain will have another home food supply, and a reproach to our national character will be removed!

THE PHANTOM SHIP.

PART II.

VI.

MARKS found that it was all he could do to keep his boat head-on to the rollers, for, although the wind had abated somewhat, there was a very heavy sea running. Once, when the haze drifted down upon them, he lost sight of both the ships. When it had passed he glanced over his shoulder, and it struck him that Captain Quinn was not trying to assist them by manœuvring to windward. But the mist swept down once more, blotting out the *Harpenden*, and Marks, though he knew it not, had looked upon her for the last time.

As they came up with the derelict, and passed under her counter in order to get to leeward, they saw on her stern the legend, *Queen Bess, London*. They sheered up under her lee-quarter, and Marks succeeded in catching hold of some loose tackle that was swinging overboard. 'Stand by to board her as soon as I give the word,' he ordered.

He waited until the lee-rail swung down upon them. 'Now for it!'

With one accord they scrambled over the rail, one of the men holding the boat's painter between his teeth, and all alighted safely on deck.

The first thing they saw was a pair of booted feet projecting from under a tarpaulin on the after-hatch. Marks drew the tarpaulin aside, revealing a dead man with terrible wounds on his head and face. 'Murdered!' he ejaculated.

The decks, he noticed, were littered with loose and damaged gear, probably the result of the storm. But there were other things—a couple of sheath-knives, one with a broken blade; a biscuit-barrel, with smashed staves; a water-breaker; and odds and ends of clothing. A sea-chest, with the lid battered in, slithered about in the water which had collected in the lee-scuppers. All the boats had gone, and everything pointed to the ship having been abandoned in mad haste by a panic-stricken and demoralised crew.

'Bos'n, get aft and secure the tiller, or we shall be drifting into some iceberg,' said Marks.

He then went forward to investigate the foc's'le, and was again joined by the bos'n. 'Will you step aft, sir?' said the latter breathlessly. 'There's a dead woman on the poop; leastways, she looks to be dead.'

'A woman!' ejaculated Marks, as he followed the bos'n.

'Yes, sir; she must have been steering, for she was right under the wheel. We got her out and laid her on the deck.'

They mounted to the poop, and Marks saw the body of a girl, clad in oilskin-jacket and sou'-wester. One of the men, who had been bending over her as he approached, stood up. 'It's my belief she's still alive, sir,' he said.

Marks knelt down, and soon assured himself that this was the case. The girl had swooned. 'Dash some water in her face,' he ordered, and then dived down into the cabin in the hope of finding some stimulant that might restore animation if the water failed. He found a bottle of brandy in a locker, and returned on deck, where the girl was still lying white and motionless.

'All right, bos'n, we'll try this,' said Marks, and soon succeeded in forcing a little of the spirit between the clenched teeth. For a while nothing happened, then the girl's face began to look a shade less deathly, and she slowly opened her eyes. 'There, there, you're all right now,' said Marks soothingly, as though addressing a hurt child.

'Who—who are you?' whispered the girl faintly.

'I am'—he was going to say 'an officer,' but suddenly remembered that this was no longer true—'I'm from a British ship, and came aboard on seeing your distress-signal. And now,' he added, 'I'm going to take you below out of the cold and wet. You must be nearly frozen.'

VII.

As he picked her up in his arms, it was borne in upon him that she was beautiful. Her eyes were of the colour of dark amber, with long, golden lashes and delicately pencilled brows. The lines of her chin were firm, but her face was redeemed from hardness by the soft eyes and the small mouth, with its subtle suggestion of tenderness; her hair, straying from beneath the sou'-wester, was a rich chestnut-brown. Who was she, he wondered, and how came she to be alone on this deserted ship?—a frail slip of a girl who might be twenty, but certainly did not look it. However, this was not the time to indulge in unprofitable speculations, and having

taken her below, he laid her in a bunk and returned on deck to help the bos'n take soundings and try the pumps. They found no sign of a leak, nor was there any undue accumulation of water.

'This here's a mystery to me, sir, and that's a fact,' commented the bos'n. 'Bar the damage to the gear, she looks to be as seaworthy a hooker as ever I stepped aboard. I make nothing of it, sir.'

'We'll learn something as soon as the young lady's fit to talk,' answered Marks. 'Meanwhile we must try to get the ship into some sort of trim. If the mist holds, it may be days before we sight the *Harpenden*, and we don't want to go drifting into the ice.'

They took in the damaged sails, set fresh canvas, and then started to clear up the decks. The dead man was hastily sewn up in his tarpaulin shroud with weights at the feet. Marks repeated what he could remember of the burial service, and the body was reverently lowered over the side. Soon afterwards Marks was startled by hearing the girl's voice, and, turning, saw her standing beside him, still clad in oilskin jacket and sou'-wester.

'You must have risked your life in coming aboard in this sea. I—I want to thank you,' she said brokenly.

Somewhat embarrassed, Marks replied airily that it was all in the day's work. 'I'd better introduce myself,' he went on. 'I am—or rather, I was—mate of the British ship *Harpenden*, which is, or should be, just to windward of us. Having been disrated, I am now only an A.B., and the bos'n here is the real person in authority.'

The bos'n stepped forward. 'Excuse me, sir,' he said, 'but while we're on this packet you're the mate or the skipper, whichever it may be. I can't navigate, and it's no use pretending,' and he ambled off before Marks could reply.

VIII.

'I think,' said Marks, after an embarrassed silence, 'that if you feel up to it, you'd better tell me how this ship came to be abandoned.'

The girl proceeded to tell her story. It appeared that she had been on her way home from Australia with her uncle, the captain of the *Queen Bess*. They left Melbourne for Tocopilla much undermanned, owing to an outbreak of sickness in the port; and at Tocopilla, where they loaded nitrate, the captain had to collect a crew as best he could. The men were of various nationalities, and started to give trouble soon after they sailed. Just before reaching the Horn the *Queen Bess* encountered a terrific easterly gale, and one night the captain was washed overboard and lost. Shortly afterwards a whisper went round that the ship had sprung a leak, and, notwithstanding the denials of the

officers, the crew became panic-stricken and made a wild stampede for the boats, in trying to check which the second mate was knocked overboard. The first mate also tried to stop the panic, and was threatening the mob with his revolver when one of the men sprang at him with a crowbar, and he went down. Apparently at this juncture the girl, watching the scene from behind a deck-house, had fainted.

'When I opened my eyes,' she went on, 'the moon was shining. The ghostly silence terrified me. Presently I saw, lying on the after-hatch, the body of the mate. It was some time before I could nerve myself to cover him with a tarpaulin. But it was too awful to see him lying there in the moonlight, so at last I screwed up my courage and did it. Though I tried not to look, I saw his face—'

The girl broke off and covered her eyes with her hands. Marks, who had also seen the dead man's terrible wounds, laid his hand awkwardly on her shoulder as a sign of understanding.

'I think that's nearly all there is to tell,' she continued, after a pause. 'I hoisted the Union Jack upside down as a signal of distress, and then tried to keep the ship head-on to the seas, which I had often heard my uncle say was the right thing to do. When I felt hungry, I lashed the wheel and went into the cabin and ate. Sometimes I slept, and I must have fainted once or twice from cold or nerves or something—you found me like that, didn't you?'

'It's a wonder you lived through it,' said Marks, leaving quite a number of eloquent things unsaid. 'However,' he added, 'as soon as it's possible we'll get you aboard the *Harpenden*, and you'll have a chance to forget these horrors.'

But the mist still lay thick upon the waters, and presently the bos'n gave it as his opinion that they had seen the last of the *Harpenden*.

'Why, what makes you think that?' asked Marks.

'Nothing, sir, just a notion.'

IX.

Events proved the bos'n right. The next day dawned bright and clear, but although he searched the horizon, Marks could see no sign of the *Harpenden*. He was frankly astonished, having taken it for granted that Captain Quinn would hang up in the wind as much as possible, in order to keep in touch. They had done the same on the *Queen Bess*, yet there was not a sail in sight.

'Begging your pardon, sir, the best thing we can do is to work her to port ourselves,' said the bos'n, with whom Marks discussed the situation. 'And it won't be such a bad thing neither, when you come to think of salvage.'

'But can we do it? There are only four of us, and we shall need rest.'

'It's been done before, sir, and it can be

done again,' replied the bos'n confidently. 'The others are willing, for I've sounded them.'

As a matter of fact, they had no option. The *Harpenden* had completely disappeared, nor was any trace of her seen, even after the Horn had been cleared and they were running north. But now the weather was as fine as it had been bad before, and when they picked up the 'trades' the over-worked crew even had time for a little rest. The yards were trimmed to the wind, and for days not a sheet or a tack was touched. This weather lasted till they reached Pernambuco, and put in for fresh provisions. Here Marks had the luck to find two seamen looking for a passage home, and they, only too glad to earn full pay instead of the usual 'bob a month' given in such cases, signed on for the home run.

But Marks, even with the prospect of a rich salvage award before him, was not happy. He knew that, though he should bring the *Queen Bess* and her cargo safely into port, the damning fact that he had been disgraced would still prevent his getting another berth. And he was in love.

The thing had grown upon him insidiously; for, at the very outset, he had gravely held argument with himself, scenting the danger. And he had argued as should a right-minded young man who regarded his career at an end, telling himself he must not fall in love with this girl, or, if he did, must never speak; that he must let her pass out of his life, to find, perhaps, some man who could offer her a fair name and a hopeful future. It was comparatively easy to think this way during the lonely night watches, but, unfortunately for his peace of mind, he could not always be on night watches. There was the daytime, when she came on deck. The sight of her white-clad figure, her glorious chestnut hair rippling in the wind, the reflection of the sunlight in her amber eyes, the magic tenderness of her smile, made him forget the stern resolutions of the night, and Marks, before he quite knew what had happened, had confessed his soul.

It would have given him a kind of bitter satisfaction—in the night watches—had she repulsed him with scorn; reminded him of what he was, and demanded how he dared ask her to share his ruined life. But she did none of these things. He had no very clear recollection afterwards of what she had said, but he knew they sat for a very long time out of sight of the others, her head against his shoulder, his arm about her. The remembrance of their first kiss would be with him all his life, the inexpressible joy and pain of it.

x.

At last the *Queen Bess* lay in the Thames; the fussy little tug which had brought her up the river had cast off; the sails were neatly

furled, and the anchor had splashed into the turbid water. With a brow of gloom Marks prepared to go ashore.

'You have saved their ship, surely they can't refuse you a berth,' said the girl wistfully.

He thought of Captain Quinn's threat to keep him out of a job, and of that black entry in the *Harpenden's* log, and shook his head.

'It's bound to come out,' he said miserably.

Tears stood in the girl's eyes, for though to her who loved him it did not matter in the least that he was a disgraced man, it mattered very considerably that he should be miserable about it.

'I'm going to hope for the best, and so must you,' she said, bravely smiling at him.

'You don't understand,' he told her.

'I do. I know it's like expecting a miracle, but all the same I'm going to hope,' she said impressively.

She watched him go ashore in the boat, and to the last waved her handkerchief with its message of courage and cheer.

'I'm going to hope,' she said firmly when he had disappeared from sight, and it was as if she expected to bring the thing to pass with the very intensity of her wishing.

In a dingy building in Leadenhall Street, Marks was ushered into the presence of the managing director of the firm that owned the *Queen Bess*. He had sent a full report from Falmouth, and there was little to do except hand over the ship's papers. The great man shook hands with him, and Marks listened vaguely to his words, genuine enough, expressing admiration for the indomitable pluck and determination which had sailed such a big ship so vast a distance under such conditions.

'I suppose,' went on the director, becoming business-like, 'you are tied to your firm?'

Knowing what he did, Marks gave a bitter laugh. 'No,' he replied, 'I am not tied to them in any way.'

'I ask this,' said the other, 'because we are increasing our fleet. It is true that we have plenty of officers to pick and choose from, but you have displayed such initiative and ability that, if possible, I should like to retain you with our firm. Of course, you hold a master's ticket?'

'Yes.'

'In three months our newest vessel will be ready for sea. We have not yet selected a captain, and if you——'

Marks felt the room swim before his eyes, but with an effort pulled himself together. Why, he asked himself, should he wait for Captain Quinn to ruin him? Let the blow fall; he would tell the truth now and have done with it.

'When the *Harpenden* returns, if she has not reached port already,' he began, 'Captain Quinn——'

'The *Harpender*!' broke in the other, in a tone of astonishment. 'Haven't you heard about her?'

'No,' faltered Marks, wondering what was coming.

'Why, the s.s. *Cleopatra* came across her, waterlogged, south-east of the Horn. From the appearance of her decks it is supposed there had been a mutiny, or at least a panic, but it was too dangerous to board her, as she was then sinking fast, so nothing actually definite

is known. It seems certain that the survivors, if there were any, perished, or they would have been heard of before this. You were luckier than you thought, Mr Marks, when you saved the *Queen Bess*.'

'Yes,' said Marks hoarsely. 'Yes.'

The great man looked at his watch. 'Now about employment with our firm, Mr Marks—are you open to consider the suggestion?'

THE END.

A D A T.

PART II.

VI.

ONCE we were headed for the shore the work of keeping that position began. Each great wave lifted and carried us forward at a terrific pace until, passing on, it held us for a moment balanced on its crest. That was the critical moment, and had the boat, while thus pivoted, swung broadside to the waves, she would have been rolled over and over, and quickly reduced to so many loose planks. The Dyaks were splendid. Stripped to the waist they strained at the sweeps, shouting their war-cry, and yelling encouragement to each other. In a very short time, so great was the speed with which we were swept forward, we had covered half the distance to the shore, and, the water becoming shallower, the waves broke with greater force, sweeping the boat from stern to stem. Then we began to bump, and we all threw ourselves into the water, holding on to the sides of the boat. When in the trough of the waves we could find bottom with our feet, and this enabled us to keep her straight. It was when in this position that one of the men cried out, 'Look, *tuan*! there on the beach, the Illanuns—many of them.'

The moon was shining with unusual brilliancy. Silhouetted against the sky the jungle looked like a jagged black wall, while below it the beach resembled a snow-drift. At first I could see nothing that broke the surface of the beach except where, here and there, the trunk of a great forest-tree had been left stranded by the tide. Then I saw them, away on our right, looking like a stream of ants emerging from the darkness of the jungle, and running hard in our direction. The deep shadows of the moonlight hid it; but I knew they were coming from the village of old Rajah Tuah, an elderly chieftain, one of those who remembered and longed for the old days when the red, yellow, and white striped sails of his fleet had been the terror of these waters. Small of stature, he had rather pleasant features. He was better educated than most petty chiefs, and could read and write in the Arabic character. I had long recognised

him as the most intelligent man among the Illanuns, and also as the most hostile to the Chartered Company's rule.

My first thought was for our rifles, but they were useless, as the ammunition was all at the bottom of the boat, and the boat completely full of water. Some of the men were able to get their side-arms, the heavy Dyak fighting-sword. Pushing ahead, I went to meet the natives, who were now making their way through the waves towards us. Waving my arms I tried to signal to them to stop, but, taking no notice of me, they pressed on, about fifty of them, and laying on to the sides of the boat, by sheer weight of numbers rushed her forward. As they had passed me I had noticed with undoubted relief that they were unarmed. The boat was soon far enough up the beach to be safe from any more danger. Several of the Illanuns scrambled on board and proceeded to save our belongings. They were no longer the sulky and morose people that I had been used to. Laughing and shouting to each other, they conveyed everything up onto the beach. Taking my men to where they were collecting them I waited until they had finished, then going up to the one who appeared to be in authority, told him to take us to the chief's house. He immediately complied. Telling off half his men to bring on our things, he led us, accompanied by the other half, along the beach. Except that it was a little larger, the chief's house differed in no way from that of his people. Raised on piles about five feet from the ground, its roof and sides were of palm-leaf, and the floor of split palm-wood.

VII.

Ascending the ladder-like steps I entered, followed by the man who had guided us and my Dyaks. I admit to a very uncomfortable feeling of anxiety as I did so. A cheap oil-lamp standing on the floor but dimly lit up the interior. The rajah, wrapped up in a large sarong, came forward. 'Greetings, *tuan*; enter—it is only the house of a poor man,' he said. I glanced quickly round. In one corner a small

room was partitioned off—the rajah's private quarters. The rest of the house was all open. Sleeping-mats and pillows were spread along the walls. I could see no one but the old man. I returned his greeting, and said I required quarters for myself and men.

'Allah! *tuan*, but you are wet and cold. Such as it is, my house is at your disposal, and your men will be provided for.' Then, in response to his call, a little old woman came from within the partition, bringing a large silk sarong, which she handed to me. Other women next came carrying bundles of cloth, which they at once started to hang up so as to curtain off the part adjoining the rajah's quarters. While they were doing this the rajah was talking to our guide; then, turning to me, he said he had arranged that the building next to his be prepared for my men, that our belongings were arriving, and the police could sort them out. I was anxious about our rifles, and told the men to secure them; but the order was not necessary, as the Illanuns came trooping into the house, bringing all our things, including the rifles, which the Dyaks promptly appropriated. The women having finished hanging the cloth partition, I was invited to enter. A couple of thick, soft mattresses had been spread on the floor, and several gaudily covered pillows thrown on top of them. I was very glad to avail myself of the invitation, and quickly got out of my wet things and wrapped myself in the sarong, which reached from my shoulders to my feet.

No sooner had I done this than the rajah appeared with a cup of hot coffee; at least it had a flavour of coffee, though it was mostly hot water and condensed milk—but it was hot, and I was grateful.

Thanking the old man, I told him to sit down. 'To-day, rajah, when I found myself in trouble off your coast I was worried. I said to myself, I am unlucky in being caught here, as these people have refused to be my friends. If I am driven ashore, will they not look upon me as a bird caught in a snare? Now I find instead that I am shown great kindness. I am very grateful.'

With considerable dignity he replied, 'Oh, *tuan*, you are still a young man, while I am old; therefore you will pardon me speaking as I do. You, *tuan*, are a white man and have much knowledge, while I have a dark skin and am very ignorant. You are powerful, while I am poor and weak. My house is small and mean, and I apologise that what I have to offer is so little. My men tell me that the damage to your boat can be repaired. Until that is done, all that I and my people have is also yours. Many times I apologise if my words contradict those that you have spoken. Indeed, you are not as a bird caught in a snare. Can I order the winds to blow? Can I make the waves

rise? I can set the *jaring*—the noose that catches the deer; I can set the *jirat*—the snare that catches the wild birds; I can set the *buboh*—the creel that catches the fish; and, *tuan*, when I catch them they are mine to do with as I please. But the strong wind and the great waves, they are from Allah the Almighty, and who am I that I should take advantage of His work? Allah has sent you to our shore, and as a guest sent by Him so must I treat you; it is our *adat*.' He smiled rather grimly as he added, 'My men will help repair your boat, and when you have departed—what the future may hold only Allah can tell; it may be that to-morrow will be as yesterday. Allah is all-wise. For the present, peace be with you.'

As he got up to go, I took him by the hand. 'Never, rajah,' I said, 'can to-morrow be as yesterday, since there has been to-day.'

VIII.

The rajah's words gave me something to meditate upon during my enforced stay with him. Here was a tribe descended from a people who had for generations practised piracy with all its attendant horrors of killing, robbing, and slave-dealing; a tribe that, through their isolated position and numerical weakness, could no longer indulge in daring adventure, but had sought to carry on by means of treachery and cunning; yet, in spite of all, still retaining a code of honour which prevented their taking advantage of circumstances which, to many, would seem peculiarly propitious. That it was fear of the consequences that held their hands that night no one with any knowledge of the Malay character will contend.

The conclusion that I have come to is, that in the elements they were up against forces which they had to recognise as absolutely beyond their power either to assuage or to defy. When in gentle mood the wind and the sea were their benefactors. When angry, when the storm raged, they could do nothing but acknowledge their supremacy. They were entirely dependent upon them, yet they never knew when they could depend upon them. Can it not be understood that they should come to look upon a storm-tossed sea as a common evil, and thus evolve a law that they must come to the aid of all who were at its mercy?

However, be the cause what it may, what appealed to me most was the fact that even this degenerate tribe retained sufficient of the sturdy Malay character to subordinate their passions to the law of *adat*.

It only remains to add that I made the most of the opportunity to try to win the rajah's confidence. That I succeeded was shown in time, as never again had I to complain of being avoided, and the old man became, if not a model, at any rate a loyal chief.

THE END.

THE MYSTERIOUS LODGER.

By W. D. GRAY.

PART I.

I.

FROM the beginning I had always thought there was something queer about Fordham. It was not his looks or his manner: he was quiet and unassuming to a degree, both in his dress and in his ways. In fact, there was something precise and old-maidish about him: he always seemed to wear the same dark tweeds, well brushed but rather old, the same spotless double collar, and the same neat black bow-tie. His round, clean-shaven face was invariably rosy-looking and healthy, and his blue eyes, behind his tortoise-shell glasses, always peered out at you with the same mild and inoffensive interest. There was certainly one thing which struck me about him: he was interested in people; in a silent and tentative way he seemed to be taking everybody in.

But I should have thought little of that; what really did arouse my curiosity was that I could never make out what he did for a living. He must have done something, otherwise he would never have stopped at Bonnor's. The rest of us lodgers were all City men; we caught various trains or buses in the morning, and all turned up again in the evening at about the same time for dinner. But Fordham's hours were strangely irregular. Sometimes he would not stir out all day—he had a private sitting-room as well as a bedroom, but he took his meals with the rest of us. Sometimes he would go out in the evening, and never turn up until the small hours. At other times he would leave the place before most of us were out of bed, and not be seen again until late at night. And then again he might disappear entirely for two or three days, until one morning you would come down and see his funny, chubby face at the breakfast-table behind the morning paper. What the dickens was he *doing*? That's what puzzled me.

Impossible to look at him and imagine him to be a criminal, or even a gay dog leading a rackets existence. Besides, he had been staying with Mrs Bonnor for years, and she was not the sort of woman to put up with that kind of thing—quite the contrary. If she had not been such a grim old dragon, I should have tried to pump her about him; but, as it was, I knew I should only get snubbed for my pains. As for the rest of the fellows, they were a pretty hopeless sort of crowd. Old Renshaw was the doyen of the establishment, so to speak. He had a business of his own in the City, and was supposed to be worth a good bit of money. But he had about as much imagination and natural curiosity as a fish. I did venture to

say something about Fordham to him when we were alone one evening; but he only stared at me in silence for a few moments, and then said, in a surly voice, that *he* didn't poke his nose into other people's business, and he didn't know why I should. The others were all of the usual type of young ass one finds at suburban boarding-houses—nothing in their heads beyond tennis and football, except dances and girls. They would fly out of the house the instant dinner was over, and you would never see them again until late at night.

After their departure old Renshaw might amble out to the local Conservative club, and if Fordham happened to be at home he would quietly disappear to his room. Perhaps I might never hear him leave the house, but he occupied the next bedroom to mine, and at some unearthly hour I might hear his door open and shut, and know he had been out all the time and had only just returned. And I would lie awake and worry my head as to what he could have been doing.

You will say—well, why didn't you get hold of the man, talk to him in an ingratiating way, and try to get something out of him? Easy enough to propose, no doubt, but not quite so easy to carry out. There was something about Fordham, despite his quiet, placid, old-maidish ways—something which I can't describe exactly, but which said 'Keep off the grass' pretty clearly. You felt you could not take liberties with him; you felt it instinctively. It was not that he put on airs—it was perhaps because he didn't, because he was always so quiet and unobtrusive. At least, not even the rowdiest of our young gentlemen ever tried any tricks on with him, or endeavoured to become familiar and intimate. And I confess I did not myself. I rather think I know my way about as well as most people; you can't be confidential clerk to the head of one of the biggest firms in the City without being fairly competent and intelligent. It was not that Fordham made me feel a fool, or anything of that sort; I really don't know what it was; at all events, I had not got the nerve to cross-examine him.

But as the weeks went by my curiosity grew stronger and stronger. I said nothing, but I kept my eyes about me, and I watched him pretty closely. He seemed to have no friends, and I never saw him receive a visitor. He had a great many letters, however—four or five every morning—and I would have given a great deal to have looked over his shoulder while he sat reading them. I used to study his face at the breakfast-table as he ran them over, but you

might as well have studied a cheese. He would go on placidly reading and munching his bacon and eggs, and then put his correspondence away in his pocket, and look round the table with his usual air of gentle and cheerful interest.

II.

Well, this sort of thing went on for weeks and months, until it fairly got on my nerves. At last I could not stand it any longer. I said to myself, 'I am going to find out something definite about Fordham or perish in the attempt.' And I made up my mind to follow him some evening, and see where he actually went and what he was about. But, as luck would have it, for some time after I had formed this resolution Fordham seemed to be leading an idle, aimless sort of existence. I used to leave Bonnor's after dinner and lurk about round corners, waiting for him to come out. Sometimes he never emerged at all; at others he would merely toddle about the roads and the local park, watching the bowls or the cricket practice. I don't think he ever spotted me as I prowled about after him, but I'll admit I commenced to be heartily sick of it. After all, perhaps I was in danger of making a fool of myself; he might merely be an idle eccentric, with enough money to live on, who kept his queer hours up just to make his life a bit more interesting. If nothing happened in the next few days, I resolved to drop the whole thing and bother my head with him no more.

However, something did happen. The very next night, about eight o'clock, as it was getting dark, I was dodging about in sight of Bonnor's, when I saw Fordham coming down the front door-steps. He turned to the right as he left the house and made for the high-road, walking more briskly than usual. I said to myself, 'This looks more like business,' and set myself to follow him as cautiously as possible. When he reached the crowded high-road I kept close behind him, and saw him step into a bus. I boarded it after him. He went inside; I mounted to the top, and took a seat in the rear, where I could command the steps. The bus was one which went to Charing Cross, and thence down the Strand and Fleet Street to the City and the East End. I said to myself, 'I should not think he will be going to the City after eight o'clock in the evening; he will probably get off at Charing Cross, or somewhere near it!' You can imagine I kept my eyes on the steps pretty closely every time the bus halted.

We passed over Westminster Bridge and down Whitehall to Charing Cross, but Fordham still stayed within. Then we lurched down the Strand and Fleet Street, and up Ludgate Hill through the empty City. It was now entirely dark, and I was the only person left on the top. I suspected that Fordham must be the sole inside passenger. Now we had passed right

across the City and began to rumble through the East End. Still he sat tight. 'Where *are* you bound for, my queer companion?' I asked myself, as we moved into more and more squalid districts. I congratulated myself on my forethought in taking a ticket to the terminus.

Fresh passengers began to board the bus, blowsy women and rough-looking men with cloth caps and greasy scarves round their necks. I had been sitting there for over an hour, and I began to feel rather worried and fidgety, thinking perhaps I had missed seeing him alight at some stopping-place far behind. But at last, as the bus halted midway down a great, squalid thoroughfare, thickly studded with flaring public-houses and cheap cinemas, I saw him step quietly out and mingle with the crowd on the pavement. In an instant I was down the steps and after him. He walked along in a quick, assured manner, as though he were no stranger to this jolly district. Soon I saw him turn aside into a byway. I dropped farther behind, for this was a much quieter road, and there were few people about. He walked along until he came to a dismal-looking public-house, where another road branched off to the right. Down this he turned again, and I followed after, more cautiously than ever. I saw him halt half-way down, take a key from his pocket, open the door of a mean-looking little house, and go in.

I sidled slowly along on the other pavement until I had come opposite to the dwelling he had entered. Everything was quiet; there were no lights in any of the rooms; the house seemed to have absorbed him in silence and, as it were, without comment. I looked about me, and did not much fancy my neighbourhood. It was a very quiet street of dark and dingy dwelling-houses. The lights of the depressed-looking pub shone at one end, and I could see that a few people were drinking within. But the rest of the road was empty and deserted. There were lights in some of the houses, but the dirty-looking blinds were all drawn close, and nothing could be seen of their occupants. More and more I wondered what respectable old Fordham was doing in such a locality.

I waited, but nothing happened. Once or twice people walked by me, poor, mean-looking men and women. The night became darker, and a light summer rain fell, making the dirty pavement glisten under the dim gas-lamps. I turned up the collar of my coat, feeling very impatient. Suddenly the door of the house opposite opened quietly and a man came out. I shrank back into the shadows and pulled my hat down over my eyes. But the man who had emerged was a stranger. I could see that he was dressed in rough, workman's clothes, and had a dark beard and moustache. I watched him as he walked along past the public-house and then disappeared round the corner. 'Who can that be?' I wondered; 'and where the deuce is Fordham!'

Time went on. I heard a distant clock strike the quarters and half-hours. Then ten chimed out, and I began to grow uneasy. 'What has happened to him?' I wondered. 'What did he want there? Who was that man who came out?' There seemed something sinister about it all. I said to myself that I was going to see it out now; I would wait until Fordham appeared, whatever happened.

Eleven o'clock struck from the same church clock; people began to straggle along from the cinemas and the public-houses. But no one entered the dwelling opposite, and soon the street was as quiet as ever. I grew still more nervous and weary; something *must* have happened to the poor old chap. On a sudden impulse I strode across the street and up to the door of the mysterious house. I must know what had occurred; if all was well with Fordham and I saw him, I must contrive some excuse for my presence. But *was* all well with him? I groped for the rusty bell and pulled it vigorously. A distant jangling answered, then all was silent. I hearkened anxiously, but heard no sound of approaching footsteps. Again and again I pulled the bell, with no result. The house maintained the same sinister silence.

The perspiration broke out on my forehead, and I stepped back and looked up at the dark windows. My imagination got to work; I saw Fordham lying dead in some back room, his blood staining the floor, his pockets rifled. What was I to do? Should I find the police and tell them all about it? But how account for my presence there? Would they not think it suspicious when they found out who I was?

I peered more closely at the ground-floor window. It opened directly on the street, within reach of my hand. I formed a sudden resolution. Taking out my penknife, I opened the biggest blade and thrust back the window-catch. It gave easily to the pressure, and then I gently forced up the window. Soon it was open wide enough for me to enter. I looked cautiously up and down the deserted street, then drew a deep breath, flung my leg over the window-ledge, and vaulted silently into the room.

III.

My first action was to pull down the window, quietly and cautiously. The street lamp threw a faint light into the chamber, and I could see that it was absolutely bare and unfurnished—nothing in it save dust and cobwebs. I walked softly over the creaking planks and groped for the door. This opened into a narrow hall. Walking down it, I came to two other rooms at the back, one of them a kitchen. Here I ventured to strike a few matches and peered around. There was the same bareness and emptiness, an aspect of neglect and desolation. I did not see a single article of furniture; the kitchen cupboards were empty; the cooking-range rusty and

forlorn. I came out into the hall again sorely puzzled, my heart beating quick and loud.

A narrow, carpetless staircase led to the upper floor, and I climbed up it slowly and carefully. Three bedrooms opened from the cramped little landing. The first two I entered were as empty and deserted as the downstairs rooms; but on pushing open the door of the third I found signs of occupation. It was very plainly furnished—a bed, a wardrobe, a washing-stand, and a strip of oilcloth on the floor. But it was clearly tenanted and in use. The bed was made; a candle stood on the mantelpiece; there was a general air of neatness and cleanliness. Yet, for all that, the room was empty. This was the last apartment I had left unsearched, and there was no sign of Fordham. I lit the candle and stared about me, my heart beating faster than ever. What was the meaning of this single furnished room in an otherwise deserted house, and, above all, where was Fordham?

I walked over to the wardrobe and pulled open the doors. And then I got the surprise of my life. There were a lot of men's clothes hanging in it, and amongst them the neat tweed suit which was Fordham's constant wear. I took it out with trembling hands and examined it closely by the candle-light. There was no possible doubt about it; that was his suit. A sudden light broke upon me. 'That man,' I muttered half aloud, 'that man who came out!—he was Fordham! He came here and changed his clothes, got himself up as a workman, put on a beard, for some extraordinary reason! There was never any one else here. Yes, that's it—the fellow was the right height and about Fordham's figure. What a fool I've been!'

I put the clothes back in the wardrobe and flopped down on the bed, for I felt my head going round. I never doubted for a moment that I was correct, but my mind instantly demanded an explanation. 'Why did the old beggar come to this secret lurk in the East End and disguise himself—why, *why*? Well, my boy,' I said to myself, 'if you knew that, you would have solved the whole problem. And that must be your next task. At all events you've discovered something, and something pretty queer. This gentleman is playing a deep game, that's plain enough. And your best plan will be to clear out. He may not return here to-night, but you can follow him again, and you won't be fooled by a disguise next time.'

Getting up a trifle shakily, I straightened out the bed and looked round to see that everything was as I had found it. Then, blowing out the candle, I shut the door and groped my way downstairs. You can be sure I took a note of the number of the house before leaving it. Getting home was a wretched business. When I reached the sordid high-road I found it silent and deserted. A policeman told me that the last bus had gone, and I had to walk to the City.

It was past midnight when I struck Aldgate, but I found a taxi near the Bank, which whirled me back to Bonnor's at about twelve-thirty.

I lay awake until daylight trying to solve the mystery, and listening for any sound of Fordham's entrance into the next room. I heard nothing of him, and, as a matter of fact, it was two days before we had the pleasure of seeing him again. I came down on the morning of the third day, to find him sitting at the breakfast-table, bland and cherubic as ever, wearing the identical tweed suit which I had last seen hanging in the wardrobe of that confounded house.

All through the meal I could not keep from staring at him. As he sat there he looked too good to be true, and, as a matter of fact, that is what he was. I wondered what little games he had been up to during the last two days and nights. I have said it was impossible to conceive him engaged upon anything criminal, but I was beginning to modify that opinion. At least, what honest business could it be which took him to that East End hole and led him to disguise himself and to steal away like a thief? It must be some curious affair, some mighty curious transaction. And it was up to me to discover it.

IV.

That evening I laid wait for him as usual, but he never left the house. The next night he came out, but only to go for one of his usual aimless little strolls. But on the third night I had better fortune. As I waited round my usual corner I saw him emerge quite early, about seven-thirty, and walk quickly towards the high-road. Instantly I followed after him, as I had done before, and I saw him get on the same bus. He went inside again; I mounted to the top. But this time I was not so particular to peer at the steps every time the bus halted, for I flattered myself I knew his destination. And I was not wrong. Once more we plunged into the East End, and halted in the midst of the same high-road; once more Fordham descended, and once more I was at his heels. He walked up the same side street, past the same public-house and along the same second turning. And, once more I saw him take out a key and open the door of the deserted house. One curious thing happened before he did so. A policeman on his beat came pacing along, saw

Fordham at the doorway, and saluted him deferentially. I smiled as the constable passed by and the door closed on my fellow-lodger. 'Quite a well-known gentleman locally,' I said to myself. 'Respectable householder and all that, no doubt. If only that bobby knew as much as I do!'

This time I had not such a wearisome wait as before. After a quarter of an hour Fordham came out again. He was wearing a different suit, and had removed his tortoise-shell glasses, but was not otherwise disguised. It was only just getting dark, and I had to feign to be waiting to enter a house on the other side of the road in order to turn my back on him. He did not appear to notice me, but moved along back towards the high-road. I went after him once more, coming closer behind him as we mingled with the crowd on the main thoroughfare. I saw him glance at his watch, and his pace slackened somewhat as though he were in no hurry. He was taking the road back to the City, the way we had come in the bus. For half-an-hour he walked on steadily, and I did not lose sight of him for an instant. Never once did he look round, and I felt like chuckling to think what his sensations would be if he knew who was behind him.

At last we came to Aldgate, then to Leadenhall Street and Cornhill. The streets were fairly empty, but it was now quite dark, and I kept close to him. I saw him glance at his watch again, and he suddenly hailed a passing taxi. I came right up with him before he entered, and heard him give the driver the address: 'Twenty-seven Dalton Street, Camden Town,' he called out, 'as quick as you like.' The door slammed, the taxi groaned and grunted, then moved away swiftly. He was gone.

For a few seconds I stood gaping after him like a fool, then looked round for another taxi. Fortunately there was an empty one within sight, and I made one dash for it. As I stepped in I pointed out Fordham's motor, now disappearing down Cheapside. 'Follow that taxi,' I cried. 'Don't lose sight of it, whatever you do. When it stops, stop as well, some distance behind. Ten shillings for you if you keep it in view.'

'Right you are, sir,' said the driver, with a grin; and off we went in our turn.

NEGRI PERAK.

By FLORENCE MAUD MAGER.

WHAT a country for a white woman to live in!—a white woman used to quiet green fields and gentle rains, golden fields of wheat waving at the touch of cool windy fingers, scarlet poppies and yellow toadflax outlining narrow wavy paths through the wheat, paths

trodden by the feet of lovers, boy and girl lovers under a golden harvest moon.

And here! another spot of God's creating; but what a contrast! Hot and palpitating—palpitating with life—palpitating with unrestrained life; the forces of Nature let loose—

great, roaring gales, carrying dancing imps of darkness, which cover the high heavens with inky funeral palls of velvet, shot here and there with silver arrows. And they descend with shouts and raging glee upon man's puny efforts to build a house and make a garden. 'Tear off his roof; root up his trees; devastate his crops! Ah-hah, ah-hah! Mighty are we. What is man but sport for us!'

What a country for a white woman to worship in!—a white woman used to a quiet garden, close to a small, stone, austere, English church, with its quiet God's acre, its quiet sleepers, its tender, sweet assurances of love and remembrance at every turn; the cross upraised—'Lead, kindly Light.'

And here! a Chinese rock temple—a cavern built in a rock—a little narrow opening into a great central cavern, its roof hung with stalactites, hung with more than stalactites, with millions of quivering, squeaking, obscene bats; round the walls of the cavern little holes of darkness leading into other caverns—mysterious, forbidding, but alluring, alluring. An unshaven, long-haired, intent old Chinese priest comes, and, with a flaming torch, turns and invites, at one of the little holes of darkness, an old Chinese priest with eyes burning red.

And inside. A huge grinning image sitting in a shrine. 'Look at me—eat, drink, lust—this is the end of man, nothing more, nothing more; this is enjoyment. Look at my demons outlined in yellow and red on the walls of my home; how they dance and grin! And look at my river, black and sluggish, flowing at the end of my cavern. By-and-by I shall cast one, two, three of those who would come to me into my river, and through its waters they shall reach me and be clasped to my bosom. Ah-hah!

Ah-hah!! and another way they can come to me. Look at the stone stairs leading up out of my cavern, clinging and creeping up the side of dark cavern after dark cavern, up, and up, and up, and then out onto a little wooden platform, outside at the top of the rock—and then——!!'

But what a gorgeous country for a white woman to live in!—a white woman used to an ordinary English life, with its quiet sunsets, its periodical quiet visits to country and seaside.

And here! The cool of the evening, and the blue waters of the China Sea at rest; small Malay *prahus* are coming home laden to the edge with silvery fish, pink fish, red fish, long, broad, or globular fish, and the huge brown sails of the *prahus* curve and bend proudly. The sun is departing through a field of cloth of gold; he has worked royally; he has given his brown Malay people their coconuts, their padi, their sugar-cane, their sago in ripe abundance, and now he must depart as befits a king, in royal splendour at the head of his battalions—a huge army flying pennons of gold, purple, blue, scarlet, fit colours for so great a king. And now comes night with silent foot-fall, and receives into sweetly gentle and all-embracing arms her royal lover, folding round him soft exquisite rose and amethystine veils, and so to sleep.

But what a country for a white woman to die in!—a white woman used to the idea of a quiet God's acre, and a wreath laid by loving hands for remembrance.

And here! a small patch of ground with a coloured watchman at night to keep the little patch sacred, only a small patch, for there are not many white people to lie in it, and overhead the Southern Cross.

THE SENSIBLE MR SANDERS.

PART III.

VII.

'YOUR holiday appears to have done you good, William,' greeted Thomas Keith Chalmers. 'You're brown as an Indian. Did you call at Sandypool? You might have sent me a picture post-card.'

William Sanders seated himself on the edge of the writing-table. 'I've been in Sandypool for two weeks,' he said simply, and then added, 'I was too busy to write any one—sorry!'

The editor rose slowly to his feet and stared at his friend in amazement. 'You stayed in Sandypool for two weeks,' he repeated in a dazed voice. 'Two days of it was too much for me. William, I've been doing you an injustice: you have possibilities of which I never dreamed.'

'Do you know anything about Northtowers?' asked Mr Sanders, his colour deepening slightly.

'I've only been there once or twice myself.'

'Northtowers; I was there once some years ago—an extremely large and dirty city.'

'Do you think it would be a likely place to open a new warehouse, Tommy?'

The other shook his head. 'Crêpe-de-chine is out of my province, William; but why choose a town you know nothing about?'

'I—I just thought I'd mention it,' was the lame explanation.

'Why not tell me all about it, William?' suggested the editor softly. 'We both know perfectly well that you would never dream of asking my advice about a new business venture, not even if I had been a native of Northtowers, which, thank Heaven, I'm not. The truth of

the matter is, William Sanders, that you've been getting yourself into trouble,' he concluded severely. 'Now come, out with it.'

'It's—it's like this, Tommy,' began Mr Sanders, with a sort of shameful pride. 'I—ah—I am interested in a—lady.'

The editor chuckled gleefully. 'It was bound to come some day—a Northtowers lady, eh?'

Mr Sanders nodded.

'A middle-aged lady, no doubt—one who understands the drapery—business woman, eh?'

William Sanders looked extremely uncomfortable. 'As a matter of fact this lady is about twenty-five, a—a mere girl—she is a school-teacher.'

The editor sighed. 'Tell me all about her, William,' he suggested. 'I can't give my consent and blessings until I know the details.'

Breathing rather deeply and pausing often Mr Sanders told the story of his meeting with Margaret Jennings, and of the two wonderful weeks which followed. He concluded somewhat breathlessly on the sand-dunes. Thomas Keith Chalmers listened with his old mocking, affectionate smile.

'Ah, William, William, laddie, it's a good job you've always got me to run to with your troubles.'

'Told me I must not write, and yet she seems to want to remain friends. Now what d'you make of that, Tommy?' concluded William Sanders, frowning.

Thomas Keith Chalmers shook his head vigorously. 'There's no doubt, William, that this lassie has a certain affection for you, but I expect you have made the mistake of talking business to her. When you do that you are apt to give a mistaken impression. To be perfectly candid, William, you sound bumptious when you talk business. You have such a good opinion of yourself that no intelligent woman would accept you the first time of asking. It was the instinct of self-preservation that made her refuse you. Miss Jennings realises that you are the sort of man who is likely to value a thing according to the amount of trouble you have in obtaining that thing. Naturally, she has no intention of playing second fiddle to your dusty old warehouse.'

'Why, at a word from her I'd burn the blessed warehouse to the ground,' exclaimed Mr Sanders indignantly.

'She wouldn't want you to go that far, I'm quite sure,' answered the other dryly.

'What do you think I ought to do next, Tommy? Let a short time elapse and then go down to Northtowers? This idea of a new business enterprise seems to me a pretty good excuse.'

The editor chuckled. 'But can't you see, man, that she wants you to go down there straight away—without an excuse. She wants you to put her before business for once in a way. If you go down there talking about

warehouses, you will, in all probability, lose her for ever.'

'But look here——'

'Don't waste any more time, William. Be off at once, and remember, not a word about business.'

VIII.

In spite of his preoccupation with other matters, the shrewd Mr Sanders, seated on top of a tramcar, found his thoughts constantly turning on the business possibilities of Northtowers. Almost automatically his eyes sought buildings and building sites suitable for a drapery warehouse. However, as the tram drew quickly away from the centre of the town he was able to give his full attention to the cause of his present pilgrimage. By the time the outskirts of the city were reached he was in a state of suppressed excitement. It seemed to him that only now he was about to see her again did he realise to the full just how much he had missed her. He wondered with amazement how he had managed to live through the past two or three days. The tram was now travelling down a dreary suburban street of interminable length. Mr Sanders knew instinctively that this thoroughfare would be called 'High Street.' He sighed, and drawing from his pocket the tiny card she had given him, consulted the instructions—results of previous inquiries—which he had pencilled with business-like brevity on the back.

At last the tram stopped, and the guard shouted a name which brought Mr Sanders to his feet. Alighting, he crossed to the sidewalk, and after a single glance to right and left started off without further hesitation. His vocation had so developed William Sanders's bump of locality that his uncanny instinct for direction amounted almost to an eighth sense. Arriving at a side street which possessed no outstanding points of difference from innumerable other side streets he had already passed without favouring them with a glance, he again consulted Miss Jennings's card. A few moments later he came in sight of a large block of buildings, which bore all the characteristics of the best type of modern Municipal Council School. Even as he approached the stolid suburban silence was broken by the insistent clanging of a bell, and then the shrill clamour of liberated children. Mr Sanders consulted his watch. 'Twelve o'clock,' he said, aloud. 'Now, I wonder if she goes home to lunch?' A wave of laughing, quarrelling youngsters of all sizes and shapes came tumbling through the great doorways and across the school-yard. A daring idea occurred to Mr Sanders. Why not seek Miss Jennings at once? Her home, he knew, was some considerable distance from the school, and it was more than likely that she would remain at the school for lunch. Even if this was not the case, he would, at all events, have the pleasure of seeing her home.

Once his mind was made up, Mr Sanders never hesitated. He permitted the main body of the children to pass, and then approached a hatless little girl who was walking sedately alone. 'Can you please tell me where I shall find Miss Jennings?' he asked.

The child stared at him for a few moments with a disconcerting steadiness, and then nodded with great vigour. 'Um—m—I'm in her class,' she announced, as though this fact gave her considerable satisfaction.

Mr Sanders smiled and produced a silver coin. 'I wonder if you would walk back with me as far as your class-room?' he said.

The child gulped once, grasped the coin with a pudgy but capable little hand, and led the way back without a word.

IX.

Miss Jennings, wearing her hat and coat, stood at her desk, marking a pile of copy-books. It was a very modern class-room, with pretty, bright pictures on the walls and several glass cases which illustrated various processes of cotton and wool manufacturing. There were brightly varnished cupboards and the latest things in blackboards and easels; also the room was lofty and cool; but all this was lost on Mr Sanders. He had eyes only for that slim, straight figure with the serious gray (or blue) eyes. For once he acted on an impulse which came straight from the heart. He went quickly towards her.

'Margaret,' he whispered, 'I have come,' and in that moment he knew that although her fingers were turning the leaves of copy-books, she was thinking of him. Uttering a little cry, she turned and faced him; then she half turned away, but not quickly enough to hide the wonderful truth which his unexpected appearance had startled into her eyes. 'You have business in Northtowers, then?' she whispered, fighting desperately for control.

'Yes—the business of seeing you—no other.' Suddenly he took her hands in his. She uttered a little laugh that was half a sob. 'You really left your warehouse—oh!'

Mr Sanders had drawn her to him.

For a brief moment he lost all count of time, and then an authoritative voice called him peremptorily back to earth. It was a voice which could, he felt, be a very pleasant voice on occasion, but now there was an austere note in it which jarred on his ears and filled him with apprehension. His hands fell to his sides as he turned.

Standing in the doorway was a lady of imposing appearance; a stately, elderly lady, with a handsome face, a youthful complexion, and a great mass of beautiful gray hair—obviously a woman born to command. 'What is the meaning of this?' she demanded crisply.

Margaret Jennings faced the principal of the

Lower School with heightened colour, and a smile that was half humorous, half ashamed. She still retained her quiet dignity, but speech was beyond her.

'My—my fault!' stammered William Sanders, finding his voice suddenly. 'My fault entirely' (he really thought it was). 'I—I surprised Miss Jennings.'

The lady adjusted her gold-rimmed glasses and gave him a frozen glance. 'So I should imagine,' she answered dryly.

'She—she wasn't expecting me,' continued Mr Sanders, with a gulp. 'I—I made myself ridiculous.'

The head-mistress inclined her head, thus indicating that she entirely agreed with him. 'The classroom of an infants' school is hardly a suitable place in which to make yourself ridiculous,' she pointed out with some severity.

Mr Sanders glanced about him despairingly. He was overcome with a sense of the futility of attempting to make this austere, level-headed woman understand the beauty, the inevitableness of his folly. She was his own counterpart; a few weeks ago he would have regarded her as the perfect woman, the sort of woman he had once thought of as a suitable mate. A wild and foolish thought occurred to him, as wild and foolish thoughts do occur to us in the great crises of life. Suppose he had met this lady, who was the very personification of the ideal he had so recently discarded? Suppose it was she and not Miss Jennings he was visiting at this moment? He ran his fingers round his collar. 'You see, madam,' he resumed, the despair in his eyes communicating itself to his tongue, 'things like this are above and beyond all ordinary conventions. It isn't that a man makes a fool of himself; it is rather that circumstances make a fool of him.'

The bright gray eyes behind the gold-rimmed pince-nez softened a little. She regarded Mr Sanders with new interest. He took fresh courage, and talked as he had never talked before. With the thought that the girl might have to suffer for his recklessness to urge him on, he argued and cajoled with all the art and cunning of the trained salesman. He appealed both to the emotions and to the intellect. He was in love with his subject, and his deep voice vibrated with that persuasive note which he usually reserved for his very best customers on very special occasions. It was William Sanders at his best, the William Sanders who weekly sold scores of yards of crêpe-de-chine to shopkeepers who were already overstocked with crêpe-de-chine.

The principal of the Infants' School was, after all, just a woman. She smiled faintly; then the smile broadened and her eyes began to twinkle. Finally the last vestige of austerity melted, and she laughed outright.

'I assure you,' concluded Mr Sanders, 'that

this is the very first time in my life that I have ever done such a thing.'

The lady sighed, and then laughed again rather wistfully. Mr Sanders knew that he was forgiven.

Formal introductions over, the principal, who desired to have a few moments alone with her assistant, requested Mr Sanders to withdraw. She promised not to keep him long, and graciously expressed the wish that they would meet again in the near future.

'We shall,' murmured Mr Sanders, as he left the building.

'Miss Martin wasn't angry with you?' he asked anxiously, when the girl, looking unusually thoughtful, joined him in the school-yard.

Margaret Jennings shook her head. 'No, she was very kind. She said she had attained her highest ambition in this life, because she had always been too well-balanced to do anything impulsive. It seems that years ago there was a boy who wanted to marry her, but she put her career first, and he went abroad. . . . She says that if he would only walk into the school and—kiss her as you did me, she would gladly throw her position and career to the winds for the privilege of acting foolishly in the eyes of the world just once.'

'Is that all she said?' asked William Sanders.

The girl blushed. 'No-o, she gave me some advice.'

'Tell me what it was?' he begged.

She hesitated for a moment.

'Please,' he persisted.

'Miss Martin says that—that no career, however brilliant, can compensate a woman for the loss of home and children.'

'Good old Miss Martin! Do you agree with her, Margaret?'

'I—I think there is a great deal in what she says.'

'We shall invite Miss Martin to the wedding,' declared Mr Sanders in a firm voice.

X.

'I congratulate you, William,' said Thomas Keith Chalmers gravely. 'Although I have not yet had the pleasure of meeting the lady, I am sure you will be very happy.'

Mr Sanders started, and then began to pace the room nervously. 'To tell you the truth, Tommy, I haven't thought about me at all. Shall I be able to make her happy and keep her happy!—that's what's troubling me. You see, I've never had much to do with women—only met 'em in the way of business.'

The editor smiled. 'That fact alone is enough to make any young wife happy. Cultivate a sense of humour and you'll make an ideal husband.'

'By the way,' said William Sanders, some time later, 'I've decided to open a warehouse in Northtowers.'

'Then you'll be advertising for a capable man to look after the place—or this one?'

Mr Sanders hesitated. 'To tell you the truth, I'd like to get Smith back. He's absolutely reliable. I'd make it worth his while. Perhaps you wouldn't mind mentioning it to Miss Hale?'

The editor nodded. 'With pleasure. So far as I can make out he isn't doing too well at present. They became engaged a short time ago, but the poor lassie seems very downhearted sometimes.'

'He can't return too soon for me, and the sooner Miss Hale and he are married the better I shall like it. There is nothing like marriage for concentrating a man's energies and abilities. Marriage is an anchor; an unmarried man is a man without ballast.' Mr Sanders stroked his moustache, but not offensively. Love had made of him a philosopher, and a philosopher is one who has found the blessed quality of humility.

They were married in the summer of the following year. It was a magnificent wedding, to which the best man, Thomas Keith Chalmers, editor of the *Advertiser*, gave an added note of distinction. The happy couple left immediately for Sandypool, where they intended to spend the greater portion of their honeymoon. They meant, in the words of Mrs Sanders, to walk and walk and walk, but the heat was so intense that for the first two days they simply lounged and lounged and lounged.

They were, however, very happy.

On the afternoon of the third day of their honeymoon they took deck-chairs and magazines onto the sand-dunes. Sandypool was deserted as ever. In the shade of a huge parasol the happy pair settled down until the cool of approaching evening should make tolerable the thought of further movement. For a long time they sat in silence—Mrs Sanders, too happy to read, gazing out to sea through the shimmering heat haze; Mr Sanders, in cool white flannels, lying back in the chair, his head a little to one side. She thought he was asleep, but suddenly a sharp exclamation left him.

'Is there,' exclaimed Mr Sanders, with great bitterness, 'a single place left in all the world where a man and his wife may be alone for a few days?'

Mrs Sanders gazed about her. To right and to left Sandypool was deserted and motionless, for there was hardly enough breeze to stir a blade of grass. Not a sound was to be heard save the gentle, insistent murmur of the calm sea. Mr Sanders, catching her look of inquiry, waved a limp and resentful hand. Far away, across the shallow natural bay, purple and misty, rose precipitous cliffs. By shading her eyes with her hands Mrs Sanders was able to make out two tiny black specks on the highest point of the nearest cliff. Probably intrepid golfers seeking lost balls. . . . She laughed softly. . . .

THE END.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

A SENTIMENTAL sadness crept into senses stirred by the beauty of the scene, by national pride and historical fancies, when, standing this morning for a while in the garden of the British Legation at Tangier, I looked over the Moorish city and across the sea beyond, for this patch of foreign soil that has been England, official, proud, ceases so to be. The Tangier problem, a most vexatious diplomatic thing, seeming at times to call for such ingenuity as possessed by one who set out to square a circle, may possibly have been settled for a time. It may not be an ideal settlement; the state of the world does not permit of easy attainment of ideals. A feeling exists in some foreign places that while the arrangement may be the best that was to be reached from a confusing and difficult set of circumstances, and is the result of acute diplomatic skill, Britain by it loses some prestige. France is, on the whole, pleased; Spain is disappointed with the settlement and with ourselves as her strong friends; Italy is inclined to wonder and be captious; Holland, Belgium, Portugal, and some others who like to insist on public occasions on the importance of their existence, say this and that in a querulous way; and the United States looks wonderingly and with an ironical smile upon it all, as of one who says to himself, 'Poor old Europe!' seeing in the past chaos and confusion of Tangier, geographically and politically endowed more richly than most other spots upon the globe, sad testimony to the futility and the insincerity, to the materialism and the jealousy of the Powers of Europe in pitiful slavery to the tyrant—Force. However that may be, Tangier has a new statute which may come into full action soon. It should be controlled in the future by an international legislative assembly composed of four French members, four Spanish, three British, two Italians, one Belgian, one Dutch, one American, and one Portuguese, with six native Moslems, and three native Jews. Over all, formally at least, is the Sultan of Morocco, who is devoted to the interests of France. At all events, this affair and the compromise of a kind now resulting constitute a great event in a contending world, and the first outward sign of the new order of things is

that which I have contemplated, not without a touch of melancholy, in the garden of our British Legation, on this pleasant morning of the Moroccan summer. For in the old order there were legations and ministers, and there has been a British representative, endowed with all the grand prestige of Britain, since mid-Victorian times, and now there are to be no more ministers. The new scheme excludes them. The Legation comes to an end. The building must be sold as a desirable and commodious residence. How can there be no tinge of melancholy at this parting? And it is not the less because Tangier once was wholly ours, and because our parting with it and all the line of happenings that followed—the resulting course of history—changed the chances of the world. This garden, its borders shaded by palms and eucalyptus, sparkles and glows with delightful flowers in such variety and abundance as Morocco in May-time can best achieve. Framing a brilliantly-coloured confusion is a stone wall beyond which is a Moslem cemetery, wherein bodies are buried in very shallow graves, from which, in the fancy of the pious faithful, they may emerge at night to walk the earth again. Beyond, not far, the minaret of the new mosque overlooking the big zoco cuts through the blue, the white sign of the muezzin fluttering from a brilliant chromatic exposition of faience. And next to it is the English church, whose square tower displays a panel of faience, while its door is in Moorish style. Men honoured in British history sleep in this churchyard where cypress mourns and eucalyptus droops. Near to it, but invisible, is the native market-place, where two or three thousand natives gabble and sell. Farther are the glistening cubes and rectangles of white Tangier piled from the edge of a brilliant sweep of sea, and, beyond the sea, distant yet clear, cut sharply to the vision, is a long, low line of Spanish hills—blue-gray, soft; delightful in the view. Magic is in this outline, for the human eye first takes it leftward, by the west, and passes with some emotional instinct to the right, coming by climax to—Gibraltar! Then in the swim of wonder and of thought, the flowers, the church, mosque, sea and all fade off, and we pass to contemplation of the majestic emblem of the Rock. Here for an inspiring view from

a diplomatic garden! No other can equal it. . . . But Gibraltar has lost some of its old mightiness and meaning. Tangier is its sister. By repute they are the children of Hercules, and one at least, the Rock, has justified the tradition.

* * *

Curiously speckled is the history traced by this key-point of the political and geographical world, where Europe came in the uncalculated past, and has more or less exerted herself at intervals ever since. In an unknown age this tongue of land was fast to the south of Spain, and the early human adventurers wandered down from the north over or round the Pyrenees, and then had apparently a track down Spain through what is now called Andalusia, and over on the land then existing to those parts of North Africa, where the route was forked, one section leading east in the line of the present Fez, and the other south, towards the corner of the Atlas Mountains, the desert, and the parts where natives are all black. What happened when the roaming races came this way has now little apparent concern for us. But it is very different with the later tale of Tangier in the second half of the seventeenth century, for then Britain impinges upon it heavily and rather clumsily, and it is made to seem that the fate of the world was handled here. By the strange and romantic colouring of circumstance and the human waywardness of action, the story of Tangier in those times and later is fascinating. Here or there assume a certain happening more harmonious to the case, more reasonable, than what in fact developed, and a logical or even seemingly inevitable sequence of events thereafter must have led to a world constituted very differently from that we know and live in. Once we held and owned Tangier. Had we continued to do so, our penetration and ultimate possession of Morocco could hardly have been avoided. Then we should naturally have turned attention to the African parts beyond, to Algeria and Tunisia as they are now, and Tripoli. The lure of extension, propagation, annexation, could have had no more fascinating field than this, which is mottled by the broken stones of Roman empire, that was spread over all this land. Hence we argue not only that might North Africa have been ours, but that its modern development, which, under the French, has only opened in our own time, would have been the best part of two centuries ahead. From this we pass into the vague infinity of rosy speculation with the trail of a long red line from Tangier on to Suez, and much besides. But, with the limitations of endeavour and achievement, and with the jealousy of rivals, what of India then? And how would the Mediterranean problems have been shaped? And what of that imagined British North Africa during the Napoleonic wars? None can guess answers to these questions with any sort of

satisfaction; but we may assure ourselves, negatively, that the British Empire, as we know it, might not have been the same, and that France would not have been the same, or the world with them. Perhaps it is unavoidable that now, when we survey the brilliant work of France all along North Africa, its bounding spirit, and the amazing transformation of Morocco in little more than one decade, we should experience a twinge of envy and regret, and hark back in thought to Stuart days with one more grudge. Morocco, however, may not prove the jewel of empire that some imagine. It causes France anxiety now. But behold Tangier at that epoch, a key-point of the world most pregnant in significance geographically and politically, and yet just a wedding-gift to England! And even at that, the offer of it as part of a marriage dowry, it might have been refused but for the allurements of a lady's eyes.

* * *

The business of a British consul is to be official and practical and to state facts truthfully in his reports, so when our consul at Lisbon observed unemotionally that the Princess Catherine of Braganza was 'as sweet a disposition prince as ever was born, a lady of excellent parts and bred hugely retired,' she must have been attractive. She appears to have been a lady of charm, with deep, ravishing eyes, an ivory skin, ringed jet hair. In her the peculiar thickness and heaviness of dark countenance we notice in the Portuguese was softened seductively. This desirable lady was offered to us by Portugal, bidding for friendship as part of a miscellaneous collection including, besides the princess, Tangier, Bombay, and a quantity of cash, as well as trade rights in Brazil and the East Indies. European politics were then, in 1661, in this common condition of flux, intrigue and covetousness abounding. Portugal was grappling with a shaky independence, Spain watching her opportunity, and the Dutch likewise were regarding Portugal with an unkindly eye. The world was opening then, and foreign commerce was the thing. France was not benevolently disposed towards Spain, in spite of a royal marriage between them, and this circumstance offered Portugal her chance with England. The lady, with half a million sterling added to her, and transference of possession of Tangier, which Clarendon said was 'a place of that strength and importance as would be of infinite benefit and security to the trade of England,' was tempting. It was an affair mainly for King Charles II. The Spanish Ambassador threatened him with unpleasant consequences if he contracted such an alliance, and this circumstance had for result that Charles, like a very proper and independent Briton, told him he 'might be gone as soon as he liked, and that he would not receive orders from the Catholic king how to

dispose of himself in marriage.' That is the way to talk to them. By this time Charles seemed to be studying the picture of the Princess Catherine. It is reported that he found her not 'dull and foggy,' as were so many German princesses, and he felt sure she 'could not be unhandsome.' He had no misgivings. The marriage treaty was concluded in May 1662, and the king told Parliament they would find it to contain many great advantages to the kingdom, and that he would make all the haste possible to bring a queen hither, doubting not that she would bring great blessings to them and him. Possession of Tangier was appreciated in some measure then. Schemes for its development were entered upon with enthusiasm. Coveted before by England and others, Portugal would not have lightly parted with it had she not felt herself being pressed by rivals. Even then it was an obvious strategic position, a fine haven of refuge, and a base for dealing with the pirates, especially the Salli Rovers, some way down the coast, who were something more than a nuisance to all navigation in those times. On the other hand Portugal, apart from its crown and treasury, for whom the maintenance of Tangier in those days was too much, was not pleased at the parting. Prestige was being lost. Tangier was a place of quality. Belonging to the aristocracy of old-world citadels claiming origin from the gods, Hercules being its builder, while its name came from his wife, Tangerang—so they say—it had passed through the common course of North African vicissitude and soared in importance when the Moors began their invasions of Spain. It fell easily into Portuguese possession in 1471, and so remained until 1580, when Spain, having assumed power over Portugal, took and kept it until 1656, when once more it became Portuguese. Thus there were traditions in the case, and the Portuguese in Tangier had their pride. Fernando de Menezes, fourteenth member of his family to be Governor of Tangier, felt the case so keenly that, though offered the consolation of a handsome title, he flatly refused to deliver the place according to the instruction he had received from Lisbon, and, when he was recalled, a successor in Luis de Almeida was only found to perform this galling task on the promise of a finer title and the governorship of Brazil. Even so, the local Portuguese would probably have made trouble but for the fortunate chance of the surrounding Moors making it in advance for them. The British sea forces, standing outside under Lord Sandwich, were asked to give assistance, and thus England glided smoothly into possession.

* * *

We started with a prideful programme in Tangier. It is of peculiar interest to know that among the schemes advanced for peopling the place from home was one that a third of the people of Scotland should be deported to

Morocco, this cunning plan being supported by the suggestion that 'his Majesty's revenue would be increased by their transport thither.' But the story of our occupation, which ceased in 1684, unpleasant and confused as it is, may be left. We were always in trouble with the surrounding Moors, the administration was not good, our Tangier politics were bad, and too much money was spent upon the place, largely wasted. Our old friend Samuel Pepys of the Admiralty was sent out there upon inquiry, and made his usual pointed and caustic comments. But he was once entertained 'with harp, guitar, and dance, with Mrs Sheres in his garden, with mighty pleasure.' Christopher Wren was another of fame who briefly was linked to Tangier, advising upon the plans for the harbour construction. Extensive and really excellent works were made, and when at last, because of the difficulties and expense, and of the excuse then made of the worthlessness of it all, Charles's government decided on evacuation, these were partly destroyed. Grievous were some of the circumstances of the departure. Though there was never any tranquillity in the place, some flavour of our later Gibraltar attached to our occupation. We started a municipality, organised our society with all its accompaniments and institutions, and Tangier, with its sweet climate, its flower-laden lands on which asparagus was found wild, was pleasant for living. But the king's men could not manage it. For a long spell Kirke, of 'Lambs' fame, was governor there, and it was between him and the Sultan of Morocco, Muley Ismail, that the most historically colourful incidents were enacted. This sultan holds a remarkable place among the rulers of the past. A despot of tremendous will, energy, and ambition, he rescued Morocco when it had fallen to uttermost disorder. He was a great constructor and builder. Marvellous walls passed from his flaming imagination to a quick reality; the city of Mequinez, which he desired to be the 'Versailles of Morocco,' was his doing. Thus far praise to Muley Ismail. But his reputation for cruelty even exceeded his fame in other respects.

* * *

When you have read so much of horrors that they sound plain and dull, turn to the details of this sultan's life and the blood will curdle once again. Such as Nero, Spain's cruel Peter, and others of like infamy were of angelic turn in contrast with Muley Ismail; they were triflers in the arts of pain and torture. He practised cruelty from the beginning of his long reign of fifty-five years, and his methods were enlarged and intensified as he advanced. He cut off the heads of subjects and slaves for mere casual diversion. A number would appear before him, and with a sabre he would decapitate them, run them through with a lance, or exercise some strangling method upon them. Once, on St Louis' Day, he speared a dozen, and

then, withdrawing to the privacy of his apartments in a very bad mood, strangled three of his wives. However, three were few among so many, for he had thousands, and more than eight hundred children. The stories and records of his reign and doings are veracious. One day he strangled one of his ladies because she had plucked an orange from a tree in one of his beautiful gardens without his permission. Numbers of Christian women who had been taken prisoners were assigned to his harem. One of them became a great favourite, and had a certain, if precarious, influence over him. She was bold enough, one day when he was in good humour and told her she might beg a favour of him, to ask that all the Christian women prisoners that he held might be assembled and given a piece of land to live on apart from all others. He agreed, and assigned to them a place about eighteen miles south of Mequinez, where to this day there are people bearing European names—Schneider is one of them—apparently as fully native as any others. Moslems like the rest, who say they are descended from the European Christians. When his eldest son attempted a revolution and was captured, Muley Ismail went out in fine imperial panoply to meet him, displaying six executioners with their business swords in his entourage. The prince's right hand and foot were cut off, and he died a few days later. The Sultan's girl children were mostly strangled at their birth. He would for mere caprice, or for the momentary pleasure of fleshing his scimitar, strike off the head of the slave who had assisted him to his saddle. Murdered slaves in great numbers were packed among the walls they had been set to build, yet these were not the most awful of his acts. It has been reckoned that he was personally responsible for the death in his own country of thirty-six thousand human creatures. Contemporary of Louis XIV., with whom he had dealings, the ambassador of the French sovereign made bold to protest to him against his cruelties, and his answer was, 'Your king rules over men, but I rule only over brutes.' But the strange thing is that Muley Ismail might have stood boldly in history without these horrors. Imagination, confidence, and caprice, aiding an ambition not controlled by conventions, led him to curious schemes and adventures. Circumstances and disposition brought him to a close degree of contact with Europe. He entertained the strange notion of converting our King James II.—him of all kings!—to Mohammedanism, and wrote a long letter to him on the subject. He proposed to Louis XIV. that he should marry his daughter, the Princess de Conti; but the lady had no ambition to leave the palace of Versailles for the harem of Mequinez. So much was he talked about that in some respects Muley Ismail became quite a vogue, as we say, at certain European courts. Perhaps, knowing what we

do, and appreciating our own incapacity to realise the Islamic mind and consciousness, we must not be surprised that he presented himself as a devout Mussulman, that he prayed earnestly and long, that he is now a saint, and that on his tomb, at which the poor and the afflicted kneel, there is an inscription thus: 'This tomb, sanctuary of orphans and widows, refuge of the poor and the abandoned, is that of the prince of believers, the warrior who fought in the way marked out by the lord of the worlds, the tomb of Ismail, the son of Muley Cherif. May God sanctify his soul and yield to him a large space in his paradise.' And this 'Versailles,' a mass of walls, neglected garden, and meagre ruins of palaces, is now perhaps the most depressing place in the Moghreb, used chiefly as a storehouse for the living relics of the harems of departed or exiled sultans. I have felt a deep melancholy lately when wandering in Mequinez.

* * *

All this strange romance of easternism running riot in cruelty and imperial freak is not so distant from our touch that its detail and movement cannot be evoked in grim and fantastic reality in our meditations in this garden at Tangier. In the native market-place, just beyond the wall of the Legation garden, the humbler trading and labouring Moors pass their days much as they did when Muley Ismail was the king. Tangier is a shabby, neglected place. It has the appearance of being nearly broken down, and forlorn through want of a master—one only. But, despite its cosmopolitan shoddiness, it has many qualities and attractions; and the zoco—a babel of three thousand voices on Thursdays and Sundays, and always alive, a great display of the industry, patience, and capacity for burden-bearing of the women from the country, who bring their produce here—is a fair introduction in experience and study to the beginner at travel and adventure in North Africa. It is nearly a quarter of a century since I first knew it, and in this 'period of progress' no great change has taken place in it save that the camels have gone, and motor omnibuses now rattle into the middle. A new mosque stands over it. Islam is still here, though four languages are being spoken and four countries' coinages being used. And here the old squatted white-bearded story-teller in his suave tones tells in phrases that he fondles for their romantic meaning the stories of departed princes. Now at the parting we are brought to remember that when Britain for that score of years held Tangier for her own she had need to parley and negotiate with Ismail, and one more strange thing is that Colonel Kirke, Governor of Tangier, who went on a mission to Mequinez for three weeks, was delighted with him! Muley Ismail was on his best behaviour, and we may believe that a man of such egoism and character could be ex-

ceeding nice at will. Yet Kirke knew all about him when he reported, 'Colonel Kirke has been received with all the demonstrations of kindness and civility imaginable at that court, the emperor telling him that for his sake (since he had pleased to come to wait on him) he would give him four years peace for Tanger, and swore, by God, that as long as I was Governour here, he would cut off the Alcaydes head if he gave us any the least suspicion of a breach of peace, and that we needed not to make complaint for that hee would have spies to informe him if any injury were offer'd us.' Kirke found the gardens of the palace at Mequinez to be very lovely; he was entertained at times by displays of remarkable horsemanship by the emperor himself; and we reach at last to not the least of the achievements of Muley Ismail, the most terrible, when, his visit ended, Colonel Kirke wrote to London, 'I must tell the holle worlde I have mett with a kinde prince and a just generall in Barberey.' But trouble enough with Muley Ismail later, trouble indeed! Our modern missions are not so impressionable. With all its faults of materialism and expediency, the twentieth century breeds quick and sure discernment, and though it praises persons grandiosely, it holds its reservations, and the diplomatic insincerity is understood. Men have had long experience, and have learned much, and learned it everywhere. As this

legation closes, its last chief, Sir Arnold Robertson, has added three most fateful years of Tangier to his former offices in Berlin, Peking, Madrid, Bucharest, Rio de Janeiro (twice), Monte Video, Washington, The Hague, and as High Commissioner on the Rhine. He gives me a message of hope to those who now and aforetime have watched the development of the Tangier problem and still have misgivings upon it. He says: 'The British negotiators at the Tangier conference at Paris, Mr Villiers and myself, had constantly to bear in mind the safeguarding of vital British interests, and no fair-minded person can deny that the settlement now reached after twenty years of misunderstanding is a compromise that meets the legitimate interests of all concerned. In my considered opinion the future prosperity of Tangier and the safeguarding of British interests, both strategic and commercial, will now depend in a very large degree upon the energy, enterprise, and tact of the new British Consul-General, the British representatives on the legislative assembly, British traders and British shipping companies. It must always be borne in mind that all foreign nations look with respect, almost with veneration, to British integrity and the British sense of fair-play to all.' There are difficulties to be overcome, and they are serious, before the new era begins, but Tangier is hopeful.

THE MYSTERIOUS LODGER.

PART II.

V.

I WAS beginning to be fairly filled with the spirit of the chase. As the taxi dashed along, I promised myself that I would discover Fordham's secret and sinister business before we saw our home again. What it was I had still no idea, but more and more it was borne in upon me that it was something dark and criminal. I put my head out of the window to see if his taxi was still in sight, when suddenly my own vehicle halted with a jerk.

'What are you stopping for?' I shouted to the driver.

'Can't knock the bobby over, sir,' he said sulkily. 'Did my best to get through!'

I looked ahead and saw that we were just upon the point of turning into a great highway, the Euston Road I think it must have been, and that a policeman stood before us with uplifted hand, allowing a stream of traffic to pass along the main thoroughfare. Fordham's taxi had evidently just got through, and was now lost to sight. I swore aloud as I realised the position. It must have been nearly five minutes before that infernal policeman lowered his hand

and let us go on. But I stopped the taxi at once and got out.

'It's no good,' I said angrily; 'you've lost sight of him. Take your fare and clear out.'

He took the money grumblingly and moved away, while I walked aimlessly along the pavement. But suddenly a new thought struck me. After all, I knew where Fordham was going. I had heard him give the address to which he was to be driven, and that should also be my goal. I looked round for another taxi. It was long before I found one, and the driver was apparently more stupid than usual. He had never heard of Dalton Street, Camden Town, and seemed to have extraordinary difficulty in finding it. It was nearly half-an-hour before he finally drew up and announced triumphantly that Dalton Street was before us. I had previously told him not to drive down it, for I had no idea of advertising my presence at the front door of number twenty-seven.

Dismissing the taxi, I turned and surveyed the locality. Dalton Street was a road of tall, sombre, flat-chested houses, once probably highly respectable Victorian dwellings, but now beginning to come down in the world. The ex-

perienced eye could readily deduce that some would be let out in cheap theatrical lodgings, that others might be split up into flats, others be occupied as offices. Only in some few cases would the whole tall three or four-storeyed building still be in the hands of a single family. Though the street differed greatly from that other one in the East End to which I had previously tracked Fordham, it had one characteristic in common—it was singularly quiet and deserted. When my taxi had grunted away I saw no one moving down its whole length. It was now about ten o'clock; the night warm, but very dark and still. I looked at the number of the nearest house, saw that twenty-seven must be about half-way down the street on the opposite side, and moved towards it silently.

When I came in sight of it I halted and looked across the road. Number twenty-seven was apparently deserted; from its area up to the top of its three storeys there was no gleam of light. I walked across and listened, but could hear no sound of life.

'Now I wonder,' I said to myself—'I wonder is this another of Fordham's secret hiding-places. Is he lurking within, as he was at that other place in the East End? And if so, what on earth can be the meaning of it all?' I pushed my hat back and thought for a few minutes. I was certain I had heard him give this address. Unless he had countermanded it on the way, his taxi had driven him up here and he was now probably within. The question was, should I hang about and wait for him to come out, assuming that he was there, or should I try to solve the mystery by a bold but secret entrance into this house? I felt strongly prejudiced in favour of the latter course. I had lost him once to-night, and I did not feel like hesitating any longer. The conviction was growing upon me more and more that I did right to follow him, that though I might break the law in entering these houses of his, nevertheless in the end I should be justified by what I found there.

I looked up and down the road, saw it was quiet as ever, and then stepped down into the area. I had brought with me a big clasp-knife with a heavy blade. Gently inserting this in the nearest window, I again forced the catch with very little trouble. I began to think I possessed the necessary qualifications for a burglar. When I had quietly raised the window I climbed into the room. I was reminded at once of that other house in the East End. This room I had entered was evidently a kitchen, and though it was very dark I could see that it was bare and deserted. Making my way to the door I walked down a passage and found the door of another room facing me. I opened this and entered unsuspectingly. Instantly I heard the click of

a switch, a flood of electric light almost blinded me, and a hoarse jarring voice rang in my ears.

'Got you this time, me lad!' it said. 'Put your hands up—quick, unless you want the top of your head blown off!'

Instinctively I held them up, blinking in the sudden brilliant light. When I could see properly I discovered I was standing in a large, low room, which was apparently fitted up as a workshop. It was half-filled and littered with machinery. Amongst other things I saw what appeared to be a printing-press. Standing in front of me, under the electric bulb, was a big, burly fellow in his shirt sleeves. His appearance could not have been prepossessing at any time, but at present his features were fixed in a most malignant and sinister smile. He was pointing a big revolver at me, though he lowered it as I thrust my hands up above my head. Another smaller man stood behind him. He also was in his shirt sleeves, but instead of smiling he had a thoroughly daunted and frightened appearance. As he took me in, this latter fellow seemed to give a gasp of relief.

'Gawd! Jim!' he said breathlessly, 'I thought we were done. I thought the tecs were on to us. But who's this blinking fool, after all?'

The big man looked at me, still with his evil grin. 'You 'ear?' he said, in his hoarse voice. 'What's your name, what do you want in this room—in short, 'ow do we come to have the pleasure of seeing your ugly face pushing itself in where it wasn't asked?'

VI.

The whole thing had come on me with such overwhelming surprise that I felt conscious I was not conveying a very favourable impression. I tried to pull myself together, though I knew my lips were dry and my knees had a deplorable tendency to give way from under me. 'Where is Fordham?' my brain demanded. 'Is he in league with these ruffians? What is it they are doing in this place?'

The big man raised his revolver again. 'Not lost your voice, 'ave you?' he demanded brutally.

'My—my name is Venning,' I stammered, 'and I came here to find some one, a Mr Fordham. I—I had no idea that there was any one else present.'

'Ow did you get here?' demanded the other. 'Never 'eard you till you was in the passage.'

'I got through the window,' I began. 'I—I know it sounds bad, but, you see, I had—'

'You got through the window!' the big man broke in. 'You did, did you?' His voice was indescribably cruel and menacing.

'Yes,' I said hastily. 'But, you see, I had my reasons for following Mr Fordham, and—'

'Who's this perishing Fordham?' said the smaller fellow suddenly. 'What do you mean—you followed him 'ere?'

My heart sank lower than ever. 'Why,' I stammered—'why, don't you know him? I supposed he would be here—I mean, his taxi came—'

'What do you mean?' exclaimed the burly man violently. 'It's my belief you're off your onion. But I'll tell you one thing—you've butted in 'ere where no one asked you, an' you're not going out again. I dunno anything about your pal Fordham, never 'eard of him. But I know *you'd* better say your prayers.'

He pushed the revolver barrel right against my chest, and I recoiled with a cry of horror. At the same moment his companion clutched him by the arm. 'Jim!' he whispered. 'Jim—listen, listen!'

They both stood silent for a moment, and I myself listened eagerly. There came a sudden sound of heavy footsteps from the passage, the door was flung violently open, and a police inspector, followed by half-a-dozen constables, rushed into the room. The big man raised his revolver with a furious curse, but he was too late. There was a short, sharp scuffle, the pistol was twisted away from him, and handcuffs were snapped on his wrists. The other fellow made little resistance and was easily secured. Finally, I too was handcuffed and marched across with the other two, despite my protestations.

'And that's that,' said the inspector, mopping his face. 'Pretty neat job, though I say it.' He turned and looked at me curiously. 'Who are you?' he went on. 'I supposed there were only two in it.'

I had opened my lips to reply when another man strolled into the room and stood glancing around. It was Fordham! He was still without his tortoise-shell glasses, and his eyes seemed to beam cheerfully as he took in the scene. 'You've got them all right, then, inspector?' he remarked blandly.

'Yes, sir,' said the inspector, 'we have, thanks to you. In fact, we've got one more than we expected. I don't know who this third man is.'

Fordham glanced at me for the first time, and I saw his eyebrows go up. 'Mr Venning!' he said slowly. 'Ah! yes!—well, Mr Venning, I was aware that you were becoming highly interested in my movements of late, but I certainly never expected to find you here. We must have a little explanation later.—But you can release this gentleman, inspector. I know him, and will answer for it that he is quite innocent. We must be satisfied with Mr James Anderson and Mr William Jevons.'

'Of course, if you say so, sir,' replied the inspector deferentially. He bent over me and unlocked my handcuffs, whilst Fordham cross-

examined the two prisoners. I felt as though my head was ready to burst.

'Look here,' I said hurriedly. 'Excuse me, but what are you arresting these two blighters for?'

'Uttering false bank-notes,' he said gruffly. 'They've been turning 'em out by the hundred and thousand. But we've got them all right now.'

'Then—who is Mr Fordham?' I stammered.

'Fordham!' repeated the inspector. 'Do you mean Mr Twining—he says he knows you.'

'I—I thought his name was Fordham,' I said. 'But who is he?'

The official smiled gravely. 'Well,' he said, 'I suppose he's about the smartest detective in London—yes, I can't think of a smarter. He's been working at this case for six months, and now he's finished it. He 'phoned us up an hour ago and said we were to make the arrests to-night. So there you are. I'm telling you this as you may be wanted at the trial.'

Well, you know, I was stunned; it was too much for me. I felt like—like a stoned adder. As I thought of my spying and my house-breaking my face burned, and I had a sensation of cold water being poured down my back.

'Yes,' I said. 'Oh yes!—of course—I see now. Well, if you don't want me any longer, I think I'll be off. Mr Fordham—I mean Mr Twining—he knows all about me and where you can find me if I'm wanted. I—er—I congratulate you on your captures.'

And I got out of that.

THE END.

LIFE.

ONLY a lily dreaming in the twilight,
With snow-white petals and with heart of gold;
Only a rosebud blushing in the noontide,
Waiting its crimson glory to unfold.

Only the breeze that whispers in the dawning,
Kissing the waking flowers and dew-drenched
grass;
Only the ecstasy of living, loving,
Unheeding as the golden hours pass.

Only a hand stretched out amid the darkness,
To help a fellow-traveller on Life's way;
Only a word of comfort softly spoken,
To cheer a heart whence Joy has gone away.

Only a mortal wound received unflinching,
And hid with smiles within a heart that bleeds;
Only that sympathy, divine, unfailing;
Only that undefeated courage that succeeds.

Only the memory of a joyous meeting;
Only a long farewell where two ways part;
Only the echo of a loved voice speaking,
That lingers still within a lonely heart.

Ah, only these, but these are Life's true essence,
Through Life and Death they help us to endure,
Until at last in the Eternal Presence,
With everlasting joy we rest secure.

HELEN M. CARVER.

RIDLEY'S BOOKSHOP.

By SHEILA RAND.

I.

'SELL many of this?' I asked, lifting into view a bulky edition of *The Modern Reader's Bible*.

'Not now. I used to.' The dapper little bookseller's somewhat cherubic countenance became shadowed by reflection. 'Once the publisher wrote to me and expressed pleasure at the number of copies I had sold. Something unusual in a city of this size. He would have been interested had he known how little I had to do with those sales. . . . But now—I hardly ever get asked for a copy. There was a time when I'd sell three or four in a month. All to the same man. He must have bought fifty of them.'

'Funny thing,' the little bookseller continued in his pleasing, friendly voice, 'the way that chap would come in here and make straight for those shelves.'

He indicated a narrow aisle at my left, formed by counters piled high with new novels on the one side, and on the other, a wall covered with shelves that held much of the world's best literature. John Ridley is more than a merchandise man. He has vision and a kinship with winged words. The dust that so often lay thick upon those classics did not convey to him financial loss. It had its own glint of gold. The books were welcome upon those shelves until a lover came their way. Then he would gladly part with them. Never had he been guilty of hastening the departure of one of those precious volumes by including them in a bargain sale.

'If they go,' he once said, 'they go with dignity, and not like some poor unfortunate young man who is blown into the street by the boisterous breath of his landlady demanding the rent.'

Ridley had stopped speaking, and stood gazing down that aisle with a half-puzzled, half-tender expression on his unbookish countenance. When he spoke again, it was as if he saw 'the chap' standing ahead of him, only his profile in view, as he bent intently towards the books on those dusty shelves.

'There he'd stand,' continued Ridley, nodding his head in the direction of the memory, 'pulling out the books very gently as one who loved them. When he had read a paragraph here and there, he'd put the book back with a caressing pat. I used to like to see the way his fingers would linger on them, like a mother smoothing her baby's hair. At first we didn't talk much. He'd hunt for the books he wanted, and if they were not there, he would

order them. His gentleness was something quite remarkable. Only his voice would express urgency when he said, "Please order for me three copies of *The Modern Reader's Bible*, cloth edition." Always he asked "how quickly" I could get them; as if he did not know as well as I that under ten days it was not possible. When I had added the quite meaningless "I'll hurry them up for you," he would go out of the shop with a look on his face as if he had come into a great fortune.'

'Perhaps he was crazy,' I suggested flippantly; 'a kind of obsession, a mania for collecting copies of that one book.'

'Oh no,' replied Ridley seriously, his gray eyes hurt for his tale's sake. 'He was a man of great learning. As time passed we had become more friendly. We'd talk.—Or rather, he would talk for an hour on end, about the literary beauties of the Bible.'

"Ridley," he would say, in his enthusiastic manner, "Moulton has done a tremendous service to mankind. He has made it possible for all to read the Bible with understanding. He has been like a miner who delves deep and brings up, for all the world to see, most precious gems. And to this work he has added the further tasks of cutting the stones and of so setting them that their beauty has been fully revealed."

'That is how he used to speak to me,' said Ridley quietly.

'But did he never buy any other books?' I questioned, persisting in my theory of a pathological obsession.

'Oh yes,' replied Ridley quickly. 'Dozens—whatever appealed to him. There was no limit to his interests. One day *Amiel's Journal*—I've another copy now—the next, *The Little Flowers of St Francis of Assisi*. Then Fabre, all his works, as quickly as he could read them. But once a month at least, he'd buy another copy of *The Modern Reader's Bible*. After the publication of *The Spirit of Man*, he began ordering that frequently, often coupling it with the other.'

Just then the clock struck eleven. In an hour my feature story for the day would have to be ready for the afternoon edition. Abruptly the question broke from me, 'Where does he live now, Mr Ridley? He must be quite a character. I should like to interview him, hear from his own lips just why he kept you busy ordering the same book over and over again.'

The unemotional gray eyes, on a level with my own, misted. He turned his head slightly, peered down the aisle as if he were making sure of something, and then in a voice that ex-

pressed a tinge of wonder rather than grief, 'He died a short time ago. On a Friday he was standing at those shelves. On Saturday, so I learnt later, he slipped from the world of books. Couldn't have been more than forty, if he were that.

'No, I don't know anything more about him, nor why he bought so many copies of Moulton. He always called personally for his orders and never talked of himself. Just of books. God! How he loved them.'

A hasty 'good-bye,' and I was tearing along to the office of the *Watchman*. Not only was I late, but balked in my effort to turn in a human interest story. Of course I had learnt from Ridley the name of that eccentric book-lover. But that hardly gave me the right to hunt up his relatives, if any, and face them with the crude question, 'Why did Paul Rossiter buy so many copies of Moulton's Bible and *The Spirit of Man*? Write up the story as it stood—The Man who had an Obsession? No, emphatically no. For the first time in my newspaper career I shrank from the journalesse. Ridley's voice, the expression in his eyes more than his words, had made a little picture for me. A tender little picture, as soft and hazy as an Indian summer, but poignant also, like Whistler's mother. 'The Man at the Book Shelf.' How this picture drew my eyes. It must hang awhile, undisturbed on the walls of memory. Sooner or later, I felt sure, another incident would dovetail with this puzzling story, and the pattern would be complete. Always it is so in life. As the small circles of individual existences whirl around within life's all-enclosing one, sooner or later they are bound to intersect, one circle with another, and they together with a third. Thus points of contact are forever revealing themselves with surprising suddenness. Fate, some call it. . . .

II.

For the first time in his long business career Ridley was being threatened with competition. An enterprising young woman had rented the large, bright room above the De Luxe Hair Dressing Parlours, had hung out a gay sign, 'The Blue Willow Tea Shop,' and had announced through the columns of the two local dailies that she, Priscilla Jordan, would sell books, food for the mind (she was guilty of the bromide) as well as food for the body. To me was assigned the task of interviewing her. There was nothing the chief liked better than a good story for the women's page.

'Play the women up strong,' he would say. 'Give 'em plenty of space. Let's hear what they are thinking, saying, doing. The *Watchman* aims to be a good family paper.'

Miss Jordan's welcome was cordial but not effusive. Her manner of greeting suggested reserves that few might penetrate. Her business-

like air seemed to express but part of her. A comparison flashed into my mind. She's like Ridley, I thought, a merchandise man with a soul. Surely the very person she should not resemble if business competition was to yield the palm to the newcomer. Besides, the comparison was rather absurd, and prompted me to grin stupidly. Ridley, short, rotund, with a pink and white complexion that suggested Mellin's Food, and gray eyes that had never grown up. Why should he come to mind as I stood explaining my presence to this tall, graceful creature with a business-like forehead and eyes of a mystic? Still, Ridley had floated on to the horizon, and while we exchanged polite conventionalities preliminary to an interview, the presence of Ridley seemed to pervade the room.

Miss Jordan excused herself. She would make me some tea 'so that my copy,' she laughingly remarked, 'might have the flavour of experience.' During her absence I glanced around the room. A hospitable open fireplace, wide enough to admit of a large semi-circle of cheerful tea-drinkers, soft blue hangings, willow furniture, a cool fern or two, and at the far end of the room, the beginnings of her bookshop. The shelves for the most part were still in the making. One stack, however, was well laden with books, and these drew me like magnets.

I began to read off the titles: *Rare Luck, If Winter Comes, Main Street, The Mountebank. . . . The Modern Reader's Bible!*

Madame Bovary, or *Une Vie* could not have surprised me so much. But Moulton's Bible! Standing there so mutely, and in such company!

I felt the desire to laugh aloud. What a mean trick some book agent had played on innocent, good-natured Miss Jordan, so eager in her quest for modernism. Doubtless the title had suggested to her a new-fangled cult; and she had deemed it the type of book that women's clubs like to discuss in between bites of cake and sips of tea. Had she not already told me that until a few weeks ago she had been a stenographer? She was not to be blamed for her mistake. Ridley, despite his young eyes, had been a bookman for twenty years. How he would laugh when I told him about Priscilla Jordan's choice of best sellers! Once again had Ridley seized my thoughts. And then suddenly, a memory: a misty, poignant picture; Ridley's bookshop, the narrow aisle, the tall, slight figure; yes, Ridley had emphasised his height and slenderness, the fine ascetic face, the long lean hands caressing each dusty volume, and the inevitable question—'How quickly can you get me a copy of Moulton's Bible?'

All this in a second or two. The next minute I was sunk deep in the comfort of a well-upholstered chair, watching Miss Jordan pour out the tea into bright-blue willow cups, and at the same time holding out toward her

the copy of Moulton. She seemed to seize my question out of the air. I had not spoken, and yet she was answering me.

'Do you think it out of place,' she questioned wistfully, 'among all those light novels? I made up my mind if I ever had a little bookshop of my own, there would always be a copy or two of Moulton in case hungry folk should be seeking food.' This time there was no hint of the bromidic quality in the metaphor.

Her words stumbled over each other. She caught them up with her breath and hurried on. 'I should like to tell you a story. There has been no opportunity before to speak of it to any one. But oh, how I have longed to! I wonder whether you will understand me. I have felt that when the time came, when the right person crossed my path, I would tell this story. And in so doing I should be raising up a monument to him.'

Priscilla Jordan pushed aside her bright-blue willow cup and put her elbows on the table, propping her head on her hands as if the rush of words from her heart was too much for her. There was in Priscilla Jordan's voice throughout her story a note of peculiar tenderness. It made me think of mothers, and the joy they have in speaking of their children, of how they delight in letting drop those loving words—proxies of caresses. What a caress there was in Priscilla Jordan's voice as she spoke to me of a 'precious, strange habit of his.' She had been a stenographer in a lawyer's office. One day an unknown man came for advice.

'My employer was busy, so the client sat in the outer office, and I went on with my work. I felt his huge dark eyes fixed on me. Suddenly, in the gentlest voice I had ever heard, he began to talk to me. He talked as if he had known me all his life. At first I was too astonished to quite take in what he was saying.'

A whimsical smile flashed across Miss Jordan's still countenance as she broke off her narrative to inquire of me how I should have felt had a strange young man suddenly asked me if I were not hungry for books.

'That is what he asked me,' she said, not waiting for my reply. 'Never will I forget, as long as I live, that soul-piercing question. "Excuse me, madam," he said, "but do you ever read? Read good books, I mean. You look as if you are hungry for good books."

'Could you have spoken?' asked Priscilla Jordan. 'I couldn't. My reply hung silent in my throat. But he continued quite unembarrassed, as if he were speaking to an old, old friend. He spoke of what books had meant to him all his life. He spoke of the Bible, of art, of beauty, of all the things that never before had been said so that I could hear. I cannot remember many of his remarks in detail. Only the impression of great beauty remains. Of

Paris, I remember that he said, "No city in the world could vie with her in loveliness. But its loveliness was that of the maid who decked herself out with ornaments to catch the eyes of the passers-by." He spoke of sculpture, of Virgil and his eloquent advice to Rome. He quoted from Sophocles—how many times since I have read a translation of the Oedipus that he gave me! He had lived several years in India. When he spoke of the Eastern moon and "her chaste and solemn walk of beauty amid the clouds," I had for the first time a desire to understand poetry. It was almost an hour before my employer was disengaged. And during that time I said scarcely a word. Just listened to that flow of beauty. Listened and developed a soul.

'The following day he brought me two books.'

Priscilla Jordan jumped up and left the room, and I feared that emotion was going to deprive me of the end of her story. But she quickly returned, bringing with her two well-worn volumes: *The Modern Reader's Bible* and *The Spirit of Man*. Silently she opened them at the fly pages, and I read in one, 'To Priscilla Jordan, with fervent wishes for her advance on the rugged hill of wisdom and understanding.' There followed that passage from the twenty-eighth chapter of Job, beginning, 'But where should wisdom be found, and where is the place of understanding?'

In the other volume, inscribed to Priscilla Jordan in the same small, artistic writing, were these words: 'Wishing her, in the words of the great Idealist of Israel, "The Lord shall guide thee continually, and satisfy thy soul in dry places . . . and thou shalt be like a watered garden, and like a spring of water, whose waters fail not.'

Both were signed, 'Paul Rossiter.'

I looked at Priscilla Jordan, but I saw instead Ridley's bookshop, the long, narrow aisle, and standing opposite to what my friend Ridley called his 'star boarders,' a tall, slender man, lovingly caressing the backs of the books. Ridley seemed to be at my elbow, so very clearly did I hear him say in a half-puzzled, wholly tender voice, 'He was a queer chap. "Ridley," he would say to me, "there is only one joy greater than the possession of a precious book—the giving of it to a hungry soul."

EYES OF LOVE.

THE verdant fields that should console
With flowers so fair and glad,
To-day but serve to make my soul
Intolerably sad.

Though happy birds may greet the dew
In song of sweet surprise,
You are not here; and only you
Can lend me Beauty's eyes!
J. M. STUART-YOUNG.

IN FATHOMS DEEP.

By THEODORE RUETE.

I.

'WHAT fearful sights the diver must see,
Walking alone in the depths of the sea,'

wrote the poet. As a matter of fact, however, at 210 feet below the surface of the water it mostly is dark and gloomy, and the diver actually sees but little. This depth is the greatest authenticated at which British divers, undoubtedly the most scientifically trained in the world, have done practical work in safety. Three divers of the United States navy, using British methods, certainly have touched bottom at 275 feet, but they remained there only a few minutes.

Writers of fiction often have incautiously allowed their imaginations to run riot around the career of the diver. Nevertheless, his life really is a fascinating one, and his equipment and methods are both wonderful and peculiar. These have been well set forth for us by Mr R. H. Davis, who tells us in his *Diving Manual* that, although it takes but some two minutes to descend to the ocean's bed, coming up again from great depths, or shallower ones where much time was spent, usually involves about half-an-hour or more.

The diver travels down and up a shot-line that trails from the ship to the sea-bottom, and that is clasped between his legs. When the diver, by means of his helmet-valves, admits further air into his dress, he becomes buoyant, and easily slides up the shot-rope towards the surface. His progress is controlled, however, by those at the air-pump in the boat above, who cause him to stop at certain prescribed stages, by reducing his air-supply.

Were the man to come to the surface too quickly, his blood would get filled with bubbles formed by the nitrogen in the air that has penetrated every fibre of his being while down below. Gradual lessening of the enormous pressure the diver unconsciously has been enduring tends to dissipate this nitrogen, an end that is helped also by the gymnastic exercises the diver should perform while waiting, with one leg comfortably curled round the shot-rope, for the signal to continue his ascent.

Sometimes the diver's dress accidentally gets filled with air, and the wearer is 'blown up' to the surface like a rocket. If, then, he has been long below, he is certain to suffer badly from caisson disease, or diver's palsy, that may even end fatally.

The cure is *instantly to send the diver down again*, even though feeling ill; he will begin to improve as soon as he gets below. Too quick a descent occasionally causes pains in the ears. But these are not serious, and will dis-

appear as the diver gets accustomed to the depths.

With proper precautions, the above writer contends, most diving evils can be avoided, and he proceeds to show that a modern diver's life is by no means the hazardous, gruelling one romancers have pictured it. For, nowadays, the diver, properly equipped and rigidly controlled from the ship, by men specially trained for the purpose, can descend beneath the water, anywhere, and do his work, not only in comparative safety, but in actual comfort. If the depths are great, he simply is not allowed to remain below for long, that his ascent may not be unduly protracted and wearisome.

II.

Fatalities in this business rarely occur, and it is the proud boast of our principal makers of diving appliances, used by thousands of divers in various parts of the globe, that no accidents ever have been due to any defects in equipment supplied by them.

Some years ago, certainly, a diver was killed on the ocean-floor of the Chilean coast, when a heavy box of silver he had worked hard to recover fell out of its sling and crushed him. Diver Pearce, too, once was salvaging some bales of cotton from the *s.s. London*, and had to fix four large hooks at the end of a chain into one of the bales. After signalling to those above to try whether the strain would hold, he felt to ascertain if the bale had started upwards. But the hook suddenly gave way, and, tearing out of the bale, caught Pearce in the palm of the hand, dragging him from the bottom of the wreck's hold to the upper-deck. When the diver was brought to the surface he was in a state of collapse, but he was back at work again within three months. These accidents, however, could scarcely be attributed to the diving appliances.

Nor could these well be held responsible for the fight for life that once ensued during the operations on the wreck of the famous *Royal George*, between the divers Girvan and Jones. Keen rivalry between these two at last came to a head over which of them had the right to a particular cannon. Girvan was trying to release it from its deep bed of sand, when he was reminded by Jones that it was his—there being an unwritten law among divers that the first to find an article is entitled to save it.

Girvan, however, refused to give way, and soon it came to blows. Jones presently thought it wiser to retreat, being much the weaker of the two, and had already ascended the shot-rope a few feet on his way to the surface, when

Girvan seized his legs and tried to draw him down. A desperate struggle followed, in the course of which one of the windows of Girvan's helmet was smashed in. The attendants at the surface, noticing a violent tugging at the life-lines and air-tubes, realised that something unusual was happening below, and hauled both men unceremoniously to the surface. Girvan was more dead than alive, but after a few days in hospital recovered sufficiently to be able to resume work. A happy outcome of that awful 'breeze' in the depths, however, was that the two former enemies afterwards became the best of friends.

It is commonly supposed that the diver is in great danger from sharks, but, as a matter of fact, he is but little interfered with by these tigers of the deep.

The famous diver, the late Alexander Lambert, whilst fixing copper sheets to a coal hulk off Diego Garcia in the Indian Ocean, however, found his work interrupted, for several days in succession, by the attentions of an enormous shark. Each day the monster ventured a little nearer, but the diver managed to scare it away by opening the air-escape valve of his helmet.

After a week's annoyance he determined to make an end of the fish, so he signalled for a rope and a large knife to be lowered to him. This intrepid fellow then coolly held out his bare hand as a bait to the shark, and as the brute began to turn on its back for the attack, Lambert stabbed it repeatedly, passed the noose round its body, and had it hauled to the surface.

Actually, the most dangerous sea denizen the diver ever meets is the octopus, and it is almost impossible for the man to free himself once a large one has fastened on him. There are cases on record where the struggle has terminated only when both the diver and his dreadful adversary have been hauled bodily to the surface and on to the deck of the ship, and even then the octopus has continued to fight furiously.

III.

In out-of-the-way spots, in eastern seas, divers salvaging treasure really are in the greatest danger from human sharks, or pirates. The experienced divers, R. Ridyard and W. Penk, both of Liverpool, once were working off Shanghai for Captain Lodge, who had undertaken the recovery, on behalf of the underwriters, of the treasure of the sunken *Hamilla Mitchell*, amounting to £50,000.

The party started in the pilot cutter *Maggie*, but the search for the wreck eventually had to be continued by boat, as the cutter could not get close enough to the high rocks. After searching in depths of from 120 to 160 feet of water, the wreck at length was located. Her fore part still was sitting on the ledge she had struck, but she had parted amidships in a storm,

and her after part had rolled into water of 26 fathoms.

Ridyard went down, and after some difficulty succeeded in entering the ship's treasure-room, where some of the dollars were lying in heaps. Talk of diver's gold—here it was in plenty! For the worms had eaten the wood of most of the boxes, so that these were completely riddled.

The diver made four successful trips, the last being the best of all, for he then sent up the contents of no fewer than sixty-four boxes of specie.

On finally arriving at the surface, Ridyard declared he was thirsty, so Penk offered to ascend to a spring he knew of, at the top of the island alongside which their boat lay, to fetch some water. Ridyard assenting, he started, and, while filling the bucket, happened to glance round the horizon. To his great astonishment, he saw there numberless white sails, bearing down towards them from the mainland. He mentioned the fact to Captain Lodge, who instantly recognised them for what they really were—piratical junks.

Orders therefore were given to slip the anchor of the *Maggie*, and, scrambling into her from the boat, they set sail at once. But the wind was light, and they had to take to the oars. Ridyard was terribly weary after his long stay at such great depths, but, exhausted and almost fainting as he was, he, too, pulled his weight; till, a breeze springing up, they at last were able to make sail.

With the aid of the night they eventually reached Shanghai safely, but they had run a great risk of losing not only the treasure they had on board, but their lives into the bargain. The Shanghai papers blamed the authorities for not giving the expedition proper protection, for, but for this contretemps, Ridyard would have made salvage of the entire treasure, instead of only £40,000. The balance was recovered later, however.

The salvage of sunken treasure always has been the part of the diver's work that makes the most popular appeal, two circumstances contributing to make noteworthy any special instance—viz. the depths from which the bullion is recovered, or the difficulties attending the operation, and the bulk of the amount in question.

When down below, searching for articles, the diver mostly works in overlapping circles. To keep him in touch with the shot-rope, for in the vasty deep he cannot see far, and landmarks there are none, he has what is called a distance-rope fastened to the shot-rope. Mostly he crawls about, breathing being very much easier so than when walking.

Unnerving is it for the diver to lose his distance-rope, as sometimes happens, for with it goes all sense of direction, and then the man must take care not to lose his head also. If,

after quietly sitting down and carefully thinking out how he came to drop the rope, he cannot recover it, there is no need for panic or despair. He is still attached to the boat by means of his life-line and air-tube, and should signal to be immediately hauled up, and ask to be kept, during that operation, as close to the shot-rope as possible. For this is also attached to the boat by its other end, and, as the diver ascends, he probably will come across it. Now he knows where he is, and can descend again and continue his business.

IV.

Divers have worked on peculiar jobs ere now, but probably a unique employment of one was in the saving of Winchester cathedral.

But how, it may be asked, could a diver work on dry land? Thoroughly to understand this, it is necessary to realise that the old builders, in 1202, were unable to sink the fane's foundations further than ten feet, for at that depth they came to water-level. The engineer in charge of the work of underpinning the famous pile had a trial hole sunk, when it was found that below the water was a six-foot-thick bed of marly clay, resting on an eight-foot seam of bog peat, whose subsidence gradually was undermining the building.

This peat, however, rested on a firm bed of water-worn flints. The clay was therefore brought away by light pumping and ordinary excavation, when the water naturally rose in the hole, down into which a diver then was sent. This man, working in complete darkness

and entirely by *feeling*, under water, removed all the peat in sections, and substituted for it foundations of cement-concrete, upon which ordinary stone-work then was built, and the cathedral saved for posterity.

A novel use for divers was found in the recent disaster at the Redding colliery, when three such men were lowered into the flooded section, to wade through to the higher levels, and bring hope and help to the poor fellows supposedly awaiting rescue there. But the obstacles encountered proved insurmountable, and after the divers had groped about under water for four hours, much hampered for want of proper air-supply, the effort had to be abandoned.

The principle successfully demonstrated by Augustus Siebe has been put to many uses since first he applied it to his 'close' diving-dress in 1837, and a modification of this dress enables its helmet effectually to be used in dense smoke at fire-outbreaks. For use over short periods of time, however, we have now developed a self-contained diving-dress, invented by the firm that manufactures Siebe's patents. The helmet of this appliance, which requires no air-pump, is supplied with a substance called 'oxylithe,' which gives off pure oxygen when breathed upon—its residue, an alkali, absorbing the poisonous carbonic acid gas of the expired breath. Together with a water-tight jacket, this forms a life-saving equipment for use in submarines, by means of which each member of the crew, in cases of accident to their craft under water, has a chance to reach the surface by becoming an independent diver.

THE MONTH: SCIENCE AND ARTS.

THE WORLD'S LARGEST FLOATING DOCK.

EVERY ship has to be docked periodically, so that her bottom can be cleaned of the barnacles and other marine growths which seriously affect her speed. For a good many years it has been a slur on our supremacy as a maritime nation that we possessed no dock which would accommodate our largest liners, and these vessels have been docked in the United States. Two kinds of dock are used. One, the dry dock, is excavated at the side of a harbour, and fitted at the entrance with water-tight gates. Such a dock is allowed to fill with the tide until at high-water the vessel to be docked is floated in, and the gates are then closed behind her. Powerful pumps are next set to work, and the water pumped out, the vessel having been previously shored up so that she cannot fall over. The other type of dock, known as a floating-dock, is in the form of a trough, with thick, hollow, water-tight sides and bottom. So long as the sides and bottom are empty, the dock floats on

the top of the water. When a ship is to be received, water is admitted into the bottom and sides until the dock sinks to a point where only a few feet of the sides remain exposed. The ship to be docked is then floated in and shored up in the middle of the trough. By pumping the water out of the bottom the dock is caused to float again, the ship being raised clear of the water. Every one will have read of the opening of the huge floating-dock at Southampton, which is capable of accommodating the biggest Atlantic liners, thereby removing the reproach that this country had to send its greatest ships abroad to be docked. This floating-dock is the largest in the world. It measures 960 feet in length, and has a width of 170 feet, while the clear width inside the trough is 130 feet 8 inches. The thickness of the hollow bottom is 20 feet, and the sides stand up 50 feet above it. The dock will lift a ship weighing 60,000 tons, while the structure itself weighs 18,000 tons. One important feature is that the dock can clean or repair itself. To make this possible, the

length is divided up into seven sections, which can be taken apart from each other. To clean one section, it is separated from the others and turned half round, when it can be floated into the remainder of the dock as if it were a ship. Each section has a powerful pump at each side which can pump it dry from the deepest immersion in four hours, this being the time taken to lift the largest ships. These pumps, and all the other machinery about the dock, are driven by electric motors, for which current is derived from the Southern Railway's power-station on shore. Water is admitted to sink the dock through huge valves. All the motors and valves are controlled from one station by electric push-button switches. Here the operator has instruments which tell him the depth of water in each section, and other information which enables him completely to control the docking operations. It is, of course, important that a ship should be exactly in the centre of the dock before it is raised; this is ingeniously accomplished by four horizontal shores at each side of the dock, which are moved towards each other in unison until they nip the ship between them when it is central. The dock is moored at each end by immensely heavy anchors and enormous chains, the bar from which the latter are made being no less than $3\frac{1}{2}$ inches in diameter. Sideways the dock is kept in position by booms, 110 feet in length, which have universal joints at the ends, so that they can move up and down with the rise and fall due to the tide, and accommodate themselves to slight end movements of the dock. The shore ends are fixed to reinforced concrete dolphins, while gangways give access to the shore. Messrs Clark & Standfield, of London, designed this dock, and it was built by Sir W. G. Armstrong, Whitworth & Co., Ltd., at Newcastle-on-Tyne.

CLINOMETERS FOR CARS.

The steepness of hills has been a matter of interest to road-users ever since wheeled vehicles were first invented, but until recently no instrument for gauging gradients has been available. To motorists the steepness of the inclines their cars ascend and the speed which can be maintained on known gradients are matters of special interest, as such statistics form a basis of comparison between one car and another. A clinometer, or gradient meter, brought out some time ago, is now becoming increasingly popular. The essential feature is a heavy pendulum which is hung on hardened centres and enclosed in a case, minor oscillation of the pendulum due to the shaking of the car being prevented by a damping liquid with which the case is filled. When the gradient meter is mounted on a car which is either stationary or moving at a uniform speed, the pendulum takes up a vertical position, and the relative angle of the car is shown by the pointer, which consequently indi-

cates the gradient. When, however, the car is accelerating, the pendulum swings away from vertical to an angle which is exactly proportional to the rate of acceleration, and as this angle is also shown by the pointer, measurements of both gradients and acceleration are provided. The pointer of the dial at the front is made to follow the movements of the pendulum in a very ingenious way. The pendulum is a permanent magnet, and attracts, through the copper bottom of the case, an armature of soft iron, which therefore moves with it. This armature is connected by multiplying levers to the indicating pointer. In this way a frictionless connection is provided, while the case can be, and is, hermetically sealed. To be precise, the pointer does not move, but always remains vertical. It is the case containing the graduated dial which turns as the car is inclined when going up or down hill. Gradients from 1 in 30 to 1 in 4 are shown, level being indicated when the pointer is central. Rises are marked in black figures and falls in red. These gradient meters are handsomely finished, and are mounted on the dash. From their indications the various factors contributing to a car's performance may be measured, and the motorist is given a knowledge of his car's capabilities which is otherwise unobtainable, and thus any necessary adjustment so as to give the best results is facilitated.

AN AUTOMATIC CELLAR DRAINER.

It is often necessary to drain or pump the water out of cellars or pits which are below the level of any available sewer. A simple device for this purpose, which is entirely automatic in action, is based upon the fact that a high-pressure jet of water, or steam, in a larger pipe than is necessary to contain it, creates a partial vacuum which may be used to raise water. Usually the jet is arranged to enter at one end of a horizontal T-piece, in which case it passes across the mouth of the vertical pipe forming the leg of the T. If the lower end of this pipe is immersed in water, the pressure of the atmosphere will force the water up it to fill the partial vacuum caused by the jet. In the T the jet ejects the water through a discharge-pipe which is attached to the opposite end. It is only necessary to connect the jet-nozzle to a water main, and to provide suction and discharge-pipes. With a water pressure of 40 lb. per square inch, the water from a sump can be raised 9 feet; with double the pressure, the lift is increased to 18 feet. This simple device would work quite well as described, but it would be very wasteful unless some one was in attendance to turn off the water when the sump was empty. To overcome this difficulty, the control-valve is operated by a float. The complete device consists of a cylindrical strainer, with holes round the periphery, mounted on legs to allow of sediment accumu-

lating in the bottom of the sump. After passing a foot-valve, the water is drawn up the vertical suction-pipe to the T-piece, at one end of which are the jet-nozzle and the control-valve, the latter being opened and closed by a copper float. A hole in the centre of the float enables it to slide up and down the suction-pipe as a guide. The top of the float is connected with the valve-lever. At the other end of the T is the discharge-pipe. All parts, except the strainer, which is of cast-iron, and the copper float, are of brass, and the working parts, except the float, are above the water. Four sizes are made, the smallest of which will lift 285 gallons an hour through a height of 9 feet with a water pressure of 40 lb. per square inch, or 340 gallons per hour through a height of 18 feet with a pressure of 80 lb. per square inch. The largest size has a capacity of 670 gallons per hour and 1050 gallons per hour for the same lifts, with 40 and 80 lb. per square inch water pressure respectively. These quantities are net—that is, over and above the small amount taken from the water main.

FIGHTING THE MOSQUITO IN ENGLAND.

Although the mosquitoes found in England are not so numerous or so bloodthirsty as those met with in tropical countries, they form a pest at many places along the coastline of Dorset, Hampshire, Sussex, and Kent, while they are by no means unknown in Essex. Such a nuisance have they proved, that a society, known as the 'Hayling Mosquito Control,' was formed in 1920 to wage war upon them. The third report of this body, which deals with the period between May 1923 and May 1924, shows that the voluntary efforts of its members, under the able directorship of Mr J. F. Marshall, M.A., F.E.S., have practically abolished this insect pest from the district. The examination of many thousands of mosquitoes in the control laboratory at Hayling has shown that the nuisance is caused almost entirely by a particular species (*Ochlerotatus detritus*), which breeds in stagnant water which is either salt or partially so. The breeding season extends over nine months of the year, and the range of flight greatly exceeds that of any fresh-water species. Hence these salt-water mosquitoes not only breed in almost incredible numbers, but are capable of becoming a serious nuisance at considerable distances from their actual breeding-grounds. It is only the female mosquito which attacks human beings, and, although a meal of blood is not indispensable for keeping her alive, it is an essential preliminary to the process of egg-laying. The eggs, of which 100 to 200 are laid at a time, hatch out into larvæ, the curious-looking creatures (often called 'wrigglers') which hang head downwards in stagnant water, with their tail-like breathing-tubes just penetrating the surface. The larva changes its skin four

times, and then becomes a pupa, out of which the adult mosquito soon bursts forth. The larval stage is passed entirely in water, the period of growth varying from three weeks to several months, according to climatic and other conditions. Mosquitoes are, therefore, only found in districts where water is permitted to stagnate for long periods of time. The most effective way of achieving permanent success against them is to destroy their breeding-places. This can be done by filling in or draining the breeding-pools, by restoring the flow of water, or by establishing communication with tidal water. Alternatively the larvæ may be killed (a) by pouring paraffin into the water (the oil forming a film on the surface, entering the breathing tubes of the larvæ, and suffocating them); (b) by introducing some chemical substance which acts as a larvicide; or (c) by stocking the water with fish, insects, or other creatures which devour the larvæ. It has been found difficult to maintain a film of paraffin on the surface of the water owing to reeds and wind. The introduction of the White Cross Disinfectant, a form of disinfectant which contains 15 per cent. of soluble cresol, has been found to kill mosquito larvæ in as small a proportion as one part in 30,000. Water thus treated is quite harmless to human beings or animals. Several pieces of stagnant salt water were treated last year with the disinfectant specified, the strength used varying between one part in 8000 and one part in 16,000. In each case entire success was achieved, not a single mosquito larva being found alive after the water had been treated. Laboratory experiments show that the larvæ can be killed by as low a proportion as one in 48,000, and even this is not considered to be a limit. This useful work by the Hayling Mosquito Control, which is carried on mainly by voluntary subscriptions, has been recognised by the Ministry of Health by a grant of £100.

A SMALL PORTABLE LISTENING-IN SET.

It is impossible to take the ordinary listening-in set on one's journeys because of its bulkiness and the unwieldy character of even a coil aerial. This difficulty has been overcome by a portable instrument which is entirely self-contained. What the makers claim to be the most sensitive and compact portable receiver which has yet been devised measures 14 inches by 12 inches by 8 inches, and weighs only 16 lb. The various instruments making up the set are contained in an oak cabinet with a hinged lid. The aerial is wound in the lid, and makes a complete circuit, so that no 'earth' is required. With this aerial and a loud speaker, a range of from 20 to 25 miles is obtained, but stations at much greater distances can be heard with the head phones, while with an outside aerial, for the connecting of which provision is made, any

range up to 1000 miles is easily possible. The high-tension battery is of the dry-cell type, which will last from eighteen months to two years, while the unspillable low-tension accumulator will work for 30 hours at a cost of one shilling per charge. It is claimed by the makers that this receiver is only about one-half the size of any other portable set, while the range is considerably greater. Another advantageous feature is that, instead of using inductances, which involve loss, electrostatic devices are employed that give the fullest possible control, being in fact much more delicate than the magnetic arrangements for producing similar effects. Although the range claimed for this receiver with a loud speaker is only 20 miles, and 50 or 60 miles for head phones, the instrument when fixed in a passenger train at Southampton has enabled those on the platform to listen-in to a concert in London; while Bournemouth transmissions have been reproduced on a loud speaker in the Channel Islands. The wave length can be extended indefinitely from 330 to 30,000 metres. This instrument was used in the magistrates' court, at the Guildhall, London, at the time when the King was opening Wembley, and those in the court were astonished to hear the King's speech clearly without any aerial other than the small coil in the lid of the box.

EAR-TRAINING WITHOUT A TEACHER.

Music students engaged in ear-training for examination and other purposes are often handicapped by the absence of a teacher or an obliging friend to do duty at the piano and strike notes and chords by way of aural tests. Self-help in such cases is apt to be a delusion and a snare. Even if one resists the temptation to look at the notes one is striking, the relative position of the fingers enables the self-tester to guess intervals when these should be identified by the unaided ear alone. To overcome these drawbacks and permit students to practise ear-training without the presence of a second person, an ingenious set of three aural test-triangles has been devised. Made of thin mahogany (varnished or unvarnished), these triangles have a hole in the centre and two or three tooth-like projections on each outside edge. The projections serve as fingers, and are differently spaced on each side of each triangle in such a way as to allow the student to strike different intervals and combinations thereof without the sense of touch or that of sight coming to the aid of the sense of hearing. By passing the thumb through the hole in the middle of the triangles, and using these singly, reversed, superimposed, or one in each hand, the practiser can press gently on the white keys with first one edge and then another in turn, producing all manner of intervals, chords, and their inversions. The answers to the self-imposed tests can then be confirmed or corrected by studying the edge or edges in con-

tact with the keyboard, useful annotations and directions being printed on the triangles. For beginners there is available a satinwood 'tortoise' which will strike intervals in the same way.

A NEW POCKET CALCULATOR.

When large numbers of calculations have to be made, an instrument known as a slide rule is often used. In its simplest form it consists of a rule about one foot long, in the middle of which is a slide. Where the edges of the slide are in contact with those of the rule anti-logarithmic scales are marked, these scales exactly matching when the slide is closed. By setting the slide from one figure to another all kinds of arithmetical calculations can be made rapidly, the answers being read off the scales. Sometimes the scales are marked on the peripheries of discs, which slide round against fixed ring scales, the instrument resembling a watch with a face at each side. With such short scales it is easy to understand that the markings must be very close together; hence the results are never absolutely accurate, because of errors in setting and reading, if not in the marking. It is clear, therefore, that the longer the scales the greater the accuracy. A big instrument with the scales marked in a spiral on a cylinder has been available for many years, but it cannot be conveniently carried about, as is the case with the rule and watch types. A smaller cylindrical calculator has recently made its appearance which has a scale 66 inches in length. Each division is therefore $5\frac{1}{2}$ times the length of one on the ordinary slide rule; yet the appliance will go into a pocket. When closed it is $1\frac{1}{8}$ -inch in diameter, and 6 inches in length. It consists of a small tube marked with a spiral scale, which slides and turns within an outer tube having a similar scale marked upon it. A third tube, marked with an arrow at each end, slides upon the outer one, and serves to connect the two scales. The tubes are of brass, the whole appliance is handsomely finished, the results obtained are correct to four significant figures, while the price is low.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

DREAM VALUES.

By DOUGLAS NEWTON, Author of *The Mountainous Mr Neuburg*, &c.

PART I.

I.

'THIS one still unconscious,' said a voice.
'I'll go through his pockets,' said another and very weary voice. 'Must get the list on the wire.'

Martin Romanes felt hands upon his body, turning him. Hands searched in the breast pockets of his coat.

'Trustring,' said the weary voice.

There was a pause, in which papers rustled. Then the first voice said, 'Edgar P. Trustring?'

'That's it,' said the tired voice. 'E. P. Trustring. Here's another envelope, though—' 'Edgar P. Trustring.' Tick him off. What was his cabin?'

'Half a minute.' More rustling papers. 'Here we are. Stateroom 54, E deck. He was in there with another fellow, Martin Romanes.'

'What about Romanes?'

'Haven't found him yet. This chap may be able to place him though, among the dead. This feller'll come to presently; he ain't so badly hurt.' The voice went on slowly, as though the speaker was writing. 'Edgar P. Trustring. That closes the list of survivors, Jim, doesn't it?'

'Yes, that's the lot.'

Martin Romanes opened his eyes and saw two men about to walk away. He knew them to be stewards of the *Tapajos*, and he guessed their business. He ought to correct the mistake they had made. He could not. He felt too weak and tired.

But his wits were clear, if his will was weary. He knew, for instance, that he was lying in a freight-shed full of strange, tropic, spicy smells. He knew that outside the warm, still gloom of the shed the tropic sun burned like a steady fire. And he knew why all this was.

He was a survivor from the wreck of the *Tapajos*, which had been rammed by a Mexican oil-tanker in the midst of a Caribbean hurricane.

He could remember it all. The hurricane had punched down on them about eleven o'clock of the day after they had left New Orleans. The tanker had got them somewhere in the small hours, just as the blow was tailing off. He had got off in a boat, and had been picked

up by a 'sponger,' with, he thought, most of the others.

But he wasn't Trustring; he was Martin Romanes. He remembered the last he had seen of Trustring with a touch of cynical superiority. Trustring had panicked when he heard the crash. He had bounded to his feet, for both of them had been flung from their bunks, and, in pyjamas, had snatched a life-belt and bolted like a scared hen through the door and away.

Martin had dressed. He rather gloried in his stoic calm. With the deck kicking and hiccuping under him, he had fished his clothes from the tangle into which the collision had flung everything. It had been easy, for the light had not failed until he was putting on his waistcoat.

And easy, too, because, actually, he did not care what became of him. Without doubt, that was the thing behind his calmness—he didn't care. Even, he remembered muttering, 'After all, perhaps this is the way out.' He didn't mind if he were killed. If it happened it happened, and there would be an end to all their troubles—his and Silvia's. When the light went out he had picked up his coat, reached for a life-belt, and with easy steps had walked along the reeling alley-way to the deck.

II.

As he thought of this in the freight-shed, he half-raised himself, looked at his arm. He saw why the stewards had taken him for Trustring. He had put on Trustring's coat in the dark.—They had found Trustring's papers in his breast pocket.

He thrust his hand quickly to the false belt that made part of his trousers.—No, he hadn't made a mistake there. They were his trousers, and the five thousand pounds in notes bulked under his fingers.

On deck there was a wildness of wind and sea—or rather of sea only, for the wind had vanished as suddenly as it came. Somebody had thrust him into a boat, and there had been an interminable hell of tossing about, of shipping water, of baling. Then the sponge schooner had driven out of the spray, and they had been hauled on board. He'd been knocked insensible

then. He had been swung against the ship's side. . . . And here he was in the freight-shed, apparently quite safe, and the stewards were taking him for Trustram.

He must really correct that. They would telegraph that Trustram had been saved, and raise false hopes. . . . But, no, that wouldn't matter. He had only spent a few hours with Trustram, but the fellow was the sort who told everything about himself on the shortest possible acquaintance. Trustram, he remembered, was alone in the world, an orphan and a bachelor, and without friends.

He, Martin Romanes, was nearly as lonely, but he had Silvia. And of Silvia all he could say was, 'This will solve things—this will be a way out.' If he were dead—reported as dead—she could begin again, marry again, make something of the life they had both spoilt so utterly.

He knew quite definitely that he had failed Silvia; that they had both failed. They had, he supposed, married too young, before they had steadied and settled, before they had realised the difference between their ideals and their interests.

He had met Silvia in his last year at the university. She was a bewildering bundle of daintiness and temperament. She had appeared to him vivid and eager with life; she seemed to want to snatch at life, to do things with it—big things. And because he was like that too, young, ardent, anxious to put his shoulder to civilisation and push progress a little faster, they seemed to come together, and to go up in marriage like an inevitable flame.

And then the rift came—how it began he didn't quite know. Was it, after all, that her idealism was a phase, merely a sort of modern pose, or had he, as she said, choked all her high aspirations out of her? Was it that they had failed in their ideals, or merely come to grief over methods?

The latter, he thought. She was all for hurrying things on, all for making the world anew at once; she wanted to begin right away, even in the middle of the honeymoon. He had had to check her. He had told her that reforms could not be handled like that. To do any lasting good, one's plans must be sure and sound.

So, because he had insisted, they had shelved a fine but sketchy scheme of Co-operation on her estates and in his factories, and had gone out into the world to get sound experience. Out of that friction there had grown his certainty that her interest in these big things had been merely superficial, that it could not stand wear and tear.

Gradually she seemed to become more absorbed by the smart, vivid, gay life in which they naturally moved, and when he came to lay his well-developed ideas before her she had either a dance or a party that took her away, or she was indifferent, or she was quite frankly bored.

From somewhere about this point dated their

drifting apart, their estrangement, he taking refuge in his sober circle, she in her rather fast set. Then came the quarrels, his protests against her dubious companions and their forcing-house pleasures, against her continual absence from his side. At last, inevitably, the grand explosion, with his striking out into the world to travel aimlessly. He wanted to escape the sense of complete crash, of utter failure, to drug himself by movement and constant change. He had never succeeded.

Silvia was all right without him. She had her own income, and his settlements. That was all she cared about—the means to enjoy herself. His presence was not merely unnecessary, it was irksome. She ought to be mated to her kind, to be married to a gay butterfly man. He prevented that.

He sat up in the freight-shed, nursing his knees with his arms. He *had* prevented that—he wouldn't any longer. He would be dead; she could marry again.

He felt certain that the real Trustram was dead, and that he could take on the fellow's name and status. And since he had taken on Trustram's name, somebody must be dead to make the thing fit. That somebody would be Martin Romanes. Martin Romanes would be reported dead, drowned in the wreck of the *Tapajos*. Silvia would hear; Silvia would be free to marry one of her kind.

III.

Almost impatiently he stood up. He wanted somebody to come and find him well enough to identify the dead.

As for himself—well, he could manage. Perhaps, even, it was his chance of doing things. He could take Trustram's place. Trustram was going out to South America 'on spec.' He had ideas about the development of cacao and the utilisation of the *urucu* plant in the dye industry. Well, he, Martin Romanes, could follow up the idea. He had a capital of £5000. He could do something with that. He could begin again, build up, do something big, maybe—maybe find his life's work.

Half-an-hour later he stood before a battered figure in the rags of pyjamas.

'Yes,' he said evenly. 'That's poor Romanes. He rushed up on deck at the first sounds of the crash. Yes, there's no doubt that is Romanes.'

The wires recorded what he had said, and next day in her home Silvia learned that her husband had perished in the wreck of the *Tapajos*.

IV.

Martin felt release. All that had seemed fettered until now was freed, and he felt strong with an irresistible power and assurance. He could do things, he *would* do them. He was going to put into the future all his ideals, all the pent-up energy of years.

He had a very settled plan for creating the perfect estate. He had it all cut-and-dried. He would bring into being a plantation that would stand for all time as a model of what plantations must be. He'd show how human brains, with the human heart inspiring them, could do wonders.

But, of course, he would have to study conditions.

He studied them during six months all along the coast, from Cartagena to Para. He drifted in indolent fashion, feeling that there was a good deal of wisdom in the Latin 'To-morrow,' absorbing, as he said, facts and practical politics in scores of American and English clubs, on planters' stations, and even in cafés.

It was unwise to hurry a matter like this. Only—well, only Silvias rushed in where solid men trod carefully.

He picked up bales of facts, mainly unsympathetic towards his ideals ('You can't work out ideas like that with Latins, half-breeds, and Barbadian niggers,' was the attitude), but he was the sort to keep the hot flame of his enthusiasm undimmed, and, though he gained wisdom, he was not turned aside. And it wasn't a bad life either; gentle, indolent, full of attractive acquaintances and good-fellowship. To a reflective and observant nature such as his it was an idyllic existence. He might have gone on with it, drifted serenely, gathering valuable wisdom all down the coast to Rio, had he not overheard something in the club at Para.

Hidden in an alcove, he heard a group of men talk of him. It was pleasant, at first, to listen, because they all obviously liked him as a good sort. Then one of them, one of the shrewdest planters of the area, said abruptly, 'But there's nothing to him, of course. Just a drifter.'

'Oh, but think of his mighty plans for the regeneration of planting,' said another, and he said it with a grin. There was also a general laugh.

A cynical man said, 'Oh, well, we *all* feel we must have some excuse for existence. And that's his. He can have all the thrills of a world-worker without any of the labours. It makes him feel that all the hours he spends cosy in an arm-chair are really tremendously significant.'

'Queer thing, isn't it,' said another, 'how these spineless, driveless fellows manage to hypnotise themselves into the feeling that they are wonder-workers? To hear him talk makes you feel that Cecil Rhodes and Goethals are just trying amateurs beside him.'

Martin Romanes, or, as they knew him, Edgar Trustram, slipped away. He was almost angry—not really angry—for, after all, they were fellows of common clay; they didn't understand. They were fit members of a stupid world that demanded immediate results—always

immediate results—furious activities. They reminded him of Silvia. She'd had just that attitude, she must do things—'Now.' She couldn't wait for plans and wisdom to mature . . . and see how she had drifted away from their ideals!

No, he was not really angry, but he was hurt. Hurt enough to feel that he would like to 'show them' what he stood for. His first impulse had been to catch the next steamer down the coast away from this coarse-grained place; but as he sat in his room, and each rankling word and grin came back to him, he felt stirred, he lost his reflective calm. Yes, he ought to show them, he really should demonstrate to them.

An examination of his purse decided him that he would. It was surprising how his money had dwindled, although he could swear he had spent practically nothing. He had only £2800 left. Of course, he was a rich man in his own right, but, as he had killed himself so that he might be free as Trustram, he couldn't touch his money—well, not yet.

He sat and thought things out. He'd heard of a fine piece of land, above the flood-mark up-river. He could buy it at a ridiculous price and work it cheaply—it would be well within his means. He could, in fact, clear expenses in the first year's yield—that was the beauty of this rich country. The 500 hectares at Pijos would be just the thing for his experiment; it was part planted, there was water-transport—every advantage. He had his scheme well enough defined to start now, and with a fine gesture.

v.

A week later he said, smiling on the same group at the club, 'I'm going to begin work up-river within the week. At Pijos.'

They were a little taken aback, as men faced with their intellectual superiors are taken aback when they hear their decisions, but quickly they were talking.

'What, taken the old Tembe station? That's splendid. That's fine land; you ought to do well.'

'I think I'll do well,' smiled Martin.

'Not much trouble to work either. You've taken the whole 500 hectares?'

'No,' said Martin, with his wise smile. 'I've only taken 100 hectares. You see, I mean to go slowly, solidly, carefully.'

They looked at him blankly. One said tersely, 'But that's only fooling with things. You can't make it pay its way with only 100 hectares.'

Martin smiled again. It really was delicious. He could not forbear reading them a lesson.

'That's because you want big returns—in cash. You are looking at it your way, you see. I'm looking at it in mine—and, if you'll allow—a rather more far-reaching way. This is merely to be the nucleus. I'm going to start in

what means a small way to you, but it will be a sound way. I'll get my scheme grounded solidly. Then gradually I'll expand. The thing will grow outwards, you see, until, well—'

He stopped, stared above their heads dreamily, the soft, splendid glance of a visionary. He saw all Brazil, all South America . . . all the world gradually being swallowed by the gigantic expansion of his scheme.

Afterwards the big planter took him aside. 'It's none of my business,' he said, 'and I suppose you can afford to mess things up—but, well, that's what you are heading for, a bad mess up. You can't possibly make this a going proposition.'

'Perhaps your and my ideas of a going proposition differ,' smiled Martin.

(Continued on page 727.)

WHITE FISHING ON THE CAITHNESS COAST.

By N. M. GUNN.

I.

A COLD wintry morning with a heaving lift in the sea; a sky banked by massive clouds that lower threateningly; a small wind from off the sea with a cutting edge to it; now and again a spot of rain stinging the face. Standing near the point of the old cement pier, one feels there is little romance in this business of going down to the sea in ships—little romance, but plenty of cold, uninviting danger and even more of bitter, hard work. Against the break-water that forms the opposing wing of this narrow inlet on a wild, precipitous Caithness coast, the long roll of the sea smashes itself to froth, but without warmth—even of passion. The most characteristic quality—a relentless, encompassing, sucking cruelty—is exhibited with such deadly indifference that one feels, in a shuddering moment, that if an army of men were drowned there before one's eyes, the insatiable green water would not pause even to lick its chops.

So it breeds the hardy race of men who, as the school-books teach, have had no small hand in making 'our island story.' Running in on the wind—they are favoured to-day—the brown sails come from the 'haddie ground.' Small boats these, undecked mostly, that pitch and toss like corks on a turbulent river. We wait for the first one to make the narrow opening. Straight on the pier-head she comes, with a certain gallant indifference that mocks the sea and raises a spark of warm admiration in the cold watcher. Now she is at hand, heaved to the crest of every wave, sent sprawling to its trough, but coming, always coming, nose to the pier. At the right moment her head is eased off, she gets the last kick from the wind, and as the block tackle rattles and the traveller slips down the mast, she glides safely alongside the quay.

There is a gathering of folk. Questions are asked and casually answered. 'Ay, there wis a bit lift in id the day. . . . Weel, aboot three baskets o' haddies an' a basket o' blockies [codling]. . . . They're gettan scarce.' No more. There is none of the enthusiasm or the despond-

ency of the amateur fisherman here; merely a grave, unemotional attitude born surely out of the element with which these men have been in such close contact since first they 'traiked off' as callow school-boys to the cold 'ebb' for a 'baiting' of mussels.

The catch is thrown, each according to its kind, from the open hold into a cran-basket (four such baskets filled with herring make the measure of a cran) and heaved on to the quay. Two of the crew carry it to the little curing station, where the local fishcurer is prepared to receive the contents and deal with them in the most profitable way. Haddock, whiting, cod, codling, coalfish, flounders, and a few odds and ends, from crabs to starfish, make up the catch.

Primarily the fishcurer wants the haddock. But if a boat sells him its total haddock catch he must be prepared to take the codling too. In creeks such as this one, where a direct daily service with the southern markets is not possible, no matter how early the fish be landed, and where, in addition, freightage charges constitute an almost prohibitive burden, the industry in despatching fresh fish is small; for haddock arriving on the market two days old, after having been shaken to a soft, sticky appearance over a long journey, do not command the same sale or price as fish brought to market a few hours after being landed. Codling, however, are despatched in boxes without ice (there is none available), and the curer states he is satisfied if he can realise a price sufficient to cover all his charges—though it may confidently be added there is not infrequently a small margin of profit as well.

II.

However, the fish is the haddock. And already I notice four or five women entering the curing-shed. They have oilskin aprons on, and are obviously ready for their work. The little boats come in one by one—five in all—and the total haddock catch is soon piled up on the benches. The women are now busy gutting, splitting open, and scrubbing the fish in the sweetest (and coldest!) of spring water,

preparatory to the interesting process of turning a fresh haddock into an appetising 'finnan.' In many places on the Scottish coast 'smoking haddies' is an important industry, but it can readily be understood that nowhere is its importance so vital as where freightage charges and distance from the markets severely handicap the marketing of fresh fish. In passing, a word may well be said about this industry, though a special article would be necessary to give an adequate outline of its history and of its processes.

The name finnan is popularly believed to be derived from the little village of Findon, on the coast a few miles south of Aberdeen, though authorities seem to agree that finnans were first cured 'near the Findhorn.' Altogether the controversy is somewhat obscure, especially to those old curers and fishermen who have followed the industry on the Moray Firth. However that may be, the making of the true finnan in the fishing-villages south of Aberdeen was at one time a simple and homely industry, as so many of our old Scottish industries were. The young lass sat by the peat fire knitting. Whilst watching that the fire did not go out she had to be equally careful that it did not blaze up in 'lowes.' In the latter case she damped the flame's ardour with a handful of sawdust. The 'lum reek' did not go straight up the chimney in the ordinary way; instead, the 'lum' or 'chimbley' itself went slantwise across the gable wall, and in its course passed through a specially built cupboard, where the haddies hung by their ears to spars with bent, nail-like hooks. These homely scenes, with whatsoever of human romance entered into them, vanished, as the handlooms vanished before the mills. Now along our coast special curing-sheds deal with quantities of fish not by the cupboardful but by the ton.

Moreover, nowadays the astute nose of a Glasgow or Edinburgh fish-dealer may not be easily deceived. He opens a box of finnans and takes their bouquet. 'Peat!' he will sniff disdainfully, if no wood shaving and oak sawdust have gone to the smoking process; for it is the oak that gives the true and delicate flavour to a smoked haddie. And there are degrees of flavouring. To those who know only the full body of the 'dark-browns' one word of advice: Try the 'light-pales'! Roughly, the light-pale stage is reached thus. After the fish have been finally cleaned and split they are dropped into a tank of brine for about an hour and a half. Thence they are picked out, graded, and pinned by the ears to those thin spars bristling with their rows of nail-like hooks—'tenterhooks.' When they have been in the smoke long enough to get their tails dry they are about ready.

The rest of the catch, from whiting to the possible crab, is shared out amongst the crew

for home consumption and for the selling of 'six-pence-worths' to neighbours. But the crab! What a centre of interest to the young of the family, from its powerful claws, its propensity for crawling below kitchen dressers, to the final feast, and the use of the big toes by the very young men as pipes for illicit smoking of 'foug'—that sort of shag produced from rolling and teasing out a piece of mossy peat!

III.

Meantime, the fisherman's day is not done. He has been at sea since the wee sma' hours, for he is one of those who perforce recognise a very literal tide in the affairs of men. All through the bitter cold of the early morning he has been heaved about in the frail shell of his 'small-boat.' Now he has to set about preparing for the following morning, for while the weather lasts every hour is precious. And the preparation of the 'small-line' is the nightmare of all fishermen's lives, ay, and of the lives of their wives and families as well. Each fisherman—and there are almost invariably four or five fishermen to every small-boat—has his small-line, and each small-line for every outing has to be cleaned, baited, shot, and hauled. When it is remembered that a small-line carries about 600 hooks hanging at regular intervals, about a fathom apart, to a correspondingly tremendous length of supporting back-line, the amount of toil involved may be dimly grasped.

So he sets off home with the 'skoo' (a basket specially designed for holding the baited line) hitched across his back, and the prospect of a cold, busy afternoon looming up in front.

After 'denner' the work begins. The fisherman himself, on a wooden chair out by the back-door if the weather permits, otherwise in the stone-floored kitchen, settles down to the task of 'redding the line.' This consists in running it carefully from end to end through the fingers into an empty cran-basket, cleaning each hook as it comes along, and with a dexterous loop and twist burying its barb in the 'tipping,' which is made of home-twisted strands of horse-hair, and which takes the place of the trout fisherman's gut. In the business of taking a 600-hook line from the sea, laden with fish, crustaceans, molluscs, and other strange things of the deep, the marvel to the casual observer may well be that the whole line is not in a hopelessly inextricable tangle. Sometimes, indeed, there is confusion of knots and twists—'raivels'—and hooks have to be followed through a perfect maze of intersecting coils, but with a good stiff pipe of 'bogie roll' going full blast after a warm, satisfying meal, the patience of the fisherman, at all times great, now seems to be inexhaustible. Hook after hook is fished out, and bit by bit the line passes, smoothly coiled, into the cran-basket. When it is considered that at the rate of even four hooks a minute the whole task would take about two

and a half hours, its arduous and painstaking nature may be understood. Moreover, as happens frequently enough, many of the hooks have been torn from their tipplings. In such a case the tipping is threaded through the basket, to hang outside until such time as the line has been 'redded' and the 'baiting' is in view. Then a new hook is 'bisked' on with strong thread to the old tipping, or, if the latter has been badly torn, a complete new tipping with hook is affixed.

IV.

The line redded, the next question is the getting of bait. Mussel bait is best, though limpets are used when mussels are not available. The limpet, however, is a poor substitute, even when boiled, and it is usually boiled both to soften the bait and to make the 'shelling' easier. (After boiling, it can be easily gouged out with a thumb, but if raw it has to be scooped out with an empty limpet shell, and this is a difficult art, requiring much practice before facility is gained.) If the fisherman has a family of helpers, he will find himself in the lucky position of being able to send one of them to the 'ebb' with a bag to bring home sufficient mussels for a 'baiting.' Unfortunately these mussels are not naturally available on this rocky coast, and have to be 'imported,' generally from Tain, Leith, or England. Those from the Dornoch Firth, near Tain, are dredged from the bottom, are not riddled, and consequently hold on to enough of their native grit and byssus to permit them quickly to anchor themselves when laid out in beds on a suitable tidal shore (the 'ebb'). Those from elsewhere are generally riddled smooth and clean, and are stored in bags within the tidal harbour-basin itself.

When sufficient mussels have been dug and plucked from their bed, or simply taken from the sack, the youth hurries home with them. Now begins the shelling process, one in which an astounding degree of proficiency can be, and is, attained. With a sharp knife (the 'corkag,' made for the purpose) the bivalve is cunningly split open, broken over in two, and the bait scooped out plump, whole, and juicy into a bowl. So quickly does the knife work in experienced fingers, that it all seems easy as shelling peas—until tried! And efficiency is never sacrificed to speed, for the bait must reach the bowl perfectly whole and never torn or ragged, otherwise when the head of the house is baiting there will be gentle remarks to make young ears tingle. For it is a point of honour with each fisherman that his line be perfectly baited—slovenly work is a thing not to be borne.

And soon the redded line begins to coil back again into the skoo. As each hook comes along, it is unwound from its tipping and cunningly hidden in a soft, luring mussel-bait. Side by

side in rows the baited hooks are placed, the back-line being curled in behind. All must be done with very great care and precision, so that in the darkness of the following morning, when the small-boat is again tossing to the cold sea, the line may run out, bait after bait, without a single hitch. And when the last hook is baited, and the fisherman, straightening his back, looks at the clock, he finds the following morning is indeed but a very few hours away.

V.

It is a strenuous life, though interrupted all too frequently by stormy weather—and long spells of stormy weather mean poverty. A brave race of men, with quiet, undemonstrative ways, inured to the hardships of life, and tempered to a fine self-reliance by the ever-lurking danger in the restless sea. All their lives long they have known only the sailing-boat, and now, in face of the concentration of the fishing industry in a few big ports, such as Wick, Fraserburgh, Aberdeen, and of the general introduction of steam and motor power, they are a vanishing race. Even to-day it is one of the saddest things on earth to wander down to their little harbours, and to feel the silence hanging about everything like a shroud; the cooperages with gaping windows and roofless walls, the jetties crumbling, the lonely, cavernous crying of the gulls, the few small-boats even emphasising the loneliness, where once, in the season's height, 150 two-masted herring-boats thronged, 'mid a life pulsing with the thousand and one energies of a great industry. To many a mind not yet past middle age, how memory will recall the hum of life that was there: the chant to the creaking halyards as mast or sail went aloft, the gay, stirring sight of the fleet, one by one, negotiating the narrow entrance, the children's voices, the clank of the coopers' hammers, the herring-gutters with their gay chatter and incredibly dexterous fingers, the guttural Gaelic voices of the hired men from the Lews ('Lewsachs'), the endless coming and going, the glamour and glow of abounding life. It is hard to have to write it, but all has gone gray, and the sadness is inexpressible. Only the sea pays no attention, but day by day, with cold indifference, eats a little more of the cement, loosens a stone here, a stone there, slowly undermines a jetty till it sags with the decrepitude of decay.

POT POURRI.

ROSES gathered long ago

While the summer days were bright,
Breathing sweetness, though the snow
Falls in silent flakes to-night.

Thus do happy memories last,
And the heart with pleasure fill,
When life's sunny hours are past;
Like these roses, fragrant still.

E. MATHESON.

TRAVELLING IN 'PERSIA.

By Lieut.-Colonel Sir WOLSELEY HAIG.

I.

GOOD health, the placid temperament which ignores discomfort and the lesser hardships, patience, tolerance, and the love of seeking 'strange strands' are the proper equipment for the enjoyment of travel in Persia.

Here are no railways; here is no stepping into a cushioned carriage to be whirled in the course of a few hours, divided between repose and the absorption of food, drink, and the lightest of current literature, to a distance of hundreds of miles. Motor-cars run on two or three chosen tracks as yet ill-fitted for them; a decrepit carriage may be hired at great expense, and in this the traveller may be slowly jolted over a rough and stony desert by four horses harnessed abreast, but at the cost of a bruised body and lacerated feelings, for the lameness, sores, and the galls of the poor jades which draw him will wring the withers of his soul. Only imperious haste should persuade him to travel by post-carriage; but haste is of the devil, as says the Arab, and the philosopher will travel by caravan.

Not a glorified gipsy van with every necessary and most luxuries cunningly stored into the smallest possible space, but a string of pack-mules. The traveller himself will mount a horse, providing his own saddle, for the Persian saddle is a seat at once painful and insecure. The sturdiest mule will carry his cooking pots, his samovar or Russian urn, his small stock of provisions and creature comforts, and his servant perched on the load.

Thus furnished, let the traveller set out, neither in the summer nor in the winter, for—though Persia is not, as some believe, a tropical country—the heat of summer, endurable within doors, makes journeys a purgatory, and the winter is bitterly cold. The climate in spring and autumn is hardly to be surpassed in any part of the world. It is dry and bright, warm, but not oppressively hot, and the exhilarating air is so clear as almost to annihilate distance.

Both scenery and atmosphere differ widely from anything to be met with in the British Isles. The cool gray skies, soft moist air, brown heather, and refreshing verdure are exchanged for a brilliantly blue cloudless vault, intensely dry atmosphere, and a grayish-yellow plain, with naked hills ever changing in hue as the sun moves on his course. Persia is, in fact, one vast desert, dotted with oases large and small, the former its towns, the latter its villages. Here, and in the glens, watered by streams in the higher hill ranges, are verdure, trees, and tillage; elsewhere the country is barren for

want of water, and the desert herbage, wild rue, and camel-thorn lend no colour to the scene.

II.

A dreary prospect for the traveller, some will say, but much depends on the traveller. Let us go with him. As he is not in a hurry, there is no need to rise before dawn, and six o'clock will be early enough to turn out. A bath, or at least a wash, is the first thing we think of, but there is no time for a bath, and on this occasion it is better not to wash even the face. The natural secretions of the skin protect it from the ravages of the sun and wind, and should not be disturbed immediately before a day's march. The precaution is unpleasant, but there are said to be fair women who have not washed their faces for years. The traveller should not, however, imitate them in their use of unguents, for if he greases his face the sun will fry it. The wash is but postponed to the evening, when there will be dust to remove.

By the time that the traveller is dressed his breakfast of tea, Persian bread, and eggs, sardines, potted meat, or some such 'kitchen,' should be ready. The bread, which comes from the baker's oven in large flaps, is excellent, but the butter of the country is not recommended, for the strong, rank flavour which appeals to the Persian palate is apt to turn a western stomach.

After breakfast there will be time for a pipe or a cigarette while the mules are being loaded, and it is advisable to await the end of this operation, and to let the caravan set out before mounting, giving it a start of a mile or so, because it is seldom safe to be far distant from one's luggage in a land where gentlemen of the road work in companies, and it is unspeakably wearisome to ride constantly at a foot's pace beside the laden mules.

The day's march, as we are in no hurry, need not exceed twenty miles, and at some point on the road it will be pleasant to indulge in a light lunch of bread and cheese, or hard-boiled eggs. The muleteer may know of a likely spot, or one may be descried from afar. Towards it the traveller, followed by his servant on the sumpter mule, will make his way at a trot, leaving the caravan behind, and will dismount under the shadow of a great rock, or a tree, or, it may be, in a post-house or a caravan-serai. Here he may take his ease, allowing the laden mules to pass, and, when he is rested and refreshed, he will overtake them, leaving them behind him once more as he approaches his destination, where he must seek a lodging.

This may be one of the fine caravanserais built more than three centuries ago by Shah Abbas the Great, and now falling into decay, but yet providing the stranger with a roof and some degree of privacy, which is all that he will require in such a climate; or there may be a post-house, where he will find an equal degree of comfort. Failing caravanserai or post-house, he must rely largely on the address of his servant for a night's lodging. A well-to-do family may be persuaded to vacate a room or two for him, or, if he is specially fortunate, he may occupy the garden-house of some rich absentee. This is the most luxurious lodging of all; the custom of the country allows him to use it, not only without permission, but without even acquaintance with his absent and unconscious host; and the only return which he need make is a small gift to the gardener, who will usually earn this reward by ready assistance in obtaining such provisions and fodder as the village affords.

A lodging having been obtained, the servant will soon have some tea ready, and after the tea a wash, a saunter through the village, and some conversation with its inhabitants will fill the time until a simple dinner is ready; then a pipe, and a book, or the diary, until drowsiness warns the traveller that it is bed-time.

III.

This, slightly varied, will be the daily routine. Occasionally the path may lie through defiles, gorges, and narrow glens, where the roughness and difficulty of the road will be counterbalanced by verdure fringing and trees overhanging a mountain stream—a welcome relief from the drab monotony of the desert. When he is less fortunate the traveller may find himself faced with one of those apparently interminable stages which lie across a great dip in the desert, so that he may keep his eyes fixed, almost throughout the long day's march, on his goal, perched on a hill-side or some rising ground.

Sometimes a long march, say of thirty or forty miles, must be made, owing to the scarcity of suitable halting-places or the necessity for avoiding the haunts of brigands. At such times the traveller must be stirring betimes, and, if he is in the saddle before the night is past, he will see the wonderful dawn of the desert.

The darkness is first broken by the false dawn, when 'the wolf's tail,' a gray light, sweeps across the sky. This fades, and the world relapses into darkness until, within an hour, the true dawn appears. The pale light of the sky is first reflected on the everlasting hills, which lend infinite variety to the prospect on the otherwise monotonous highlands. Their dark mass emerges purple from the gloom, and as the earth's blue shadow gradually sinks on the western horizon, and the purple of the hills

brightens into rose madder, and that again into brilliant pink, the gray billows of the desert are tinged with gold. As the sun climbs higher the whole scene is clothed in that blinding grayish-yellow which it will wear until the shadows lengthen again—yet not the whole scene, for the hills retain shifting shadows of blue and purple, and the bright light reveals black rocks, red rocks, and green rocks, and here and there in a clench a clump of trees veiling unseen dwellings of men.

The march will be tedious and wearisome to-day; the traveller, approaching the haven where he would be, will welcome with sympathy the muleteer's suggestion of rest for his beasts on the morrow; and it will not be long after enjoying the glories of the sunset, rivalling those of the dawn, that he will creep to bed.

IV.

Does such a life seem drearily monotonous? That depends on the traveller. He who cannot bear to be alone has two courses open to him. He may secure as a companion for the journey a friend from his own nation; but let him be careful to select a friend indeed, for a *solitude à deux* in the Persian desert is a severe strain on friendship. There was a case of two friends travelling together in Persia who, long before they reached their journey's end, were writing notes to one another at dinner for the salt and the pepper.

The wiser course is to master the language of the country. He who does this need never be lonely. Intercourse with the villagers will give him glimpses of life from an angle to which he has not been accustomed. He will hear of the wonderful power of the evil eye; of the infirmities of the local governor's temper; of the treasure buried under a neighbouring mountain by the hero Rustam, and protected by him with a diamond wheel, which whirls round at such a rate that any laying predatory hands on the deposit would instantly be cut in two; of the sufferings of the robber who was built alive into that stone pillar standing near the entrance to the village; of the *sagtur*, a mysterious hybrid beast of incredible strength, ferocity, and cunning, and of many other marvels. With the sick and the infirm he must be very patient, for the charity of our physicians and the good fortune of a passing layman, who may have chanced to relieve suffering by an opportune pill or dose of quinine, have convinced the Persian rustic that all Europeans are skilled in medicine, and the traveller may be asked for drops warranted to cure blindness of many years' standing, or a liniment to restore a withered arm.

Above all, he must be tolerant of curiosity, remembering that in many respects he is a wonder to those among whom he moves. His umbrageous hat, his indecently short coat, his

strangely cut breeches, the general skimpiness of his attire, his energetic movements, are all wonders. He must bear with those who steal softly to watch him at his meals, for who can forbear watching one who cannot, by reason of the poison which, as every Persian knows, distils from his nails, plunge his hand into his victuals like an ordinary human being, but must arm himself with fearsome weapons, and attack his meat with both edge and point?

On the road he may meet others, and there are few travelling Persians whose conversation is not worth listening to, at least for a time.

Even the servant can tell his master much that he did not know before, and, if the worst comes to the worst, he can cap verses with the muleteer; for this boor, who cannot write his name, and does not even know the letters of the alphabet, may have a memory stocked with masterpieces of the classical poets, and will correct a doubtful reading with assurance.

A journey in Persia affords both entertainment and instruction, but it resembles the study of Scripture, in that he who would gain something from it must take something to it.

‘MARY TRUE.’

By J. E. S. P. BRADFORD.

‘To be a light to lighten our darkness.’

I.

SHE was ketch-rigged, black of hull, slate-gray of sail, and her deck always a litter of trawl-nets and rope-coils, lobster-pots, or the odds and ends of fishing gear.

At first sight you would hesitate before naming her a lady, a weather-worn lady at that, but the white-painted letters of her name, on bow and stern, brought reassurance—*Mary True*. With such a name, could she be anything but a lady?—and a lady she was, from keel to slanting deck, from bowsprit to her rudder of teak wood. But her home and her ways, her means of life and existence, were anything but lady-like. At all times and in all weather she would thread her way, a light-footed gray ghost or a heaving, plunging mammoth, along the winding, sinuous creeks, out through the leagues of sand-bars and mud-flats, following inexplicable channels, till she reached the fairway, where the gray waters of the North Sea broke into white, scudding foam. ‘At all times’—but I am wrong there; her goings and comings followed the will of tide and time and her master for one-half the year; but from October till the far end of February, be the tide what it willed, or the fish however plentiful, she remained at home from dusk to dawn. A strange edict, an edict founded on fear; not her fear, for the *Mary True* was afraid of nothing, but the fear of Joseph Benn, her master. And his fear, be it said, was an impersonal one.

And her home? From Blettering Creek to Wharton Creek, which is three miles from mouth to mouth as the crow flies, there is neither foreshore nor beach, neither sand-dunes nor rocks, to break the sea from the land—only the marshes, two miles broad, that lean seaward till they melt into the gray, fœtid mud or the glittering yellow of mud-bank and sand-bar.

Only the marshes, but if you have not seen them you have missed one of the wonders of

the world. At low tide they stretch green to the eye, here lined criss-cross with queer black streaks, there pock-marked with gray-black speckles; and the streaks are but shelving creeks, black of sides, at times five, at times twenty feet in width and depth, and with evil swelters of ooze hiding their bottoms; and the speckles their younger sisters—grotesquely formed pit-holes, in squares or circles, ovals or semi-circles, some small, some linked up till they resemble miniature lakes, but all alike filled with the same fœtid ooze of gray mud and brackish sea-water, either depthless or shallow as the whim seizes them.

And over all, the green of the marshes, grows marram-grass or prickweed, stunted sea-covered gorse bushes, straggling clusters of sea-weed, and a multitude of sea-grasses and fibres, sinuously interwoven together, whose names are legion. At times they stretch over till they all but cover pit-hole or narrow creek; at times they flourish on shifting mud that sinks at the weight of human step a matter of feet.

They are barren, lonely, and evil marshes, resonant to the shrill call of the curlew, and o’er-topped by darting objects, redshank or tern, godwit or dunling, an all but safe refuge for the wandering shore or sea birds, a more than probable death-trap for the stranger who loses his way there at nightfall. For when the tide turns, the gray flats of mud that are but the sea’s bed cover quickly, the water hurries onward in each and every creek. Still flows the tide, and the winding creeks are brimful one moment, the next the taut line of water breaks, swirls, and eddies over the green top of the marshes. Sometimes it varies, and the marshes are but decked in a bare three inches of water; a gray sheen from which reeds and bushes rear their heads on high, and a pleasant harbourage for all manner of duck. More often than not the ebb commences ere the creeks be as yet quite full, but there are times when the moon and the seasons, or the blustering gales, will it that the

flow of water rises and rises, till the marshes are three feet under their cold, impenetrable covering.

Then is the time when the gray ghosts of long-dead men arise from the waste of waters, and the sea-birds mock at man in insequent derision. Woe betide the person who is caught there in such a time and tide; he must swim shorewards if he wills to live, for the swirl of waters will drag him from off his feet, and the shore is a long two miles distant. He cannot walk; he may flounder perhaps, and from sinking mud his feet will fall into swirling water, the unseen course of a creek, or, surviving that, stumble into the clinging ooze of a pit-hole.

And for that reason the *Mary True* abided at home from October until February, at dusk and at dawn.

And her home? The inky-black sides of a broad creek midway between Blettering and Wharton creeks, midway between land and sea. There she sat, either floating jauntily on the ebbing or the flowing water, or wallowing, her keel awash, in the fathomless mud and ooze of the emptied creek.

And the reason, or rather reasons? From a line square of posts, bordering on the marshes, and on the mud-flats' farthest encroach, the one safe track leads shoreward. It is unseen, and the track is in reality but an imagination. Yet if you steer for the riding-light which adorns the mast of the *Mary True*, there is a line of marsh-land free from pit-holes, uncrossed by creeks, a narrow line, an unintelligible edict of Mother Nature, but, be it said, a safe one; for, as you near the *Mary True*, a bare hundred yards on her sea-girt side, stands the first of a line of black, rotting posts, guide-marks of a long silted-up creek, that stretch four to five feet from out the marshes. These, if you follow them, lead shorewards, winding in and out amidst other new-born creeks, till at length you may scale the bank of tide-tossed silt and garbage that makes the land-girt side of the marshes.

II.

Richard Fortescue always took his stand close to the square posts, always made his way homeward by these guide-marks, and therein lies the essential reason of the *Mary True's* unseaman-like attitude. For Joseph Benn and Richard Fortescue of Blettering Hall, the owner of the marsh, were friends, and therein lies another story, whose gist is the following.

It chanced, in the bygone years, that Joseph Benn was wild-fowling at a spot farther up the coast-line. It happens there that any man may shoot the flying duck or geese, up to the limit of high tide, up to and no farther, for the rest is private property and well preserved. It chanced also that a badling of duck, flying

in from the sea, whirled down and settled in a reed-bound pool, a hundred yards inside the preserved domain.

Is it to be wondered at that, unseen and stealthily as a weasel, Joseph Benn stalked forward and added a brace of duck to his game-bag? Yet the unfortunate occurrence was that the marsh-watchman should catch him, on the wrong side of high-water mark, engaged in secreting the duck in his bag.

In the County Court, where such petty crimes pay toll, and, moreover, where Richard Fortescue held the rôle of magistrate, Joseph Benn was duly tried and acquitted.

At the worst, two sovereigns would have been his punishment, but Richard Fortescue, nodding drowsily to himself, found his interest awakened, agreed inwardly that Benn had done the only wise thing, voiced to the rest of the Bench that it might have been possible for Benn to have shot the duck while fighting overhead, to have gone on to preserved ground to pick them up, with the result as stated. But more than the verdict was the friendship that was born therefrom, for Richard Fortescue would admit of no sport in comparison with wild-fowling, and wild-fowlers are friends all the world over.

It was Richard Fortescue who presented Benn with the *Mary True*, who set him up in his trade of general fisherman, mussel-gatherer, and lobster-catcher. It was Richard Fortescue who offered the *Mary True* her anchorage and Joseph Benn free wild-fowling over his marshes, and hence, is it to be wondered at that Joseph Benn, with *Mary True's* pleased consent, uttered his edict, that was to turn her into a welcome beacon-light; or that he worshipped 'the Squire,' as he called him, with a whole-hearted delight?

And from Joseph Benn's gratitude and reverence sprang his fear. For Benn's home was the *Mary True*, and the *Mary True's* the marshes. A home of ten years' standing, but, more than that, a home brimful of knowledge to be acquired, of fears to be feared.

You may know the salt-marshes superficially, and be able to appreciate their charm and have some taste of their dangers, but you must live amongst them to feel the throbbing pulse of their ecstasy, or shrink from the unseen concrete terror that is their own, and Joseph Benn had acquired both the knowledge and the fear. A haunting, ever-present fear that one dusk the Squire might be caught by tide or sinking mud, by blinding hailstorm or sudden sea-fret, and the swirling, hungry waters lick their lips over a predestined prey.

It was Benn who, by diligent searching, found the one safe track; Benn who, hesitatingly, and in a casual, off-hand manner, voiced his discovery to the Squire; Benn who replied to the Squire's perplexed query—'Nay, sir, *Mary True* and I will be here alway at dusk

and dawn, for why should I bother overmuch if I do miss the tide and the fishing? Surely there be mussels to be gathered, and nets and pots to be mended? Have no fear, sir. Why, we'll act as the 'Green Woodpecker.'

The 'Green Woodpecker,' as all the world knows, is the concrete lighthouse that stands by Bexham Point, whose strident fog-horn, 'Yafool, Yafool,' sends the hurrying smacks and trawlers panting breathlessly towards the fair-way, away from the quickening miles of sand-bars.

And for ten years the arrangement had rung true, till Joseph Benn's fear had all but died out, and the rising light of the *Mary True* had become a permanent fixture in the Squire's calculations.

III.

For October the day was oppressively warm, with a faint off-shore breeze to rustle through the marram-grass and twirl the water into little ripples.

And with the first red tints of dawn the *Mary True* sped seawards, threading her way against a flowing tide, an all-but-silent voyager, with only the frou-frou of her sails and the thresh of parted water at her bows to break the stillness. As she veered into a broader channel amidst the rapidly decreasing mud-flats, for the tide was flowing in, a babbling chorus of voices bespoke her approach, rising crescendo to an uproar, that ceased as suddenly as two thousand downy bodies spread wings, rose, and gained height. Then, their clamorous honk-ahonka renewed, they turned shorewards, heading for the fresh clover-fields of the mainland.

'The geese, William,' Joseph Benn said to the youth who aided him in the *Mary True's* workings; 'but too high for the Squire if he be down there, and I doubt he be not, with this wind.' For, be it said, a gale is only less preferable to a hurricane if your chance is to be anything with the wild geese of the north.

And so the *Mary True* passed onward till she felt the full force of the incoming tide, the never-ceasing rise and fall of the fairway, bucketed twice to show her delight, and then fell in with an ever-growing welter of trawlers and smacks; at about which time Richard Fortescue roused himself dreamily from the comforts of sleep and warm bed-clothing, peered out through an open window, shook his head, muttered, 'No good, no wind,' and got back into bed, to be reawakened twenty minutes later by the clamorous honking. He smiled faintly. 'The old devils! They're using Bett's clover, I believe. We'll see if we can't get one of you to-night.'

IV.

The sun rose to its zenith, to dip farther and farther as the hours sped by. At four o'clock, when already the air felt chillier, Joseph Benn turned to the youth, 'Home now, William; the

tide's well on the flow again, and there be an hour's sailing afore we be back. Lordee, how the days draw in! It be dark by half-five now.' And light-heartedly the *Mary True* swung round to the rudder's touch, and jaunted gaily as the slanting breeze and the flowing tide drove her homewards.

For the *Mary True* was proud of her mission, proud of her beacon-light, and more than inordinately proud of 'the Squire,' who in bygone years had saved her from the broker's yard; also she loved her master-owner, and bowed joyously to his will. The cliffs by Bexham Point showed bright against the sinking sun; to the right, lined in faint gray mist, a score of miles away, was the coast of Lincolnshire; and in front, ploughing along the fairway and heading out to sea, were three wallowing tramp steamers. Joseph Benn gazed querulously at the far-off Lincolnshire coast, frowned once, gazed to left and to rear, and frowned again. 'Happen we must not be late to-night, William; there be a sea-fret a'coming.' A sea-fret or fog, call it what you will; to the landsman or the town-dweller it but spells an abomination that is damp and clammy, and confines one to one's house, but to the fisher-folk and others, whose living and life are on or of the sea, it holds infinitely worse in its all-embracing survey.

And it comes apace; one moment it is not, the next the sea and the land are wiped out in cold, clammy, impenetrable grayness.

By the time the *Mary True* was midway betwixt the opposite shores, ploughing an invisible course down the fairway, the world and all its marks were blotted out.

'Get thee forrard, William,' voiced Joseph Benn, 'and keep thy ears skinned, or I'll give thee a jobbin'.'

From Bexham Point came the thunderous shout of the 'Green Woodpecker'—'Yafool, Yafool, Yafool.' The minutes lengthened to a quarter of an hour, and all the while the *Mary True* slid gaily homeward. Joseph Benn tapped her deck with his foot. 'Yafool? But we knows our way, eh, old lady? Why, we could find it blindfold. I'm not worryin' about us, but what about the Squire, and the tide comin' in a'fast? That's whom we're worrying about, eh, old lady?' And, as if in answer, the *Mary True* ducked her nose into a sudden swelling wave.

'Darn it!' cried Joseph Benn. 'One of them tramps. Sound ye the rattle, William.' The whirling, clanking hand-rattle creaked out its vibrant notes. To the right a grunting bellow, as of a disgruntled cow.

'One of them,' cried Joseph Benn. Two more bellows, piercing in the silence, this time from in front. 'And another, there. Watch ye well, William.'

The *Mary True* plunged forward again, rolling slightly.

'And she be nearer'n t'other one. Sound ye the rattle, William. Darn this fog and the steam——!'

The words died out on Joseph Benn's lips as the fog ahead broke—broke into the dingy black line and curving sides of oncoming bows, broke into a sudden swirl of parted waters.

'The rattle, William!' He flung himself onto the rudder, and the *Mary True* lifted her bows and spun sideways. Spun sideways, but the oncoming tramp stayed not; over the *Mary True* she towered. Then the silence was broken by a shriek, two shrieks; one from above those grinding bows, one from the *Mary True's* deck. 'God a'mighty; look out, there!' and from Joseph Benn, 'We're done, William; done, old girl, and the Squire!'

Came a sudden sickening crash, a clatter of falling spars and sails, the threshing of screws hastily reversed, and the evil gurgle of covering waters, and then silence, a moment's silence, broken suddenly by the shrieking call, 'Yafool, Yafool.' And over all the impenetrable fog.

V.

Behind the square of black posts, and unseen in the slowly gathering dusk, stood a figure, and behind the figure, lapping noiselessly in from the sea, the ever-moving wall of gray fog. In the creeks the waters hissed and gurgled a bare six inches from the top, and the mud-banks were hidden beneath depths of swiftly-flowing tide.

To the left, the soft whistle of quickly-beating wings, and Richard Fortescue turned, raised gun, and as quickly lowered it—the all-but-invisible shapes had sped into the gray wall of mist.

'The devil, I never noticed it;' and with the words the sea-fret leant forward, stretched its clammy fingers across his face, and the world became a gray blank.

For a full minute he stood lost in thought; thoughts that not even the sudden resonant honking of the fighting geese overhead could disperse, the unseen fighting geese buried in the gray wall of fog; and the thoughts were not over-pleasant ones. 'It's the highest of high tides to-day, I know—Benn told me so yesterday; and how the deuce am I going to see the old hulk's light in this fog?' He paused, suddenly aghast. 'Damn it! The boat wasn't there when I passed. She's not come in since. I—— Good God! I'd better be moving.'

And as he moved there came the faint flopping, breaking sound, as the swollen creeks poured their water over the top.

For three minutes he slithered forward, the ever-rising water now swirling around his boots, now feeling above his ankles. Then one foot stretched forward, found no bottom, and sunk. He lunged backwards, and gasped, 'My God, a

near shave, and a creek!' He paused in growing fear. 'Lord, help me, I'm lost! There should be no creeks, if I'm going right.'

He listened intently, peering into the gray blanket about him, and no sound came to him save the hissing of water, and one faint whistle, as a dilatory curlew flitted by. Then he moved onward again, now bearing to his left, and in a minute his foot slithered forward down the side of another creek, or the same one for all he knew; and the waters rose, slowly but surely, an inch above his ankles, now swirling and sucking in evil desire. And then fear gripped him.

'To drown like a rat in a trap! My God, it's impossible! I—— Oh, if only I could find the *Mary True*.' And of a sudden, as if in answer to his prayer, there came through the deathly silence of the fog a soft sibilant sound: the frou-frou of water circling round a hull, and followed by the gentle flapping of rigging in the faintest of breezes.

Richard Fortescue breathed a sigh of relief. 'Thank God, the old boat has come back.—Hi, Benn! Benn, where are you?' No answer. 'Benn!' Again no answer, but through the gray wall of fog there glimmered a ruby pinprick that flared up momentarily to steady and glow.

He made for it, the tide keeping pace with his steps, but all fear was gone now.

Far to the left it showed, and as he walked he voiced his thanks in heartfelt gratitude. 'But for old Benn I'd have been a goner. Miles out in my reckoning—the good old soul!'

A black post loomed up before him. He touched it, swung right-handed, shouted out. 'Thanks, Benn, you've done me a good turn to-night,' and made his way forward. Halt-ingly, but with a queer increased confidence, despite the ever-rising tide that threatened at times to swirl over his knees, despite the fact that the next post ahead was all but invisible in the mist; at long last, with the water swirling over his knees, rising, ever rising, babbling in futile anger at his escape, the guardian bank of silt and sand loomed up before him. Up the rough-hewn steps, a shake, the kicking of water from over-filled boots, and Richard Fortescue shuddered suddenly as the nearness and the horror of it all hit home.

'The Lord be good to old Benn for his work to-night. I'll thank him to-morrow myself, and the old *Mary True* as well. We'll have her painted and spruced up in token of it.' He shivered again. 'Blast this fog! I'm wringing wet, and it's as cold as charity.'

He made his way along the sea road, walking quickly, his thoughts running over, and recalling his meeting with Benn, and the crowded events that had befallen them together in the last few years. Of a sudden, a light, the light from the lodge, showed faintly at his side.

He turned up the drive, and then as a thought struck him, turned back, and peered into the fog, into the blackness, the filmy gray walls of mist that shrouded the unseen cottage. Then he voiced the sudden thought that surged in his brain. 'I can't see the light in the cottage from five yards away. How—how the devil did I see the light on the *Mary True*, two hundred yards away?'

All that evening he pondered over the thought, fitfully irritable at its insolvable aspect.

'I suppose Benn's must have been a search-light or something, but even then it's curious, almost uncanny. The light looked the same. I—oh, well, I give it up. I'll ask him to-morrow.'

But that question may never be asked in this world, for the floating bodies of Joseph Benn and his mate William, and the wreckage of that queen of ladies, the *Mary True*, were washed up that night on the sand-bars that skirt the shore two miles south of the 'Green Woodpecker.'

A LITTLE-KNOWN GROUP OF INSECTS.

By D. M. REID.

ARTICLES innumerable have been written at various times about the social habits, &c., of bees and ants. Butterflies have received their portion of publicity, and even the beetles have not been overlooked. But perhaps the commonest and most widely distributed group of insects has been entirely neglected. This neglect does not confine itself to the more or less popular writer only, but to the average entomologist as well. The Collembola or Spring-tails, as this group is called, seem to thrive everywhere and under all conditions, from the dry cellar to the surface of water, from the tropics to the arctic.

Lift any old board which has lain for some time on the ground and examine its under-surface, you will be sure to see some little member of this order. He may vary in length from one to five centimetres. He may be pure white, brown, or more or less iridescent in colour. As he runs along, touch him with a blade of grass—he disappears! Examine another with a lens and you'll see that all his six legs are the same size, and not adapted for jumping; he can't fly away, for he has got no wings. How, then, does he effect his 'get away'? The reason is simple, effective, but hidden away beneath his body. Lying along the under-side of the abdomen there is a long forked organ, the forked end pointing towards the head, while the other, or 'handle' end, is hinged to the tail end of the body. This instrument is held in position by a catch which projects down from the body and passes between the prongs of the fork.

When the insect is alarmed he releases the catch, and down goes the fork or 'spring' with such force that he is sent hurtling out of harm's way. Thus the name 'Spring-tail'—and a very good name too.

The spring is not the only peculiarity possessed by the Collembola. On the under-surface, just behind the legs, there is a stump-like organ through which the insect can emit a fluid, or, in some cases (perhaps in all), a sucker-like tube, often bifurcated. I have watched a little

fellow climb up the glass side of his temporary home, stick this sucker up against the glass, and withdraw some of his legs as if to rest them.

As for their habits of life—well, comparatively little is known. They seem to feed for the most part on decaying vegetable matter. Very likely they act as distributors for the spores of fungi. They have been blamed for destroying fruit in green-houses, but I fancy this is hardly possible, owing to the weakness of their jaws. Admittedly, I have seen them feeding on a tomato, but then the tomato had previously been bruised.

Collembola do not, however, confine themselves to a purely vegetable diet, as is often instanced by the numbers which congregate with indecent haste about the carcase of a dead slug. Thus they do useful work as scavengers. A great many 'Collems' live on the surface of water, over which they run and jump as easily as they do on dry land. One species, named *Maritima*, lives on the seashore. This little wonder does not appear to mind an occasional ducking at all. He crawls out of the way of the raging element, his whole being expressing the idea of tolerant boredom rather than terror. Of the life history of the Collem there is little to be said. There is no spectacular change such as takes place in the case of the butterfly, no peculiar caterpillar, no chrysalis bursting with an unfolding of splendid wings; his is just a straightforward process.

An egg is laid which hatches out into a minute replica of the parent. This youth grows up by a series of 'moult,' until he has assumed parental dimensions, and that's all there is to it.

Perhaps the Collembola form a link between the Centipedes and the higher insects; they certainly have some centipedian characters, and they most certainly are insects. Thus it almost seems as if we have here another 'missing link' which has been under our noses all along.

THE TREASURE ISLAND OF COCOS.

By JOHN G. ROWE.

COCOS ISLAND, which must not be confounded with the Cocos Keeling atoll group in the Indian Ocean, is 'a palm-covered, picturesque, solitary bit of land,' between 400 and 500 miles to the west of Panama. You will find it on any good map of Central America. It belongs to the republic of Costa Rica, on the Isthmus of Darien or Panama, and is the treasure island *par excellence*.

All manner of romantic tales are associated with it, and various estimates give the total of wealth still lying hidden upon it, awaiting discovery, at from six to twelve millions sterling. Numerous expeditions have been fitted out to try to find these buried riches. Among others, the officers and crew of H.M.S. *Imperieuse*, and also of H.M.S. *Amphion*, conducted searches on two separate occasions; and some twenty years ago Earl Fitzwilliam, with Admiral Palliser and a party, landed there from the steam yacht *Veronique* on a similar enterprise. Earl Fitzwilliam's party met with a mishap through a landslip. The island is volcanic, and landslips are of frequent occurrence. Several members of the party were injured by the falling rocks. Earl Fitzwilliam himself received a slight scalp wound, and three of the crew had to be taken to a hospital in Panama.

The island is about twelve miles in circumference, and is well watered; and not only the coconut palm but also the banana tree grows in groves upon it, while it is not without animal life, which includes droves of wild pigs, so that abundant sport can be enjoyed by the treasure-seekers.

The first lot of treasure is known as the Benito treasure, and the story attached to it is as follows: In the early part of last century, Don Pedro Benito was a notorious pirate—one of the true breed, of the old-fashioned, 'blood and thunder,' walk-the-deck type, like 'Black-beard,' Ned Low, Kidd, Montbars, and the rest of them. He was one of the last ocean freebooters who were the terror of the seas through their ruthless ferocity. He commanded the brig *Relampago*, carrying eight carronades and a 32-pounder swivel or 'Long Tom.' 'On the ships he attacked he never left a soul alive if he could help it, and he was known to have obtained immense booties from his piracies in the Spanish Main.' He made Cocos Island his headquarters in 1820, having previously infested the Caribbean Sea, on the other side of the Isthmus of Panama. He sailed to the Pacific Ocean through the Straits of Magellan, and, landing on Cocos, buried all the ill-gotten wealth he had acquired by his depredations round the

West Indies. This treasure consisted of 733 bars of gold, several tons of silver, jewels, and other valuables.

He then proceeded to Valparaiso, where he left part of his crew for some reason or another, and sailed northward. He took in succession several ships with rich cargoes, and off Guayaquil fell in with a Spanish galleon, which was conveying an enormous quantity of priceless church plate. This was in 1822. Peru was fighting for independence from Spain, and Chili was free, and had sent an army and a fleet to her sister state's aid. The Chilean fleet was under the command of the renowned Lord Cochrane, afterwards Earl of Dundonald, and the army under General San Martin, the illustrious liberator of the Argentine. The Spanish Viceroy, General La Serna, had retreated into the interior, but was still holding out, and the whole country was in a dreadful state of confusion and turmoil. Much brigandage went on, and so this costly church plate was being removed to safer quarters by its ecclesiastical owners. Benito captured the plate-ship, returned to Cocos Island, and buried his precious freight. Next, he sailed northward to Acapulco, in Mexico, 'from which castled port the Spanish galleons were wont to sail with the wealth of the west.' There he captured two more Spanish vessels, 'killing both passengers and crew, and transferring the booty to his own craft;' whereupon he sailed back again to Cocos.

He used, it would seem, four separate hiding-places for his spoil. In one excavation, we are told, 'were buried 300,000 pounds of silver and silver dollars. In another cave were deposited the 733 bars of gold already mentioned.' 'Another hiding-place contains 273 gold-hilted and bejewelled swords, precious stones, and several kettles filled with gold.' The church plate went into a specially constructed pit, and included solid gold chalices, patens, ciboria, richly chased and begemmed monstrosities, &c., 'a golden triangle studded with jewels, and a crown that bore, amongst other ornaments, a diamond the size of a pigeon-egg.'

Marks were made to locate each site; but the usual tale is told that, 'when the treasure-pit was sealed up, Benito murdered every one who had assisted in its making, so that he might be the sole depository of the secret.' Another and more likely account is that the pirates quarrelled among themselves, and the band was considerably reduced in number in the furious *mité* that ensued. Anyhow, Don Pedro and what was left of the band sailed away again from Cocos, intending to return there, however, but

proposing to pay another visit to the West Indies. Probably they had made the western seaboard of America a little too hot for their liking. *En route* they were captured by the British man-of-war *Magician* or *Magician*, and the savage Benito met his deserts. 'Official sources show capture, trial, execution of leaders, and imprisonment of men.' Eighty-one of the pirates were hanged. The man-of-war proceeded to Cocos Island, and recovered a part of the buried treasure—so it is reported. The hoard recovered 'was very carefully hidden by sinking in gravel and tunnelling in rock.'

But when some of the reprieved pirates were subsequently taken back to Cocos in expeditions from San Francisco and Australia, they failed to locate the other treasure-pits, owing to changes in the configuration of the place.

The other lot of hidden gold on the island was stolen by the English barquentine *Mary Dier* in 1836, when Chili went to war with Peru, and a Chilian army had united with Peruvian malcontents under General Agustin Gamarra, who afterwards became President. The *Mary Dier* had sailed from Bristol to Valparaiso, and, after discharging her cargo, proceeded to Callao, anchoring off the fort there. Callao was threatened by the besieging forces of Chili; and as none of the warships of the Peruvian Government happened to be in the harbour at the time, the authorities, in order to save the funds of the national treasury and the wealth of many private persons, induced the captain of the *Mary Dier* for a handsome consideration to hide the treasure on his ship until the crisis had passed. The British flag would prevent the vessel from being looted. An immense hoard, consisting of gold, silver, jewellery, church ornaments, and precious stones, especially diamonds and emeralds, was secretly conveyed on board the *Mary Dier*, and stowed away.

The story was told by a man named Thompson, who was one of the barquentine's crew. This man and his fellows, tempted by the prodigious wealth aboard, conspired together—just like Long John Silver, Israel Hands, and Co. in Stevenson's *Treasure Island*—and 'in the silent watches of the night' overpowered the guard, slipped the anchor-chain, and sailed off with the treasure. A Peruvian armed vessel gave chase, but the pursuers knew not in which direction the pirates had gone, and had to return to Callao—baffled.

'We were now in undisputed possession of the treasure, with no fear of capture,' runs Thompson's confession, given to a man named John Keating. 'In the hold of our little craft was wealth sufficient to supply us all with princely opulence; but how was it to be disposed of? After many plans had been proposed and rejected, we decided to bury it on Cocos Island. Eleven boatloads were, one after an-

other, conveyed to the beach and buried there. I do not know the exact amount in money, but it was said to be many millions, some of it in boxes and some of it in hides. After leaving the island we encountered a heavy storm, had our sails carried away, and were driven by the wind to the coast of Peru, where we were captured, taken to Callao, and sentenced to be shot. That sentence was carried into effect against eight of us, but I and two others were placed on board a government ship and promised that if we would show where the treasure was concealed we should be pardoned.'

Thompson and his two fellow-survivors of the *Mary Dier*, however, owing to further political troubles in Peru and the absolute anarchy which prevailed, were not taken to the island. Nor did they ever manage to return there on their own account. All three of them died 'within the next decade,' but before his death Thompson gave a plan of the hiding-place to John Keating, who was unable to do anything in the matter for five years, and then persuaded a Captain Bogue to join him in partnership and take him to the island. Bogue's crew did not share in the secret, and, on reaching Cocos, the captain and Keating went ashore in a boat by themselves. According to the narrative before the writer, they 'unearthed the treasure, but it was of so great magnitude that they could not carry it away on their persons. They therefore took out about £6000 in gold each, which they carried in vests specially made for the purpose, and in their boots, &c.'

As the pair were rowing back to the ship with their first load of treasure thus concealed about their persons, they squabbled, fought, and upset the boat. The captain, weighted down with his secreted gold, went to the bottom like a stone, but Keating managed to cling to the upturned boat, and was picked up by another boat from the ship. This account states that Keating died without again visiting the island, and gave a clue of the whereabouts of the treasure to a Captain George Hackett, who was preparing to go to the island when he too died. Before his death Keating told Captain Hackett that the amount of treasure seen by him on the island was very great, there being a large number of boxes of specie and bar gold and jewels. He left a drawing that he made to indicate the location of the treasure, and an expedition subsequently sailed to use this sketch. 'But a landslide had obliterated the bearing upon which all depended,' and had apparently covered the site. To find it in the circumstances was impossible, and any attempt at excavation would have entailed grave risk of bringing about a second landslip and burying the party.

In April 1900 George Hackett's brother, Captain Fred M. Hackett, sailed in the schooner *Aurora* to Cocos, to search both for the *Mary*

Dier treasure and the Benito treasure. The vessel was fitted out by prominent business men of Victoria, British Columbia, and had a crew of eight hands, 'but the chief personage on board was a Mrs Brennan.' This lady was in possession of an old Spanish chart of the island. It had been handed down from one to another until it came into her hands, and she had joined forces with Captain Hackett in persuading the Victoria merchants to equip the expedition. When the men of the *Aurora* disembarked, they found other treasure-hunters there before them—a Captain Gissler, a German, who had sailed from Stockton, California, seven years before, his wife, and an American named Charles Hartford. Hartford had come to the island in the previous September, and 'professed to know where treasure to the amount of thirty million dollars was buried.' He offered to divulge the hiding-place to the crew of the *Aurora* on certain terms, to which Captain Hackett would not agree. After searching vainly for some time, the party from the *Aurora* were satisfied 'that the treasure, if in the locality pointed out, would be covered under a landslide which had occurred all along the vicinity,' and so abandoned the quest and returned home. Hartford also came away in the *Aurora*.

It is said that earlier expeditions to the island had 'found grouped skeletons, which told them of the fate of the previous explorers.' A writer in the *Globe*, some sixteen or seventeen years ago, asserted that on one occasion a Pacific Steam Navigation ship landed a party of treasure-hunters on this island, and called there again to take them back to the mainland. The mate on board this vessel and his chum, a man named Jack (surname), discussed the question as to which they thought the most likely place a boat's crew would select to deposit the treasure. A year or two afterwards, about twenty years ago, proceeds the *Globe* writer—that is, nearly forty years back from today—this same mate was employed to navigate a pearl-fishing schooner. This tale goes on to say that the schooner remained at Cocos Island for a week, and, while the divers were diving for pearls in the bay, the mate was searching for the treasure-cave; that he found it, and, on his return to Callao, deposited with his friend Jack 'gold doubloons, which two days after they sold for £300.' The pair then prevailed on two more men to join them and pool funds, so as to buy a schooner to take them all to the island and fetch the whole of the treasure away. A fresh Chilean war broke out, however, and the mate went off in a Chilean man-of-war, so that the scheme fell through, Jack being unable to return to the island.

The Captain Gissler already mentioned lived on Cocos Island, which was otherwise unin-

habited, for over sixteen years, on and off, searching incessantly for the Benito treasures. He was a modern, though voluntary, Robinson Crusoe. Two years before he took up his residence on the isle, he had bought from a relative of one of the Benito pirates a clue to the spot where the freebooters had buried their spoil; at least so it is said. But apparently he was no more successful than many others.

No fewer than seventeen or eighteen expeditions have been fitted out to search for these treasures of Benito and the *Mary Dier*, 'the most notable, because of the vessels and the men engaged,' said a newspaper account at the time of Earl Fitzwilliam's expedition in the steam yacht *Veronique*, 'being that of the flagship *Imperieuse* and other vessels of the North Pacific Squadron under Admiral Palliser.' The schooner *Vine* sailed from San Francisco, the schooner *Hayseed* from Stockton, California, on further fruitless searches for Cocos's buried hoards; and the Pacific Exploration and Development Company of Victoria, British Columbia, fitted out the brigantine *Blakeley* for the same purpose. The men of the *Blakeley* were to conduct the search on scientific lines, aided by gold and silver 'finding' instruments, which had just been invented in the United States for locating precious metal. The company was a joint-stock one, and the shares were reported as finding a ready sale. Captain Gissler wrote threatening to have a Costa Rica man-of-war at the island to prevent the expedition landing; and certain it is that about 1905 he obtained from the Costa Rica government the privilege of exploration. The company issued a prospectus briefly relating the facts of the deposit of the two lots of treasure on Cocos. The account given of the *Mary Dier* treasure was pretty full. This treasure was estimated by the correspondent in the London *Globe* as worth about four millions when placed, but, as much of it consisted of silver, he argued that its value must have depreciated to about one-third only of its former value, and the same with Benito's treasure.

In December, 1907, a Mr Claud Robert Grieves Robinson also obtained from the Costa Rica government sole rights for two years to explore Cocos Island, Gissler having failed in the previous October to secure a renewal of the concession granted to him. Lord Fitzwilliam was said to have been interested in Gissler's venture, and to have found the vessel which took him back to the island. Since that time nothing has been heard of Gissler, who was reported to have returned to the island in spite of the lapse of his grant, 'vowing that no one else should find the treasures of Don Pedro;' and apparently, too, all other attempts at unearthing the buried millions have been abandoned.

Chambers's Journal

SEVENTH SERIES

ASLAN KHAN, MAHSUD.

By Lieutenant H. P. CINNAMOND, M.C.

I.

CAREFULLY and methodically Aslan Khan folded his loin-cloth, placing it upon the top of his other garments; then he stood upright, naked, save for a tiny rag about his middle, a perfect picture of a man, six feet of bone and muscle and sinew. He shivered a little as the night wind struck upon his unprotected body, for there was more than a suspicion of frost in the air, and Aslan Khan was not of those who love the cold; moreover, he knew that it would be worse when he left the deep nullah in which he crouched, and which afforded him a very fair protection against the weather.

He glanced at the stars—a good six hours yet before the dawn. Drawing a bottle from among his garments, he proceeded to smear himself from head to foot with oil. This ceremony completed, he was ready for his work—or almost; he picked up the heavy triangular bone-hilted blade which lay at his feet. Now he was ready. He crawled to the lip of the nullah and—vanished.

II.

Old Ali Murad, chowkidar, sat on the veranda of Morrison Sahib's bungalow humming softly to himself; he was happy, so why should he not sing? Here he was in a good position, earning ten rupees a month, and pickings; ah, ha! and pickings. What were his miserable ten rupees a month compared to the bakhshish which he almost daily received from his comrades of the hills?

The night-watchmen in the cantonment of Peshawar are, presumably on the principle of setting a thief to catch a thief, selected from the Pathans of the neighbourhood; but, however excellent the arrangement may be in theory, it hardly works out in practice, except in so far as wolves will keep jackals away from a carcase. The Pathans hold a monopoly of the thieving around Peshawar, and they will not share it.

Of course, there *may* be good chowkidars, but if so they are dead ones, and even then, owing to the climate, they can hardly be expected to remain good very long.

Still, there *must* be good ones, for occasionally one hears of one of them having his throat cut

during a raid; but then that may be owing to a blood-feud.

At any rate, old Ali Murad was not one of the good ones; far from it. The Prophet's injunction to all true believers, that they should not seek to lay up treasure on earth, he entirely ignored, possibly because he had a very fair idea of what his fate hereafter would be in any case. As a just-minded man, he did not believe in a last-minute repentance.

So he was laying up treasure on earth; it was a bad day for him when a five-rupee note didn't slip into his palm from one source or another. As he wandered about in the daytime he was able to pick up a good deal of information. Down in the Sudar bazaar old Ali Murad, with his wicked tales of a past generation, was a great favourite with the servants of the sahib-log. Mostly down-country men these servants—soft, foolish, and loose-tongued; with the information he gained from them, he trotted off to the native city, where he exchanged it for cash. There wasn't a 'budmash' in the country that Ali Murad, like most of his brotherhood, was not acquainted with.

Still, life was not all bakhshish; there were awkward moments with the police after the bungalow which one was supposed to guard had been raided. And the Punjabi policemen were by no means particular as to how they extracted information; their methods weren't official, Ali Murad knew that, but—they hurt.

But there is no rose without its thorns. Ali Murad was prepared to put up with a beating now and again—had he not but yesterday added a cow to the fine stock which he already possessed?

There was another fly in his ointment, as an item of news which he had heard that day in the bazaar recurred to him: men said that Aslan Khan, Mahsud, had returned to the district. Ali Murad doubted very much if this was true, for the Mahsud-Waziri *versus* British Empire fight was still going on. But one never knew. That devil Aslan Khan would risk anything; he was the very Shaitan himself.

The thought of his presence so disquieted the old man, that he found it necessary to get up and make a complete tour of the grounds before he could compose himself sufficiently to prepare

for his night's rest. Like all good night-watchmen, he carried a little blue-and-white-striped jail-made rug. This he now spread on the ground, and it, with his thick sheepskin posseteen for covering, made an excellent couch for his tough old frame.

He lay down, but got up again; he felt uneasy about this thrice-accursed Aslan Khan. Could it be really true that he was back in the district? He rolled up his bed, and sat down upon it. Brooding deeply, he peered into the gloom. If Aslan Khan had really returned in the face of the present danger, there could only be one reason for such return, and Ali Murad realised gloomily that *he* was that reason.

What a fool he had been to meddle with anything belonging to a man like Aslan Khan! But he had been so sure that no Mahsud would dare to show his face in Peshawar for, at least, some months to come, by which time he would have retired to his village of Hadji. Even a devil like Aslan Khan would hardly have dared to follow him there, and if he did he would never leave the place alive. But if he was really back already, well he, Ali Murad, would have to get out. Yes, if the affair turned out to be more than a rumour got up to frighten him—all the people knew that he had Aslan Khan's woman—then he would clear out on the morrow.

As for the woman, she could take her chance. She had come to him only for his money—it was a well-known fact that Aslan Khan never had a pice—and she had had a fair slice of that; anyway, now he was tired of her. If Aslan Khan would only come peaceably he could have her, but he knew the other too well to hope that he *would* come peaceably. Had he not sworn that day, when he had been compelled to make a dash for the border, that he would slay any man who dared interfere with his woman? It was very unjust, thought Ali Murad. After all, she was a public woman; Aslan Khan had not been married to her, so why should he grumble if some other in his absence took her? But that was the way of these filthy Mahsud dogs; they came stalking into Peshawar as if they owned the place, always bragging and shouting of what they would do to any one who annoyed them. Who were the Mahsuds, anyway? Was not he himself an Afridi, of a tribe that could eat the Mahsuds ten times over?

III.

Private Jones, leaning against a rifle rack, stared discontentedly at the row of sleepers before him. He was 'fed up' with this business of sentry-go in a dormitory. His regiment had just arrived in Peshawar, where they had taken up their quarters in the Khaibar barracks. Private Jones had been all through the war, he had been in many barracks, but he was hanged

if he had ever been in one yet which required so many sentries stuck about the place. Every blessed room had got one; they could easily get on with half the number—then a man might get a bit of sleep at night.

Rifle thieves! Everybody talked about rifle thieves, and how regiments from England were always caught out by them. Regiments from England! You'd think they were a bunch of recruits, to hear people talk. Men that had gone through the war in France weren't likely to be taken in by a bunch of niggers out here. Besides, the whole place was wired like the ground before a front-line trench.

He straightened up as faintly he heard the No. 1 group's 'All's well' sound in the distance, then, nearer, No. 2 group, and so on round the outposts. There was another thing—you'd think the barracks were expecting an attack every minute. He'd been in Peshawar nearly six weeks now, and, so far as he could see, the people were as peaceable as any others.

IV.

Aslan Khan lay motionless in the shallow ditch separating the circular road from the Khaibar barracks as the 'All's well' rang out. He knew that for nearly five minutes after the call the barrack sentries would maintain some show of vigilance, then—he smiled. What sort of a country did these Gorah-Log come from? In his own hills a person of their habits would never arrive at manhood at all. But they were infidels; no doubt Allah, or His Prophet, upon whom be the Peace Everlasting, blinded their eyes, even as he had blinded the eyes of those other infidels before the attack of the Faithful some twelve hundred years ago in the valley of Bedr.

He slipped from the ditch, and, flattening himself to an almost incredible degree, slid between the bottom strands of wire and the ground. Soon he was through the fence and in the sacred precincts of the barracks. Some seventy yards to his front lay a shallow stream, part of the magnificent irrigation system of the cantonment, which runs the whole length of the barracks, affording excellent cover. Towards this Aslan Khan made his way inch by inch, taking advantage of every patch of shadow, every inequality of the ground—and there are many in that barracks. Arrived at the stream, he slipped into it and walked swiftly along until he came to an elbow, where the stream curved abruptly to the left. Following the new course for a short distance, the stream made a second turn to the left, leading away from the barracks towards the married quarters and the Mall. On Aslan Khan's right at this point were the stores and some of the regimental shops. His particular objective, the barrack-rooms, lay some hundred yards to his front across a flat maidan. There were other barracks much easier of access

down by the circular road, but in most of them robberies had been perpetrated, and the inmates might be more alert than in his present objective.

For a brief second Aslan Khan rolled on his back in the soft dust; then he commenced his long wriggle across the maidan. Small blame to the sentries whom he passed now. At a distance of five yards he was, when motionless, quite invisible, so perfectly did the dust clinging to his oiled back harmonise with the surface of the ground.

Arrived at the veranda of the barrack-room, which was raised a foot from the ground, Aslan Khan lay perfectly motionless in the dust, the sentry passing within a couple of feet of him. He raised his head when the man had passed. The barrack-door was closed at the moment, but that mattered little, for he knew that men were constantly passing out for one purpose or another. Waiting until the sentry again passed him, Aslan Khan, like a great gray snake, glided to the wall of the room, and, flattening himself near the door, so perfectly did he match the gray wall that in that light he was entirely invisible, save to the very closest scrutiny.

Shortly afterwards the door opened, and a sergeant stepped out for the purpose of assuring himself that the sentry was on the alert. At the same moment Aslan Khan slipped through and lay stretched out, under the nearest cot.

From cot to cot he slipped until he reached the foot of the room, whence he glided behind the rifle-rack, against which Private Jones leaned, inwardly cursing the idiots in authority who considered his present job necessary, and envying his loud-snoring comrades.

How it is done remains an unsolved mystery on the Frontier, but it *is* done, and that frequently. Rifles in a locked rack—that is, rifles in a wooden stand having a steel rod passing through their trigger-guards and locking to the rack at the end—vanish mysteriously, leaving no sign of the manner in which they have gone. The general theory is that the trigger-guards are cut; but they are of steel, and the sentry is never more than *six feet* away! However, be the method in which he obtained them what it may, the fact remains that when Aslan Khan, some two hours later, slipped into the bed of the stream, he carried with him two rifles valued by the government at £6, 10s. each, but worth Rs. 300 (£20) each on the Frontier. Private Jones, that veteran of France, would have to pay £13, the government valuation, and in addition he would be court-martialled, and would probably receive a couple of years' imprisonment. To lose a rifle on the North-West Frontier is a very serious crime.

v.

Ali Murad stirred uneasily in his sleep; then he sat up, rubbing his eyes and gazing about

him in a terrified manner. Ugh! then it was only a dream after all; he clutched his heavy iron-shod staff nervously as he peered into the blackness. He thought the end had come that time. Why, he seemed to feel the iron grip of the Mahsud still on his throat. Tenderly he fingered the part. Why—Mashallah! it was bruised and sore. How could that happen? He must have gripped it in his sleep. But this was serious; was he, then, to choke himself through fear of a Mahsud — (the word is not a nice one)? He rose to his feet. As he did so his heart leapt to his mouth. Something moved, rolled away into the darkness. In terror Ali Murad peered after it. Yes, there it lay. He picked it up, and the heart died in him as, with a sickly gasp, he recognised it for what it was—a woman's head. There is but One God. He glanced down; yes, there were other things. He knew what *they* were without being told; they were the hands, the feet, and the breasts of his inamorata, the ardent Zulma.

Hai! Hai! for some time he crouched on his heels, swaying backwards and forwards, wailing softly. Occasionally he murmured his 'Allah il Allah ilaha Mohammed er Rassoul Allah,' the profession of the Faith. The word 'Moslem' means resigned; Ali Murad knew that as a good Mussulman he should be resigned to whatever fate held in store for him. But Ali Murad wasn't a good Mussulman.

He shuddered all over as he thought of Aslan Khan visiting him in his sleep. Why had he not slain him then? But this temporary release engendered no hopes in his mind; he knew the Mahsud temperament too well for that.

Hai! Hai! what a dreadful death he would die! And he was old; he could not bear pain. Hai! Hai! Hai!

A low chuckle answered his wail and—there stood Aslan Khan. Mad with terror, the old man leapt to his feet, striking out blindly with his chowkidar's staff. The iron-shod end caught the Mahsud full upon the brow, and he collapsed. In wild amazement Ali Murad gazed at his work; he struck again and yet again. Then he took the blood-stained knife which Aslan Khan yet held in his lifeless hand, and he cut the dead throat Afridi fashion. And then, for he was very angry, he—but that cannot be written.

YOUR MEMORY.

I WOULD not have my memories of you
Lost 'mid the shadows of the gathering years;
Or the clear vision of your perfect face
Dimmed by the mists of my too-frequent tears.

I should not fear old age could I but know
'Mid failing powers and weakness I could keep
God-guarded in the cloister of my soul
Your memory, till I, too, fall asleep.

M. HEDDERWICK BROWNE.

TECUM HABITA.

By G. A. FOTHERGILL.

I.

PERHAPS one of the most useful essays, in the broad sense, ever published for man's edification, is that short and delightful piece of composition from the pen of William Hazlitt entitled 'On Going a Journey.' It is to be found in *Table Talk*, a work which has gone through many editions since it was written, rather more than a hundred years ago. But this particular essay has not yet reached the hearts of the people in the way its author intended it should do: contemplation of Nature, such as he alludes to, and the best method for attaining it are still indulged in only by the very few, and not too often by them.

It comes to be a question whether the majority of us now can contemplate in the way laid out for us there—we are so crowded together in this little Britain of ours. Each one of us must settle this question for himself or herself. Hazlitt has at any rate shown the way, and many after him, including Robert Louis Stevenson, have done their best to point out where and how the truest and most lasting delights are to be obtained.

'One of the pleasantest things in the world,' Hazlitt writes, 'is going a journey; but I like to go by myself. I can enjoy society in a room; but, out of doors, Nature is company enough for me. I am then never less alone than when alone.'

The fields his study, nature was his book.

I cannot see the wit of walking and talking at the same time. When I am in the country, I wish to vegetate like the country.' There are those, he adds, who 'carry the metropolis with them.' But Hazlitt liked liberty to think and feel and to do just as he pleased, and to get rid of others for a few days together, much as he loved good-fellowship and the being with others at other times.

For an author who deals with the science of first principles of nature and thought, this kind of reasoning is sensible enough: he must be all alone, attending only to the call of Nature and in the most solitary places:

There must ye go; there will I stroll again
And taste the fountain of that woodland glen—
The pure delights of rock and moss and fern
Beside a crystal stream; there ye shall learn
How rare and sweet the fount of Eskdale is,
And feel the purest sense of worldly bliss.

We are not all, however, author-metaphysicians, and we most of us have to be content with but a snatch now and again of the beautiful in Nature, following it up afterwards as well as we can in book-land:

We try to love it from a learned book;
They learn it wholly from a loving look.

Nature's life is different from ours: we who are cooped up in large towns, slipping over the cobbles beneath a smoky sky, never can know life in the open quite as they know it. Yet there seems no reason why a great many more of us should not take occasional opportunities of being better versed in metaphysics than we are, by studying Nature herself a little more closely whenever we do get the glorious chance.

There are still many parts of the country where Hazlitt's and Stevenson's method for securing this study may be carried out to the heart's content. Let us, then, say with the former, 'Give me the clear blue sky over my head, and the green turf beneath my feet, a winding road before me, and a three hours' march to dinner—and then to thinking!' And that 'thinking' is to be done at some quiet wayside inn where one is utterly unknown—such inns are to-day, we must allow, a rarity, but there are still some if we hunt for them, where rest and freedom for thought may be procured—where 'take one's ease at one's inn' is not an untruthful advertisement to the place. One has to read Hazlitt's essay to know how he could enjoy it all. His abundant relish of life in the heart of the country was such that he could never there repine, whatever he did elsewhere—and he was not unknown to quarrel with the world! Emeritus-Professor George Saintsbury has said of him, that he must have been 'one of the most uncomfortable of all English men of letters, who can be called great, to know as a friend,' but goes on to say, 'he is certainly, to those who know him only as readers, one of the most fruitful, both in instruction and in delight.' Apart from Hazlitt's confessions in *Liber Amoris*—which were unnecessary and revolting—nearly all of us who have read his *Table Talk*, *The Spirit of the Age*, &c., would wish that there were a few more 'uncomfortable' people just like him now to become acquainted with: the world would not be the poorer for their presence, and, knowing their superiority, would willingly put up with their failings.

II.

I have purposely coupled the name of Stevenson with that of this brilliant essayist, as their natures in many respects were akin; and from what one has read of the former, one is inclined to think he must have revelled in all the works of the latter—excepting the unfortunate *Liber Amoris*, which we gather was quite sufficient to turn Stevenson away from him as a subject for an essay. Stevenson

was undoubtedly influenced by Hazlitt, and followed him in the flesh as well as in the spirit: both were by nature 'vagabonds'—both loved the liberty of the countryside, and neither could have rested without roaming from home. R.L.S.'s best-known song of travel is 'The Vagabond,' and in it he exhibits exactly the feeling promoted by Hazlitt in his essay 'On Going a Journey,' the main difference being that the Scotsman seemed to wish for nothing better than bread and water for all his meals, while the Englishman looked for a good dinner at the end of each 'three hours' march.' The one would vegetate alone in the country as a tramp of the lowest order; the other would do it like a gentleman—he must at least have money in his pocket. The great critic and essayist was human and sensible; the poet-novelist aimed at the impossible—for how could he expect to make a living out of Nature and be fed only on 'bread dipped in the river'! Stevenson's flow of words and rhythm are beautiful, but the subject, on the whole, abject nonsense; whereas everything Hazlitt has to tell us contains the best of good sense. In passing, let me suggest that, shortly before R.L.S. had written his sweet song, he had read Hazlitt's fine bit of prose. No one to my knowledge had offered any critical remarks of the following kind upon this subject until I brought the matter up in the presence of two well-known students of everything Stevensonian. Any one, after placing the essay and the poem side by side, and reading the essay first and then the poem, would surely be struck with the sameness of motive in each, and how R.L.S. has taken to heart the brief passage which I have quoted near the beginning of this paper, and actually started as Hazlitt started, and used some of his words, and in the same order, too. The poem commences:

Give to me the life I love,
Let the lave go by me,
Give the jolly heaven above,
And the by-way nigh me;

and in the second stanza we find:

Give the face of earth around,
And the road before me—

which words are repeated in the fourth and last stanza. Stevenson says he must travel without wealth, hope, and love,

Nor a friend to know me:

and Hazlitt writes: 'But I like to go by myself . . . out of doors, Nature is company enough for me.' So far as the delights of vagabondising are concerned, though the former's 'fine madness of the poet' does not harmonise with the sane remarks of the latter, these two writers would seem to be closely related. With Hazlitt's assistance, I take it, R.L.S. has converted their own peculiar sentiments and landscape into a fine lyric; Hazlitt, single-handed, and without employing any metrical

form specially to catch the reader's eye, has described all we want to know, all that can be of use to us, in plain but excellent language. Didactic as in many things he may be, on this subject he has written so as to please every sensible reader, and he has 'talked far above singing.' And yet so strong is the breeze of popular favour, so long does it take the world to discover what is wholly original, were the MS. of his essay to come into the market and Stevenson's thirty-two lines of verse with it, we might find that the second would fetch the bigger price of the two: those much-loved initials, R.L.S., would weigh down the half-forgotten W.H., the very one who must have given the novelist so fine and rare a keynote for his 'Vagabond.' This discovery should in no way detract from the pleasure of reading 'The Vagabond'—rather the reverse. At the same time, 'On Going a Journey' might be more appreciated than ever, when it is thought that so famous an author elected to pick a few feathers out of the essayist's cap. William Hazlitt pulled many leaves out of the laurel crowns of the ancients, as well as plenty of feathers from the caps of his contemporaries, and the world thinks none the worse of him now for so doing.

III.

In no spirit of misanthropy did Hazlitt wish to be left to his repose at times when in communion with Nature—that 'undisturbed silence of the heart which alone is perfect eloquence' was the making of him for others; without it we could never have had *Table Talk* with its thirty-three essays. It was in these solitary excursions, with only the host and the waiting-maid, or some casual visitor whom he met at the inn, to talk to, that he laid in the stock of ideas for the enrichment of his work, and to make him the deep critic and brilliant conversationalist of whom Charles Lamb thought so highly. Even a dear friend on one of these journeys would have reminded him of too many other things, and, perhaps, 'ripped up old grievances and destroyed the abstraction of the scene.' But he tells us that he was not unmindful of some people—he loved to repeat aloud to himself long passages from the poems of his old friend Coleridge, whenever any particular prospect reminded him of them, and other great artists of the pen and brush would be continually swimming into his view. If it was a matter of investigating the ruins of some ancient castle, going to see a cathedral, or looking at a collection of 'old masters,' then he would jump at pleasant company—not upon it! For, said he, 'They are intelligible matters, and will bear talking about. The sentiment here is not tacit, but communicable and overt. Salisbury Plain is barren of criticism, but Stonehenge will bear a discussion antiquarian, picturesque, and philosophical.' But for the 'swelling theme' of the

rest he preferred to be alone—they led to ‘associations too delicate and refined to be possibly communicated to others,’ and these he cherished and sometimes fondly clutched at when he could escape from the throng to do so. ‘To give way to our feelings before company seems extravagance or affectation; and, on the other hand, to have to unravel this mystery of our being at every turn, and to make others take an equal interest in it (otherwise the end is not answered) is a task to which few are competent.’

This *Tecum Habita* spirit did not start with William Hazlitt; it comes down to us from the ancients. The essayist knows his Bible very well indeed, and there are plenty of the dwell-with-yourself sort in the Book of books to have prompted him to go and do likewise. When reading Persius, too—which, of course, he would have done long before he wrote ‘On Going a Journey’—he would find, in the Fourth Satire, this line:

‘Tecum habita; nōris quam sit tibi curta supellex.’

Conington paraphrased it thus, ‘Be true to yourself and learn your own weakness.’ Others have construed *Tecum Habita* in such words as ‘Keep at home,’ ‘Keep your own counsel,’ ‘Mind your own affairs,’ ‘Mind your own business,’ ‘Dwell with thyself, and thou wilt know how short thy household staff is’—in other words, what an ill-furnished mind you have. Marcus Aurelius (b. 121 A.D.) also had something to say about this subject—‘Remember, then, to retire into this little territory of thine own and there look at things as a man, as a human being, as a citizen, as a mortal. Remember that things do not touch the soul, for they are eternal and remain immovable. . . . It is in thy power, whenever thou shalt choose, to retire into thyself. . . . And I affirm that tranquillity is nothing else than the good ordering of the mind. . . . Constantly, then, give to thyself this retreat, and renew thyself.’

IV.

It was in April 1910 that the writer made an exceedingly careful drawing of an inscribed stone, with this semi-satirical motto upon it, at the Edinburgh Free Library, and it was reproduced and published in one of his books, entitled *Stones and Curiosities of Edinburgh and Neighbourhood*. Originally it was one of the door-lintels of a large house in the Cowgate belonging to Sir Thomas Hope, Bart., that ‘sturdy old Scottish statesman,’ who was Lord Advocate under two kings, James VI. of Scotland and Charles I., and from whom the present Marquis of Linlithgow descends. The Carnegie Library is built upon the site of that old house, and all who have entered the large reading-room must have noticed the motto staring them in the face at the top of the stone stairs—a most appropriate inscription to find over a library

door. Should any one prefer to be a recluse, and have the means to be one in comfort, he cannot go far wrong by burying himself in a library of good books. And if he cannot live five whole years away from Edinburgh, as Sir William Temple of yore boasted of doing from London—though he could see the metropolis from Sheen House (where he went to reside, surrounded by his peaches, grapes, and oranges, and excellent literature)—he can, in certain seasons of the year and at certain times of the day, be almost alone in Edinburgh’s Public Library, yet in the society of the great and wise of past and present times, and in touch with Nature as she is described in the works of Hazlitt, Wordsworth, Tennyson, George Eliot, Ruskin, Fiona Macleod, and many others.

We fear that neither Hazlitt nor R. L. S. would have found much to interest him in the psychology of modern travel parties, unless he perceived in it a medium for giving vent to his thinly-veiled satire! ‘You depend for happiness on your fellow-travellers’ was at any rate not Hazlitt’s way of thinking, as the essay he wrote clearly shows us; and the same would apply to him when digging in a library full of good and rare books. There were no half-faced feelings about Hazlitt—he must be either deep in his own thoughts and away from every one, or placing himself entirely at the disposal of others; and happy would he be if he chanced to meet people not ‘cut to pattern,’ but of a varying outlook on life; and then, as they expanded in thought and sympathy, he in turn would wax eloquent and brilliant in their company. On the other hand, ‘delightful travelling companions’ are not always to be found, and the trend and end of the vast majority of them early in last century, and even more so to-day, would be just meal times—they expand in belly a good deal more than in thought and sympathy for others. They come in, too, ‘ungraciously between us and our imaginary character,’ and, after all, it is but present objects and passing events that are usually discussed by them *ad nauseam*—there is no shaking off the trammels of the world in such society. ‘The more the merrier, with children admitted in the park,’ we find some enterprising twentieth century manager has introduced in his company’s circular, a clause which most assuredly would not ‘catch on’ with Hazlitt. To be boxed up in stage-coach or motor, with a squalling child returning his milk and toast full into his lap, would not be pleasant—an incident that would be quite sufficient to send Hazlitt back to the *Tecum Habita* mood, and no director or manager under the sun could persuade him to rejoin the ranks of a party for that particular ‘tour attractive.’

V.

The ancient Cramond bridge, dated 1619, which gives the name to the hamlet where I am

now writing, was crossed on foot by William Hazlitt in 1822, during his 'melancholy errand'—the visit he paid to Edinburgh in order to procure a divorce from his first wife. His wife, who was in lodgings in Edinburgh by herself at the same time, also came over the old bridge when on her journey alone into the Highlands, an account of which she has left behind her. The new and much larger bridge (close beside the old one), over which the bulk of the traffic now passes, was only in the making in 1822, and was not completed until the following year, the date 1823 being beneath one of the fine arches on the Edinburgh side of the Almond. Within three miles of this bridge is Craigerook Castle, which Hazlitt visited as the guest of his friend, Lord Jeffrey. It will be remembered that the former wrote much for the *Edinburgh Review*, of which Jeffrey was editor, and Macaulay the mainstay, for twenty years or

thereabouts. The present writer has some pleasant recollections, dating back to 1893, of Craigerook as it was then. In one of the paddocks he had one of his hunters running out at grass, and on two occasions he sat in the identical study, 'hallowed by talent and worth,' to use Lord Cockburn's words about it, where Jeffrey for over thirty years received so many distinguished literary people—Sir Walter Scott; Tom Moore, who challenged the Scots judge to a duel, but outlived his resentment and called Jeffrey 'one of the most cordial and highly valued' of his friends; Sir Humphry Davy; Captain Basil Hall; Sir James Mackintosh; Henry Mackenzie (the *Man of Feeling*); Macaulay (most probably, though his presence there is not authenticated); William Hazlitt; Carlyle and his good dame; Charles Dickens; Lord Moncrieff, and a host of other lesser lights in the land of Law and Letters.

DREAM VALUES.

PART II.

VI.

MARTIN went up-river to Pijos with a handful of Barbadians, and good consignments of cacao and *urucu* for planting out. He was rather impressed by the silence and deepness of the bush, the farther he got into it. The hot, thick loneliness of it oppressed him almost. He was cutting himself off from man for the sake of his ideals. What is more, he felt with a qualm that he would be labouring here for the good of man for years, perhaps, and man—the great world of men—would not know. That rather dismayed him. He would be out of sight; nobody would hear what he was doing—Silvia would not hear.

That was rather disturbing. Like all prophets of a new movement, he wanted to justify himself before men—and, in a way, before Silvia. Of course, he had cut himself entirely off from Silvia, and she might even—might even have married again. (The thought gave him a nasty twinge, and he ran away from it.) But he did hope that in some way, some day, Silvia might learn that the Edgar Trustram who was doing such wonderful things, who was, in fact, inaugurating a new world-phase in the relations between master and man, was none other than Martin Romanes, who was thought to have been lost on the *Tapajos*.

He did not put that into words, but he had the feeling, and it filled him with a glow. He really would like Silvia to think fine things of him. But if he laboured up here unknown. . .

But, of course, he *might* jot down the framework of his idea, put, say, into a review article, just the outline of the things he was actually accomplishing.

When he landed at Pijos he was full of this. The barracôa was in good order, and the Barbadians could be trusted to look after their own housing. He had pens and paper; he would just get down the rough outline of what he had in mind while it was still hot in his brain.

In a fortnight the 'boss boy' of the niggers interrupted him at his writing. 'What we do, boss?' he asked. 'We put up shanties some time, and we sit and wait till byemby you tell us what we here for. I think you tell us now, boss. I Englishman an' good feller, but some of these coloured gents with us is low trash, and they get fat and lazy.'

The man was right, Martin saw. Now was the time to tell them of the great things they were all to accomplish, how they were to work together to launch a new world-movement. A good talk to them would also help to render clear some points that had been difficult in the writing. Also it would start them out on their great work.

He had his negroes sit before him while he spoke eloquently of 'Work-brotherhood,' that was the title of his—not article, he couldn't get it all into an article; he was making it a pamphlet—treatise. He spoke of community work and sharing profits and management, and pointed out that this estate was not actually his, but 'ours,' theirs as much as his. How they were all owners, workers, and profit-sharers in one.

His words were so well received that he took back an enthusiasm to his desk that enabled him to write all night.

VII.

The big planter, Dempster, was going up-river nine months later, and he called at Pijos to see

Martin. Martin was conscious of his presence because of a shout outside the house, a scuffle, and then a squeal. He dragged himself to his feet just in time to see a big black nigger go down before Dempster's fist.

The planter came angrily into the house. 'You should look after your hands better, Trustram,' he snarled. 'That son of a pig was insolent.'

'Surely not insolent,' breathed Martin, but he knew a qualm. He had felt himself that—that there was a certain lack of brotherliness in the niggers' treatment of himself latterly.

'Far too insolent for this country and climate,' snapped Dempster. 'First he had the confounded cheek to ask me what I wanted here, asked me to state my business. Then when I sent him to blazes he ordered me—ordered me off the station, as though it were his.'

'Oh,' said Martin smiling, but not too easily, 'in a way it is his, of course, as much his as anybody's. We share——' He saw the light in Dempster's eye. 'He took too much on himself, naturally, but these primitive people do.'

Dempster stared at Martin. The hot words on his lips died down. They'd have no effect on this Trustram. He looked, if anything, more dreamy, more drifting and spineless than ever. He was charming and intelligent—he always was; but he had gone to seed, clothes on anyhow, and such clothes. Hair ragged, a new beard unkempt. He looked like a man who had forgotten everything outside his dreams.

'I see,' said Dempster slowly. 'These being your views, all this is explained.' His hand swept that part of the estate in view. Martin suddenly saw the estate. He had grown into it, grown accustomed to it up to now, but—and probably it was the presence of Dempster—he suddenly saw it in its ruin. It was an ugly, a heart-twisting sight. The little cultivation that had been put in, under the first drive of the boss-nigger, under the occasional spurts of activity from Martin himself, had gone rank with neglect. The voracious jungle had swept into his clearing, and mingled its tangle with the riot of weeds. The huts of the compound were unkempt and filthy; there was a mess of litter everywhere. . . . His own house was falling to pieces.

His estate, he saw, was disgusting. He turned lamely to Dempster. 'Yes, it—it appears to have gone a little to seed,' he faltered. 'We haven't really started yet on—on our scheme. To be honest, I've been occupied on a book. True, I finished it two months ago, sent it home—but I've been down with fever since.'

'A book about your scheme?' asked Dempster dryly.

'Naturally,' said Martin. 'A book called *Work-brotherhood*. It sets down clearly all we are going to do—all we are aiming at.' Again he saw Dempster's eyes. He laughed nervously. 'I suppose it does look as though my practice was inferior to my preaching—but

give us time, my dear fellow, give us time and we'll show you.'

Dempster frowned as he stared at him. 'Look here, Trustram,' he said. 'Theories, dreams, are all right—but some of us aren't good at actualities, at making 'em good.'

Martin threw up his hand. 'Don't,' he cried almost tearfully. 'Don't say that. There are moments when—— No, I will show you all that it can be done.'

VIII.

Dempster went up definitely to see Martin seven months later. He had heard rumours; also his accountants had told him how they had dunned Trustram for goods supplied without ever getting a milreis in return.

The condition of the Pijos estate was frightful. Weeds and jungle had conquered it completely. Martin was ill in what was the wreck of a once fine house. He was ill, but not so ill that he could not follow the conversation between Dempster and the boss-nigger—the only man he had left—outside in the sun.

'He is a saint, boss,' said the big nigger, 'but he is bughouse, too. He's craze. Look! he tries to make de black trash work, but he no let me beat dem niggers up for to do it. Dey knew he wouldn't hurt. Dey knew, too, he hadn't got no punch in him. Look! one day him come out tearing craze; he is all for work; we clear whole forest in one day, an' plant him too, it seem. For one, two hours we work till we fit drop. Den him begins to stare empty into de ribber. Sometime him pull up, an' shout at black trash for stopping work—den he go off dreaming again. Den he walk away to his hammock, an' lie swinging an' dreamin'. An' den, of course, dere no more work for a week—for a month. No, him fine feller, saint, too, but him no boss man.'

The nigger then told how the others had drifted away, some because they were fed up with the mad sort of life, others because money had given out, and credit and luxuries had ceased to come to them.

'He couldn't hold dem,' said the nigger. 'He couldn't make dem work for to get money byemby. He jus' done know how about work. Oh, he fine talker—such lovely words, but he don't can't know how to do anythings. He jus' don't can't know where to begin. He jus'——'

Martin, listening in his hammock, yelled, his lips twisting wryly, 'Come in and hear the rest from me, Dempster. I can tell you all about it—without prejudice.'

And he did. After reciting the dry facts of his failure, he said, 'Didn't you say last time you were here that theories and dreams were all right, but some of us aren't good at the actualities? Well, that's my epitaph. I dream, but I can't do.'

'It's something to dream,' said Dempster,

who saw that he would have to handle Martin carefully if he was to get him down to Para alive.

'It is, if you don't dream mush,' said Martin, who, in the completeness of his awakening, saw himself in the starkest light. 'But if you dream mush, make yourself mushy by dreaming, then it's wrong. The only way to dream is to dream hard, to dream vigorously, to dream things that can be put into practice. I didn't.'

'Oh, I thought some of your ideas were good,' said Dempster, and he really meant it.

'They weren't,' said Martin cynically. 'Oh, I'm seeing myself as you saw me—as others saw me.' His voice shook a little. 'You weren't the first to warn me against myself. Some—some one else did that, earlier than you. Some one else told me that that old attitude of mine, that pretending to gather facts, that pretence of going slowly and carefully with my ideas, was only a cloak for my inertia, an excuse for laziness. . . . And she—and all of you were right. I hadn't really the guts, the drive, to realise what I dreamed, so I sunk myself into, drugged myself with, dreams. . . .'

IX.

Dempster took him down-river in his launch. He had always liked 'Trustram'; he liked him better now. He was more human in his failure. He'd lost his faintly superior, his softly obstinate mulishness, that had made him difficult before.

At Para the doctors said that the only thing to get the fever out of his system, and give him a chance of life, was to send him home. As he happened to be penniless, Dempster saw to that. Dempster also saw to it that he got some sort of outfit, and, what is more, packed it for him, since he wasn't fit for exertion.

It was in the middle of the packing that Dempster came across Martin's book, *Work-brotherhood*. He picked it up, puzzled over its cover, which bore no author's name, and said, 'What's this?'

'Something to amuse you,' Martin chuckled weakly. 'Keep it, old fellow; and, if you can, read it. It'll tickle you to death. It's all about work by a man who is congenitally incapable of doing it.'

'*Work-brotherhood*,' said Dempster. 'I remember something about that.'

'You do,' laughed Martin. 'I told you about it up in the bush. That's the great gospel I was preaching during all the time I was failing to practise it. It's my book. The publishers sent me out some copies a few months back.'

'I know it's your book,' said Dempster. 'But that wasn't the thing I was remembering. It was in a paper from home. If I remember, they said some wonderful things about it.'

'Said! . . . Talk! . . . Another talker on a talker. It meant nothing,' said Martin.

X.

On the voyage home he picked up a good deal of his strength. So much, in fact, that, on landing, he was well enough to go to visit one of his own factories near the port.

He went there mainly out of curiosity, for, as yet, he hadn't any definite ideas as to what he would do. He was still Edgar Trustram, and, apart from the cash Dempster had advanced, a pauper. He didn't know how things were, whether Silvia's new husband—he was certain, with an almost morbid agony, that she had married again—had sold up his estates, or reorganised them, or—what. In fact, so uncertain was he that his visit was perhaps more than curiosity; it was an expedition to spy out the land.

It was easy to get into the works. The old time-keeper was at the gates, and he'd had instructions in the old days to let anybody interested go over the place. The time-keeper still had the habit, though there was a hint of a new order, for, quite distinctly, he hesitated, he seemed put out.

Martin walked about, and soon became rather startled. There were changes here, more changes than he had anticipated. But it wasn't that so much as the quality of them that made him frightened. He was extraordinarily pleased when Weatwood, the manager—he was glad they hadn't got rid of him—crossed his path in the machine tool-room, and stopped to chat.

He wasn't afraid of old Weatwood detecting him; his beard, his tan, the wasting of the tropics made too good a disguise.

Weatwood, inclined to pass on, stopped by him, indeed, began to walk by his side explaining the things they had done, and were, in fact, still doing. When Martin suggested that Weatwood was being kept from his work, Weatwood hurried to say no, protested that he was only too glad to show round somebody who was so keen on things. Weatwood, in fact, was keen, too; he seemed to hang on every question eagerly.

So intimate did they become that at one point Martin almost betrayed himself. When they came to some new building, he cried, 'Hullo, what are you doing with those old annealing sheds, Dick?'

He could have bitten his tongue out, but Weatwood, who was a pace ahead, didn't hear, thank goodness, but stood staring at the building for quite a minute before he turned and apologised, and asked if he had spoken.

Martin got it correct then, and Weatwood told him that the old, dark, dirty sheds had been taken down so that up-to-date saw-tooth sheds with plenty of light and heat and cleanliness could be put in their place. 'They've got blue-prints of these over there at the clerk of works,' he said. 'Come an' look at them,

sir. You'll see what a fine job they are going to make of it. Those sheds will be more like dance halls when they are finished.'

XI.

While they were studying the blue-prints, Weatwood was called away, and the assistant-manager, who had come for him, took his place. Martin did not particularly know this, he was so absorbed by the things that had happened. He was getting a series of shocks. He was hard put, even, to realise that he was seeing actual and concrete things, and not dreaming again his old slow dreams. He put a question to the assistant-manager.

'Oh, there were changes before, a good many, and most of those remain; but most of the things you point out, sir, have been brought into force in the past few months.'

The past few months. The past few months. . . . The words kept echoing in Martin's head.

But even he had his fill, rather before the enthusiastic assistant-manager had his, in fact. There came a moment when Martin felt he must go away, and lie down and try to get something like sanity into the whirling bewilderment that made his head. But the assistant-manager was dense. He seemed absolutely spell-bound by the big club—a combination cinema-theatre-dance hall that was one of the prides of the factory. He couldn't tear himself away—none of Martin's hints would move him.

Then, just as Martin felt there was nothing for it but to walk straight away from the fellow, a big covered car swept up to and stopped at the entrance to the club. Martin, caught indecisive, stood dazed before it.

And Silvia got out.

She looked at him, put out her hand, said, 'Martin! . . . Martin!'

He was conscious of something tenderer and deeper in her beauty, something graver, finer, more reposeful. He stood away, wondering why he could not run away.

'Martin,' she whispered. 'Martin, dear, . . . do get into the car.'

Then he began to fall. . . . Then soft arms and strong ones gathered him, and he knew that that sly assistant-manager was helping, and that the slyer Weatwood was also on the scene. . . . Then there was swift, smooth motion, and he felt a strong arm about him, and a soft cheek against his, . . . and the cheek was wet. . . .

With a sigh of happiness he fainted.

XII.

Silvia sat by his couch—his couch in his own home.

'Let me do all the talking,' she cried. 'First, the time-keeper at the gate recognised you and told Weatwood. Weatwood couldn't quite

believe it, so he intercepted you in the works. He grew surer and surer it was you, and then, when you gave yourself away at the old annealing sheds, his mind was made up.'

'Then he wasn't called away when we were looking at the blue-prints?'

'No, he was telephoning to me.'

'Were you very, very surprised, Silvia?'

'Not very. I was overcome—but I felt it would happen all along.'

'You felt it?' he cried, staring at her. 'But you must have been certain that I went down in the *Tapajos*?'

'I never was quite convinced of that—somehow, and a few months ago I became certain there had been a mistake.'

Again Martin said in surprise, 'A few months ago?' and stared at her.

'Yes,' she laughed at him, a tender motherly laugh. 'A few months ago. . . . Did you notice anything about the factory, the improvements?'

'I was absolutely startled by them,' he cried, sitting up. 'If I'd—Are they your own ideas?'

'No. I have no ideas of my own, I've found out. I got them out of a book.'

'*Work-brotherhood*,' he gasped, and then, seeing her face, 'You—you guessed I wrote that.'

'It seemed unmistakable, . . . all your propositions put down in your own language, but the whole thing stronger, finer, surer, more mature. And—I say, Martin, do you happen to know that that book has opened a new era in industrial conditions? That it's become a sort of text-book on the relationship between Capital and Labour?'

'Good God!' cried Martin, gaping at her. 'And all the time I was making a muck of things out there on the river.'

'Of course, I saw that too,' catching his puzzled stare. 'I saw that too; it taught me to understand you—to understand *us*. How, with the best intentions in the world, we'd gone to smash.'

'Yes?' he asked.

'My dear,' she said, 'we'd got the partnership wrong. We both wanted to *do* everything, dream and plan and do, together. And I couldn't dream—I was all *do*, I wanted to rush at things, get a hustle on, do something—'

'And I,' he said, 'was merely able to dream, not *do*; to preach, not practise. That's all I was fit for. . . .'

'All?' she cried. 'All? Why, with the right partnership you and your dreams could renew the world.'

'The right partnership, Silvia?' he said, and he put out his hand timidly.

'My dear,' she said softly, and she knelt beside his couch.

THE END.

THE WEST COAST OF SOUTH AMERICA.

By RICHARD THIRSK.

PART I.

I.

THE first landfall we made after waving farewell to the shores of England was the little island of Mona, situated between Puerto Rico and Haiti. From there we had three days' sailing through the Caribbean Sea to Cristobal, the port for Colon. Here we had our first experience of a town in the tropics, of *dry* America, and of wet, very wet, Panama.

Cristobal and Colon are one and the same town, though the former is under U.S. jurisdiction, while the latter belongs to the Republic of Panama. The line of demarcation thus forms a *dry* and a *wet* zone. U.S. midshipmen do not approve of the *dry* zone. There was a boat-load of them at Cristobal while we were there, and I can safely say that I never before saw so many young men reeling through the streets of a town. How they mobbed the drinking saloons in Colon, and how they painted the town red, proving that they were 'Some boys!'

Colon is a town that has come into existence with the building of the Panama Canal. It is interesting because of its many-coloured life. All the peoples of the East seem to be represented there. Chinamen supply provisions and chop-suey; Indians and Japanese sell gold and silver wares; Armenians compete with them; Arabs and Egyptians sell their wares; while niggers of all shades do the work. The real American, when he is not a canal employee, makes ice-cream.

Groups of coloured women squat at street corners behind piled baskets of pine-apples, which cost only a few cents, while for twenty-five cents you can buy more bananas than you can conveniently carry. In quality and flavour these fruits are infinitely superior to those imported into Europe.

As a protection against the sun the upper storey of all the houses projects over the pavement, so that it is not necessary to go out of the shade, except when crossing the road. All the shops are under this balcony and are cool, especially as most of them have large revolving fans hanging from the ceiling.

What possibly strikes the visitor most forcibly is the extraordinary depth of the gutters he has to step over at either side of the street. At some corners they go down to a depth of about three feet, and the sewers are so wide that it is said that on one occasion a small boy was carried down one of them, and came out, strange to relate, alive, at the outlet on the sea-front. As likely as not Nature will explain the reason for the deep gutters. If the traveller

has the misfortune to experience a rainstorm, he will learn to his discomfort that even a three-feet gutter is not sufficiently deep to carry off the deluge.

Most people you meet carry an umbrella, even workmen. When I spoke to an American about this custom, he explained that they had rain at Panama, but that they seldom paid much attention to it. No, they didn't, for the good reason that the rain paid so much attention to them they were soaked through almost before they had time to know it was raining. Rain! Bah! Perhaps what I experienced was a miniature deluge, an imitation of the emptying of the seven seas of the world. It was not rain; it was a solid mass of water that tumbled down, flooding the country. Luckily it did not last for long—else it is easy to imagine a navigable sea taking the place of the Panama Canal.

This rain, which entirely blotted out the landscape as effectively as does a London fog, made navigation impossible and delayed us somewhat. As soon as it was over, the pilot took us through Limon Bay towards the Canal. All vessels passing through the Canal must take a pilot.

Though it is an exaggeration to speak of the Panama Canal as one of the wonders of the world, it is nevertheless a colossal feat of engineering, of human ingenuity and endurance. It enables a vessel to do in six hours what in the old days took six weeks, and more.

II.

From the Atlantic side the ship passes through three locks, the Gatun Locks, each one of which is calculated to take the largest vessel afloat. Immediately before the first lock is entered, a crew of niggers comes on board to work the ropes. These wire ropes are stretched from the ship to motor-tractors running on rails the length of the docks. Electric 'mules' the tractors are called. There are three on each side, two towing the bow ropes, two amidships, and two for steadying astern. These mules both guide and propel the ship—because of the possibility of damage being caused by the wash from her propellers, she is not permitted to use her engines.

All the operations at the locks are electrically controlled from a two-storeyed building situated between the different locks. The gates open and close as if by unseen hands, while the water rises to the level of the next lock without any apparent human effort. The passage through the three locks occupies little more than half-an-hour, in the course of which time the ship is lifted 85 feet above sea-level.

It should be explained that all the locks are double—that is to say, two ships, one westward-bound and the other sailing in the opposite direction, can pass through at the same time. Thus there is practically no delay. But two ships bound in the same direction are not permitted to enter at the same time.

On leaving the last of the three locks on the Atlantic side, we enter Gatun Lake, an artificially-created expanse of water extending over an area of 164 square miles. This lake was made by impounding the waters of the Chagres River, and is necessary for the supply of water for the locks on either side of the canal; that is to say, it supplies all the water for raising and lowering ships.

The dam necessary to resist the tremendous force of such a large sheet of water is not the least interesting feature of the canal. It is a mile and a half long, and half a mile broad at the bottom. In the middle is a spillway, or overflow channel, 300 feet wide, cut through solid rock: 154,000 cubic feet of water can be discharged through this per second. This overflow drives the hydro-electric plant for supplying electric power and light for the working of the machinery of the canal, the railway, and the entire zone.

In Gatun Lake the steamer can go at full speed for a distance of 23 miles. The lake is dotted with numerous islands, covered with palms and tropical vegetation, and you hear screaming parquets among the trees. In many places the bare stumps of trees that grew before the inundation may be seen rising above the surface. It is a beautiful tropical lake, and the traveller feels sorry when he leaves it to enter the Culebra Cut.

This is where the range of hills running down the isthmus was cut in two for a distance of nine miles. You will have some idea of the difficulty in constructing this portion of the canal on realising that 5,000,000 cubic yards of solid rock were taken from this cut, and that many hundreds of lives were lost. Serious obstructions have occurred here from time to time, and gangs of workmen are still employed in cutting the rock, in order to prevent future accidents.

At the end of the Culebra Cut is the Pedro Miguel lock, where the ship is lowered 30 feet to the level of the artificial Miraflores Lake, a sheet of water about two square miles in extent. Through this lake the vessel passes on to two more locks, where it is lowered another 55 feet to the Pacific level, coming out at Balboa, now used as an American naval port.

We left Cristobal at 11 A.M., and reached Balboa at 5 P.M., thus completing the passage in six hours.

When building the canal the Americans used no part of the old French workings. Parts of these may yet be seen. A good deal of the

rusting machinery is still there, sinking into the mud, sad relics of the loss of millions of francs and the useless sacrifice of many lives.

Canal dues are very high. Our captain told me that his steamer, 7000 tons dead weight, had to pay over £1000.

The U.S. Government has rented the land adjoining the canal, known as the Canal Zone. One of the conditions is that money thus received must be expended in improving the roads and means of transit within the Panama Republic.

III.

Something like twenty-four hours south of Panama we crossed the equator.

Guyaquil, in Ecuador, was our next port of call. To reach it we had to steam about twelve hours up the river, and lie at anchor in mid-stream while the cargo was discharged over the side into lighters. Natives, many of them coming off in canoes hollowed out of tree-trunks, swarmed on board to vend Panama hats, fruits, live-stock (monkeys and parrots), and to steal anything they could lay hands on.

Guyaquil suggests a town that man started to build, but tired before he got little more than half-way through. The streets are most of them impassable, except for donkeys, and all of them lead to rubbish-heaps that mark the end of everything. Many of the streets are used only for the drying of cocoa-beans, among which numbers of men sit patiently turning them over and selecting the dry ones, which are taken down to the wharves on slow-moving bullock-carts.

There is one prevailing fashion at Guyaquil to which all those who can afford boots must conform—that is, to have them shining so that you can see yourself reflected in them when you look down to admire. A man may be in rags and tatters, and there may be nothing of his shoes remaining except the laces, yet these must shine so that the sunlight may play among them. More energy is expended on shining boots than on washing faces; it is the serious business of life. An army of shiners, ranging from six to sixty years of age, keeps on shining all the day and well into the night. If you sit down at a café or a hotel, along comes one of the army with a boxful of bottles and silk-cloths, and begins operations. Board a tram-car and there is another, polishing as though dear life depended on it. Stand in the street for a second, and one of the faithful will get to work on your footwear, which, if not up to the standard, will be a source of much trouble and possibly danger to you. I got the impression that half the male population of Guyaquil lived by polishing shoes.

Not so long ago yellow fever and kindred horrors were endemic at Guyaquil. Happily the transmitter of the yellow variety has been

exterminated, but other species of mosquitoes still live and flourish abundantly, as I can vouch. Bah! those nights at Guyaquil were nightmares. With the dusk, while we were at dinner, down came the mosquitoes in clouds to feast on our ankles, making us itch and wriggle in our chairs like so many people possessed. When we hurried out to escape those in the saloon, fresh clouds were waiting for us on deck. Worst of all, they were already in possession of our bunks when we retired for the night, not to sleep, but to spend weary hours listening to their venomous ping-ping, waving our arms in a vain endeavour to chase them off, and scratching ourselves until we bled. I recommend mosquitoes as a counter-irritant to the languishing love-sick who lie awake at night counting the hours.

Guyaquil is ashamed of being a town built of wood, so it has invested in paint and done its best to make the low houses look as though they were built of stone. Churches—even the cathedral itself—are of wood painted to resemble marble. It gives you a shock of surprise to walk across what appears to be a mosaic floor and hear

it sound hollow to your tread. Yet it must be remembered that Guyaquil is subject to frequent earthquakes. The inhabitants know not if they may wake up one morning and find their town vanished, and presumably they argue that it might be more comfortable to be struck on the head by a piece of falling timber than to stop a stone hurtling from a height.

I never in my life saw so many donkeys as at Guyaquil. Everybody ambles along on a donkey. Two hefty men think nothing of sitting astride a decrepit little moke, which one of them might easily carry. Sometimes the load is so bulky that it is impossible to see anything of the donkey under it. It is only a donkey, which needs neither care nor attention, and which picks up its sustenance as it ambles through the streets—banana skins and offal—a kind of scavenger.

But the outstanding memory of Guyaquil is mosquitoes. At the end of a week of their blood-sucking we all of us looked like scarlet fever patients, and were glad to lift anchor and sail down the coast to Callao.

(Continued on page 760.)

THE FIREBALL.

By LADY NAPIER OF MAGDALA.

THE sun was sinking into a great bath of crimson, rose, and gold, behind the island of Eigg.

The 'Scur' stood up black and menacing against the gorgeous background: the scene of sinister memories of dark days of old, with the cave at its foot and the whitening bones of murdered Macdonalds trapped by treacherous and savage MacLeods. The Macdonald clan had their turn at the MacLeods later on, sure enough, and an ugly one, too. But those days are long since past and relegated to the rites of the long ago, and now Macdonald and MacLeod plod along peaceful plains of dull conventionality.

There, however, is the remote island of Eigg, and on that summer evening of which we write an exquisite peace reigned. The great plane of the sea was as a sheet of pure gold. The rich red-brown of the tangle waved in the tide, which whispered soft nothings to the rocky shore. Sometimes a whale came up, his black back shining. Gulls chattered peevishly, and crowded round him, when he would sigh and sink again to his depths. Cormorants fished and fluttered noisily, disturbing the calm surface.

The day's work was done. The old dairy woman and the two daughters of the farmhouse down in the hollow near the shore were seated high up on the Tor, watching and waiting.

The old woman had a grim look on her worn face. The brown eyes that looked out from

among a forest of wrinkles had seen many things, and were still keen and far-seeing.

The girls talked to each other in low tones in Gaelic. They were watching to see the fishermen from the Aird swinging down the track, wending their way to join the steamer that was to take them to the herring-fishing.

'They are coming,' said the old woman in her native Gaelic, in the soft, minor key of the west. 'And how many of them will come back? God help them!' she muttered.

'Be quiet, Seonaid,' said the girls. 'You are always a prophet of ill.'

A long straggling procession of men came down the hill. Splendid men, most of them, talking, whistling, singing.

Dusk was falling. The golden glory of the sunset was fading into the exquisite aquamarine, blue green of the northern night.

'That is not all,' said the old woman, counting the heads. 'No, I thought not,' and as she spoke a single figure came round the shoulder of the hill. Just in front of him a ball of fire* seemed to spring out of the ground and run along the ground. The man was walking with bent head, and did not appear to see it. Then it paused and plunged into the earth at the side of the track.

'Tis for Angus Ban,' said the crone, white to the lips.

* A fireball was not an uncommon sight in those parts, and was the source of many conjectures.

'Be quiet, Seonaid,' said the girls again.
'You will bring bad luck.'
'Wait you,' said the crone.

Summer lingered long that year in that beauteous land, and then the gales burst upon it; the forces of the storm were loosed, and worked their will. The Walkyrie shrieked.

More than one gallant little boat went down with its gallant crew. The Glasgow steamers carried many a long box that year, to be borne to its burying in the old land so well loved by her sons in those bygone days.

Once more the crone and the two girls, sitting

far up on the Tor above the farmhouse, watched and waited.

A sad little procession was winding down the track. It paused, and the men rested the coffin they were bearing by the side of the rough road.

Some of them piled up a cairn of stones after they had lifted it, to mark the place where it had rested. Then they continued their journey.

'Ay,' said the crone, and the painful tears of the old stood in her eyes; 'you will believe me now.'

The little cairn was on the exact spot where the fireball had disappeared, and the coffin contained what remained of fair young Angus Ban.

CANDLE-LIGHT.

By FRANK KING.

PART I.

I.

THE moor was shadowing as Jacob Webster trotted briskly along the rough bridle-track that led to Far Intake. The long summer day had ended in splendour of gold and crimson, and now the rich night-purple was softening the bold silhouettes of the hilltops towards Lancashire. Through the dusk, the circling peewits called plaintively; an occasional grouse cluttered hoarsely among the heather. Apart from these, the moorland lay silent, sinking into peaceful slumber after the drowsy content of the sun-bathed day.

Both man and beast were tired. It was no easy achievement to journey to the distant prayer-meeting at Heptonstall and return the same evening. Yet Nell pressed on with knowledge of the oats that awaited her in the comfortable stable at Far Intake. And the man urged her forward to still greater haste; for in the cool, oak-raftered kitchen of the farmstead two gentle eyes would be watching for his return, two warm red lips would speak welcome.

'The Lord hath smiled upon His servant,' he murmured, his dour face softening into tenderness. 'He hath rewarded me far beyond my deserts.'

A staunch Puritan was Jacob, with full conviction that salvation could be attained only by constant and ever-watchful struggle with the powers of Darkness. His close-cropped head and stern, solemn face marked him out as one of those who had lately rebelled against an ungodly king, a distinction further enhanced by his severe and sombre garb. He had many of the virtues and most of the faults of his sect. Among the scattered circle of zealots whose prayer-meetings he attended he was known as 'Sweet Humility,' an honoured pseudonym

earned by the fervour of his exhortations against the besetting sin of pride. Yet a word against the honour of a Webster of Far Intake would have sent his hand to his sword-belt in unthinking haste.

Jacob had fought against the Royalists, and fought like a true-bred moorman. He had been at Marston Moor and, with his fellow Roundheads, helped to turn the failing day for Noll. He had seen the Cavaliers routed at Naseby. He had gone through the campaign with a stern exaltation in the triumph of Heaven over Hell. When the forces of evil were finally overthrown, he had obtained an honourable discharge and returned home to lay his heart at the little feet of Anne Halliday. And she, strangely attracted to this dark-visaged man who loved his moorland so well, and a trifle dazzled, maybe, by the rumoured fame of his battles, had taken his heart into her gracious keeping and consented to become the mistress of Far Intake.

'The Lord hath smiled,' he murmured again, with tender memories of those earliest days. 'In no other way could her love for such unworthiness be explained.'

His thoughts flew back to the wedding in the old barn-chapel, and to the busy, glowing time that followed. He had been perfectly happy within the limits of his austere religion. There was much work to be done on the farm, neglected during the fighting. He had toiled early and late with plough and spade, and praised God for the gift of so fair a flower as Anne. But little by little a vague uneasiness had disturbed his content. For Anne was no Puritan, but a care-free daughter of laughter and joy. She showed no enthusiasm for the God-fearing life. He began to grow anxious for the safety of her soul.

With earnest sincerity, he had taken the

matter in hand. His wife was too dear to him to be allowed to go the way of the unbeliever. His entreaties and gentle admonitions, watchful and never flagging, had had their effect. Anne had become more serious in mind, more sober in conduct. Her joyous laughter was heard less often in the sombre rooms at Far Intake. She performed her household duties with only rare interruptions of frivolity. Jacob rejoiced to see his fears for her salvation thus dispelled. Yet there were times when curious doubts assailed him, keen though momentary regrets for eyes that had danced and lips that had smiled so readily.

Doubts such as these damped his anticipation as he turned the mare from the bridle-track into the boulder-strewn path near Far Intake. The very intensity of his feelings, the eagerness of his desire to fold the loved one in his arms, warned him of the danger of idolatry. It seemed to him that this keen longing to see her smiles and hear her care-free song came very near to sin, that it betokened a tendency towards that worldliness against which he had spoken.

'I must keep good watch,' he muttered anxiously, 'lest I give the Devil the foothold he seeks. This love for Anne is a wonderful and a sacred blessing. Yet it must not become more to me than the love of God.'

In a moment, however, his fears vanished, ousted by the glowing tenderness which swept through him with thought of the welcome waiting at the farm. Visualising the dear face, he remembered that Anne had lately lost colour and grown thinner. The weather had been hot and trying, and maybe she had expended too much energy in the care of the house. He promised himself that he would keep careful guard over her health for the next few weeks, even at the expense of an occasional prayer-meeting.

The mare's hooves clattered loudly upon the cobbles of the farmyard. Jacob was surprised to note that no light shone from the kitchen. 'I warrant the lass sits dreaming in the darkness somewhere,' he smiled, slipping from the saddle.

He lit a lanthorn and attended to the mare's comfort. Then, carrying the light, he crossed the yard to the house.

The kitchen door stood ajar and the house seemed strangely silent. Jacob stood on the threshold, peering into the room. 'Anne! Anne!' he cried cheerily. 'Where art thou, lass?'

No reply came from the darkness. The silence was broken only by the ticking of the long clock and the chirruping of the crickets beneath the hearth-stone. With some faint premonition of trouble, the man advanced into the stone-flagged kitchen, his footsteps echoing hollowly through the house. 'Maybe she has

gone on to the moor,' he muttered. 'Yet 'tis unlike her to be absent when she knows of my return.'

He placed the lanthorn on the white-scrubbed table, and at the same moment noticed the square sheet of paper there. He picked this up and held it to the light so that he could see the few words scrawled upon it: 'Jacob, I can bear it no longer. Thou dost not love me. I have gone to one who does. Anne.'

II.

A slow sigh escaped from the man's lips, and the paper fluttered to the floor. He gazed slowly round as though expecting to see Anne hiding behind some piece of furniture, ready to spring out with a merry laugh when her trick was discovered. But he was alone in the dim, silent room. Abruptly he dropped into a chair. For long he sat staring at the paper on the floor. 'Tis Anthony Cartwright's work!' he muttered at last. 'The loose-living Royalist! No man in the countryside but he would dare to philander with the wife of another in these days when the laws are made by God-fearing men.'

His hands clenched angrily at mention of the hated name; for there had always been enmity between the two men, so unlike in manners and appearance, who had been rivals for the love of Anne Halliday. Cartwright, with his handsome face, courtly bearing, and easy morals, found much to amuse him in Jacob's gloomy appearance and equally gloomy beliefs. Nor was he tactful in concealing this amusement, but rather quick to share it with others. So that a deep resentment had grown up in Jacob's heart, and had not dwindled with the two years of happy married life. True, his enemy's beauty had been spoiled by the sword cut which he brought back from the war; and since a mistress had reigned at Cartwright Hall, there had been fewer rumours of drunken and dissolute orgies. Still, Jacob had found it hard to be civil to the man, harder to countenance his frequent visits to Far Intake.

He had always suspected him, with his easy laugh and light banter. He had tolerated his visits only because they seemed to give pleasure to Anne. And now their purpose was revealed. He had been a fool to allow such as he had knowledge of. There must have been many more of which he was not aware, stolen meetings which had seduced the girl-wife from her honour and duty. 'She has gone like a lamb to the den of the wolf,' he cried bitterly. 'Dazzled and betrayed by lies and false promises!'

He fell on his knees then and prayed, prayed earnestly that the sins of the guilty should not be visited upon the innocent. For well he knew the purity of Anne's soul. She was no light woman. Nor was this an ordinary

elopement. She had been misled and deceived into taking a step the sin of which she could not know.

'She does not know, O Lord!' he muttered. 'Thou knowest there is no evil in her. She is careless, maybe, and does not all that she should do. Yet her heart is gentle and unstained, and is ignorant of evil.'

For long he argued with his Maker, humbly submitting every argument which could help to explain Anne's action. And in the process, his troubled mind lost any trace of doubt, finding only a firmer faith in the integrity of the wife who was, apparently, false.

Slowly, and as a natural corollary to his faith, came the realisation that Anne was in danger. Cheated and deceived, she must be contemplating the final step, must be standing even now on the brink of the river over which, once crossed, there could be no return.

'Save her from this, O Lord!' he pleaded. 'Watch over her timid footsteps. And guide Thy servant into doing Thy will, so that the innocent may return to Thy fold without suffering.'

The night was far advanced before Jacob Webster rose from his knees. But as he stretched his stiffened limbs he knew that the vigil had been well spent, that Divine guidance had been vouchsafed to him. The call to the sword had come again. Lover of peace though he was, this evil could not be overcome without strife. It was the will of the Lord that he should regain his wife by force, that his good right hand should be the instrument to punish the evil-doer.

He took down his sword from the wall and wiped the grease off it. It had struck shrewd blows for the right in the past. And now it shone bright and untarnished, slender and true, a fit weapon for the protection of so slender and fragile a maid as Anne.

'Art tried and proved!' cried the man, handling the tempered steel with tender and reminiscent care. 'Wert ever faithful in the days of Armageddon; and wilt not betray me now.'

A curious thrill ran through him when he buckled on the sword, a lusty joy of fight that had tingled in the veins of his ancestors for generations, the exhilaration that had transformed him on the field of battle. There had been times when he doubted the godliness of this savage enthusiasm. But to-night he gave no thought to it; for Anne was in danger.

Flinging open the door, he strode out into the yard. The night was moonless, and a dark screen of clouds hid the stars. The heath around lay black and silent. It was a far step to Cartwright Hall, but Jacob decided to walk. Through the darkness and over the stony moorland roads he would make as rapid progress on foot as on Nell.

He stepped out quickly through the heather, heading directly for the edge of Turvin Valley, at the top of which stood the home of Anthony Cartwright. A gentle breeze sprang up, rustling the grasses and the ling stems, stirring the blood of the man to fierce yet tender longings. But he thrust them aside with grim determination. The Lord's business was of greater moment than his own puny, earthly desires. His mission was to slay the guilty and save the innocent from sinful snares, whatever might result to himself. Maybe, if he acquitted himself righteously, the Lord would see fit to grant the full extent of his prayers and give Anne back to him.

Arrived at the edge of the valley, Jacob scrambled down the steep wooded slope to the road below that twisted and turned up the valley to Cartwright Hall. Here he could proceed with less caution and delay. He walked swiftly up beside Turvin Water flashing noisily over its boulders. Soon the three miles were behind him and he stood on a knoll near to the stream, looking up at the home of his enemy, barely distinguishable in the darkness.

No light showed in the black mass of the house, and for a while Jacob hesitated, uncertain what course to pursue. It was useless to advance and knock boldly at the door. Through dogs and servants, he would have little chance of winning to the master. Moreover, the warning of his approach would give ample time to Cartwright, if Anne were in the building, to hide her in some forgotten corner of the rambling wings.

At last he decided to climb up the ivy and seek an entrance into one of the upstairs rooms. Once inside, he could investigate cautiously, and, if discovered, hold his own against any attack. He stepped forward quickly. After gazing upwards in a vain endeavour to distinguish the windows, he chose a root of ivy at random, and climbed it with as little noise as possible.

'The Lord guideth His servant!' he muttered exultantly as he neared the deep-mullioned window and felt it yield to the pressure of his hand. It was the work of a moment to push it fully open and wriggle through into the room.

(Continued on page 744.)

IN THE CITY.

DEAR, where you are I country see
Where we have wandered wooingly;
Your eyes the amber of sweet streams
In whose loved depths I find lost dreams;
And all about you still do blow
The gentle winds of long ago.
So, on this air, there comes to me
The fragrant of field and tree;
And in this dark the sunshine gleams,
Since, in your hair, lurk truant beams.
To be together is to know
That birds are singing, flowers grow.

Chambers's Journal

SEVENTH SERIES

SERVANTS OF THE LAW.

By H. MORTIMER BATTEN, F.Z.S., Author of *Habits and Characters of British Wild Animals, Tracks and Tracking, &c.*

I.

THE pool lay in the hollow of the mountains—just a circle of crystal water overshadowed by pine and poplar, and having no visible inlet or outlet. Crystal, I say, and so, normally, it was; but to-day its waters were of the colour and consistency of *café au lait*. Moreover, there was something strange about that pool, something one might not have noticed in peering through the bush from any one of the jagged ridges rising all round above the fallen timber, for there protruded from its surface at irregular intervals sundry pairs of huge exclamation marks, standing erect or flapping back and forth as though all were engaged in semaphore conversation. Also there were heavy swirlings and bubbles here and there, while above each pair of inverted champagne bottles hung a dense cloud of mosquitoes.

Yet, save for these curious signs, there was nothing to indicate that the herd of cow moose had sought the sanctuary of the pool as a haven from the flies and from the mid-day heat—though, of course, a skilled tracker might have followed them there. They lay hidden, their bodies totally submerged, only their huge ears and at intervals their nostrils rising to the surface, and the keenest of their foes, passing on the leeward side, might indeed have gone by without knowledge of their presence. For the water was doing more than shield them from the flies and the sun's heat—it was hiding them from view; and more important still, it was hiding their body scent.

Suddenly, however, a great ungainly head rose from the surface and remained a moment, bearded, streaming, and grotesque, while two great black eyes peered from it into the chaos around. Then, in the fraction of a second, the whole surface became alive. It was as though a hatching of gigantic water mammals burst all at once from the inert caddis, possessed of a desperate desire to leave their aqueous habitat. The cow moose rose with one accord, till the whole pool was a seething mass of spray—each great ungainly beast wallowing in awkward bounds for the break in the timber by which they had entered.

What had alarmed them?—for alarmed they certainly were, and desperately so. Yet there had been no sound on the mid-day heat save the buzzing of cicadas and the rhythmic purr of the spruce bugs.

The first of the cows reached the opening, her half-grown ungainly calf beside her; then came the rest with their calves, jostling each other like oxen on market day as their paths converged at the opening of the runway.

Above the slush of wet bodies and the rumble of hoofs there rang out a single rifle shot, and one of the cows fell to her knees, uttering a grunting bleat, presumably to her calf. She was trampled over by the rest, her calf was borne on with them, and there, very still, she lay on the trodden earth, among the dripping foliage.

So the rumble of hoofs died, and soon silence fell again, save the never-ceasing insect life. The cow moose was dead, shot through the spine, I fancy. Someone did not care for the white man's game laws, nor heed the boundaries of the great National Reserve. Some poor devil out of grub, perhaps, so we must not judge too soon.

II.

About ten minutes passed, then a man came forth from the thickets—an unkempt, ragged individual, whose black hair hung to his shoulders. There was nothing about his carriage which suggested hunger—indeed the whole impression he gave was one of wiry quickness and panther-like alertness. His feet were shod in moose-hide moccasins, from which still hung a ragged adornment of stained porcupine quills, while the tattered finery of his buckskin shirt and trousers lent lustre to his primitive manhood. Over his shoulders hung a service carbine, and his face was lean, wolfish, and dangerously keen. The man was an Indian, and his name was Nahara Too. No mean hunter, Nahara Too!

Nahara went up to the dead moose, and drawing his hunting knife he went to work quickly and skilfully. He stripped off the skin, or rather a portion of it, then he took some of the meat. It was of no use taking much,

because he was alone, and it would not keep, so he took only the best and left the rest for the wolverines.

While Nahara was at it the calf came back to look for its mother, and peered at him big-eyed, not ten paces away. It moved slowly round in the bush, watching the Indian at his gruesome work, but there was nothing to indicate that Nahara even so much as saw it. He made two thongs with which to carry the hide, then he rolled the meat up in it, flung his heavy burden over his shoulders, and trudged silently off—back towards his canoe.

But Nahara's luck was out. Ere he gained his canoe he heard a metallic click in the bush behind him, and knew it to be the click of a safety-catch. He froze in his tracks, for he felt the sights burning into his shoulders, and he knew that at last the game was up.

'Drop your gun, Nahara, also your knife—in double-quick time!'

Nahara obeyed. He had no alternative; he turned and looked back as his captor stepped from a thicket. 'You, Vaughan!' he said in a quiet voice, but without surprise.

The white man made no comment. He took up the Indian's belongings and leaned them against a tree; then he said, 'I've been watching you the thick end of a month, Nahara. Three times already I've warned you. You can't say but that I've given you every chance. You'll go to jug this time.'

Nahara shrugged his shoulders indifferently, but his face was not pleasant to behold. This was the White Man's Law, and Nahara hated that Law. Many times he had broken it for the sake of breaking it, and, too clever to be caught, he had yet let the rangers know that he was defying them. To him the rangers were the Law. To his way of reasoning Val Vaughan, the man standing before him, was responsible for the changed order of things. And Nahara had hunted that range ere the fetters of the Law were known—hunted in freedom, as his fathers had hunted before him.

'What now?' inquired the Indian at length.

'You are coming back to Outpost River,' Vaughan answered. 'The skin and the moose meat we will take. We shall need them as evidence, but we will leave your rifle and the knife till I return with the inspector. You will not need those.'

Nahara stepped forward and leered into the ranger's face. 'To-day you what you call—the high horse, ah?' said he. 'But some day, I kill you for this!'

Then it was that Vaughan struck the man—struck him a blow which smashed his own knuckles, as the order of things out there justified; but Nahara went his way peaceably, yet with the slur upon his manhood indelibly engraved.

III.

Two days later, having left Nahara under arrest at Outpost River, Vaughan returned with the inspector to collect what evidence there was by the pool. It was sun-down when they arrived, and there, of course, was the evidence staring them in the face. When there was light enough they would take photographs, for they meant to leave no stone unturned. Nahara was a bad Indian, and they intended to make an example of him. Quite prepared were they to overlook the occasional killing of moose and deer for food, but this systematic wastage, this killing of female animals out of season, simply in defiance of the Law, could not go on.

Near to the pool the two rangers made their camp and lit their fire, and, as the velvety darkness of the forest night closed about them, they heard at intervals the sound of stealthy steps, now here, now there. An inquisitive bear, no doubt, or possibly a panther—and they paid little heed. They were sitting over their pipes when Vaughan suddenly rose, his fingers clutching his rifle, gazing over the inspector's shoulder. The latter did not move. 'What is it?' he questioned quietly.

A grim smile curved Vaughan's lips. 'Well, I never!' he exclaimed. 'You poor little devil!'

The inspector also rose, and there, behind him, the fire-light reflected in the wonder of its gaze, stood a straddle-legged moose calf, which clearly had no fear of them.

Vaughan went up and stroked its nose. It tried to suck his fingers. He felt its ribs. 'Starving!' he announced. 'Isn't it an infernal shame? Doubtless the calf of Nahara's victim, haunting the place where the smell of its mother still hangs.'

They had plenty of grub with them, including canned milk and oatmeal, so they fed the calf sumptuously, and it lay down near to them for the night. Next morning it followed stumbling at their heels, sucking their clothing at every chance, while they did what had to be done. And finally it followed them out over the mountain route by which they had come. And so little Wama became the established pet at Outpost River.

IV.

Nahara was, of course, sent to prison. His term was a short one, but it is not likely that he would ever entertain very happy memories of it, as it was for him to carry home to his people the hell of white man's justice. Moreover, his punishment did not cease there, for the rangers in the meantime had visited Nahara's chief, and talked long and earnestly with him on the welfare of his tribe. So when Nahara got back his chief ordered that he be

publicly whipped for bringing disfavour upon his tribe, and for destroying game to no useful purpose.

Nahara was not without his enemies among his own people, and the old chief, anxious to make a good show of it, saw to it that Nahara's enemies were chosen to wield the rawhide. This was an affair after the hearts of all, reminiscent of the good old days, though enveloping it all in a halo of light was the justice of the White Man's Law. 'It is well that it come from you rather than from us,' the white ranger had said. 'Nahara must suffer that your tribe may prosper under the Law of the Paleface, even as the Palefaces themselves prosper.' So, by a savage creed, the prosperity of the tribe would be in exact ratio to Nahara's sufferings.

Three weeks after the Indian's return to his tribe he left it again, broken in health and in spirit. His squaw wished to follow him, and he had to strike her many times ere she would obey his order—to remain with the tribe and take good care of their little daughter, Snow on the Mountains, till such time as he returned. For assuredly he *would* return when the shame and the shadow had died from his name.

He went as a child goes forth into the world, went in all his tattered finery, and he drifted southwards. He drifted into the service of the Hudson's Bay Company, and he drifted out again. He guided a white explorer north of the Great Slave Lake, was two years in the Arctic, and guided the explorer safely back. Then he and the explorer, regaining civilisation's edge, both got roaring drunk, and Nahara drew his knife. Of course he went to prison again. That was the White Man's Law.

He was converted under the Holy Cross, and took the Blue Ribbon, but a week later he went to prison once more for riotous debauchery. Again he was converted, again he took the Ribbon, and again he got drunk and went to prison. So he came to regard the White Man's Law as a mockery of itself, and the white man's creeds as a travesty of God. He married an Italian woman, and deserted her. From Calgary he drifted to Winnipeg, and he established the record time on the winter trail between Winnipeg and Fort William, driving the Northern Packet. He became known as an Indian with gifts if he could but use them to effect.

V.

Then the Earthquake came which shook the world, while its tremors ran out far beyond the bounds of civilisation. And Nahara drove a dog-team two thousand miles across the snowy wastes, and went to other lands. With the scum of the north country, out in search of grub tickets, with the cream of the world's pioneers, with all the blotched and motley throng he

went, and shoulder to shoulder, man to man, he toiled and suffered with the rest.

Three years later he returned, pronounced by the Law as war-broken and useless. The desire to go back to his own land was dead, for he had seen so much that he no longer wished to tell his people of it. It was too long a story, and he was too weary. Also, they would not understand.

But there shone on Nahara's horizon one lone star. Very brightly it shone, fresh and unfading as the dawn. Ten years had passed since he left the children of the tepees, but they left his memories unchanged. For him the meadows of his youth were still rich in musquash and beaver, and the fat deer were in the grassy bays.

Hard times followed Nahara's return, and his youth was passing. His constitution had been wonderful, but after all he was but a red man. And now the cough of the lungs assailed him, and he knew that his face was towards the sunset.

Yet to Nahara that knowledge bore no sadness. He was not afraid. He had drunk deeply of the cup of life; he knew its sweetness and its gall, and he feared not to drain its dregs. Life owed him nothing. Assuredly he owed nothing to the world, which to him had evolved itself into the White Man's Law. For ten years the Law had stood over him like a drawn sword, ready, inexorable, crushing all men into submission, even as he was crushed, though their hearts yearned for freedom. The Law! That was the Law! To him the tyranny of military rule was but its semblance—rising like a brass god over all creation, though its power dissolved into smoke for those who feared not human suffering. Once he had regarded the Law as a god indeed, but now he knew. He no longer feared it, for he saw in its power but a feeble thing—like the Blue Ribbon of the priests—because it was helpless to stay the human will.

So one day Nahara turned his face northwards again, knowing that his feet were set towards the journey's end.

VI.

During the winter succeeding her capture, Wama, the moose-calf, was broken to harness, and so Vaughan was able to satisfy a pet desire. For long he had held that the wild deer of the woods, the moose and the caribou, might aptly be employed by the Mines and Forests Department as beasts of burden. Always they were short of dogs, and dogs, at any rate, were expensive, while food had to be carried for them. The moose, on the other hand, could feed itself anywhere, and, compared with the sled-dog, or even a whole train thereof, it was a mighty beast.

Left alone, when winter came, with God and

the snows, Vaughan set to work to train his moose, and so well did he succeed that very soon he had little use for his dogs. He used the moose as he might have used a pack-horse, travelling overland instead of by the long and circuitous routes of the waterways. This was rendered possible by the animal's wonderful knowledge as to the whereabouts of drifts. Guided by some mysterious sense, it would jog despondently in and out, seeking the wind-swept patches, sometimes making a seemingly needless detour to avoid the deep snow, but unerringly returning to their line of travel by the most direct route. It could pack on its shoulders more than the strongest man could carry, and trot all day as fast as an unladen man could move on snowshoes, feeding during the night and taking its rest while it fed.

All next summer Wama was used as a draught animal, and the principals of the department became much interested. It drew Vaughan before their notice, but of course there was just one fly in the ointment. Wama was becoming so fierce that no one but Vaughan could go near her. She would rear like a horse, and strike out with her terrible fore-hoofs, uttering a trumpet-like squeal should any one try to make friends with her. And whenever Vaughan left her tethered outside trading-post or depôt, he was compelled to hang a glaring notice over her ears, incidentally eclipsing her eyes, 'This Animal is Dangerous!'

Naturally he and his strange companion became somewhat famous, but all who had anything to do with Wama were unanimous in the opinion that they would prefer dogs.

Things were going well with Vaughan, for he was a very able servant of the Law—ever ready to give quarter where it was deserved, but inexorable in his justice. As civilisation advanced, Outpost River became more than an outpost, and from it the tentacles of Government groped their way outwards into the wild, till Vaughan had many rangers under him. He built a bungalow, trained flowers over the walls, and took to himself a wife. Time passed, and the music of children's laughter crept into his life. And no call came to Vaughan when the whole earth shook, because he had his own great work there in the untrodden places. Ten years passed, and the first shades of autumn laid their frosted fingers upon the ranger's temples

VII.

Christmas was near. Vaughan had been up-country visiting some of his outposts, but, determined to spend the festive season with his family, he made a hard push to get back. Wama, as usual, was carrying his packs, and his half-breed servant accompanied him, the moose eager to make good time now that her nose was towards home.

The trail was one which she knew well, for

it led down a rocky defile, piled and pillared on each side with gigantic columns of ice. And when the close of the short day found them only twelve miles from home, they decided to push on rather than spend another night on the trails.

They had not made very many miles, however, when Wama stopped and refused to budge. No mule on earth was more obstinate than Wama when she chose. Vaughan tried coaxing, but she would not stir. He went ahead, calling after her, but she stood with her fore-legs wide apart like a wooden image.

What to do Vaughan did not know. Wama was quite prepared to go back, but go forward she would not. The half-breed, of course, became superstitious, and very soon he too refused to go on. He said that some evil awaited them on the trail, and that the moose knew it. He rather suspected wolves, or possibly a grizzly, lurking in hiding for them. But the ranger knew that he feared the River Inua—the dread ghost of the waters.

Vaughan cared not a rap for wolves or Inuas, but he knew that it was as useless to argue against the breed's superstitions as against Wama's obstinacy, and thoroughly out of temper with them both, he decided to make camp where they were. Indeed, he had but one alternative—to return eight or nine miles to a base-line crossing, then make a wide detour homewards over the most appalling going, which, of course, was unthinkable.

They were astir next morning with the first glimmer of dawn, and, Wama having forgotten her prejudice, were soon into their stride again. The sun was up when, gaining the mouth of the defile, only a few miles from home, something prompted Vaughan to look back.

Then it was that he saw a man lying between two boulders some fifty feet above the trail. Vaughan called to him, but he did not stir, and the ranger knew then that he had answered yet another call, for the cold was intense. So Vaughan went up among the rocks to see what there was to see.

The man lay between two boulders, his sightless gaze still fixed along the sights of a service-rifle trained on the open vista down which they had come. His stark fingers were locked about the trigger-guard, hoary with ice where his breath had settled.

The heart of the ranger was heavy as he looked down at that still, cold figure—silent evidence of the Law which he himself served so ably. He knew now why Wama had refused to take the trail, but his gaze became misty as he saw, protruding from the Indian's pocket, in significance of the season—a tousel-headed plaster doll.

So Nahara's star had shone, and he had forgotten that his little girl, Snow on the Mountains, would be grown-up now.

YPRES, THE PHOENIX.

By THEODORE RUETE.

I.

TEN years have now passed away since Britain entered the war by Belgium's side. During the four and a third grim years that succeeded the violation of Flanders, Ypres and its famous Salient, where our empire is calculated to have lost some 250,000 sons, were busy making history that will live for ever.

On 4th August of this year, therefore, the Earl of Ypres, as representative of the Ypres League, crossed to the town whence he derives his title, to mark the memorable occasion by laying a wreath upon the ruins of its renowned Cloth Hall—the great cenotaph to all who fell in defence of Ypres and the Salient.

In Belgium, however, this anniversary is also celebrated as a national festival. The booths and roundabouts covering every inch of Ypres' Grande Place are always thronged with merry-making crowds, but these were especially great this year, in honour of our distinguished soldier on his mission of piety and respect.

The wonderful old town of Ypres dates from about the year 940 A.D. During the whole of its long history, wars and pestilences constantly have ravaged it, but although shorn, latterly, of most of its former importance, it continued fairly prosperous right up to the Great War, when at last it was levelled with the ground. Of all Ypres' 5000 houses before the war, but one small building, in a distant corner, still remained standing. This, although severely damaged in several places, managed to retain four walls and a roof of sorts, and to-day is pointed out by the inhabitants, with a mournful kind of pride, as the single structure that survived the four years' bombardment of the Germans.

Despite this terrible disaster, however, Ypres, thanks to the Belgians' wonderful pertinacity, is rapidly rising again, phoenix-like, from her ashes. About two-thirds of the town have already been rebuilt, and some dozen up-to-date hotels, with several smaller ones, and many first-class shops offer visitors every possible comfort and luxury.

These facts are all too little realised by the streams of British continually crossing to Belgium to visit the battlefields in this cockpit of Europe. Most of them imagine, probably, that 'Wipers' is still a heap of ruins, or at best a collection of little wooden hutments. Both are certainly present there, but the ruins are fast disappearing, and if folk continue to live in the streets of wooden structures put up as emergency dwellings on the former cavalry drill-ground, many of them, nevertheless, now

possess proper houses, which they are renting out to others.

The reconstruction of Ypres is, indeed, one of the marvels of modern times. Of the town's 18,000 pre-war population, over 13,000 already have returned thither, and almost all buildings occupy their former sites—the records of owners and positions fortunately having been preserved. Many of the streets, now well-lighted and clean, have been widened, however; slums, swept away by the war, have not been permitted to return; and with a good drainage system and an efficient water supply from Lake Dickebusch's 105 acres, close by, Ypres, nowadays, is a far healthier town than ever it was before. People in those villages that escaped bombardment are quite envious of Ypres, in fact, and only regret that their houses were not also destroyed, that they, too, might be getting the far superior type of dwelling now quickly rising in Ypres.

II.

The rapidity with which Ypres has been, and still is being, rebuilt is hardly credible to those who have not seen it, when it is remembered that six years ago not a brick had been laid. As a matter of fact, except for a few scattered edifices erected by private enterprise, building here began officially only in April 1921. Luckily, the pleasing old style of architecture, modified where necessary to conform with present-day engineering principles, has largely been retained. All the houses are distinctive, and many of them show once again those famous Spanish fronts, so common in Flanders since the Duke of Alba's occupation. A tree-branch lashed to the topmost rafter of a house that has reached its upward limit is a common feature in Ypres just now, and signifies that no further progress will be made in connection with that particular house till the owner has stood drinks to all the workmen employed thereon.

Quite a number of buildings in Ypres are being put up by a contractor with an interesting history. He was a mere nobody before the war, and his father died owing large sums to various people. The son managed to secure employment selling wine to the troops, and thus amassed considerable wealth. With this he at once honourably discharged his father's debts, then started in business for himself as a builder, and to-day is exceedingly prosperous.

Work on the St Martin's cathedral-church is proceeding apace, and it is expected that the nave will be completed by March 1925. The fine gateway to the cloisters has already been cleverly restored to much of its former weather-beaten appearance; and in the ruined square of

these cloisters stands the only memorial as yet erected in Ypres to British soldiers. Here will stand, eventually, a Gaelic cross to the memory of men of the Irish Legion, whose countrymen, with characteristic impetuosity and humour, have had the pedestal, which alone, so far, is in place, already unveiled—on the 7th of July 'twas done—by General O'Brien Mahon.

The ruins of the Cloth Hall, however, present a problem of quite another nature. For some considerable time past certain persons have favoured the project of completely restoring this grand old building to its former condition. This notion, however, has been strongly opposed by others. They truly say that the town no longer has any use for a cloth-hall as such—the cloth-trade has gone, never to return. Moreover, they consider that the ruins should be left as they are for all time, as a national memorial and a universal reminder of Germany's brutal savagery. Feeling has waxed very warm in this dispute, but despite the contention of the party opposing reconstruction, this, under pretence of consolidation, was quietly going forward. At last the others, among whom were some of the town's most influential members, announced that, if this work was not instantly stopped, they would withdraw all their interests from the place. The protest finally was successful in forcing reconstruction to cease, and further elicited a promise that, if at any future date the hall should be restored, it should only be used as a national museum.

III.

Although Ypres' principal occupations at the present time are 'building' and 'tourists,' the government-owned railways have so far shown lamentable want of vision in not providing this celebrated town with better and cheaper facilities for getting construction materials, on the one hand, and with a service for tourists, who would bring money to the place, on the other. At the present time no train, either way, connects with the boats entering Ostend, where arrivals by the afternoon boat have to cool their heels for an hour and a half before they can leave for Ypres. The consequence is, that most folk visiting Belgium stop in Ostend, or some other of the country's watering-places. Or perhaps they rush on to Bruges, or Brussels, whence they make hurried pilgrimages into the Salient and Ypres.

They would be far better advised, however, to take up their abode for a time in Ypres itself, where H.R.H. the Princess Beatrice and H.M. the Queen of Spain have lodged before now when visiting the grave of Prince Maurice of Battenberg—near the famous Menin Gate; for the whole neighbourhood here is studded with places of deathless interest, easily reached from the central point of Ypres. The town itself, too, with its beautiful cemeteries—250 of these

exist within a ten-mile radius from its centre—its architecturally-fine new structures, copies of the best of the old, and its captivating ruins, is a fascinating spot for such as really desire to be informed about the centres of conflict on this front.

A whole morning, for instance, could easily be spent in walking round and inspecting Ypres' picturesque old ramparts, on which the trees and shrubs are rapidly growing up again. The ramparts curve inwards and again outwards at certain points, and at each side of all such bends exist various chambers, whose exits, facing inwards from the exceedingly wide moat, are invisible from without the town. During the war these turrets were used as starting-points for reconnoitring parties of our brave lads, who, slipping out of these doors, crossed the moat on bridges concealed beneath the water.

Standing on these ramparts, it is easy for one to understand how the foe was able to work such terrible destruction on Ypres, for the place is completely dominated by Kemmel Hill, Monts Rouge and Noir, the Messines Ridge, and various other vantage-points, including Hill 60. Among the shell-holes and churned-up ground on these heights, where so many of the enemy flew into the air on the exploding of our mines, the trail of war still lingers, and beside a battered rifle and a shattered pickelhaube there was a human foot, still completely fleshed, six years after cessation of the conflict.

In one of these rampart-curves previously mentioned, a small shore has formed in the course of centuries, and hereon is located what surely is the most romantically-situated hen-run in existence; for a Belgian veteran keeps fowls and raises market-garden truck upon this spit of land, while his dwelling is in the thickness of the rampart's wall behind. Farther along, one comes upon a meat-refrigerating station established in this same wall, its chimney-stack sticking up, periscope-like, through the earth. Here were divisional headquarters during part of the war, but these ramparts also contain many other dug-outs, some of them 200 or 300 feet long. These are to be preserved for posterity, restored exactly as they appeared in the war.

At one part the moat has a fairly large island, on which has been erected a jolly little tea-house, and rowing-boats now pass lazily across the water over which shells formerly screamed.

IV.

Many visitors to Belgium doubtless would like to see for themselves the very 'Flanders' fields where poppies blow, between the crosses, row on row.' The actual dug-out where that fine Canadian poet, Lieutenant-Colonel John Macrae, wrote these lines of his immortal poem, 'We Shall Not Sleep,' is in the bank of the

Yser canal, a short motor-run from Ypres. Leaving the town at 'Dead-end' and turning at 'Hell-fire Corner,' one passes at length the fine memorial to the 47th Yorkshires, on a bluff by the canal—the beautiful little cemetery, embellished and tended with loving care, being upon the opposite bank, between the road and the waterway. This last lies choked with weeds, and useless nowadays, but the spot, at a bend just beyond the bridge of a branch-road—beside which highway a brand-new flour-mill has sprung up—for ever will be associated with some of the most moving poetry ever conceived by the human brain.

Throughout the Salient, at various points along the roads, stand squat little obelisks, bearing the legend, 'Here the enemy was halted,' and the date of that noteworthy occurrence. Moving about from village to village, too, one constantly meets still with waggon-loads of rusty, galvanised iron, and miles of ragged barbed-wire, packed by the 'Bijou' presses into neat bales, for shipment to Cardiff or Swansea. These keep coming into Ypres all day long, and every day, and it is calculated that they may continue so to do for another couple of years. Bodies also still are being found daily in this neighbourhood, forty per cent. of which are instantly identifiable by some means or other, and a further twenty per cent. eventually identifiable—to such perfection have the records of this very sad work been brought.

No more need sorrowing relatives go wandering aimlessly around nowadays, seeking their departed's resting-place; if they know his name and number, his grave, provided he has one, can be located quickly and with certainty. There are, moreover, no more unknown warriors now; the words on the neat tombstone, or little wooden cross, above any remains that cannot possibly be identified being these, 'A soldier of the Great War; known unto God.' Further, those known to have fallen in Ypres or the Salient, of whom no grave as yet has been discovered, are to have their names inscribed upon the panels on each side of the majestic restoration of the famous Menin Gate, which is being undertaken—it is already under way—at a cost of £150,000, as a memorial in Flanders to the whole British army. Despite the most painstaking efforts to establish the rightful resting-place of every soldier, those thus commemorated, alas, will form a company so great, that it has been said a large number of workmen will be more than two years completing the task of recording their names!

V.

Along the Flanders roads, where formerly passed the various firing-lines, the smashed pill-boxes, the pitiful headless stumps of trees, and the occasional passing waggons of barbed-wire are almost the only signs of war that are still

left. The roads have been put into repair, the country scientifically drained, and the land smoothed and brought into good tilth again; splendid crops, so far as the eye can reach, witnessing to the indomitable courage and tireless industry of these wonderful Belgians.

In Langemarck, where are stacks of local bricks, the new church is nearly completed. Money for churches, by the way, always seems forthcoming in the villages of the Salient where, if anywhere on earth surely, good excuse could be offered were it lacking. But building seems to cost much less over there than with us, to judge by the results of inquiries and comparisons. In building anywhere in the Salient, however, caution always has to be exercised, for sometimes the ground is mined, the foundations sink, and edifices suddenly collapse. Notwithstanding every care, all mines have not been recorded upon the surveys.

The new church in the village of Kemmel, upon the slopes of the famous hill of that name, is also almost finished, and looks a fine building for so small a place. Likely the hamlet will grow, however, and become a summer-resort, for which its fine situation admirably fits it; one of its most commanding sites already has been sold to an orphanage in Armentières.

It has been proposed that the top of Kemmel Hill, which is 153 metres high, should be used for an international War Memorial, to be contributed to jointly by Great Britain, France, and Belgium, and a meeting to discuss this matter was held, indeed, on 7th July, in a certain hotel in Ypres.

These hotels of Ypres, by the way, are replete with every modern comfort, such as excellent cuisine and wines, central heating, electricity, baths, etc., and intending visitors would find it advantageous to make private arrangements with any of them, or to work through the Syndicat d'Initiative. They would thereby save at least 2s. 6d. per day on the prices charged by various tourist organisations and semi-religious bodies, and should not have to pay more than thirty-five francs (about 7s. 6d. per day) at even the very best places.

WHEN PLANETS RISE.

WHEN planets rise serene in night's array,
By sequence sure a path ordained for each,
A reign of law so bright, so calm, may teach
What bliss is theirs who burn but to obey.
I would my course were thus forbid to stray!
When I recall my infancy of speech
And thought, unfeigned and pure, I could beseech
Yon silver moon, some potent, mystic way,
To draw a tide from seas of innocence
Where childish memories fragrant float—a tide
Rising in flood o'er shallows' mean pretence,
Lifting my barque on swelling stream to glide.
So borne, I might with chart and sail dispense,
And trust Thy grace to bring me to Thy side.

A. WISHART.

CANDLE-LIGHT.

PART II.

III.

INSIDE, the darkness seemed still more intense. Feeling his way with groping fingers, Jacob brushed against a small table, on which stood a half-burned candle. Taking tinder-box from his pocket, he lit this, closing his eyes as the light dazzled him. When he opened them and glanced round the room a grim smile curved his lips. The Lord had delivered his enemy into his hands!

He tiptoed to the door and shot the heavy bolt. Then he turned and advanced to the bed, gazing sternly down at the occupant.

The man slept on undisturbed. A bandage over his eyes hid the upper part of his face, but there was no doubt as to his identity. The long hair and the thick beard, both of the same flame colour, were known throughout the countryside, and had earned him the sobriquet of Red Anthony. The last of the Cartwrights, the last of many generations of wild, ungodly men, lay there sleeping peacefully as a child.

Jacob seized his shoulder and shook him roughly. 'Awake, thou son of Belial!' he cried. 'The time of punishment for thy sins is here!'

The other sat up in bed and turned his head from side to side sleepily. He raised his hands to rub his eyes, felt the bandages, and dropped them again. 'Who speaks?' he asked irritably. 'Who is it disturbs me thus? I cannot see.'

'Why canst thou not see? 'Tis Jacob Webster speaks.'

'Oh, 'tis Sweet Humility! I' faith, Jacob, I never guessed lack of sight might be so near a blessing. Your sour face was ever enough to turn a man's stomach! I have one of your Roundhead fellows to thank for this relief. My old wound has broken open and inflamed my eyes. But what do you here in my room, man!'

'I have come to kill thee.'

'To kill me? Egad, 'tis vastly inconsiderate to waken a man up for that!' Cartwright laughed heartily. 'May I know the reason for the slaughter, or must I die in ignorance?'

Jacob was watching him intently, a dull flush staining his dark cheeks. Now he seized the man by the shoulders again, swinging him round so that they were face to face. 'Where is my wife?' he asked in level, yet urgent tone.

Cartwright's smile faded, and his mouth hung open for a second. It was as though he had remembered an important matter which should never have escaped his mind.

'Your wife?' he echoed uneasily. 'What do I know of your wife?'

Jacob's grip on his shoulders tightened. 'Where is my wife?' he repeated.

'I—I do not know,' faltered Cartwright. Then, recovering his composure and brushing away the other's hands, 'I have a wife of my own,' he continued, more easily. 'And, in truth, one is as many as I should care to manage. How should I know aught of Mistress Webster?'

'Thou liest!' said Jacob sternly. 'But 'twill not avail thee. The Lord hath spoken to me and made me the instrument of His wrath. Thou hast gone too far, Red Anthony. Thou hast beguiled an innocent woman into sin, enticed her from her honour and duty. The note she left said not where she was going. But I have long suspected the good faith of thy frequent visits to Far Intake; and thy guilty bearing now has stifled any doubts. My wife is in Cartwright Hall at this moment! If she were here with full knowledge of her deed, there would be naught for me to say. But because thou hast lied to her and betrayed her, I shall kill thee before I search for her. Up, and get thy sword!'

Cartwright slipped out of the bed and fumbled for the dressing-gown which hung over the foot of it. His movements were calm and methodical, and he showed no sign of the confusion which had made him falter and stammer a few moments ago. 'I always knew Sweet Humility for a hypocrite,' he said smoothly; 'but I had no suspicion Jacob Webster was so arrant a fool. I say once more that I have no knowledge of Mistress Anne.' His voice roughened. 'And if I had I would not tell you! A maid with youth in her veins is well rid of so amug and self-righteous a Puritan. 'Tis a puzzle to me how she has borne with your psalm-singing so long. Away with you now! Else I call the servants and have you thrust from the door!' He made a move towards the bell-rope.

Jacob drew his sword and sprang to intercept him, pointing the steel against the other until it pricked his chest. 'Another step!' he cried, his lips drawn into a straight line and his eyes burning fiercely; 'another step, and I kill thee as I would a mad dog! Dost think thou canst escape the Lord's vengeance by such trifling? He hath chosen me for His purpose, and naught can save thee. Yet I would see thee die as a moorman should. Wert not always a craven, Red Anthony! Must I taunt thee to bring back thy manhood?' He flicked the other lightly on the cheek. 'Now, wilt thou fight?'

For a moment Cartwright stood motionless as though dazed. Then he flamed into furious

anger. 'Fight! God rot you! I would give my soul to spit you as you stand there, grinning at my impotence! I cannot see'—his fingers flew to the bandage—'yet I will fight——'

'Stop!' Jacob's voice rang out hard and decisive. 'Hast said hard words against me to-night, Red Anthony, many of which, maybe, are deserved. Yet no man has earned the right to call me coward. I would not have thee die thinking the Lord had chosen so sorry a tool for His work. I give thee my word that I was not laughing at thee, that for the moment I had forgotten thy blindness. Dost believe me?'

'Indeed, 'twas not like Jacob Webster,' muttered Cartwright, almost reluctantly. 'Aye, man, I believe you!'

'Tis good!' said Jacob soberly. 'Leave thy bandages on. I will give thee thy sword and blow out the candle. The night is pitch dark and I shall see no more than thou canst. We will fight till one of us finds death, and the Lord shall choose who goes before the Judgment seat. I—I am sorry I taunted thee in forgetfulness of thy affliction.'

'Agreed to your plan!' cried the other eagerly. He hesitated, then added, 'I would have you know, Jacob, that when I hinted at cowardice I spoke in anger and excitement. And—I am sorry, too.'

IV.

Jacob caught up a sword which lay on a chair and handed it to Cartwright. He strode across the room to the candle and pursed his lips to blow it out. Glancing round as he did so, he paused, at last picking up the candlestick and walking slowly back. 'Red Anthony,' he said, placing the light on a table, 'thou hast always been a sinner, yet hast ever sinned openly and generously. A brave man cannot be wholly lost to the Lord. I know that I shall kill thee; for the issue is already judged and determined. 'Tis only right that thou shouldst have full warning. But one small inch of this candle remains to be burnt. I would postpone our fight until it flickers and dies, to give thee time to prepare for death, to repent and pray for forgiveness. What sayest thou?'

Cartwright shrugged his shoulders and sat down on the bed. 'As you will,' he muttered uncomfortably. 'I would that the decency in you, Jacob, was not so overshadowed by this whining hypocrisy. I warrant the Lord has scant concern in your fate or in mine. 'Twill be pure chance who first pricks the other in the darkness.' He laughed shortly. 'And as for repentance—'twould burn many candles to confess all my deeds which you would deem sinful!'

'I will tell thee when the light goes out,' said Jacob solemnly. 'And canst rest assured that thou wilt see thy Maker face to face before

the wick has ceased to smoulder. The Lord hath spoken to me, and His will shall prevail.'

After this there was silence. Jacob drew up a chair to the table and sat down. His sombre eyes alternated between the candle and the half-hidden face of his adversary. He would have given much to know what was going on behind the bandages. He would have given much to know that Red Anthony was striving to make his peace with God. For he had no doubt that the man was on the point of death; and it would be a good work to save his soul while taking his life.

But beyond the tenseness of the waiting, Cartwright's face showed no indication of what was in his mind. Occasionally, his lips would curve into a brief half-smile as though he could not refrain from tasting some forbidden jest. And after each smile there was a perceptible increase in his restlessness. 'I would that your nature were not hidden by so thick a cloak of hypocrisy, Jacob,' he muttered once, breaking the silence abruptly.

The candle burned lower. Jacob's eyes now fixed upon it, and he paid no further attention to Cartwright. In a few short moments the greater part of his work would be done. He would be free to seek out Anne and take her back home. He was strangely confident that no harm had come to her yet. Otherwise Cartwright could not have faced him in this way.

The exultant confidence in Anne's safety affected Jacob curiously. Because of it, and because of the man's courage, he experienced a certain reluctance for the fight, a new-found shrinking from his task. 'Yet the Lord's will must be done!' he murmured. And, aloud, 'Red Anthony, thou hast less than five minutes to live!'

His eyes never stirring from the flame, Jacob watched the concave top of the candle as it sank into the lip of the holder. Lower and lower it burned until the shape of the candle was lost in formless ruin, and only the wick, charred and bent, remained floating in the little pool from which it still drew light. At any moment this might fail, or the top-heavy wick fall over and be extinguished.

Jacob groped for his sword and his fingers closed tightly about the hilt. With the feel of it, the thrill of fight ran through his veins again. At the most, it was now a matter of seconds. Yet still the tiny light flickered feebly, and he could not avert his intent gaze from it. He saw the end approaching. The wick slowly heeled over and lay flat. As the light went out, he closed his eyes to accustom them to the darkness. 'The time has come, Red Anthony!' he cried. 'On guard!'

He sprang to his feet and opened his eyes. As he did so, his body stiffened and he stood rigid as though in the fascination of some evil. His sword dropped from his nerveless fingers

and clattered upon the floor. His heart thumped unmercifully in his chest. Dimly yet unmistakably, in this room which should be black as sin, he could see his adversary rise from the bed and raise his arm in defence.

'Stop! Stop!' he cried, his voice shrill almost to screaming. 'Stop! I can still see thee!'

'No matter!' growled the other. 'Pick up your sword. 'Tis time this farce was ended!'

v.

Jacob did not move. His gaze was fixed incredulously on the windows. These were now sharply defined. The light in the room, though faint, grew stronger every moment. Outside, a lark was soaring aloft, greeting the new day with rapturous song. The dawn had crept up unnoticed while Jacob watched the dying candle.

He turned to Cartwright, staring at the bandaged face with fearful eyes. Suddenly, full realisation came to him. He dropped into the chair and buried his head in his hands.

'Come, man!' cried Cartwright impatiently. 'Pick up your sword and fight.'

A low moan came from Jacob's hidden face. 'I—I cannot fight thee,' he stammered. 'The Lord hath spoken!'

The other hesitated, fingering his sword in perplexity. 'Now this I do not understand,' he said angrily. 'What has come over you, man? First the Lord commands you to kill me; then, on a sudden, you turn about! Yet I know you are no coward. What does it mean?'

Jacob sat motionless in the chair, his soul in a wild confusion of fears and doubts. To him the breaking of the dawn was a revelation of Divine displeasure, a sign that he had erred and striven against the Lord's will. The light had come at too appropriate a moment for him to misunderstand its meaning. In unmistakable fashion, the Lord had forbidden him to kill his adversary. This could only mean that he had been wrong, miserably, hopelessly wrong in deeming himself the instrument of a Heavenly design. The shock of the knowledge rioted through his consciousness until the whole structure of his faith rocked on its foundations. He had been so sure! And he was wrong!

'Egad, 'tis beyond all sufferance!' cried Cartwright, taking a step towards him. 'Maybe if I prick you, 'twill persuade you to pick up your steel!'

'Thou couldst kill me before I would touch it,' replied Jacob dully.

The other flung aside his sword in disgust. 'It must be my head grows wooden!' he said with a gesture of resignation; 'for your changes of mood pass far above my poor comprehension.'

Jacob raised his face, smiling sadly. 'Tis no change of mood,' he said, in a slow, passionless

tone, 'but a man's realisation of his unworthiness. While preaching the sinfulness of pride, I have myself nursed a pride swollen and immeasurable. I came here to-night to kill thee, imagining, in my vainglorious folly, that I had been chosen by the Lord for the purpose. Thou knowest the compact we made, that as the candle left us in darkness we would fight. When the light of man went out, the dawn-light of the Lord appeared! . . .

'The message to me was plain. I saw myself naked in my presumption and sin. I had ventured to judge and punish, to usurp His prerogative! I—with human failings as any other man!'

For a long while both men were silent. The light in the room brightened, and birds outside wakened into gossip and song. Cartwright sat down on the bed, and again the brief half-smiles appeared about his lips. 'Jacob,' he said, turning to the other at last, 'I would have you speak as man to man. Is 't true that you came here thinking your mission inspired from Heaven? Or is 't part of that hypocrisy of which I spoke?'

'Tis no hypocrisy,' replied Jacob earnestly—'though 'twas rankest pride and folly, and seems scarce credible now. I believed it sincerely. I have, I think, believed it always, believed myself a favourite servant of the Lord, something a little above my fellows.' His hands gripped tightly together until the knuckles gleamed white beneath the tanned skin. 'Yet I also believed in my right to the name of Sweet Humility! Doubtless thou findest amusement in this?'

'Nay, I do not smile,' said Cartwright. 'An hour ago, in truth, I would have laughed you to scorn. For I believed you naught but a mumbling hypocrite. I see now how far I was from the truth. And because, in return, I can speak to you as a man, I am about to tell you something of what your blind and intolerant pride has done.'

vi.

Red Anthony paused for a moment. When he spoke again, few of the moor-folk would have recognised the voice as his.

'In days gone by, when we were rivals in love, there was no sweeter maid in the land than Anne Halliday—save one! She was a tender flower, a laughing fairy sent by God to brighten the world and make men glad. I grudged her to you, Jacob. Even after my Elizabeth showed me the meaning of life, I grudged you the gift of Anne. For 'twas wasted on you! I know now that in your own way you loved her well. But what did you do with the bright jewel of her love? You ground it remorselessly beneath the iron heel of your gloomy fanaticism. You stifled her light-hearted joy in life, you killed her urging to laughter. She must not smile, she must not sing; for such are

the marks of the loose woman! Damn you, man! You choked and throttled her with your nauseous creed until her love for you despaired. She drooped and withered. She lost desire for life.'

Jacob stared at him open-mouthed. Then he remembered the pale cheeks and the thin fragility that had lately caused him some concern. A new light, more powerful even than the day's dawning, flooded his soul. 'Tis true!' he muttered wretchedly. 'May God forgive me! I did not understand.'

'Nor is that all!' went on the other heatedly. 'Anne has the purest soul in Christendom—save one! Yet you were jealous—jealous of me who did but carry messages between her and my Elizabeth, her only friend! You heeded all the loose talk you had heard about Red Anthony, condemned him out of your own self-righteousness, and suspected the virtue of your wife, suspected the most innocent—'

Jacob sprang to his feet, overturning the chair. 'Thou liest!' he cried angrily. 'That I did not do! 'Tis true I suspected thee. But never Anne! I knew her too well. I believed thou hadst made false statements and cheated her innocence. I did not believe she had left me in sin. I—I came here to save her from thee!'

'You are right!' said Cartwright. 'I spoke too far in my anger. I ask your pardon.'

'Tis little need there is of that,' said Jacob

wearily. 'I have sunk lower than aught thou canst say. No blame can be too severe.'

Again a long silence ensued. Jacob righted his chair and sat down, staring miserably at the floor. The rising sun peeped in at the window and filled the room with golden light. Cartwright fidgeted restlessly, as though unable to make up his mind. The half-smiles had returned to his face once more.

'Come!' he said at last. 'I am about to break a promise!'

He groped for Jacob's hand and led him into the corridor. Outside a door at the end he halted.

'When Anne, believing that your gloomy bearing could hide no spark of love for her, decided that she must leave you, she could think of no refuge but with my wife. She came to Cartwright Hall. And we promised to keep her hidden for a while and deny all knowledge of her whereabouts. I break this promise now because I have dug down to the man beneath your harsh exterior. Anne sleeps in here! If you have found that your cold, saintly regard for her has turned into a warm, human love, go in and tell her so!'

Jacob looked at him for a moment, his eyes incredulous and eager. Then, without a word, he opened the door and strode into the bedroom, heedless whether the door closed behind him or no.

THE END.

AN UNATTRACTIVE BIRD-HAUNT.

By T. A. COWARD.

I.

THE particular bird-haunt under consideration is not attractive to the general public. This is well; well, also, that the ground is private, and that the sporting rights are let. The majority of the birds which come are beneath the notice of the ordinary sportsman, but not of the man who carries nothing more deadly than field-glass or telescope. A sewage farm is hardly a popular promenade.

The farm is the property of an urban district council, who let the shooting, for partridge and snipe abound, and put up notices warning against trespass. It covers many acres, and is divided into squares by low banks and ditches. Looked at from a distance, it appears as a tract of low-lying, cultivated land, chess-boarded into fields under various crops, with small square lakes here and there. The artist would not call it picturesque; the ordinary country walker would say it lacked interest. But food, not æsthetic feeling, attracts birds, and in consequence the bird-watcher also is attracted.

Years ago this spot was wild moorland, a

haunt of grouse, curlew, and twite; these and other birds associated with the hills nested amongst the ling and cotton-grass, whilst the night-jar churred in spring in the birch zone which formed the boundary of the lowland moor. Now the avifauna has changed, but the variety and interest of the birds is even greater than in the days when first I knew the locality.

Various methods of disposing of a town's waste products are adopted, and doubtless some are superior, more sanitary than others. From the ornithological outlook, however, the deposition of sludge in settling tanks, taken in rotation, has great advantages. In addition to the tanks are sundry dumps, where street refuse, the contents of dust-bins, and all the litter of a town, are tipped into unwanted ponds or used to raise hollows into level fields. Piles of waste paper, straw, empty tins, broken bottles and crockery, rags, and cinders may be burnt, but here there is no modern destructor, and amongst the inorganic matter condemned to the smouldering fire are many fragments of organic rejectamenta which birds appreciate. The

dumps are popular. Here are the starlings, peering anxiously into empty corned-beef tins, the sparrows in thousands pecking at decomposing cabbage stalks, the chaffinches, and in winter bramblings seeking grain in the stable-litter. Greenfinches and linnets are there, and a robin or two keep watch and guard over what they assert is their territory. Rooks and daws bicker over the fragments, and now and again a sly magpie flies with a chatter when it sights an approaching man; when treasure-hunting it has a guilty conscience.

Though the farm is sixteen miles from the nearest salt water, and double that distance from the open sea, black-headed gulls are always present. They feed on the dump, a wrangling, noisy crowd, a symphony in black and white when the rooks are present. Many objectionable scraps are swallowed, even greasy paper, and no doubt they help to clear away useless rubbish; what they find to satisfy them on the settling tanks is difficult to understand, but they spend much of their time wading in the shallow water or resting on the mud. At dusk they retire, lazily winging to a large lake a few miles to the south; there, in the centre, they spend the night together with many hundreds of their fellows who have been performing better service in the neighbouring fields. What a heterogeneous collection of comestibles these inland gulls must gather in the daily forage.

Skylarks are on the fields at all seasons. They nest amongst the crops and sing overhead in summer; they fly in purring winter flocks from field to field when domestic cares are ended. Meadow-pipits abound, though uncommon in the surrounding country, and the red-backed kestrel drifts or hovers, tail expanded, as it scans the ground for mice or beetles.

All these birds, including the gulls which seem to have forgotten the sea, are inland species, but the birds of the tanks are, for the most part, maritime. From December until the end of February, and in June and July, there is little stirring, but at seasons of migration the tanks have a varied and ever-changing avian population. The autumn passage is the more interesting, though the presence of numbers depends largely upon the prevailing force and direction of the wind. The large group of shore birds known collectively as waders provides the most interesting variety.

II.

Every autumn large flocks of lapwings or green plovers join the gulls on the settling tanks. Young birds are flocking in June and July, but it is not until August that the gatherings are extensive. The young birds in juvenile plumage have short crests and speckled faces, and their voices are wheezy and discontented. In September and October the resident flocks are replaced or augmented by the overseas

immigrants, but the numbers fall off again in November, when many have travelled farther south.

Next in abundance, and always ready to advertise its presence, is the noisy redshank. Within recent years this progressive wader has pushed its nesting area inland, farther from the shores and marshes, where it is still abundant; not a few pairs nest within a few miles of the farm on some frequently flooded water-meadows. These, however, form a very small minority of the autumn redshanks, for most are travellers from far and wide, passing in no great haste from northern Europe, or perhaps Siberia, to wintering haunts, which may be in Africa. Many remain in England, and the tanks are seldom entirely deserted by redshanks. How long individuals stop is hard to say, for the numbers fluctuate from day to day; probably some are reluctant to leave a plentiful food base.

Redshanks are a nuisance; they are far too wide awake. Before it is possible to get near the tanks the birds begin a plaintive, wailing whistle of uncertainty, and though the watcher may be sheltered by a hedge or a pile of rotting cabbage stalks, smelling worse than the sewage, they rise with yelping alarm cries and warn every other other bird upon the tanks. As they fly round, yelling in chorus, the white inner rim of the wings is a sure specific label, but to those who know them too well their voices proclaim identity.

Amongst the redshanks—a taller, more graceful bird—a greenshank may be detected. Its pose when standing is less upright than that of its companions, and when it rises with a liquid *tchou, tchou, tchou*, the large expanse of white upon its lower back is very conspicuous. Ruffs and reeves consort with the redshanks when they come, but they are irregular in their visits. Probably they have crossed sea and land from the Dutch polders, where they nest, but what brings them so far west is difficult to understand. So great is the difference in size of the sexes—the ruff is the male, the reeve the female—that they might be taken for distinct species, but in autumn the plumages are more alike than in spring, when the male is adorned with handsome head and neck ornamentation, which he spreads and displays when engaged in the mock heroics which are intended to charm the feminine eye. In a poor light the birds may be confused with redshanks until they rise, when the absence of wing border will be noticed; the spread tail, when the bird is flying, shows a dark centre with white borders. Several ruffs and reeves visited the farm last autumn, for it was a busy year, bringing numbers of unexpected and some rare travellers to halt for rest and refreshment at the urban council hostelry.

Among the lesser fry which leave the tide

washed shore to wade in the shallow tanks are numerous dunlins and ringed plovers. Many of the earlier dunlins show on their breasts traces of the black of summer plumage, but this soon vanishes, and leaves white-breasted winter birds difficult to distinguish from birds of the year. Dunlins wade until their under parts are submerged, and probe the ooze with long bills; they are deliberate in their actions, and often very tame, when they stand, half-asleep, on the islets where polygonum or other plant has taken root. The critical eye discovers differences of size in these dunlins, but dare we assert that the smaller birds are the British nesting species, and the larger more northern breeders? Ornithologists who work on ranges of skins now believe that this explains the difference, but there is so much variation in the birds, especially in the length and droop of the bill, that the cautious field man hesitates to accept these theoretical assertions.

Many of the first incoming ringed plovers are in juvenile dress, with ill-defined face markings, and breast-bands refusing to meet in the centre; but in addition to these plumage signs there is in their behaviour a psychological distinction. There the systematist will, doubtless, fear to tread; he may admit that the nestling has all the irresponsibility of childhood, but he does not know his birds well in the field, for he shoots at sight to obtain specimens for his study. The young bird, the adolescent bird, has lost the trustful simplicity or ignorance of infancy, but it has yet to gain the caution due to long and often painful experience. It is puzzled by man—is he a danger? It looks at him with uncertainty, wondering if he is as harmless as the complacent cow or horse, or even the noisy train, belching out smoke, which roars through the cutting close to the tanks. These it soon learns to ignore, but man is a problem. One has only to look at its eye, or note the uneasy jerks of the head and body, to realise that the young bird is getting as near to thought as is possible in the avian brain. How do we know how much is possible?

III.

During the autumn a very rare bird for northern counties spent at least two days on the tanks; it was a Kentish plover, a near relative of the ringed plover, whose present status as a British nesting species depends upon the day and night protection afforded by the Royal Society for the Protection of Birds. North of its breeding area on a small reach of the south coast the Kentish plover is known only as a very occasional bird of passage; it, too, nests in Holland, and no doubt it had travelled thence with ruffs, for these birds were present on the tanks. The Kentish is smaller than the ringed plover, and instead of a breast-band it has brown patches on the sides of the breast; the

young ringed plover, when the band is unfinished in the centre, might be mistaken for the rarer bird were it not for the colour of its legs. Though they are chrome-yellow in the mature bird they are brownish yellow in the young, but the legs of the Kentish are black. I saw this little black-billed, black-legged bird within five yards of my hiding-place, and it was with two immature ringed plovers. It was easy to see the difference in the breast, and the fact that the black of the legs was not due to paddling in mud.

In July common sandpipers in little parties—family parties in some cases—visit the tanks and pass on, but later the green-sandpipers appear, though seldom more than two at a time, and usually as solitary visitors. In a good light the back is really dark green, but when the bird is on the wing few waders look more black and white; the under parts below the breast and the upper tail-coverts are conspicuously white. The green-sandpiper is a shy and nervous bird, feeding on the vegetation that fringes the tanks or in the deep ditches; at the least suggestion of danger it is up and off with a loud triple whistle, and does not return until the coast is clear. Next day it may be found in the place from which we disturbed it.

The wood-sandpiper, a rarer bird, came at least twice last autumn. The first visitor was mature, the second a bird of the year. The wood-sandpiper is smaller than the green, but its legs are longer in proportion, so that it appears to stand higher; it is lighter in colour, and its upper parts are more distinctly spotted. All the birds of this species that I have watched have been less nervous than greens; they rose with somewhat similar cries, but after a flight round returned to the place whence they had risen or dropped again at no great distance away. Neither of these birds can be counted as a nesting species in Britain, though eggs of the wood-sandpiper are recorded, and a nestling was obtained; the breeding of the green-sandpiper is suspected, but direct evidence is lacking. A curious habit of both birds is that of occasionally—the green-sandpiper frequently—placing the eggs in deserted nests of other birds, or on the platform provided by an old squirrel-drey.

At intervals the little stint appears amongst the dunlins; it is a pocket edition of this species when in winter dress. The little stint and the curlew-sandpiper, another irregular visitor, nest in remote Siberian tundras; they are long-distance migrants. The latter bird is taller and more shapely than the dunlin, and its bill has a more decided curve, not a mere droop towards the tip; it is another species which shows white above the tail when it flies.

Flocks of golden plover feed annually in the fields at no great distance from the farm, but they seldom visit the tanks; last autumn I saw single birds on two occasions, and they

rose, calling anxiously for companions. A mature gray plover appeared in December as a winter visitor, but did not remain long. It was kind enough to raise its wings to stretch, when the black auxiliaries against the light under-wing settled any doubt about its identity. It is a common shore bird in winter, but seldom leaves the estuary or coastal muds or sands.

The snipe is always with us, for many nest upon the farm. The numbers rise considerably during spring and autumn passage, and many stay throughout the colder months, to the joy of the sportsman. The jack-snipe is a winter bird and passage migrant; when it rises it soon drops again, and it will crouch in the rushes and withered brown grass until in danger of our feet; but it is always smart enough to avoid accident. Snipe probe the sludge and mud in the ditches, feel for movement with the sensitive end of the long bill, grip with the prehensile tip, and drag out the struggling worm.

IV.

This exhausts the list of the passage and other waders which I saw as visitors to the farm last year, but in previous years the curlew has dropped, the whimbrel tittered over, and on other farms in the neighbourhood the oystercatcher, turnstone, sanderling, and knot have called. On a sewage farm in the same area a spotted redshank was seen by two reliable observers on more than one occasion in the autumn of last year. Anything may turn up when migrants are on the move.

Ducks are little attracted by the sludge, but an odd mallard or teal may be disturbed from the deeper ditches, and for some days a shelduck in juvenile plumage paddled about with an air of indecision; mature birds also wander in from the neighbouring estuary.

In autumn passerine visitors are interesting, for the tanks are frequented by large numbers of pied, yellow, and white wagtails, whilst gray wagtails are usually about in winter, and in autumn after they have left the hills and 'the little brooks that tumble as they run.' What a change from those clear streams of the uplands are these shallow, discoloured, muddy tanks!

When the wagtails are passing in spring there is always the chance of discovering amongst the hundreds of yellows one or two blue-headed wagtails on passage. Swallows, house and sand martens, and swifts feed above the tanks in spring and autumn in incredible numbers, for when the flocks are passing, slowly wending their way north, or drifting towards winter quarters, they are sure to find small-winged insects in plenty over the pools.

Many other birds, both in summer and winter, visit the farm, some nesting in the fields, hedgerows, or scattered trees, but they have little to do with the tanks, and may be met with over other cultivated land. Common, herring, and lesser black-backed gulls are frequent visitors, but are never so numerous as the black-heads; not much more than a mile away is a refuse tip from a city market, where fishy remains are dumped for the benefit of the farmers. The larger gulls prefer this odoriferous supply to the uncertainties of the tanks.

What is it that attracts the waders and other birds to the settling tanks? The sludge is a precipitated sediment, not from crude sewage, but from the treated effluent from the filter-beds; the water in the outfall from the tanks is clear as gin. Sanitary engineers assert that it contains no deleterious matter. Countless millions of larvæ of small flies, mostly chironomid gnats, and moth flies (*Psychodidae*) inhabit the tanks and filter-beds, and several species of earth-worm abound. These insects and worms perform useful service, devouring dangerous organic matter and cleaning the clinkers in sprinklers of too great an accumulation of fungal matter. It might be argued that the birds were fighting against us, destroying our humble assistants, but too much of a good thing is apt to be troublesome. These insects, if too numerous, might spread to places where they were troublesome instead of useful; the birds regulate the supply. We have provided something that is abnormal in its quantity, and have thereby encouraged the growth of low vegetable and animal forms; their abundance becomes abnormal and unnatural. The birds see that the numbers are reduced. Nature everywhere adjusts balances, even in sewage farms.

THE WEST COAST OF SOUTH AMERICA.

PART II.

IV.

CALLAO, the chief port of Peru, lies in a sheltered bay. Though there is a small harbour, few vessels take advantage of it, for the reason that bubonic plague is endemic at this port, and vessels lying along-side are

submitted to a long period of quarantine on their return to Europe; hence they prefer to anchor in the bay at a safe distance from the shore.

At this busy port is the terminus of the highest railway in the world. It winds its tortuous way up over the Andes to a height of

17,665 feet. Most travellers who are not accustomed to high altitudes suffer from mountain-sickness, while others develop serious cardiac troubles. At the building of the bridges, when about half-way up to the eternal snows, men began to drop dead at their work, and the mortality became appalling until it was discovered that the trouble was caused by the bite of a peculiar fly, known only in those regions. Building began in 1868, and the last section was not finished until 1908, exactly forty years later.

Lima, the Peruvian capital, is only a few miles distant from Callao, and is connected by rail and electric tram, the journey occupying half an hour. Quite long enough to view the gruesome sights by the way—flocks of hideous raw-necked vultures feasting on the carcasses of mules, and dogs, and filth. In the fields you can see men following the wooden plough drawn by oxen, preparing the land for cotton, maize, or bananas. The men do not show more enthusiasm in their work than do the slow-moving oxen.

A praiseworthy attempt is being made to beautify Lima, to construct wide boulevards, and to abolish the flat mud-roofed houses on which cats delight to scrape holes. There are still a few old Spanish houses left, built by the Conquistadors, with carved balconies jutting over the pavement, and in the cathedral may be seen the bones of Pizarro, the overthrower of the Incas, who set his stamp on the place. He could not easily have selected a nicer situation for his city, at the base of the high Andes, though unfortunately the original town fell a prey to the flames long ago. Fires are more feared and more devastating than earthquakes, particularly in those districts where water is scarce. The local authorities do not worry much about fires; therefore at Lima the different foreign nationalities represented have been obliged to organise and keep up their own fire-brigades.

Having travelled so far, it is only natural that one should begin to think about food and drink. It is always interesting to hear how people abroad live and what they eat, though the majority of travellers who record their experience would seem to have a soul above such trifles. They do not realise that the difference between good and bad food is just the difference between a pleasant and a disagreeable voyage.

Here I must tell a story. Two fellow-passengers ventured ashore on their own at Lima, intent on seeing the sights of the town by day and its attractions by night. To our surprise they returned soon after lunch, full of execrations and vile language. Lima they condemned as the most God-forsaken place in Christendom—they could not get anything to eat!

'But aren't there any restaurants?' they were asked.

'Of course there are, but they are all Spanish, and you can't get anything in them except onions and garlic, followed by garlic and onions,' they answered.

They had done their best with the aid of one of those neat little books compiled to mislead travellers in foreign languages and mystify the natives; they had made themselves look foolish making signs and grimaces; yet all they could extract from the kitchen was onions and garlic—one admitted to having discovered a piece of some kind of meat under the garlic.

Quite as bad as that it is not, though it must be confessed that Lima does consume vast quantities of onions and garlic. Our fellow-passengers were invited ashore by a countryman, and I chanced to dine at the table next to them. I could see by the beam on their faces and the wine flush, that they had succeeded in getting something other than onions and garlic. Indeed, the fare was practically the same as one gets at any good European hotel. That night they stayed ashore, nor did we see anything of them until late on the following afternoon, when they came on board to make a hurried change and return to the flesh-pots of Lima. They had gone to curse and remained to praise.

V.

Soon after leaving Callao we entered the arid waterless region where rain is practically unknown, except that once in a decade there may be a cloud-burst, a calamity more feared than even an earthquake, since it leaves nothing behind in its track. All the fresh water used at Antofagasta, one of the most flourishing towns on the Chilian coast, is brought in pipes from Bolivia, two hundred miles distant. As earthquakes frequently destroy sections of the pipes and bursts are not uncommon, a sufficient quantity of water to last the town for a week is stored in tanks on the hills above it. That water, under such conditions, is not as free as the air we breathe is soon made evident by the sparing use made of it.

This dead, treeless track stretches all the way down the coast to Coquimbo. High hills, sand-covered, rise from the sea, mounting upwards towards the distant Andes with their snow-capped summits. There is not a speck of green vegetation anywhere to cheer the eye, and yet the unaccustomed colouring, the varying lights and shades on the parched mountains, have a peculiar charm, which it is difficult to describe. It is equally difficult to convey in words the harmonious blending of grays with the dusty reds of withered rose leaves and the greens of weather-beaten copper tints. To view these mountain ranges when they are bathed in the warm glow of the setting sun is to recall visions of fairy land.

Up on the Pampas, as the tableland behind Antofagasta is called, are the nitrate and copper

mines, or Oficinas, as they are termed locally. Large numbers of men are engaged at these Oficinas, and are cared for by the companies employing them. They are paid in tokens, with which they may purchase their requirements from the enterprising storekeepers, who receive cash on presenting them to the company.

Vast quantities of nitrate are found a few feet below the loose sand, in layers of varying thickness. The nitrate is blasted and conveyed in small trucks to the refining house, where it is boiled in huge vats. When in a liquid state it is run off into extensive filter-beds. The water is evaporated in the sun and the dry crystals are then shovelled into sacks, ready for shipment to Europe, where it is used in the manufacture of gunpowder, chemicals, and artificial manure.

Copper-mining appealed to me as being much more interesting. To obtain this metal, also gold and silver, mountains are literally moved from one place to another. The caked sand is blasted, special machines picking up the pieces, which are passed through a series of crushers until pounded to a fine powder. This is conveyed into vats filled with acid, where the copper is separated from the sand. The liquid is then run into cells containing metal discs charged with electricity. Attracted by the electricity, the copper adheres to these discs, making them several times thicker than when put into the cells.

When stripped from the metal discs the copper is melted in a furnace and run on to a revolving-plate that might best be described as an inverted saucer. Radiating from the centre of this plate are deep cuts or moulds the size and shape of the ingots. The molten copper is poured into the first of these moulds, and when that is full the plate automatically turns round so that the second mould comes into position to be filled. Cold water is sprayed on the ingot immediately the mould is full, and by the time it has revolved little more than half-way round the copper can be removed and run along rollers to railway trucks, ready for dispatch to the port of shipment. The whole process is so mechanical and scientific that the copper is practically never touched by hands until it arrives at the port. Sometimes as many as twenty-five tons a day can be produced; at other times the output does not exceed five tons, according to the value of the deposit being worked.

Our next port of call was Valparaiso, a fine-sounding name that figures largely in the chanties belonging to the good old days when wind-jammers beat round the Horn. But Valparaiso is a modern town where some two hundred thousand people live in villas built on the hills surrounding the deep bay. It is also a town where earthquake shocks are too frequent to make it attractive to any one except those

who have some particular reason for staying there.

What impressed me most at Valparaiso was the green vegetation after weeks in the waterless region, and the evidence of recent rain. It may seem curious for one from these rain-swept northern latitudes to be glad at the sight of rain. Yet after an experience of the parched desert you realise that rain, bugbear though it may be, is as necessary as air; and not the least of its blessings is the contact with people who have had their morning tub.

The magnificent valley up which the railway winds from Valparaiso to Santiago supplies all the requirements of life and of commerce, throwing an excellent wine into the bargain; Alexander Selkirk's Island, just off Valparaiso, is so surrounded by lobsters that they are anxious to be caught and placed on the table. Life amid such luxurious abundance might be a veritable bed of roses were it not for the constant dread of earthquakes—there must always be a fly in the ointment!

VI.

Since Europeans abroad take with them their European manners and customs, it is more of an adventure to get among the natives, who afford more variety and interest. All along the coast of Ecuador, Peru, and Chile the natives are a mixture of the Spanish conquerors and the original Indians. Spanish predominates, and it is from Spain they have their language and religion. They are proud that they speak Castilian, not Spanish, as they will correct you, and they are devout Roman Catholics.

To sum up the characteristics of a people and give a true picture of their life in the course of a short article is not easy. Nationality has so many moods, contradictory most of them, that it refuses to be compressed into a few sentences.

I was introduced to some of the descendants of a race said to be the original Indian inhabitants that peopled the country long before the Inca period. Their origin will ever remain a subject of speculation, for they had neither signs nor writings in which to chronicle their history. Practically all the monuments and other records of their national life, which might have been of service in enabling the scholar to piece together the story of their beginnings, were destroyed by the Spanish conquerors in their hunt after gold. All that remains to-day is an occasional burial mound—they buried their dead in brick vaults placed one on top of the other to a considerable height. Even these have been desecrated for the sake of the earthenware vessels and valuables buried with the dead. Though the Government has taken steps to prevent further molestation of the tombs, travellers may still buy thousand-year-old drinking vessels for a few shillings.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

WHEN one has wandered for weeks in northern Africa, peering into places sought by few travellers, and has worked and wondered, and, with the essential previous knowledge, studied and even conjectured, he finds, on returning, that friends affecting a high interest in political and economic things invite him seriously to inform them upon the likely future of those places and their peoples. So the infinite legends, an effort to suggest the intense Islamic easternism, the aged sombreness, the achievements in art and craft, and the peculiar beauties of Fez are insufficient for these inquisitives of Britain and America who demand skilful and well-based prophecy. A curious gesture this. Now for some time to come Fez will probably be of much interest and importance to us as a travellers' objective; in this way its value is about to soar. So one may dare to prophesy of this heart of Islam, which until yesterday was kept closely veiled from the eyes of all infidels like us. Little else may we guess upon, for what is best learned by men who watch and think along North Africa, year by year, is that of nothing and nowhere is it less wise and sure to prophesy. Let protectorates and colonies be good and firm, even what propaganda says they are, yet an uncertainty hangs upon this long-extended region, across which rays of political and religious light slant from India, from Egypt, from Turkey, touching the countless mosques of Kairouan, appealing to the shrine of Mulay Idriss here at Fez, cities which are as the elder children of mother Mecca. Only yesterday the French were very joyful, and reasonably, upon their possession of Morocco, seeming the loveliest jewel of all colonies of Europe, one that Britain might envy; and now, almost suddenly, our friends are assailed with doubts. Morocco lacks money and men, trade is still, offices and houses are empty, gloom and anxiety increase, and the question asked from Mazagan to Mogador, from Fez to Marrakesh, is whether Morocco can be 'made to pay,' with a marked tendency in sundry quarters to make the answer no. For two or three years after the Great War Morocco was booming, stimulated insidiously by speculation, from whose effects sharp reaction is

always certain. Then was propaganda played delightfully. But now the business of propaganda is to hide a little, to guard a wise reserve, and present a pleasant face to things that look not good nor are. Morocco will recover and advance to splendid things, but her present economic condition has caused some pangs of doubt for the first time in the minds of the occupiers, who now look straight at truth and make complaints. It seems that one must state these facts or impressions as news, since, near as is Morocco, our people generally live in the belief or assumption that the French protectorate here advances from security to success and reaches forward, through labour and content, to riches only measurable in terms of eastern magic. It is not so. France is seriously apprehensive about the future of Morocco. Her confidence is still rightly sound, but the present condition of temporary disappointment has caused a shock, and the authorities have to explain and encourage instead of murmuring pompously upon achievement.

* * *

But apart from such considerations, if one, knowing it were vain to prophesy upon any matter in Morocco, could still rashly venture upon a prophecy it would be that in a year or two at most from now, this ancient city of Fez, until lately secreted from the world outside, garnished in our foreign imagination with a thousand scented mysteries, may be one of the most popular attractions of the general tourist. For a season or two it may be like a chief favourite, a definite vogue, a 'rage,' as the vulgar say. A man of Manchester or Dundee, regarding the advertisements and the propaganda around him, the articles in the newspapers, the letters he receives from friends alert in Birmingham or Aberdeen, may feel that he should no longer delay the conventional visit to Fez when arranging his most imminent tours. It may be an obligation upon all travellers who venture farther out than Paris. For such conjecture there are well-set reasons. Even now, as so many know, one may journey there quite easily and comfortably, but much easier and cheaper the way soon will be. With the prophet's careful reservations one would say that in two years or less, the expedition to Fez

will be the cheapest and easiest of its kind in all the world. One reason is that the French, needing to make money from what might be called the by-products of their development, are disposed to encourage a more modest kind of tourist than has hitherto been attracted to Morocco. Another, more potent, is that the long-discussed and long-engineered railway from Tangier to Fez approaches completion. This has been said many times before, but now I have inspected it myself in different parts, seen its stations, looked at lofty viaducts towards its eastern and more uneven extremity, and trod upon its permanent way, which some engineers of a pessimistic view declare to be of such a shifty kind that no ballasting will make it secure for fast and heavy traffic for some years to come. But the optimists contend that in a few seasons the fast express from Tangier to Fez is certain, and with it the cheap fares. In such event one should make the journey from Tangier in perhaps three hours—and it is the easiest thing in ocean travel to reach Tangier from this country. At present it is two long days by road from Tangier to Fez by way of Rabat, or one very long one from Casablanca, which for us is less easy of access than Tangier. But so, the thought of landing at Tangier on a certain morning and taking tea in Fez upon the afternoon of the self-same day makes a kind of jolt in the understanding of all who by reading and experience know what an arduous and even adventurous thing the going to Fez has hitherto been. To our trained and respecting minds there seems even iconoclasm in this new projected order, a smashing of an aged system based upon obscurity and insecurity, to which colour, adventure, and some barbarity were attached at almost every yard. We of the early period may at least console ourselves, when witness to the organised excursions flying upon the route to Fez, with the reflection that in the romantic sense the travelling is no longer a splendid thing. But Fez the old, Fez el Bali, will be much the same, for it is not easy to change it and it must not be changed. The French do no injury; it would resist all the attentions of modernists beyond the electric light, the telephone, and some details of sanitation. It dislikes intrusion, and for that one may apprehend that an invasion of tourists might cause difficulties, and therefore it would be well to be among the pioneers of the new period.

* * *

Old Fez is not to be trifled with, and she for herself makes no kind invitation to the foreigner, nor ever will. She tolerates a few, but none can pace through the winding alleys of this strange and powerful city without being conscious that it is just toleration and not more, and that, though unmolested, no native welcome

beams upon him. Indeed he is regarded coldly, friendly gestures or other advances find no response, and in the most venerated places, like the precincts of the sanctuary and mosque of Mulay Idriss, a veritable heart of Islam, he must have care lest unwittingly he should offend. At this spot our wondering western vision upon another world, so strange and different from our own that it might belong to another planet, is focussed to one sharp point; and here, seated on the small stone bench opposite the shrine or in the shaded alley near, I have lingered for hours on many different days, not at all spellbound, but yet with an odd and inescapable feeling of some influence of this strange exotic mysticism upon my emotional state or condition. The street is narrow; a part is uncommonly roofed and a lamp is hung; and on one side is a dado traceried in the familiar red and green, and, first above it, a carved frame of cedar wood, and right of that three high panels traceried in red and green. To the middle of the frame, man high, a small copper orifice is fitted, two inches wide or thereabouts, through which coins may fall easily to their destination within the shrine or mosque, while, man high again, at the base of the centre panel is a kind of small wicket, which—meaning no disrespect by a comparison as inevitable as incongruous—looks like a ticket-office at a railway station. Upon the wires that are hung across, knots of wool are tied by those who, being sorrowful and anxious, thus make their appeal to Allah. Behind this wall is the mosque, whose main entrance is higher up the street, where with a careful discretion we may sometimes peer through the inside gloom on to the raised tomb of the intensely venerated saint, and more easily upon the row of seven splendid grandfather's clocks in front, such clocks being the chief ornaments of all mosques I have entered in Kairouan and elsewhere. This bit of street where is the copper hole in the wall, dirty lamps swinging over it, and the wicket for the wisps of wool for pleading, is not beautiful to our western eyes, but it is certainly different from all other parts of Moslem Africa, and one feels the pressure of exerted Islam. Here fervency, and fanaticism even, may be and are exercised intensely and all the time. It is not true, as often said, that all who pass this way drop a coin through the copper hole; but many do, and some of them hold their fingers in it, twirl them round in it, hang on to it while they let their bodies sag, as if here they touched the saint and were cast in a spell thereby; and others again lay their faces to the frame, and in a low voice murmur 'Mulay Idriss!' proceeding with a whispered prayer or appeal in the manner and tone of those who for the time being have passed from the material world and are half-way up to heaven. Then another will lay his hands against the cedar panel,

and, pressing his face against it with eyes wide open, imagine that he sees through everything, past life and death themselves, to the realms where the soul of Mulay Idriss, Fez's founder, dwells. Everywhere around this spot the venerated name is ceaselessly uttered in a moaning, wailing way. There are beggars always by, and some of them will at once deliver the alms that are offered them to the orifice in the wall. But not all of them do that, as has been said, and I think the practice is decreasing. Some women make a little cheap embroidery on coarse white handkerchiefs, and, selling them to passers-by, may make an offering of the money to Mulay Idriss. Occasionally a sheep is brought to this place for sacrificial slaughter. But of all these things and doings there seems, from what I could gather at the place, to be less done now, or it is done with less apparent intensity, and it is reasonable to suppose that, if this is so, it is due to the recent invasion by the infidel of these sacred parts. That we could understand, and not set it down for anything in decline of religious zeal. Once there were barriers placed across the streets, at a distance from the shrine and mosques, beyond which the unbelievers could not pass, but in latter times, by pressure of what some call progress, they have disappeared. The faithful seem indifferent to our watching them in their casual devotions now, but we must fairly admit that, even when observation is conducted with great respect, it is still an intrusion. For myself, I lingered there in the shade, as much out of the way and unobserved as possible, hoping thus, with some previous study and experience, to add some trifle to a timid sense of this mighty Islam, so mysterious to the European despite all his information upon it, so pregnant with possibilities for disturbance of the world. Here the fervour, the blind belief, the fanaticism—using the term in full respect—of the Moslem people can be faintly understood by a slow process of absorption when idling for hours, and not minutes, by the shrine. The French are seeking to understand, and are sympathising. They have just built a big mosque in Paris for the chief purpose of displaying their sympathy. To many Christian visitors the fervour and the fanaticism seem like nonsense, but the observer of these things is not half way to knowing the outer elements of Islam until he ceases this disdainful attitude. He must come to feel more and more that Islam, with its ramifications, its traditions, and its innumerable miraculous legends attached to persons and places everywhere, is another world, embracing an entirely different sense of life from that we ourselves possess. The European, however sympathetic and intelligent, can never come exactly to understand what a Mussulman feels and thinks, because he cannot know *how* he thinks.

After all, the fervency displayed here by the shrine of Mulay Idriss is calm in contrast with what happens elsewhere. The delirious exhibitions of the sect of the Aissaoua in many different parts of North Africa are another thing. By strange music, and rhythmical movements, by intensified concentration upon a mystic idea, by sacrifice, and especially by self-torture and mutilation, of a kind we consider shocking, the people of this confraternity, founded by Sidi Mohammed ben Aissa four hundred years ago, work themselves up systematically to an amazing condition of frenzy, in which they are evidently less of this world than of some other. They have their regular meeting places, but bands of them are formed in town and country districts, and small groups may be seen from time to time wandering in irregular procession through the streets, even the Europeans' streets, a banner at their front, and a few musicians with musettes and small drums in attendance. Thus, chanting or wailing, and with a short tail of followers, they wander along. I have even seen them threading their way through the covered market at Tangier. But these are the restful moments. One night in another part of Morocco I heard a noise coming from a small open space in a secluded part of the town, and, knowing its meaning, moved towards it. A circle of observers, all natives, perhaps a hundred of them, were gathered round some five or six of the confraternity, who had come in from somewhere in the hills on a kind of mission, and were here lined up in white burnous—ghostly they seemed in the moonlight that fell upon the scene—in front of a furled banner and two or three players of the musette and the tambour. As the rough music was wailed out, the men in white were swaying from left to right and right to left in an effective rhythmical unison, dipping their knees at the extreme point of each movement, and all the while chanting vigorously, monotonously, with, at intervals of two or three seconds, at the dipping motion, a peculiar emphasis which might almost be called a musical sneeze. The musettes, with the sound of bagpipes, were blown harder, the tiny drums rattled more vigorously, the chanting was intensified, and, all continuing monotonously for half-an-hour, the desire and the effect were evidently to produce in the white Aissaouas a state of frenzy or mystical exaltation. By-and-by, being sufficiently affected, one of them came out from the line and, immediately facing a musette player, glaring fiercely into his eyes, danced wildly, leaping and flinging his arms about. After a few moments he drew back to his associates, another advanced, and there were indications that the influence upon them was rising to its height. Much of the business might have seemed simply stupid to some western minds, and one could not guess anyhow where Allah or Mahomet came into the consideration, or yet Sidi

Mohammed ben Aissa, but in the moonlight, in this little corner of a white Arab street or lane, all otherwise quiet and dark, it was truly an emotional scene, and one could nearly understand the people being affected by it. The watchers were quietly observant. Presently, the crisis being apparently within reach, there was a whisper that a sheep might be brought along and sacrificed and eaten raw. Forgetting myself and circumstance, I had without definite intention crept through the ring and was standing on the inside within touching distance of one of the Aissaous, who had emerged for his individual dance, when I became conscious of attention being directed to me. Then a friendly Moor whispered to me in French that I might do well to creep away as unostentatiously as possible and retire to a safe distance, for the presence of an infidel was distasteful just then, and, without fear of consequences, they would not hesitate at swift killing if they thought it desirable to kill me—indeed at their crisis they would rejoice in such an act. That might be; so I, the only infidel, retired to a distance. After another fifteen minutes the spell was broken, the wailing music faded, and the Aissaous went away.

* * *

Within the general aim and desire in visiting Fez this time I had fixed some secondary objectives, one of which, a sentimental conceit, was to carry there an old paper-covered book that was itself of Fez, and there have it bound by the bookbinders of Fez, who have been justifiably famous for their art and craft, but are now by all accounts a fast diminishing number. It was really a proper and useful book to take to Fez, for it was my first old copy in French of Pierre Loti's *Au Maroc*, the tale of his journey there, when he was attached to a French governmental mission, in the spring of 1889. Getting to Fez in those times, by horse and mule and ass, with escorts provided by the Sultan, and the homage and assistance of the various tribes at intervals, was a more difficult, adventurous, and ornamental business than now, and Loti described it well, with his usual emotional effects. On nights of June in Fez I sat on my balcony, looking across a dark valley, filled with trees of many kinds, and rushes, with faint sounds of running and falling water. A high, fort-crowned hill stood up beyond, over which presently a gigantic summer moon ascended. Here I read again what Loti had to say of his coming here and afterwards. Alas for disillusionment! Many years ago this book was the first of fifty, perhaps, that I absorbed in an increasing desire to acquire knowledge and feeling of North Africa, and, for its author and its writing, and the circumstances, it has been well respected on my shelves. But, on my looking through it now in Fez itself, and paying attention to passages I had marked, it was impossible to avoid the thought that Pierre Loti, with his

beauties of style and his sensitive emotions, was not a good observer. In the days when he went to Fez it was not permitted to him or any infidel to go by the sanctuary of Mulay Idriss, and any traveller might now see and know more of Fez than Loti did in his short stay, when he was so proud to find that, attired in caftan and burnous, he could walk the narrow streets without attracting attention, and sat in the evening on the roof of his house of lodging watching for the appearance of Moorish ladies on adjacent terraces, ladies of the harem he was not supposed to see. But though Fez at that time was more strictly of itself than now, and limitations were more rigid in some ways, Loti might have looked around him more. In this book he has a chapter of hearsay about the tolbas, or university students, and the colleges they attend, and what they learn, but I wish he could have come with me to spend a while in the living cell of one such tolba, overlooking the aged decorated court of the medersa or college of Bu Anania, listening to this dreamy young Arab as he talked in a slow, tranquil way on various things. The cell was bare of furniture and equipment, with only a mat to sleep on, a jar of water and some simple cooking utensils, no books save the Koran, no ornaments, no elegances, no comforts. Seated on the floor together at the tolba's little window, we looked on to the old court with beautifully traceried walls, and ancient cedar timbering, and a fountain in the middle. The tolbas learned, as he told me, things of their language, of their religion, and things associated with astrology, alchemy, and divination. It is considered important that they should learn of the influence of the stars upon our human mundane fate, and so forth. With matters connected with other languages, with mathematics or sciences, with history or geography, and such like studies of our own schools and colleges, it is not considered desirable or essential they should acquaint themselves. There had been talk of their including the French language in their irregular and spasmodic course, but it had come to nothing. Yet here, as at universities at home, there are movements, and this young tolba told me a thing, upon the significance of which I have pondered deeply since. 'You see,' he said in effect, 'what we wish to do in our learning and teaching is to get back to Mahomet, to make our lives and thoughts and customs as much like his as we may do. Thus we would progress.' So progress in reaction was the ideal thus enunciated. As I left the tolba in his soiled white burnous, seated on the floor at the cedar-framed window, he turned back to his Koran, learning the text and studying the interpretations. . . . However, I found a native bookbinder, a skilled craftsman of the old Islamic school, who bound Loti's book for me most beautifully in blue and gold.

'ONE TOUCH OF NATURE.'

By D. E. STEVENSON, Author of *Peter West*.

I.

IT was well-known in Port Andrew that Mistress Macfarlane 'had a tongue on her,' and few folk cared to get the rough side of it, for it was apt to make one feel as if the very clothes were being stripped from one's back. She had sandy-red hair, a freckled complexion, and a pale-blue eye, with which she fixed her victim while her tongue flayed him. In view of this peculiarity, and an assured position socially, the good lady ruled Port Andrew with a rod of steel.

But if Mistress Macfarlane ruled Port Andrew in a sovereign manner, Mistress Herald, and none other, was her prime minister, and it was a brave—or an ignorant—woman who went against this redoubtable pair. Whether it were a question of the rearing of bairns, or the exact shade of yellow for lace window-curtains, their word was law. Rumour had it that even the minister's wife had taken their word as final—against her own judgment—on the subject of sheep's-head pie; but this statement should not be taken too literally, for it is well-known that all great figures in history, as well as modern celebrities (including cinema stars), have anecdotes told of them which have little or no foundation on fact—and Mistress Macfarlane was no exception to this rule. I quote the report merely to emphasise the veneration for their opinion which existed in the village, making it impossible for any one to act contrary to their mandate.

The baker's shop—the only one in Port Andrew—had been handed down from father to son in the Macfarlane family for three generations; but alas! there was no son to succeed the present owners, for their only boy had died when he was five years old, and three girls had failed to fill the blank in his parents' hearts. The shop was situated at a corner of the steep High Street, and had a small old-fashioned window in which was displayed daily a tray of cakes and scones and biscuits, fresh from the oven. Every household in Port Andrew went to Macfarlane's for its tea-bread as a matter of course, and many a scandal was discussed in hushed voices over the low counter of the dark little shop, because Mistress Macfarlane was not above lending a hand there herself when business was brisk.

One cold, snowy morning in January Mistress Herald arrived in a great fluster at the door of the baker's shop. She entered with a swirl of snowflakes, and the small bell—which rang in conjunction with a catch on the door—tinkled for at least a minute by the clock.

Mistress Herald was a privileged person, so no opposition was offered as she swept through the little shop and up the stairs to the rooms above, where the family lived.

'Losh!' cried Ben, the assistant, as he gazed after her voluminous petticoats disappearing with incredible swiftness up the steep and narrow stair.

Now, there was much in this exclamation which cannot be conveyed on paper; it betokened surprise at the rapidity of the lady's passing, curiosity as to what had brought her out so early in the morning through the swirling snow, and a certain contemptuous male superiority to such excitement, which, however, did not hinder him from running up the stairs after her in his stocking-soles and clapping his ear to the key-hole of his mistress's kitchen door.

Mistress Macfarlane was making marmalade when her friend appeared breathless in the doorway and sank on to the nearest chair, with one hand clasped to her ample bosom. She was overcome with curiosity as to the meaning of this early visit, but with a huge effort she rose to the heights of self-control, merely remarking in her amiable way, 'Ye seem short of breath this mornin', Mistress Herald. It disnae dae tae gang skitin' about that way at your age.'

Mistress Herald was so full of her news that the insult—and insult it was, for her years numbered only two more than those of her august friend—failed to stem the torrent of her tidings, which poured out unchecked as the Clyde in spate. And the gist of her news was sufficiently remarkable to make Mistress Macfarlane forgetful of her marmalade. The small shop opposite to Mistress Herald's house, a shop which had been empty for several months, had opened that morning with a display of cakes and sweets in the window, and by so doing had proclaimed itself a rival to the great Macfarlane's itself!

II.

The sheer cheek and bold effrontery of this act was enough to take any one's breath away—this was the verdict of the entire village. It seemed incredible that a newcomer, a stranger to these parts, and a mere woman to boot, should presume to open a shop at all in the sacred precincts of Port Andrew.

'Of course naeboddy will cross the door,' Mistress Herald announced; and Port Andrew bowed to the decision of its sovereign lady as communicated through the medium of her prime minister.

Many of the younger women would have

given much to look in for a crack with the new-comer 'to see what like she was,' but they were too much in awe of the baker's wife and public opinion which upheld her to venture across the threshold. Mistress Herald's window, in its strategic position opposite the new shop, commanded such a view of the street that nobody in Port Andrew dared to hold a moment's converse with the enemy for fear of eyes which lurked behind the curtain.

Day after day the window of the little shop was filled with cakes and scones, freshly-baked and tempting, but nobody bought them, and the widow saw her small capital melt away into thin air. She had so hoped to make ends meet with this tiny shop, had been confident of her ability to run it in a small way, and so rear her boy of five years old in comparative comfort; but as the days passed hope died in her brave heart and she grew desperate, and then frightened, for what remained for the pair of them but the poorhouse when her rapidly-dwindling store of money was exhausted?

The weeks passed, bringing their usual quota of snow and sleet and fog to the little village by the sea, and the widow's boy fell ill. It was partly from malnutrition, for food was scarce and dear, and partly a neglected cold which developed into pneumonia. After three nights of torture little Mrs Smith was obliged to go for the doctor in sheer terror for her darling's life.

Mistress Herald, watching from behind her yellow lace curtains, saw the village doctor emerge from the doorway of the little shop, looking grave and preoccupied. She longed to run after him and ask what was the matter, but she was too much in awe of Mistress Macfarlane to show any interest, however slight, in the occupants of the new shop. Alas, she had never felt better in her life—not an ache or a pain could she conjure up to form an excuse for visiting the surgery.

All that day she stuck to her post by the window with a fortitude worthy of her high position in Port Andrew, and towards evening she had the satisfaction of seeing the doctor paying another visit to the Smith family. This time she caught sight of Mrs Smith, who came to the door with a white, anxious face, which was clearly to be seen by the light of the shop.

It was obviously not Mrs Smith who was ill enough to warrant a busy doctor paying her two visits in one day—it must be the small boy, who was occasionally to be seen playing with an old tin on the door-step, and who was ostracised by the small people of Port Andrew, even as his mother was by their parents.

Mistress Herald's mind went back twenty odd years to a dreadful time when her own bairns

lay sick and helpless. 'Puir wee laddie!' she said; and then, after a moment's thought, she added, 'Puir soul!' She stood for several minutes, gazing across the dark roadway at the little shop, with its garish lights, as if she had never seen it before.

III.

Half an hour later a large, ungainly figure might have been seen to emerge from Mistress Herald's door. It was wrapped in a dark cloak, and carried a basket under the voluminous folds. The basket stuck out like an excrescence so that the silhouette of the figure, as thrown on the pavement by the pale moon, was inhuman and monstrous. Twice did this figure attempt to cross the narrow street, and twice it shrank back in the doorway to escape the notice of a chance pedestrian. What conspirator was this? It was the prime minister of Port Andrew in revolt against her queen, and she was so much in awe of that redoubtable lady that she very nearly turned back with her hand on the door of the new baker's shop. She hesitated there for perhaps half a minute, and then, with a gesture of impatience, she opened the door and went in. 'I'd like a poke of acid drops,' she announced breathlessly; 'an'—an' I brocht ye a wee tick o' calves'-fit-jeely for the laddie.'

Mrs Smith was too anxious about her boy to be surprised at this sudden ebullition of good feeling on the part of her hitherto indifferent neighbour. She thanked Mistress Herald for her kindness, and was about to weigh out the sweets, when the door of the shop swung open to admit another customer—and the two rulers of Port Andrew found themselves face to face! Both women were speechless for a moment with astonishment at this unexpected meeting, and the little widow was too worn and weary with her struggle against fate to cope with a situation which she did not understand.

Mistress Macfarlane was the first to recover her wits. 'I jis' ca'd in tae ask for the laddie,' she explained. 'An' I'll tak' a dizen o' scones an' anither o' cookies—we're short o' them the day.'

This was too much for Mrs Smith. She burst into tears and sobbed heart-brokenly. 'Oh dear, oh dear!' she cried, 'an' I hav'na' ony scones the day—those in the wundy are twa days auld. I've bin sae vexed about Airchie—an' it seemed sic a waste tae mak' scones ilka day when naebody wanted them—'

'Dinna greet, wumman,' said the baker's wife hastily. 'I ken fine ye've had an awfy time, but the laddie's got the turn noo—the doctor tellt me that. An'—an' I'll jis' tak' thae scones—I like them fine twa days auld.'

Before she realised what was happening the dazed widow found herself selling stale scones to her dreaded rival, and wondering in a dim

way if she were asleep and would presently awake to find it all dream.

IV.

The two friends paid for their purchases and left the shop together without having exchanged a word.

Mistress Herald was wondering what was passing in the mind of her companion. She was not left long in doubt.

'Ye'll mind wee Johnny was five when he deed o' pneumony,' said Mistress Macfarlane apologetically.

'I mind it well,' was the reply, and the

casual tone hid a wealth of sympathy and understanding not to be conveyed in words. Indeed, these two old friends understood each other perfectly; they did not need a plethora of words to make known their thoughts.

There was just one more point to be settled, and Mistress Herald waited impatiently for its elucidation. She was not disappointed; the situation was cleared up with characteristic brevity, and the future policy of the state outlined with a sure hand.

'James says,' announced Mistress Macfarlane casually—'James says there's room eneuch for twa bakers in Port Andrew.'

LONDON'S LORD MAYORS AND FREEDOM.

By A. J. GLASSPOOL, Late Keeper of the Guildhall.

I.

WE shall more eagerly appreciate the freedom we enjoy, both in the safety of our bodies and in the expression of our opinions, if we look back to the work done by those who have laboured and suffered to gain for us these great privileges.

Among those who have not been afraid of either king or parliament, some of those who were at the head of the municipality of London deserve an honourable mention.

English kings and queens of old were not slow to exercise despotic power, and the English parliament at times took upon itself authority which, in the present day, would not be tolerated for a moment. The fight for freedom has been long and bitter.

When Henry III. occupied the English throne, acting under the influence of the Papacy, he refused the privileges promised by Magna Carta. The king took into his own hands the appointment of the City's Justiciar or Chief Justice, thus robbing the City of its rights.

Fitz-Thomas, the Lord Mayor (1261), had such advanced ideas of freedom that he disgusted the barons by consulting the people in their Folkmote and by accepting their 'Ya, Ya' as law.

Henry's son, Edward I., copied his father's bad example, and endeavoured to obtain, by force, the money which he could not obtain by loan. The exasperated citizens pelted his wife, Queen Eleanor, with mud and stones as her barge passed under London Bridge. For this Fitz-Thomas was refused his office when he appeared before the Barons of the Exchequer on the occasion of his third election as Lord Mayor. When the king and the barons were reconciled at St Paul's, Fitz-Thomas had the boldness to remind the king that there must be

reciprocity between the king and his subjects. He said the memorable words: 'So long as you are willing to be a good king and lord, we will be to you faithful and true.'

This was a hidden threat of rebellion thrown into the teeth of the king. The king ordered Fitz-Thomas and a number of the principal citizens to confer with him at Windsor. On their arrival, notwithstanding the letters of safe-conduct, they were treated as prisoners and locked up in the castle keep. Fitz-Thomas was never seen again, alive or dead. His temerity had brought about his death.

Another famous Lord Mayor, who occupied the chair of the Mayoralty in 1310, was Richer de Refham. He first made a careful study of the City's charters; he then proceeded to demand of Edward II. a confirmation of these privileges. When the king ordered a poll-tax the Lord Mayor rejected it, and claimed the rights of the citizens. They were exempt; not being of the king's demesne, they could be taxed only by the consent of the barons, prelates, and citizens. The king's assessors, however, appeared at the Guildhall and read their commission to make the tax. For the moment the demand was compromised by a thousand pound loan to the king, and when Parliament met, it was too busy discussing the war with Scotland to consider the poll-tax.

The king now produced his 'Charter of Service,' calling upon the people to bind themselves to serve him in his future wars. This the mayor and the citizens refused. 'But the people would not accede to it, for all that the king would do.' They compelled the king to agree to a declaration that 'the aid granted you on this occasion should not be prejudicial to the mayor and citizens, nor be looked upon as establishing a precedent.'

Thus in the early days the Lord Mayors of London were the mouthpieces of the people in

demanding freedom; they were not afraid in those perilous times to face the wrath of kings, and in this way to lay the foundation of a more permanent liberty.

II.

The most notorious of London's Lord Mayors was John Wilkes. No other man holding an official position of this kind has attracted such public attention during his life or had so much written about him after his death. Usually the Lord Mayors 'kept the noiseless tenor of their way,' and have slipped out of office a little grander in title than on their entrance. Their arms are placed in the Gilded Chamber of the Aldermen, and except for that the place thereof knoweth them no more.

John Wilkes will ever be remembered as a fighter for personal liberty; to him we owe the abolition of General Warrants, the privilege of constituents to elect whom they please as their representatives in Parliament, and the removal of the gag upon the press which prevented the people knowing what their members had said, and how they had voted in the House of Representatives.

These are no small advantages; they represent some of our most cherished possessions, and without them life would be intolerable. Imagine our sensations if a citizen could be arrested on a warrant which stated neither his name nor his offence; with what sort of feelings we should go to the ballot box if Parliament exercised its authority to keep the one we had voted for out of his or her place in the senate chamber! Think how our digestion would suffer from anger if at our breakfast table we found every scrap of parliamentary intelligence in our newspapers obliterated!

These are the privileges for which Wilkes and other Lord Mayors of London struggled.

It is pleasant to search the archives of the great city to learn the inner workings of this campaign for liberty. In this undertaking we are much assisted by Dr Reginald R. Sharpe in his three volumes, *London and the Kingdom*.

Let us do what Dr Johnson advised, free our minds from cant. Wilkes was the son of a London distiller; he was educated at Leyden; he became one of the disgraceful order of mock monks who carried out their profligate lives in their so-called monastery at Medmenham, a charming spot near the Thames, in Buckinghamshire. This community was known as the 'Hell Fire Club'; it was probably this association which caused Wilkes to stain his pen by writing his 'Essay on Woman,' and caused Bishop Warburton to declare in the House of Lords of Wilkes that 'The blackest fiend in hell will not keep company with him when he arrives there.'

We have to remember that at the time of the Wilkes excitement, morality among public

men was not of such a high standard as at the present day; even the Great Commoner is said to have been seen in a state of intoxication in the House of Commons. Before Wilkes passed out of this life he had time to reform his character and to become much respected. What author has not written in the days of his fiery youth something he would like his friends to forget?

John Richard Green, in his *Short History of the English People*, states that Pitt denounced Wilkes as a worthless profligate; yet the historian is forced to admit: 'Wilkes became the chief instrument in bringing about three of the greatest advances which our constitution has ever made.' This is a powerful testimony from a historian who, unlike Macaulay, was not given to exaggeration.

Wilkes had a charming way of winning others to his side; his wit, tact, and powers of conversation attracted the great conversationalist, Dr Johnson, who must have abhorred the boldness of Wilkes in attacking those in authority, for the man who would not dare to sit down in the presence of a bishop must have been horrified at the bare thought of provoking a king.

III.

Wilkes was clever with his pen; he followed somewhat the style of Addison. There was no doubt as to what he meant when he expressed his thoughts upon paper; he did not hesitate to call a spade a spade.

Wilkes owned and edited the *North Briton*, a radical periodical published weekly.

It is stated that because Lord Bute, the prime-minister, declined to appoint Wilkes ambassador to Constantinople or governor of Quebec, he used the *North Briton* to attack the ministry. The most famous number of this paper was No. 45. When Parliament was prorogued on 23rd April 1763, the king expressed his opinion that the late Peace of Paris between Britain, France, Spain, and Portugal was honourable to the Crown and beneficial to the people.

Wilkes used his pen with extraordinary power. He attacked the ministry without mercy. In the celebrated No. 45 he declared:

'I am sure all foreigners, especially the king of Prussia, will hold the minister in contempt and abhorrence. He has made our sovereign declare, "My expectations have been fully answered by the happy effects which the several allies of the Crown have derived from this salutary measure of the definitive treaty. The powers at war with my good brother the king of Prussia have been induced to agree to such terms of accommodation as that great prince has approved; and the success which has attended my negotiation has necessarily and immediately diffused the blessings of peace through

every part of Europe." The infamous fallacy of this whole sentence is apparent to all mankind, for it is known that the king of Prussia did not barely approve, but absolutely dictated as conqueror, every article of the terms of peace.'

This was clearly indicating that the minister had put a lie in the mouth of the king.

This bold statement naturally annoyed the king; he had not yet learned the wise maxim 'Silence is golden'; he expressed his opinion and gave his commands too openly. A General Warrant was issued, the messenger bearing it being instructed as to whom he was to arrest.

When Wilkes found himself lodged in the Tower, no doubt he was greatly gratified that his prison home became a centre of attraction. The opposition leaders paid court to the political martyr. It was soon found that the ministers, goaded on by the king, had made a great blunder. Lord Chief Justice Pratt declared the arrest to be illegal; the prison doors opened; Wilkes was free once more.

Parliament, however, did not relent, not even when the Under-Secretary of State was ordered to pay Wilkes £1000 damages. No. 45 was ordered to be burned by the common hangman, and was declared to contain a false, scandalous, and malicious libel. In consequence of a riot there was considerable difficulty in carrying out this order. Thomas Harley, one of the sheriffs, a brother of the Earl of Oxford, after seeing No. 45 burnt at the Royal Exchange, had to take rapid refuge in his carriage, the windows of which were broken, and to save his skin he hurried behind the doors of the Mansion House.

Wilkes, refusing to appear before the House of Commons to answer for his conduct, made his way to France; the King's Bench pronounced him an outlaw.

Wilkes was not silenced, returning home in 1768. When a general election took place he made desperate efforts to become member for the City of London; but the City would not elect an outlaw, notwithstanding his glib tongue. In Middlesex he was more successful. Crowds and rioting accompanied the campaign; to be able to pass along the roads leading to Brentford one had to wear a blue cockade in the hat inscribed 'Wilkes 45.' Unilluminated windows in Pall Mall were smashed, and because Harley, the Lord Mayor, was unfavourable to Wilkes, the windows of the Mansion House met with a similar fate.

To put matters right, it was necessary that Wilkes should give himself up to legal custody for outlawry. On his way to the King's Bench Prison, the excited mob drew his coach. Riots in the neighbourhood of the prison resulted in much bloodshed and one death. At length Wilkes heard his fate in Westminster Hall on the 8th June 1768. His outlawry was removed;

he was ordered to pay a fine of £500 for No. 45, or to be imprisoned for ten months; and another £500 or twelve months' imprisonment for writing his 'Essay on Woman.' Inside the prison his influence was as great as ever; he was elected Alderman for the Ward of Farringdon Without. The Court of Aldermen refused to receive him; Wilkes being elected a second time, it was decided to keep the vacancy open until Wilkes was at liberty.

Elected a second and a third time for Middlesex, Wilkes's appeal at the bar of the House met with no favourable result. The fourth election created great commotion. Samuel Turner, the Lord Mayor, and the Common Council supported him; friends came forward to pay his fines; a procession of merchants, with an address of sympathy to the king, on its way to St James's Palace was broken up by force. The House rejected Wilkes and accepted his opponent, Colonel Luttrell.

Received at last as an alderman, Wilkes settled down to his duties with great dignity. Walpole thus expresses his opinion of his conduct: 'I don't know whether Wilkes is subdued by his imprisonment or waits for the rising of Parliament to take the field, but hitherto he has done nothing but go to City banquets and sermons, and sit at Guildhall as a sober Magistrate.'

Wilkes continued to work for the further liberty of the people. Parliament was offended because some newspapers reported its proceedings. A certain John Wheble was arrested by proclamation for the offence. He appeared before Wilkes at Guildhall; he was discharged and bound over to prosecute the officer who had charged him. On the same day, by authority of the Speaker's Warrant, a Mr Miller was arrested on the same charge. Brought before Lord Mayor Crosby, Wilkes, and a brother-alderman named Oliver Miller, he also was released, and the Speaker's Warrant declared illegal. The officer was bound over to appear for arresting a freeman.

Twice the Aldermen rejected Wilkes as Lord Mayor. In 1774 he had a double victory. He took his seat in Parliament as M.P. for Middlesex, and his residence at the Mansion House as Lord Mayor. Walpole thus commends him: 'Thus after so much persecution of the Court, after so many attempts on his life, after a long imprisonment in a gaol, after all his crimes and indiscretions, did this extraordinary man of more extraordinary fortune, attain the highest office in so grave and important a city as the Capital of England.'

As Lord Mayor he behaved with wonderful good sense and great liberality. Even the king said of him he had never seen 'so well-bred a Lord Mayor.'

Johnson, who looked on him at first as a low demagogue, confessed on further acquaintance

'Jack was a scholar, and had the manners of a gentleman.'

Elected as City Chamberlain in 1779, the emoluments received enabled him to pay his debts, accumulated by his bountiful hospitality as Lord Mayor; he was re-elected annually without opposition for eighteen years; and on the 26th December 1797 he passed away.

IV.

Associated with Wilkes were two other Lord Mayors who ought to be remembered for their independence of character and their nobility of action in protecting the rights of the citizens against the tyranny of the King and Commons. These were Lord Mayors William Beckford and Brass Crosby.

Even as an alderman Beckford commanded great respect, for when the elder Pitt, afterwards Lord Chatham, retired from office, receiving an ample pension, many enemies made use of this to slander his name. Pitt wrote to Beckford a letter explaining his actions, and declaring that his honours were unsolicited.

Faction must have run very high at that time, for when the king attended the Lord Mayor's banquet on the 9th November 1761, Pitt arrived with Lord Temple in a very ostentatious manner. His party gave him such a feeling welcome that he was received with greater enthusiasm than the king. Bute was hooted and pelted, and had to take refuge in his carriage.

Beckford was a man of considerable wealth, twice Lord Mayor of London, and M.P. for the City. He had the honour to be the father of another William Beckford, a man of eccentric habits, made memorable as the author of *The History of Caliph Vathek*. Though Beckford supported Wilkes, he was a man of very different moral character. The only Lord Mayor honoured with a statue in the Guildhall, Beckford's meagre form would lead us to believe that his habits were very abstemious, though his banquets were noted for their extreme splendour. He assisted Chatham in his efforts to persuade Parliament to regulate the affairs of the East India Company. As Lord Mayor and M.P. he was responsible for a petition to the king from the Common Hall, in which it was declared that the House of Commons did not represent the people; that it was 'corruptly subservient' to its Ministers; that the Ministers should be dismissed and a new Parliament called. This was an act of great independence and bravery; Walpole admired it, and said that 'a bolder declaration both against King and Parliament was never seen.'

It was in May 1770 that Beckford drew up an address to the king, protesting in the name of the Common Council against the violated rights of election to Parliament, as seen in the expulsion of Wilkes. The Recorder, afraid of

such bold language, refused to attend with the deputation to the king, and probably Beckford read this address himself.

The king gave a brief and unsatisfactory reply. Having in my official capacity been present at such interviews at Windsor Castle and Buckingham Palace, my special duty being to keep strangers from intruding on the Royal presence, I know that, in accordance with established custom, with the King's Speech the proceedings are ended. Beckford was, however, filled with righteous indignation at the reply of the king, and contrary to all precedent, when the king was about to retire, he stepped forward and made the speech recorded on his monument. The king listened impatiently, then retired without a word of comment.

Never before had any Lord Mayor dared to express himself with such boldness. He expressed regret that the citizens had incurred the displeasure of the king; he was not slow to denounce those who had attempted to separate the king from his subjects; he was eager to declare that the king had no more loyal subjects than those of the City of London.

Beckford's great innovation met with general approval. The Guildhall rang with his praises, and eminent statesmen joined in the universal applause.

Walpole declared that it was 'wondrous loyal and respectful.' Chatham went further, saying, 'The spirit of old England spoke on that never-to-be-forgotten day.' He affirmed that Beckford was a true Lord Mayor of London, the first Magistrate of the first City in the World. 'I mean to tell only a plain truth when I say your Lordship's Mayoralty will be revered till the Constitution is destroyed and forgotten.'

V.

Brass Crosby was Lord Mayor in 1770. He had the spirit of Beckford; he made objections to the system of pressing men into the army against their will; he consulted with Chatham to find out if this method could be altered, but, being advised that the custom was not illegal, he induced the City to seek to modify the practice by giving premiums to those who recruited voluntarily.

Lord Mayor Crosby was member for Honiton, and Alderman Oliver had succeeded Beckford as member for the City of London. The king was determined that these should be punished because they had declared the Speaker's Warrant illegal. They were called upon to answer for their conduct to the House; in the course of the examination Crosby, who was suffering from gout, was taken so ill that he had to ask permission to go home. At St Paul's he was drawn to the Mansion House by the people.

Both Crosby and Oliver were sent to the Tower, the Common Council showing their sympathy by ordering that their tables should

be well provided. The figures of Lord Bute, the Speaker, and others were beheaded on Tower Hill, and then burnt. On the release of the city magnates, the Artillery fired a volley of twenty-one guns, and the city was illuminated.

All this goes to prove how much the City's rulers deserve the kindly thoughts of those who

enjoy the privileges they helped to win. No more General Warrants were issued; no constituencies were ever more angered by the refusal of their Members legally elected; the Press was free to say how Members of Parliament had voted, and to report what they had said.

Let us give honour where honour is due!

THE WEST COAST OF SOUTH AMERICA.

PART III.

VII.

THE most interesting relic I saw of this forgotten past was the ruin of Chang-Chang. This must have been a walled town of very considerable size and importance. It is now a wilderness of crumbling bricks, a scene of desolation, causing the visitor unconsciously to speculate on the secrets that lie buried there. The most obvious curiosity is the construction of the few remaining walls. At their base they are from four to six feet thick, tapering upwards to the thickness of a single brick. Apparently the height of a wall was regulated by its thickness at the base.

Pizarro established his headquarters in the neighbourhood of Chang-Chang, at the modern town of Truxillo, while planning the conquest of the Incas. Truxillo, situated on the fringe of the fertile valley watered by the river Muche, is a delightful little Spanish town transplanted to the Pacific coast. It is the sleepy abode of *grandees*, whose houses are built round paved courtyards, made beautiful with palms and flowering plants. It is a town of much colour and many churches, which lend to it a somewhat Eastern character, particularly when viewed from a distance with the warm sunshine playing on the white domes and towers.

It is in the surrounding district that you meet the offspring of the builders of Chang-Chang. They are still in possession of the land, which is divided into fields by low mud walls. Some of the more ambitious have built for themselves flat-roofed mud dwellings, while others, at the edge of the barren foot hills, are satisfied with airy habitations constructed of branches and reeds. These they share with their domestic animals, pigs, donkeys, oxen, and dogs. Life is ordered on a communal system, most things being considered common property. They borrow and lend freely among themselves, and help each other in the fields as though such assistance were the most natural thing in the world. They are sober and industrious, and somehow manage to settle their affairs among themselves so that police are unnecessary. They even dispense with doctors, curing all their

ailments with herbs, of which they seem to possess considerable knowledge. Though almost anything will grow in their fertile land the chief cultivation is maize, which ripens all the year round and supplies all their needs. There is neither affluence nor poverty, and all seem to be happy and contented.

In appearance they are short and thick-set, with straight black hair, somewhat flat noses, and high cheek-bones. Their skin is a dark brick-red. The women, who share the work with their husbands, dress in long, black skirts, reaching to their bare feet, low blouses, exposing the arm from the shoulder, and broad-brimmed straw hats. The men seem satisfied with any old patched garments they can get hold of. They are clean in their habits as well as in their person, which is more than can be said of most dwellers on the west coast.

The people with whom I came into contact around the ports, the so-called more civilised, are an entirely different type. They are a mixture, of native and conqueror, and in too many instances, of the Chinese, who have a monopoly of the retail shops and restaurants. Yet they are all proud of their Spanish origin, though whether or not Spain is proud of them is another matter. Certainly the traveller is well-advised to keep a sharp eye on his possessions, and when a ship is lying off a town it is well to keep portholes closed and cabin doors locked. The chances are that in spite of precautions you will be relieved of some of your possessions. To steal from a ship is a sport, not a crime, and it is notorious that vessels trading on the Pacific coast are fitted with complicated burglar-proof appliances.

Here is an instance of what happened to us while loading nitrate at Mejillones, a town consisting of some wooden shanties dumped down on the loose sand. On arrival we were warned to be careful, as thieves had taken a heavy toll from an Italian vessel the week before. Accordingly our skipper set a double night-watch, armed with heavy revolvers, and ordered all the deck arc-lamps to be kept alight from dusk till dawn. Thus we felt secure, and when we sailed away the skipper smilingly

boasted that he had been one too many for the robbers. Two days later the carpenter discovered that in spite of revolvers, watchmen, and arc-lamps, a quantity of honey in the after-hold had been broached. The thieves had smashed the staves of the casks, and, after taking what they wanted, left the remainder of the honey to trickle on to bales of cotton.

Naturally, the passengers, recalling the skipper's boast, made the most of the incident. But the laugh was turned ruefully against us when we heard that the padlocks and bolts securing that part of the fore-hold reserved for passengers' luggage had been tampered with. On entering we found that every trunk had been ransacked and many necessary garments removed. The temperature, already high, went up with a jump to a height that was not altogether agreeable for the skipper.

Complaints to the authorities are answered with an unsympathetic shrug of the shoulders and a smile which seems to approve of the cunning of the thieves. From what I can gather, so many different people are implicated in these ventures, that unless the offenders are taken red-handed there is little chance of ever obtaining satisfaction. These depredations seem aggravated by the fact that customs officials live aboard vessels all the time they are lying off a port to control everything taken ashore.

But, as I have said, it is no sin to steal from a 'Gringo,' and if any one is so foolish as to be caught in the act, he has the satisfaction of knowing that the punishment will not fit the crime. It is true he will be incarcerated for a period—a period of idle days, spent in the society of jovial compatriots, who smoke and chat so that the time passes all too quickly. He will also have the satisfaction of being an object of public sympathy, for at some towns prisons are open to the populace, who seem to find them as interesting as the cinema shows.

At Huacho, a small town in the neighbourhood of Lima, I was attracted towards what seemed to be a cage, within which a number of men were poking their heads between the bars after the fashion of wild animals at a zoo. Outside the bars, keeping an eagle eye on the people who came and went, was a little fellow dressed in imitation of a French Alpine Chasseur. This, I was informed, was the local prison—the sight of the main street. The prisoners were hanging on to the bars in the hope that sympathetic passers-by might give them money or something to interest them. Close at hand was a young woman who did good business in fruit, sweets, and cigarettes, which the public were at liberty to hand to the prisoners. They were an unwashed, unkempt lot, yet with few exceptions seemed perfectly happy. Some read, while others amused themselves scribbling on the walls

after the fashion of a school-boy with his first pencil.

Though there may be many arguments in favour of exposing offenders to public view, it must be admitted that such sights are depressing. Yet in countries where hurricanes, earthquakes, and tidal waves destroy all feeling of settled security, as well as the patient labours of years, institutions, like the abodes of men, must necessarily be primitive. The recent wiping out of Coquimbo affords a sad instance of the insecurity of property, life, and institutions. Our Pacific Squadron had a naval coaling-station there, and I believe it was one of the ill-fated Admiral Craddock's last ports of call before going out to match his small force against Von Spee with his big German ships. It is the first rain-swept town one views on the voyage down the Pacific coast, the first bit of colour to relieve the monotony of the sand wilderness. Crowds of smiling natives swarm on board with fruits, caged canaries, which are caught in the district, and boots. It is difficult to think of these people fleeing to the mountains before the terror.

Unfortunately, the mortality from these causes is as nothing in comparison to the annual toll caused by pestilence and disease.

I found it difficult to understand the high death-rate, especially as the natives I saw stripped to the waist working the cargo in the holds impressed me as being of a strong, muscular type. A medical acquaintance, who had spent many years in practice on the Pacific coast, informed me that though powerfully built they are so lacking in stamina that few of them live to be old. They mature early, marry young, and have many children, most of whom die in infancy. My informant ascribed this high rate of mortality to their inborn contempt for even the most rudimentary laws of hygiene. Then, too, it must be admitted that, for the average native, life is as drab as his colourless surroundings. He has no interests except an occasional carouse when funds permit.

VIII.

Foreigners living on the coast assure me that the climate is as near perfection as can reasonably be wished. There is sunshine all the year round, with no extremes of heat or cold to cause discomfort. Europeans who take their baths and hygienic habits with them, and keep down the swarms of pestilential flies and mosquitoes in their homes, enjoy perfect health. As for their children, they thrive so well that the Pacific coast is spoken of as being a children's paradise.

Of this I had visible proof at a place called Tambo de Mora. There I met the proud parents of twenty-three children, all doing well, as the father informed me before I had spoken

to him many minutes. He is, by the way, an Italian, who settled there as a young man and saw to it that his children were brought up amid healthy surroundings. I also met an American who, after a lifetime on the coast, is as energetic at seventy-five as he was at twenty-five. When asked for his secret he answers 'the climate!' Most of my countrymen with whom I discussed the climate were equally enthusiastic, which says much, coming from the representatives of our nation of chronic weather growlers. Strange to say, they had no particular grumble that I can remember.

I sometimes wondered what these countries would do without the ubiquitous Britisher. You meet him everywhere, even in odd out-of-the-way corners. And he has a hand in everything. He goes off on lonely trails prospecting for minerals; he runs the railways, the trams, the nitrate mines, the sugar plantations; and he has a fair share of the commerce. He has practically a monopoly of the water, gas and electric supplies, and at Valparaiso I found a colony of engineers from the Clyde in charge of the shipbuilding yards. I even met some who are engaged in helping to train the efficient Chilean navy.

Probably the success of our compatriots is responsible for various schemes that have recently been suggested for establishing settlers in this part of the globe. A few went out to seek fortune shortly after the war, but I understand they are most of them home again, nursing grievances. Though these countries on the Pacific coast of South America are suggestive of future possibilities, to my mind, and I express the opinion of the people on the spot,

they are not yet ripe for the advent of European settlers in large numbers. For economic reasons, and also for political reasons, which are equally important, the 'Grengoe' settler is not wanted.

By the way, the word 'Grengoe' or 'Gringo' applied to foreigners, particularly to those hailing from our Isles, is not a Spanish word. It belongs to the Pacific coast, and one explanation as to its origin will appeal to Scotsmen, though I do not vouch for its accuracy; as likely as not it was invented by a scion of the nation that cannot see a joke. At any rate, a Highland regiment has the honour. On their march through Valparaiso the kilties sang 'Green Grow the Rashes O,' to the astonishment of the natives, who did not know what to make of the garb or the song. Yet the melody appealed to them, though the only words they got hold of were 'Grengoe.' And so to this day we are all of us 'Grengoes.'

Yes, the Pacific coast is fascinating, and I am tempted to enjoy the sunshine in those sleepy towns outside the torrid zone, among the palms, the bougainvilleas and the quaint gardens where the moonflower fills the cool night air with its perfume, and fireflies dance among high geranium bushes, which flower all the year round; to enjoy such delicacies as custard apples, alligator pears, and mangoes, plucked from the trees; to watch the flight of myriads of sea birds rising overhead, so that at times the sky is blotted out and nothing can be heard save the beat of their wings. But even the longest holiday comes to an end, and we must back through the sunshine to the drizzle and the gray days of our less-favoured clime.

THE END.

THE MONTH: SCIENCE AND ARTS.

A NEW PORTABLE CAMPING-TENT.

A novel form of camping-tent has lately been introduced into this country from Norway. When collapsed, this tent takes the form of a rectangular bag. To erect it, the closed end is pegged down by the corners. A pole is then inserted vertically in the mouth. What were the edges of the bag when flat on the ground are cut back from the mouth for about 12 inches, and ropes are fitted at the ends of the cuts, and pegged out at the sides. The result is a very curiously shaped tent, with the pole in front of a nearly vertical diamond-shaped door. The cutting back of the edges leaves flaps which can be buttoned over each other, thus entirely closing the tent. It will be noted that the bottom of the bag forms the ground sheet; hence there is no possibility of draughts or the entrance of water, because there are no openings. These tents can be erected or doubled

up in a couple of minutes, and they can be raised against the strongest winds so long as the closed end is pegged out to windward. They are made of impregnated waterproof cotton fabric in two qualities. One, of heavy material, for use all the year round, weighs 4.4 lb.; the other, of lighter fabric, weighs 2.2 lb., and is suitable only for summer camping. A very ingenious pole in three pieces, with simple fittings for its extension, is supplied with each tent when desired. The tents are convertible into man-carrying floats, sleeping-bags, or ambulance litters. The heavy tent is 7 feet 3 inches long and 5 feet 7 inches wide; the lighter variety is 4 inches narrower. These tents should be very suitable for camping tours by cycle or boat.

TWO NOVEL CURTAIN-RODS.

During the last year or two several inventors have devoted their attention to the improvement of curtain-rods, and to the devising of

sliding attachments for the curtains which are less liable to stick than rings. One very simple and inexpensive rod is a metal tube with a slot right along its under side. Inside this tube are the curtain runners, each consisting of two tiny wheels mounted on one spindle, with a space between them equal to the width of the slot in the curtain-rod. A phosphor-bronze link is hung on the spindle between the wheels and projects through the slot, terminating in an eye for the curtain-hook. These carriers cannot stick, because the 'racking' pull when the curtain is drawn comes on the spindle, while the link in the slot keeps the wheels central in the tube, and in line with its axis. Slotted brackets, which the carriers will pass, are provided where necessary. Excellent as these curtain-rods have proved, they cannot be bent by an amateur or a jobbing carpenter, although the makers will supply them bent if desired. This slight drawback is overcome by the metal strip curtain-rod, mounted edgewise, which is easily bent. This type has been in use for some years, but an important improvement has been made recently in the runners. These take the form of bent metal strips to embrace the rod and a wheel which runs on the top edge, while an eye at the bottom takes the curtain-hook. Although this arrangement is fairly satisfactory in itself, the end pull for drawing the curtain tends to tip the strips, when they are liable to stick. To obviate this tendency, the curtain-hook is attached to a link which swings on a pivot of which the centre coincides with that of the rod. Another interesting invention is a tubular metal curtain-rod, round which is wound a stout wire in the form of a helix with a very coarse pitch. The curtain-rod is mounted on rubber-faced rollers, and is fitted at one end with a pulley and an endless cord. The curtains are hung on rings in the ordinary way. When the cord is pulled the curtain-rod rotates, and the wire helix causes the rings to travel along. Two curtains may be made to meet in the middle by giving one end of the rod a right-hand and the other a left-hand helix. When used for bay-windows, the three rods are connected at the angles by universal joints, so that all can be rotated together from one end. An interesting feature is that the rings do not jam if the rod is rotated when the curtain has reached the end of its travel. They simply slip over the helix, and there is no danger of tearing the curtains. All of the above-mentioned rods and their fittings are finished in copper or steel bronze, or in brass.

A REIN-CONTROLLED AGRICULTURAL TRACTOR.

Among the implements to be seen at the Royal Agricultural show at Leicester was a powerful motor tractor, which is capable of hauling a three-furrow plough, a disc harrow, or a cultivator. A unique feature of this tractor

is that the operator sits on the implement, and controls the tractor by a pair of reins, as he would a team of horses. A slight jerk at the reins puts the tractor into forward gear from the standing position, and the special band-clutch takes up the drive quite smoothly. Once the tractor is started, no difficulty is experienced, as steering is easily affected by pulling the right or left-hand rein, the angle through which the tractor is turned corresponding to the length of time the rein is pulled. A steady pull on both reins at any time stops the tractor and applies the brake, while a further backward pull introduces the reverse. Thus a tractor which has the capacity of a team of eight horses is fully controlled by the manipulation of a pair of light reins. Only a light pull is necessary, as the actual work of steering is effected by friction wheels, one or other of which is caused to engage with the fly-wheel of the motor by pulling on a rein. The tractor is carried on two wheels, the rim of each of which is surrounded by a chain of ten pads, the two sets of pads forming tracks for the wheels to run upon. With two cylinders arranged in the form of a V, the engine has ball and roller bearings for the main bearings and the cranks respectively, while the magneto is of the 'impulse' type, which gives a 'full-speed' spark when starting, however slowly the handle is turned. Having only two wheels, the tractor depends upon the implement being hauled for its third point of support; and it is connected thereto by a telescopic draw-bar, with provision for quickly changing over from one implement to another. A two-ton trailer is also supplied with each tractor. The outstanding advantage of the rein control is that the operator, being mounted on the implement instead of on the tractor, is much better placed for getting the best results. This tractor, with its power pulley, is also very useful for driving threshing machinery, chaff-cutters, and other farm implements.

MINIMISING THE DANGERS OF COLLISION AT SEA.

At the recent summer meeting of the Institution of Naval Architects, a very interesting development was discussed in connection with passenger ships. It is generally admitted that the chief danger for ocean travellers is the possibility of ships being run into and sunk. Although collisions cannot be entirely prevented, it was suggested by Mr Spanner that the effects could be minimised by giving a soft nose to every ship. It is a well-known law that the shock caused by stopping a heavy body, such as a ship, varies with the time taken to bring it to a standstill. Theoretically the pressure becomes infinite if a body is stopped instantly. As a matter of fact, this cannot be done, because there is always a certain amount of spring in the surfaces which are brought together. The possibility of avoiding

shock by stopping a heavy body gradually is well brought out in connection with big guns. When a shell is fired, the gun is projected backwards at a considerable speed, but it is stopped by hydraulic buffers which bring it to rest by offering an even pressure over two or three feet. Without these buffers a gun would wreck its mounting. Mr Spanner proposes to fit every ship with what is equivalent to the hydraulic buffer for the gun. This consists of a comparatively light construction for the bow, which will double up if it collides with another vessel, thus helping to bring the ship to a standstill gradually, while offering a big surface to the side of the other ship instead of what may be termed a cutting edge.

A HYGIENIC MILK-COOLER.

One of the most important dairy appliances is the milk-cooler. Originally invented for cooling beer, the essential feature of this device is a rectangular, flat, hollow chamber, made of thin copper, and having deep horizontal corrugations on each side. This chamber, through which cold water is circulated, is fixed vertically in a frame, and is surmounted by a trough having a row of small holes along the bottom. The warm milk from the cows is poured into the trough, to flow through the holes and trickle round the corrugations to the bottom of the chamber, where it is collected in a second trough, and is discharged through a central hole into the churn. Throughout its course the milk is exposed to dust and to any germs which may be in the surrounding air; in addition, a considerable amount of evaporation takes place, causing a sticky deposit to form on the corrugated surfaces. To avoid these drawbacks a cooler has been invented which has duplicate corrugated chambers, the inner ridges of one exactly coinciding with and fitting into the inner corrugations of the other when they are placed together, but leaving a thin zig-zag space for the milk to pass down between the two. Both the trough at the top and that at the bottom are covered, so that the milk is nowhere exposed to contamination, and there is no evaporation and consequent deposit. Both chambers are hinged, and can be turned down into a horizontal position or lifted out of the frame for cleaning. These chambers and the troughs are, of course, tinned where they come in contact with the milk. The number of bacilli in milk is now often measured, and bonuses are given by some dairy companies for the lowest averages. Protection from contamination between the cow and the churn may therefore pay, in addition to guarding the health of the consumer.

MEASURING THE ROTATION OF THE SUN.

In view of the conditions obtaining in Russia, it will come as a surprise to many that a new

and elaborate astronomical instrument, made by an English firm, Sir Howard Grubb & Sons, has been recently erected at the chief Russian observatory, situated at Poulkovo, near Leningrad. This instrument is known as a spectrograph, the function of which is to photograph the lines of the spectrum. In this case the instrument is especially devised to photograph simultaneously the lines of the spectrum from two opposite sides of the sun's disc, preferably on the equator, from which the rotation of the sun on its axis can be studied in a way which will be explained later. Space does not admit of fully describing this interesting instrument. The spectrograph itself consists of a long tube, mounted on three concrete piers on the ground floor of the astrophysical building. This tube is fitted with the necessary slit, diffraction grating, provision for the photo plate, and an object glass. The sun's image is projected into the spectrograph by a system of mirrors, the first of which is moved by clockwork to follow the apparent movement of the sun across the sky. How the lines of the spectrum from each side of the sun's disc indicate the velocity of its rotation is explained in *Engineering* as follows: 'The rotation of the sun is studied by measuring the relative displacement of the lines in two spectra taken simultaneously from two opposite portions of the sun's disc, symmetrically in relation to the sun's axis of rotation. The displacement results, of course, from the fact that one part of the solar surface is advancing towards the earth, while the other is receding from it, the wave-length of the light from the advancing portion being diminished by the motion of the light source, while that from the receding portion is increased. The phenomenon is known as the Döpler effect, which is commonly observed in the case of sound waves by the drop in pitch which takes place when a locomotive sounding its whistle passes the observer. When the sound source is advancing towards the observer the pitch of the note is increased, and *vice versa*, and of the two sounds heard under these conditions one is higher and the other lower than would be heard if the sound source were stationary. It has been determined that equatorial points of the sun are moving with a speed of about 2 kilometres [roughly $1\frac{1}{2}$ miles] per second, and the apparatus we are now describing, used in conjunction with a suitable diffraction grating, will give from one spectrogram a velocity measurement of greater accuracy than $\frac{1}{10}$ th of a kilometre per second in the line of sight.'

A MINIATURE MECHANICAL CULTIVATOR.

Until the advent of the implement described below, small-holders, nurserymen, and growers on a small scale have been compelled to cultivate their patches of ground by hand, horse or tractor ploughing and harrowing being im-

practicable. The implement referred to is driven by an air-cooled petrol-motor, and may be briefly described as a large motor lawnmower in which the cutter has been replaced by a rotary tiller. There are, however, several important differences. The rotary tiller is, of course, the essential feature. It consists of a number of tines in the form of hardened and tempered steel hooks. These are mounted on a horizontal spindle, parallel with the axle of the wheels, and they are rotated by the motor through level gear. The hooks are mounted on springs, which enable them to 'give' to stones and other obstructions in the ground. They hook up the ground along a path to a width which is adjustable between 16 and 20 inches—and to a depth that can be regulated from 2 to 8 inches. Moreover, they revolve in the same direction as the two wheels upon which the implement is carried, and therefore help to propel it. This feature enables the machine to cultivate steep inclines. The wheels are, however, also driven by the motor through worm gear, while sliding gears give speeds of 1 mile or $\frac{1}{2}$ a mile per hour. The implement is guided by two handles very similar to those of a lawn mower. These can be turned to one side or to the front of the machine, so that the driver can walk behind, to one side, or in front. They carry the engine and clutch controls. As with agricultural tractors, the wheels precede the cultivating implement. Their track is adjustable for widths from 15 to 20 inches, to suit the width to which the tiller is adjusted. With a weight of $3\frac{1}{2}$ cwt., a length of 7 feet, and a maximum width of only 20 inches, this little implement will cultivate ground between rows of trees or bushes which must otherwise be tilled by hand. It will turn up $\frac{1}{2}$ an acre to $1\frac{1}{2}$ acres in eight hours, according to depth, and the makers claim that it will do the work of ten men with spades and rakes. The petrol consumption is $1\frac{1}{2}$ pints an hour, and the tank holds enough for about $3\frac{1}{2}$ hour's work. The above description by no means exhausts the capabilities of this machine. With suitable attachments, instead of the tiller, the machine will mow or reap, while a pulley is fixed on the motor shaft which may be used for driving pumps, circular saws, chaff cutters, and other machines. The tiller is not a new idea, many larger machines by the same makers being at work all over the world. It is the small size of the implement which is novel.

A COMPACT PLATE RACK.

An essential labour-saving device for every kitchen is a plate rack. With this contrivance the wiping of the crockery after washing-up is unnecessary. Each article is dipped in clean water and placed in the rack to dry by evaporation. In small kitchens there is little space for

the ordinary type of plate rack, which takes up a lot of room; hence the number of households in which the crockery has still to be wiped. A compact form of plate rack has been recently brought out in which the plates are stowed with their faces steeply inclined towards the wall. It consists of two sides and a back made of deal or whitewood. For cups a trough is provided at the top with drain grooves and openings for air to circulate; at the bottom is a place for jugs. The space between is filled with inclined shelves, formed of round hardwood bars, for plates. Finally, there is a removable galvanised steel drip tray at the bottom, thus allowing of the rack being fixed in any convenient position, not necessarily over the sink. The wall to which the rack is attached is protected from dampness by making the back in one piece, and as the rack is carried by crossbars $\frac{5}{8}$ inch thick, an air space of this width is left between the wall and the rack. With a height of 33 inches and a width of 23 inches, this rack stands out only 6 inches from the wall, yet it will hold forty-four articles.

'THE ROAD TO RANNOCH.'

We have great pleasure in commending to the notice of our readers a recently-published book, *The Road to Rannoch and the Summer Isles*, by T. Ratcliffe Barnett (Robert Grant and Son, 126 Princes Street, Edinburgh; 7/6). These sketches of the writer's wanderings on foot in some of the most beautiful parts of Scotland—'the records of many happy days,' as he himself calls them—will delight all who have a love for Scottish scenery and the Scottish people. To many they will recall with picturesque vividness the glamour of glorious days spent on hill or moor, by highland loch or mountain burn. The fresh wind of heaven blows through the whole book; to read it is to find the scent of the moorland in our nostrils and the whispering of the woods in our ears. The sixteen well-chosen photographs add to the charm of this altogether delightful volume.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply post-card, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

Chambers's Journal

SEVENTH SERIES

THE CURTAINS AT CHÂTEAU CORBENIC.

By LEWIS SPENCE.

PART I.

I.

WHEN I finish the first draft of a novel I lock it away for six months. At the end of that time I cast about for a retreat concealed in a neighbourhood so isolated as to ensure complete immunity from invasion and distraction while I wrestle with the perplexities of correction. Cornwall, Harris, Connemara, and the Dovrefjeld have all served me as refuges during these periods of stress and strain, and that is why I came to Corbenic, in Brittany, on an evening in late March.

Goodness knows, the place was secluded enough. I had seen a photograph of it at the house-agent's, but had scarcely realised how utterly lonely is that wind-tormented trio of promontories between Brest and Pointe du Raz, where gray tides swirl angrily in and out of the three firths and hiss round the hammer-head of Pointe de St Mathieu, on the northern claw of which my lodging reared its white tower with something of the ghostly monition of a lighthouse. Yes, I had done it with a vengeance this time, I told myself, as I stood, on the evening of my arrival, at the window of the upper room I had selected as my study, looking out on as grand a gale as only the Atlantic can show in time of equinox.

There I stood spell-bound till it was dark. I was just about to draw a chair up to the window and sit there for an hour or so enjoying the storm's huge symphony, when the old people who acted as caretakers of the place brought in supper. I snarled at first when they lit the lamp, but the odour of coffee soothed me, and I sat down to eat. And then I noticed the curtains for the first time.

It was odd that I had not done so before, for I had been standing close beside them. But then they were drawn back, and the curious pattern they had displayed had not been so apparent as it was now that they were stretched across the casement. I am inquisitive as a child about matters of design, but vexatiously short-sighted, so that it was not until I had finished supper, and had gone to the window-table for a book, that I was able to get a clear

view of the unusual figuring on the curtains. Upon a ground of blue repp was sewn in brilliant red silk what appeared at first sight a design in cross-hatching. But a closer examination showed that the pattern was by no means so regular as it seemed. Horizontal lines set at an equal distance from each other crossed the entire breadth of the curtain, and others, straight or sloping, intersected these, or met them from above or below. The whole irresistibly reminded me of some motif, artistic or symbolic, with which I had at one time been fairly familiar, but for the very life of me I could not recall its connection or significance. At last I concluded that it must be one of those elaborate pieces of folk-craft in which the Bretons delight, and sleepily satisfied that this was so, I crawled up the turret staircase to bed.

II.

But morning brought complete dissatisfaction with the conclusion of the night before. I hate to be puzzled, and breakfast had scarcely been placed on the table when I tackled old Queban on the subject.

'That's a strange pair of curtains,' I said. 'Where did you get them?'

'Oh, the curtains, monsieur! Every one notices them. They were worked by Miladi Alma Wethered when she was here, poor soul.'

Miladi Alma Wethered! Surely there could only be one Alma Wethered.

'So she has been here?' I exclaimed.

'She *was* here,' said old Queban strangely. 'As monsieur perhaps is aware, she was—' She left the sentence unfinished and tapped her forehead significantly.

Then the whole story came back to me—how Alma Wethered, the brilliant publicist and Celtic scholar, had suddenly disappeared from her circle, silently, unobtrusively, and those who had known her had seen her no more. It had been privately circulated that her mind had given way, and much sympathy had been felt for her husband, Sir Stanley Wethered, whose almost miraculous career in the world of finance was one of the great commercial romances of the age.

'That must be—let me see—about a year ago,' I guessed. 'Where is the lady now?'

'I do not know, monsieur,' with a great shaking of the head. 'She was taken away from here—where I cannot tell.' And gathering up the breakfast things on the tray, she scuttled from the room with what seemed almost suspicious haste.

Alma Wethered! I recalled the tall, vivacious Irish woman, the dark oval face, the presence fulfilled with strange charm. Hers had been a vivid personality, dominating, magnetic, intensely alive. Could an intellect so penetrating and original descend to such pitiful futilities as the sewing of outrageous patterns on blue repp curtains? I had never spoken to her, but, as I recalled her on the lecture platform, the mere notion seemed preposterous. What had prompted Wethered to send his stricken wife to such a place as Château Corbenic? Was this a fitting environment for a mind diseased, this place of gaunt heath and tempestuous sea?

I sat down and contemplated the manuscript of my novel with unrelieved disgust. Most emphatically I did not want to look into it just then. Very deliberately I threw it into a drawer in the writing-table, and just as firmly I filled and lit my pipe and crossed over to the window.

The storm had quite abated, and the morning was fine and sunny. But not a soul, not a sail was in sight. That suited my mood. I clapped on a cap and went out into the gorse-land which surrounded the château—out to the cliff's edge, where I sat down and smoked.

The truth was, I could not get Alma Wethered and her preposterous curtains out of my head. I could not picture her toiling at that dementia of decoration, she who had been so vigorously alive, so eminently sane. Could the brain play such fantastic tricks even with a personality like hers? It was inconceivable. I continued to sit moodily on the cliff's edge, chewing my pipe-stem and gazing across the quiet reaches of sea.

Suddenly I was brought back to the world of everyday by the chug-chug of an engine somewhere on the water beneath me. A motor-launch, a mere white speck, was hugging the coast. Two men were seated in her, and the figure of one, though muffled in greatcoat and slouched yachting cap, appeared vaguely familiar. Whence they had come I could not guess. Not from very far away, surely, if they went to and fro in such a craft. Yet there was no sign of any vessel from which such a boat might have been launched, although it was impossible to tell what might lie behind the claw of Pointe de St Mathieu, where a yacht of considerable tonnage could readily find anchorage. I began to feel that I had spent an unprofitable morning, and, gathering myself up, walked slowly back to the château.

III.

As I hung about waiting for lunch to be brought, I was drawn once more to the embrasure of the window by some singular spell of interest inexplicable. Those confounded curtains! Where else had I seen the extraordinary design which covered them in a criss-cross of scarlet silk? I tried to put the thing from me, but it haunted me for some days like a half-forgotten name, or a bar from a partly remembered tune, vaguely creeping like a shadow over the edge of consciousness, only to disappear again when the mind essayed to seize it. At last, to my relief, I shook myself free from the fascination of curiosity which the weird pattern had aroused in me, and grew as accustomed to the curtains as to those in my own study at home—or thought I did.

It was on the fourth day of my stay at Corbenic that I unearthed the manuscript of my novel once more. I had now quite regained the mood essential to its calm and judicial perusal. Normally I enjoy the work of correction, but I do not recall ever having found such satisfaction in it as on that particular morning. I proceeded at such a pace that by lunch-time I had passed nearly half a chapter as worthy of cold type. But it was destined that these two or three thousand words were all that should get themselves into shape at Corbenic.

After lunch I became drowsy. This would never do. I felt that distressing tightness about the temples which follows severe application, and realised that I needed oxygen. Five miles with the wind on the heath, and I should be ready for another lap at my book in the evening. For one reason or another old Armin came to remove my luncheon tray, and as a duffer in topography, I tackled him regarding the pedestrian possibilities of the district.

'The best walk is that to Kerouez, monsieur,' he told me. 'A favourite place with the English visitors, and less than a league distant. The stones there are magnificent. The great circle was built by the Courils in a single night, they say. Two kilometres of stone, monsieur, great and small, standing on the cliffs by the sea-shore. It is the finest sight in Finistère.'

Of course, every neighbourhood in Brittany is possessed of the 'finest' stone circle or avenue in the peninsula, but I was in no mood to cavil, and taking Armin at his word, and my waterproof, I set off along the coast to Kerouez. It was a misty day and visibility was poor—such a day, in short, as gives to the land of Lyonesse its quality of dream, the hazy charm from which emerge the dim shapes of legend. And the sad washing of the sea made dim music as an accompaniment to strange thoughts.

I had come nearly to the southern corner of Pointe de St Mathieu when I heard once more the chug-chug of the motor-launch. Carrying the

same half-familiar figure, it passed swiftly over the smooth expanse of blue beneath me, and was soon lost to sight behind the jut of headland.

Having had about enough of the rough and pathless gorse through which I had been stumbling, I shortened my detour by the coast, and cut across the nose of the cape. Looking down, I saw, some hundreds of feet beneath me, a tiny harbour crowded with black fishing-smacks, in which the white motor-launch lay like a seagull among crows. Here the cliff sloped gently, and huddled on its sides were the red roofs and gray walls of Kerouez, and beyond them, to the east, the long curves and upstanding lines of the great stone circle and its environing avenues.

A path, bordered by the blue flowers of the dwarf gentian, now appeared out of the heathy tract, and following this, I came to the great trilithon which forms the northern gateway to the circle. Through this I passed, and followed the inward curve of the vast ring, marvelling at the rude skill which had conveyed the giant blocks from their distant quarry and had propped them into place. Some were roughly squared, others showed no marks of handiwork. Extraordinary theories of a race of stone-workers who had raised such piles as this in many lands, from the Pacific to far-off Orkney, had, I knew, recently been advanced. Were these, I wondered, the first rude skeletons of later temples, the prototypes of those forests of pillars which Egypt and Greece had builded for the worship of strange gods? Perhaps, but overwhelming as were these gaunt monuments of a day before history, I missed the human touch that goes with handiwork. Oh for a single symbol, a carven picture, the evidence of the human hand amongst all this vastness of gray granite!

IV.

I had now come close to the eastern trilithon, a gigantic gateway mightily reminiscent of what a child slumps together out of a nursery box of bricks. One shaft was more sunken and sloping than the other, and it seemed that only by a miracle did the whole keep from toppling down in ruin. Ah, here were scratches, something in the nature of a rude inscription, perhaps. Advancing close to the mighty shaft, I peered into the worn lines on the gray stone, and quietly, and even without wonder, inevitably, as it seemed to me, recognised that their pattern was the same as the mysterious symbols sewn in red silk upon the curtains at Château Corbenic!

Triple ass that I had been! That which I had thought a rather unusual decorative motif was nothing but the simple and easily deciphered script known as Ogham—the 'alphabet' employed in the earliest Celtic inscriptions. What in the name of all romance had I come upon? The great stone stood forgotten, and I was looking once more on the curtains at Corbenic.

Lady Alma Wethered was, I knew, besides being a publicist of repute, one of the foremost Celtic scholars of her day. Had her dementia taken the form of expressing in silk those rudimentary characters which she had studied upon the standing stones of Ireland and Cornwall?

I stood amazed. From the first some queer instinct had advised me that those curtains enshrined a mystery of no ordinary kind. As a dabbler in the byways of archæology I should have known Ogham when I saw it. But it was the difference of the medium employed which had deceived me. It was one thing to recognise the characters on stone, and quite another in red silk on a ground of blue repp.

How long I stood and stared at these rude but regular incisions on the surface of the great shaft, I cannot say. But when at last I ceased to stare, and tore myself away from the spot, I began to walk back towards Corbenic like an athlete in training. Then I stopped with a laugh. Oh no! Romance must wait, for I was tired and thirsty, and the thought of cups on a white table-cloth at Kerouez was not to be denied. Nor could I have faced the curtains and what I felt to be their secret just then. So, skirting the circle, I stumbled down the slope towards the huddle of red roofs, and inquired for the inn.

V.

It was a faded, smoky place of wainscotings and beamed ceilings, and when I asked for tea they put me in a little room where there were flowers and silence. Tea was brought, and I drank off a cup almost mechanically. My brain was in a whirl. I was anxious now to return to Corbenic. A fever of curiosity and disquietude had descended upon me. I, the weaver of mysteries, had at last come upon a very treasure-chest of mystery. But what should I find when I came to raise the lid? The ravings of lunacy? I could not credit that. What then? Some story of a woman's life stranger than any I had ever pieced together out of the fragments of imagination? Ah, that would . . .

A step sounded on the flagged floor, and I looked with real dismay into a face which I had no difficulty in recognising. Once seen, the ingratiating smile, the black, crinkly hair, the heavy chin, were not to be forgotten. Yes, it could be none other than Sir Stanley Wethered!

'They told me there was tea in here,' he tenored. He had that wooing kind of voice that convinces nine people out of ten. 'You don't object, I hope?'

I did, mightily, but managed to stammer some kind of disclaimer. 'If I am not mistaken,' I followed up, 'you are Sir Stanley Wethered.'

'It's no use denying it,' he smiled. 'The beastly picture-papers give me little chance for incognito. Sorry you have the advantage of me,

door, had a cold plunge, and returned to my study, to find breakfast awaiting me.

An hour later I was tramping over the gorse to Kerouez. It was my only clue, for there I had met Wethered, and only one thing, I argued, could have caused his hurried visit to the place. The wind had risen somewhat, and my way was conveyed by the long race of billows diverted by the nose of the cape into the coastal depression which divides the headlands. I had no clear plan of campaign. A mere instinct swept me along, like the waves, in the direction of Kerouez, and, once there, to the inn.

I called for cider, and sat turning over the cud of reflection. Would open inquiry be best? I had heard and read a great deal about that suspicion which is supposed to be characteristic of the Breton, and so credulous are we regarding the estimates of others that I resolved to proceed with what now seems to me a rather comically exaggerated degree of circumspection.

The landlord of the inn was obviously the first person to tackle, and I found my way along

winding passages to his room. But after a chat of about a quarter of an hour, in which I worked slowly round to my subject, I found that he knew nothing of Lady Wethered's whereabouts, nor could he throw the least light on the matter. He remembered her stay at Corbenic, but nothing more.

All that day I mooned about the place, making inquiries in every possible quarter, but to no purpose. I even visited the office of the local commissaire, but he was obviously as much in the dark as any one else. Naturally I dropped no hint of the more serious side of the affair. For all I knew, Lady Wethered's denunciation of her husband's financial methods might not be justified, and the law of libel loomed large before me. But although disappointed at my lack of success, I felt that I had only to remain in the district long enough to arrive at the heart of a mystery which intrigued me, aye gripped me as no plot I had ever conceived had done.

(Continued on page 796.)

THE SIMPLICITY OF WELL-BEING.

By A. W. THOMSON.

I.

IF we look at the matter largely, and quite offensively, nearly every one you come across is a trifle abnormal in some direction. We are too thin or too fat, too ruddy or too pale, too short or too long, too weedy about the shoulders or the limbs, too red-nosed (with indigestion), too short-sighted or too long-sighted, prematurely old or gray, stooping, slack, lined, or care-worn; or, if not any of these, we are wide of justifiable limits of deviation in some other way.

You will pity them all in your comfortable, philosophical, and everyday manner. But the thing most deserving of pity is the probability that you and every one else will fail to notice these things. You will pass on to your own oblivion without comment of the mind; and the world, rather unfortunately, will go on as before.

But, if you really are of a somewhat original type, you will fall to wondering why on earth common humanity is made up of such a heterogeneous mass of ills and sorrows. Everybody (nearly) is a type of little ills all to himself. Even the healthiest, happiest, jolliest, and most capable person you do meet is likely to have (as the very least that can befall him) an abdomen that is definitely too prominent. You know several people who have heart's disease, and it is questionable if they have any right to have it. You know others who crawl in an affliction of kidney trouble or rheumatism. There are those who ask for sorrow by over-eating, or pos-

sibly over-drinking, and by indulging in wrong dishes, because such are given a fashionable name. There are consumptives who are to be pitied, and, in all likelihood, their parents are to be blamed. There are folk as full of nerves as an egg is full of meat, and they are foolish to think so little of themselves as to be bettered by such an insufferable complaint, unless under enormous stress and afflictions. Others have indigestion more or less chronic, which is as much their fault as their misfortune; while constipation is a national trouble, and responsible for more ultimate disease or auto-poisoning than anything else.

There are numberless simple little natural laws relating to common life that most of us either forget, or never quite realise. If you tell a person to do a few simple physical exercises morning and night, he or she imagines you are setting out to train him or her for a supposititious boat-race, or boxing-bout, or long-distance walking match. The least he will assume is that you desire to convert him into a physical-culturist, with enormous biceps, and the faculty of tearing up a pack of cards, and he has no time for such freakish antics. Alas! if he but knew, he will never be able to fight his way in the business of living unless he cultivates the *mens sana in corpore sano*. These are the coals that keep up the pressure of his ambitions to their highest intensity.

The organs, like everything else, wear out far more quickly by rust, inattention, and misuse, than by carefully attended wear and

tear. Well, then, if a few bodily exercises can be devised to stimulate the intestinal works, gently and daily, into more thorough, natural, and therefore healthy action, it is conceivable that such procedure may add ten years to the vigorous length of one's lifetime. It is natural to assume that properly directed use and care of the body is the only real and natural method to preserve it. You do not need necessarily to attend physical-culture classes to obtain the prescriptions. Your doctor ought certainly to be able to put you up to them.

For instance, if a couple of deep breaths twice per day, efficiently done and yet without straining to make a balloon of yourself, and in the purest air you can find, is going to oxygenate and clean out the accumulation of dirt in your lungs, it is indeed worth while. If gently done it will stimulate the tissues and blood-vessels, and bring no end of health to the lungs. The best and purest air is to be found on the house-top, so go up there if you can. You can work your way through each organ of your body in turn with some simple exercise. Certainly you can devise something to wind each of them up a bit, and help to keep them in a fair state of decent action, strength, and vitality.

II.

The writer is far from laying down any hard and fast rules to obtain the ideal well-being. He merely voices an idea that, if you cannot call common humanity a pack of cripples, you can at least say it is foolishly and often quite needlessly imperfect. Little daily exercises carefully systematised to meet individual requirements ought to be regarded by every one as a cleansing process for all that comprehensive anatomy known as the 'inside'; and therefore ought to rank with the daily bath that cleanses the outer skin. Yet you will find tens of thousands who make a fetish of their bath, but never seem to think it necessary to do anything to the *inside* of their bodies. All they look upon as necessary in that light is an occasional dose of salts, or else they adopt a biblical faith in the use (and misuse) of patent medicines. The carefully considered use of laxatives is verily an essential thing, but, of themselves, they cannot keep the body in repair. No matter how conscientiously you clean out an engine or any other piece of mechanism, it will not keep in perfect working order unless it is properly worked when it is working, and 'nursed' by some one who understands.

All this energy of talk applies to sickness of the mind just as it applies to the ills of the body. And it also applies to those other devastating conditions of life, known as nerves, indigestion, 'tics', 'itis', and one thing or another, all of which appear to be sort of dual sicknesses, having to do both with the mind and the body. The remedy, so we are told

nowadays, is to practise auto-suggestion, which doubtless means, stripped of its scientific garb, that greatest of all cardinal virtues, courage, scientifically directed. We set out to engage trouble until we conquer it. And, if only we suggest to ourselves often enough that we cannot be beaten, we have already half won. There is nothing quite new under the sun. This auto-suggestion, then, is an important exercise for the mind. You have to adopt it in a thorough fashion, letting it be high up in the grip of your will. But you need not tell your friends that you are an auto-suggestionist. It is more comfortable to look into the science, extract any good you find in it, and let your friends believe you are a commonplace fellow with an extraordinary quality of pluck.

Then, of course, we must account for the whole curriculum of familiar passions that humanity is prone to. These are nearly as murderous as physical disease or weakness of the spirit. Anger, jealousy, sloth, covetousness, intemperance of any shape or kind. You are permitted but one form of intemperance, that of a terrible passion to make the best of the body and soul that have been bequeathed to you. These horrible passions leave their marks on the health of a man or a woman as indelibly as they do on his or her character. The assertions of some doctrines that sickness is sin is largely justified. Without a reasonable amount of right-mindedness we cannot sustain good health and vitality. A fair and reasonable control, mark you, for without a suspicion of human weakness you become a machine rather than a man, and so defeat your own ends. In fact, to return to scientific theories, it is a fair assumption that the hot-bed of a trifle of anger may incubate those microbes that overcome other microbes more dangerous. Microbes live on microbes, and by killing and living, yet die. In this way we may keep down indifference and defeat indolence. And so we must take our copy-book moralists (as some will take this essay), with a grain of salt, beware mainly of the *brooding* forms of passion.

All the hotch-potch of this article comes to be boiled down to this, that you can, with a little thought, care, and trouble, make of your life always and ever something a little better than it is. The greatest benefit is naturally to be had by starting your course of thoughtful care at the beginning of manhood; but that is perhaps expecting too much in the way of old heads on young shoulders. It is happily never quite too late to begin. Make a little deity of yourself, an Ego, I, but don't do it without the humour of the thing. There is plenty of self in this world, and a lot of self-seeking, but there is mighty little of self-reverence. Don't do a lot of things; but you need be neither a prig nor a vegetarian

Adjust a balance between your appetite and your powers of digestion, thus adjusting the organs to their functions. Don't expect fifty horse-power from a twenty horse-power engine. You must acquire the power of extracting all the good obtainable from correct foods that suit you, and subsequently getting rid very effectually of the waste. No engine will work well and long that cannot effect easy and complete riddance

of the exhaust steam. The same remarks apply to the mind. Find the pivot on which you can balance the real good you bring to it, its digestive power, and its power of discharging useless matter. One of the weaknesses of mortality is that few of us bring our minds to absorb the total good it is possible to assimilate; fewer still can get rid of the poisonous by-products and waste.

JEAN THE REFORMER.

A DOG STORY.

By W. HAROLD THOMSON.

I.

LYING under the dripping bramble hedge, Mr Lachie MacIntyre, casual labourer and persistent poacher, put a hand behind him and thumped irritably at Jean's silky flank.

She protested faintly, and he thumped her again. Never once in her five years had this man whom she adored treated her roughly, and the knobbly, prodding fingers affected her spirit now more than her body.

'Hud yer tongue!' the man whispered. 'You yelp again like yon, m' lass, an' you'll see what 's what!'

Now Jean understood him perfectly, but on this night she was, in the common phrase, more than usually highly-strung.

A poacher's dog she might be, but she had no taste for poaching. Half collie, half retriever, she was sensitive, intelligent, loyal—and game to the last ounce. But night adventures had never been to her liking.

Perhaps some ancestor had been badly handled in the woods, or perhaps Jean was over-tender of conscience. However that may be, she loved the light better than the darkness, and only her whole-hearted devotion to this local 'bad man' persuaded her to accompany him on his nocturnal—and nefarious—outings.

It was still early, but already gloaming had merged into darkness, and never—or so it seemed to the quivering Jean—had the great wood been so eerie.

Her ears heard a score of small, threatening noises to which Lachie MacIntyre was deaf. She hated the gloomy whispering in the tree-tops, and the drip—drip from their branches, and the occasional plaintive hooting of an owl.

Moreover, the air was keen-toothed, and, as it happened, Jean had eaten nothing since early morning.

True, there would be a satisfying plateful waiting for her when she returned to the tiny cottage where her master and mistress lived, but at the moment she felt faint—and

when you feel faint you are liable to do things which you would not do under normal conditions.

The man beside her stirred, and Jean guessed that he was pushing the snares that he carried deeper into his big pockets. Being experienced in such matters, she knew that the enemy was near at hand; knew, too, that Duncan Cameron, the gamekeeper, was a very ferocious person, who held even so innocent a creature as herself in the strongest possible disfavour.

There came a moment when the enemy's stealthily-moving feet blundered, and the crash that their owner's body made as he fell into a clump of withered bracken startled Jean so suddenly that, with all the vigour of which she was possible, she barked once—twice—thrice.

The man whom she loved cuffed her with a damp hand, and called her evil names. But things moved so briskly then that he had to consider his own position, rather than the folly of his companion.

Before the echo of Jean's third bark had faded, the gamekeeper was on his feet and striding triumphantly forward, one hand gripping at the barrel of his gun, one holding a wickedly-brilliant electric torch. 'Ah! It's you, is it!' he exclaimed, when the white finger of light picked out Lachie's sweating, frowning face. 'I've got you this time then, m'lad!'

'Have you?' said Lachie, who had risen and was wiping slimy cobwebs from his coat. 'We'll see about that, Mr Clever! I can walk in this wood, if I like. Let me tell you that you've no right nor power to do more than ask me to leave. I know the trespass laws o' Scotland as well as you do. There *is* no trespass laws—not really. What d'you think you're goin' to do?'

The other had halted, and this largely because he had glimpsed the white teeth of Jean, and had heard her threatening growl.

'I'm going to take you down to the polis office, and hand you over to Rory Blair, the

sergeant,' he said. 'That's what I'm going to do.'

'Oh, you are, are you?' said Lachie. 'Well, you'll be terrible clever if you manage that, mister. Is a man to go to the polis office jist because he likes to take a wee bit stroll wi' his dog through the countryside? Here's what you can do—if you don't know. You can order me off your master's ground, an' if I don't go, you can take out an interdict against me. If I do go, you can do nothin'. Anyway, you've got to prove that I've done damage. That's the law, Duncan my man, an' it's time you learned it.'

What would have happened had Jean not lost her head again it is impossible to say. But she did lose her head. To her the torch-bearer was a repellant ogre threatening the being for whom, had that been demanded of her, she would willingly have given her life.

She saw the gamekeeper raise his hand, and did not guess that his innocent purpose was to wipe away a raindrop which was tickling his cheek. She thought that he meant to strike her man, and, her lithe, lean body trembling, she sprang forward.

The gamekeeper swore and kicked at her savagely, so savagely indeed, that, sick with pain, she dropped and lay for a moment, too deeply hurt to tell of that hurt.

But Lachie knew what had happened, and, a fighting man by instinct, yet with that soft something in his nature which made him love this dog of his as he had loved no human being, proceeded to take toll of her account.

'My God!' he cried. 'I'll sort you for that, you big, dirty goat!'

II.

Of what followed during the ensuing two minutes, Jean had afterwards but the haziest recollection. That she had been duly avenged, she knew—knew that while she limped homewards behind her scurrying owner, the enemy squatted beside a tree, moaning out terrible oaths, and fingering gingerly at a badly-damaged jaw.

Jean was angry with herself. She had behaved, so she decided, like a fool, and even the prospect of supper failed to interest her. But more than ever she idolised Lachie MacIntyre.

People who are averse to the companionship of dogs, and who are therefore incapable of understanding them, would jeer if they were told that Jean knew why the fight between the poacher and the gamekeeper had taken place. But she did know, and because she knew, the adoration in her heart swelled almost painfully, and the wistfulness of it showed in her soft, brown eyes.

When she reached the cottage, however, she shrank away, and made only a furtive dab or

two at the plate of bread and chopped-up vegetables and meat scraps which, as was her nightly custom, Meg MacIntyre had prepared.

Nose between paws; eyes, almost tearful, watching the adored one, Jean listened while the poacher told his wife what had happened in the gloomy woodland.

His tale was scarcely done when there came a knocking on the cottage's outer door; a sound which was followed instantly by Jean's barking.

'Stop it, you fool!' Lachie ordered. 'That tongue o' yours has made trouble enough the night already.'

There entered presently that good-hearted, simple-minded soul, Sergeant Rory Blair, who was to be followed presently—though he did not guess this—by a messenger from the village.

Jean padded forward and sniffed at his trouser-legs, and it was to her that he spoke first.

'It's a daft dog you'll be, Jean,' he said, 'an' by rights you should come to the station wi' your master. I don't know what my missus sees in you, but efter the night she'll mebbe no' be so terrible great a friend o' yours.'

Then, while Jean stepped back and kept a watchful eye on him, he turned to the black-browed Lachie.

The poacher stood before the little fireplace; tall, great-shouldered, florid of face, and with his glinting blue eyes holding a mingled menace and anxiety.

He was thirty-seven, and, save when the Empire's business had taken him to Flanders, had been—as he would himself have put it—jinking the police successfully, year in, year out.

'What'll you be wantin' here?' he demanded. 'You can't lay your hand on me for onythin'.'

'Can I no'?' the sergeant asked. 'I've got to do it, Lachie. It's my duty, y'see, an' wi' me, duty comes first. I'm no' goin' to arrest you for poachin', for I've no proof o' that. I'm here to arrest you for assault on the person o' yin—Duncan Cameron, game-keeper to Sir Angus MacAlister—an' you'd better come quiet. Is that no' so, Mrs MacIntyre?'

Left to himself, Lachie would undoubtedly have defied the law's majesty with force. But his wife, who had always frowned on his poaching exploits, and who was shrewder-brained than he, had her say. Having had it, she knew that this great husband of hers would be reasonable.

It was Jean who was unreasonable—for surely it is unreasonable to exchange a comfortable home for a chill and muggy out-of-doors, and that merely because you cannot bear to let a bad man out of your sight!

Yet that was what Jean did, and she did it stealthily. Into the small and already drowsy village she went, not exactly at her master's heels, but near enough to keep him in sight.

Prior to leaving the cottage, she had heard its second visitor, Dr Hamilton, whispering to Sergeant Blair. It was something to the effect that: 'I think she'll do all right now, but if she gets worse during the night, you must let me know.'

Jean, of course, did not realise what was meant by that; did not guess that the policeman's wife was very ill, and that the danger point had not been passed.

III.

Concerned only with her personal loss, Jean, once the garden gate at the little police station—the two cells of which were part of the house—had been closed, lay down in the middle of the lane.

The situation was entirely new to her. Never since she had been the companion of this rough-spoken, but kindly-hearted man, had he gone from her at night. True, he had often left his home, but on such occasions she had accompanied him, and had returned with him.

Something was gravely wrong, and as her intelligence grew more active, her distress grew greater.

There was a light burning steadily in an upper window, but everything was quiet now, and the nearest cottages, which were some distance off, were mere murky slabs in the shadows.

For how long she lay there, waiting and hoping, Jean did not know, but at length, unable to bear things any longer, she lifted her head—which was beautiful in Lachie MacIntyre's eyes, though not, perhaps, in the eyes of an expert dog-breeder—and sent out a long, doleful howl.

Nothing happened, so she howled again, and went on howling at intervals of a few moments only. Indoors an anxious husband frowned and cursed lowly, and glanced every now and then towards the bed where his sick wife lay.

'Whose dog is that?' the woman murmured. 'I hate to hear him, Rory. What's he howling for?'

'It's Jean,' he answered, 'Lachie MacIntyre's bitch. I think that she followed me down the lane.'

He wished to give no explanation beyond that, for Jess, always too tender of heart, never rested easily when she knew that a prisoner shared her roof.

'She's wanting something,' she whispered. 'I can't stand that howling. Go and send her away, Rory—or let her in.'

Jean heard the sound of a door being opened and the crunch of heavy feet on the trimly-kept path.

Running forward eagerly, she paused when she saw the policeman's menacingly upraised hand, and when she heard his hoarsely spoken orders.

Crouching, she waited for a blow to fall, but

Sergeant Blair believed, mistakenly, that he had cowed her into silence and obedience.

Before he reached the house again, however, the howling had restarted.

'Will you stop it?' he demanded. 'You won't? Well then, come in-by. But I'll knock your head off if you don't stop that infernal row!'

Blithely enough she pattered beside him, and would have been taken at once to the cell where Lachie lay, but for the fact that Jess Blair called out faintly, 'I want to see the dog, Rory,' she pleaded. 'I want to see her.'

So Jean, a trifle impatient, but with the main portion of her misery gone, was invited into the dimly-lighted bedroom, and once there, flung up, in her polite way, a paw towards the frail hand outstretched to her. She liked the fuss which Jess Blair made; liked to have her ears pulled gently, and to have a soft thumb rubbing between her eyes.

Yet she was uneasy, too, for somewhere near at hand there was a man who—it was thus that she read the thing with nothing of conceit—must certainly need her. But she waited long enough to hear the woman in the bed sigh contentedly, and to feel the stroking fingers slip away.

Very quietly, because he feared that the howling might re-start, Sergeant Blair conducted Jean to the cell, and, with a lantern in his hand, watched her transports while, balanced on her hind paws, she thrust her fore paws against the prisoner's chest.

'You might have locked her up afore we came away,' the sergeant grumbled. 'She's troubled the wife sore wi' her yowlin', an' I'd have killed her if I'd had my way.'

'No, you wouldna,' said Lachie. 'There's no law 'ud have kept me from smashin' you up if you had. But I'm sorry aboot yer wife. I thought that she liked Jean, here.'

'Well, you keep her quiet,' the policeman ordered. 'If I hear a sound from the cell the night, you'll ken aboot it.'

IV.

There did come a sound, and that sound was the shrill bark of a dog; but the sergeant did not care then, and knew himself to blame.

Long after midnight he unlocked the cell door for the second time, and stood, lantern held, the while Jean growled and leaned, protectingly as it were, against the sleepy, swearing Lachie.

'What'd you want?' the poacher asked. 'Can a man no' sleep in peace in his ain cell?'

'I'll tell you what I want if you'll keep that dog o' yours quiet,' the other answered. 'It's the wife. She seems worse—an' light in the head. She's asking for Jean.'

'Well?'

'Well, the dog's got to come up. An' that's

not all, Lachie. Some way or other I've got to get Dr Hamilton here. I'll no' be knowin' what to do. I can't go mysel' an' leave Jess alone. Onythin' might happen to her. I was thinking—I don't know how I'd explain it efterwards—but I was thinkin' that mebbe you'd go.'

'Me?'

'Jist that. Would you do it? Only, mind you, you'd have to give me your word to come back wi' the doctor, an' let yoursel' be locked up again.'

'A queer kind o' thing that,' the poacher commented. 'But—ouch well, you'll likely put in a good word for me if ye get the chance. I'll tell Jean here to stay. She'll do that right enough, for, y'see, when I say "Stay" she jalouses that I'm comin' back for her afore long.'

Thus it came about that while the temporarily-freed prisoner footed it sturdily towards the doctor's house at the far end of the village, Jean, his dog, remained. And, remaining, she gave by her presence comfort to a suffering woman, and sat dabbling every now and then a warm tongue across Jess Blair's fingers.

Less than half an hour later she was back in the cell, and fast asleep, her head resting on one of Lachie MacIntyre's feet.

V.

Weeks later, when the matter of Lachie MacIntyre's assault on the gamekeeper had been leniently dealt with, and when Sergeant Blair's wife was well again, Jean, who had brought a family of five sturdy puppies into the world, fell ill.

The illness was sudden—so sudden that Lachie heard it as a distressing piece of news when he returned from what he called a day's work, followed by half a night spent in the policies of Sir Angus MacAlister.

Dully he listened to what his wife had to tell him; the lines between his nostrils and his mouth-corners deepening, and the great hands holding his sodden cap gripping at it tightly.

It was not Lachie's fault that he was constituted as he was. Meg was his wife, and he and she got on well together, but the one living thing who had never given to him anything save adoration and faithfulness had won her way, in that gentle fashion of hers, closer to his heart.

He could not have explained that, or defended it. He merely knew that it was so, and, slow of mind though he was, would have admitted that he was wrong to give so great an affection to a dog and so little to his fellow-humans.

'You say that the vet.'s been?' he asked Meg.

She nodded. 'He's coming again the morn's

morn,' she returned. 'But he says that mebbe she won't last the night. I've taken her puppies next door to John Dundas, and Jean is too ill to care. She's lying on a heap of sacks in the kitchen.'

When the poacher went to Jean, she strove to rise. But he put a hand down and quieted her. 'A' right, lass, a' right,' he said. 'I'm here. I'd have been back long afore if I'd thought this was to happen. I'll bide wi' you for a while now, an' I'll warrant you'll be runnin' about quite perjink in the mornin'.'

He brought a small stool forward, and, seating himself, stroked softly at the wearily-lying head.

His wife, who watched him from the doorway, moved her shoulders and went upstairs. She could not understand how Lachie could be so stupid over Jean. She herself liked Jean, but, after all—well, there were plenty of dogs in the world!

But for the poacher there was one dog only, and he raged to think how short, at the best, her life must be, compared with his.

Fashioned so oddly as he was, and having little to do with deep matters, he said over and over again, as he sat watching those pain-filled brown eyes that were raised in love to his, 'What does the Lord want to make 'em so fine for if they jist sort o' come an' go?'

A very simple soul, Lachie MacIntyre!

VI.

Jean nearly died on the following afternoon, but, though she improved after that, Lachie saw at first no signs of this improvement. So he waited with her when otherwise he would have been back in the woods.

It was with no intention of going there that he rose at last, and, picking up his cap, walked towards the door.

Perhaps Jean thought that he was going to leave her; perhaps it was because she was still so very ill, but she whimpered a plea to him, and rising, followed weakly. Then, such strength as she had failing her, she toppled over and lay still.

It was in that moment that, all unconsciously, she reformed her master. He thought that she was dead, and when, on his knees beside her, he saw that the wistful eyes still held a glimmer, he made a vow.

'Jean, lass,' he whispered brokenly, 'you're no' goin' to go an' die? You're terrible young yet; there's years an' years ahead o' you. Jean, I'll tell you what I'll do. If you live, I'll never poach again. I promise you, Jean: but you've got to stay wi' me awhile.'

Very tenderly he lifted her, and when his wife came from a neighbour's cottage, she found Lachie in an old armchair before the feeble fire, with a sweetly-sleeping dog across his knees.

'Wheest!' Lachie cautioned, a hand upheld.

'She's sleeping. She's goin' to do fine now, Meg.'

From that day to this Lachie MacIntyre has never snared a rabbit or a hare; has never knocked over a pheasant nor fished in preserved waters. He is not all that a man should be, but at least he has kept his word to Jean.

And Jean, gray about the muzzle and less active than of old, goes with him every morning to his work, watches him throughout the day, and returns with him at night.

There is only one other house at which she

calls frequently, and that happens to be the police-station. Perhaps she goes there because one of her pups was given to Jess Blair. Perhaps she goes in memory of that night when she and her idol among men shared a cell.

Healthy and content, she is glad that there are no more night-time outings into the grim woods.

Lachie, on his part, is at times oddly ashamed of himself for being 'soft.'

But the secret of that vow of his is held by Jean alone. Not even Meg was told about it.

Because, you see, Meg might not have understood.

AN ORIENTAL ÆGEAN.

I.

ADEN, the Moplah country, Madras, the Andamans, Mergui, are all on the confines of the Indian Empire, and on or near the same parallel of latitude. It is to the easternmost of these that we would take in spirit those who have no chance of ever visiting one of the most beautiful spots within the realm of Burma. Mergui is in very sooth an outpost of Empire—centuries ago the port of a great trade-route running eastwards through the dank and desolate forests of Tenasserim to Siam, and thence to far Cathay. Along that route the busy trader, the pack pony, and the fever-stricken coolie passed; to-day no trace of a roadway can be found, so rapid is the process of disintegration, and so prolific is nature in this coastal region on which the south-west monsoon breaks in the early days of May, and pours forth its rich rains for the six months that follow.

Sixteenth century chroniclers mention Mergui in their memoirs. Cæsar Frederick, who visited the country about 1569 A.D., speaking of Tenasserim, wrote: 'A great river which cometh out of the kingdom of Siam, and where this river runneth into the sea is a village called Mergui, in whose harbour there lay every year some ships with veizina, nyppa and benjamin.' James Lamarter, writing in 1592 A.D., speaks of waiting at Point de Calle for 'ships of Tenasserim, a great bay to the south of Martaban, in the kingdom of Siam'; and it is said in an account of a voyage made in 1609 that 'the Guzerat vessels came to Siam in June and July, touching by way at the Maldive Islands and then at Tenasserim, whence they go over to Siam in twenty days.'

Mergui is still the chief port of the district of the same name, and enthusiasts dream of a revival of trade which will make it the great entrepôt it once was. Tin, rubber, coconuts, salt, exotic fruits, like the durian and the mangosteen, ngapi (a fish-savoury made by

allowing the fish to rot in the sun, the odour of which is more pungent than even the durian's fetid smell), wolfram, coal, and timber are all exported from or found in this, the southernmost district of Burma, the eastern border of which is not far distant from the Penang-Bangkok railway line, while the south is bounded by the Pak-Chan River, on the left bank of which lies Renong—the headquarters of a Siamese governor.

But though a hundred years have gone by since the first occupation of Tenasserim, as in Arakan, which was also taken in the twenties of the nineteenth century, development has not proceeded so rapidly as it has in the neighbouring Straits Settlements and the Federated Malay States.

Mergui can be approached only from the sea. The few miles of road that lead out of the town end abruptly at jungle villages; no railway has yet reached the northernmost border of the district; the coastal steamers running north to Tavoy, Moulmein, and Rangoon, and south to Victoria Point and Penang, are the sole link with the outside world. For a month during the *Emden* episode it was cut off from civilisation. It is perhaps well, however, that Mergui should be reachable only by sea, for whether coming from Rangoon or Penang the traveller catches glimpses of the wonderful archipelago which created the title for the province, 'Burma and the Isles.' Nearly nine hundred of these there are, stretching from Kalagauk off the Amherst coast, south to Victoria Point. This archipelago has been well described as 'a cluster of islands and islets with bays and coves, headlands and highlands, capes and promontories, high bluffs and low shores, rocks and sands, fountain streams and cascades, mountain, plain, and precipice, unsurpassed for their wild, fantastic, and picturesque beauty.'

II.

The names of the islands are a wonder in themselves. During the night, on the way

from Rangoon to Tavoy, are passed the most northerly islands of this archipelago, which lie some twenty miles from Maungmagan, a well-known bathing resort. Amongst these are the Neats Tongue and the Cradle Islands, on the latter being found caves, where the swifts build the nests which are used for birds'-nest soup. Farther south, we come to the Southern Moskos Island, and then, after leaving the Tavoy River, is reached what is really the first of this series of 800 odd islands which form the Mergui Archipelago. This island is called Tavoy Island, because it at one time belonged to the Tavoy district. It is one of the few in the north that have any inhabitants—mainly Karens. Its local name is Mali, and round it are dotted the North Button, Edward, Campbell, and Cochin Islands; while in its neighbourhood are the Great Canister and Little Canister, and the Canister Rocks. From there the steamer passes on to island after island, and just before Mergui is reached lies the northernmost part of Kings Island, the largest island of all. Away beyond it, out at sea, is Freak Island, and near it are the rocks called North Direction and South Direction, Castle, Morgan, Ramsey, and Blundell Islands. Between Chevalier Island and the Oublié Rocks, one is not surprised to find that there is a Mermaids' Passage.

After one passes Kings Island there are so many islands that a number of them have no names at all, and the reasons for the names of most are not far to seek, namely, in their shape, or in the imagination of the discoverers, or in their love affairs. There are Polly Island, Johnny Island, Rattrap Island, Haycock Island, Saddle Island, Smart Island, Greenlaw Island, Warden Island, and Lump Rock, the Ninepins and the Turrets, the Whaleback Rock and Entrance Rock, Christmas Island and Drake's Island. Mewstone Island makes one look for the Cat and Kitten Islands, which are not far distant from the Father and Son Islands. There are the North Sister, the Middle Sister, and the South Sister, and south of them the Brothers, and far to the west the North and South Twins. There are the Amie, Rosy, Biddy, Marian, Aggie, Clara, Maria, Eliza, Jane, Charlotte, Brunette, Gerty, Alice, and Molly Islands; the Gregory, the Pickwick, and the Trinity Groups; Ruby, Iron, Silver, and Money Islands; Cooper Driver's Island and the Marble Patch. There are the Westminster Hall, the Sugar Loaf, the Saucer, the Naked Hump, the Jimmy and Pine Tree Islands. There are a Black and a Brown and a White Rock, a Red Island and a High Rock, a Blunt Island and a Steep Island, a Chimney Island and a Sloop Rock. Parson's Rock, the Warning, and the Saul Islands form a fitting trio. The Horse-shoe, the Cockscomb, the Mouse and Tucker Islands are there, and so too the Lion and the Alligator Rocks, the Dolphin Nose, the Rhinoceros Horn Peak, the

Turtle and the Pigeon Islands. The St Matthew's and St Luke's Islands, with Hastings Island, form a great harbour called Hastings Harbour, and it does not surprise one to pass by Thanks Island at the entrance to Escape Bay. Others of the largest amongst them are Sullivan's, Domal, Bentinck, Ross, Elphinstone, and Grant's Islands, and one of the biggest of all, Kisseraing, which is said to have been a great haunt of pirates.

A great number of these islands are named after men who have been famous in Indian history, such as Pitt, Elijah Impey, Campbell, Lawrence, Pollock, Malcolm, and Bernard. If the names of these Islands conjure up visions of romance long forgotten, or episodes in the history of these parts—Kings Island being so-named after Louis XIV. by the King of Siam of the time; Kisseraing, after a noted pirate who found its dense jungles a useful hiding-place; Elijah Impey, after Warren Hastings's Chief Justice—the islands themselves, once seen, remain an abiding joy to memory. Variety is here, for not only are they geologically different—the most westerly being granitic, and those nearer the mainland being composed of sandstone and conglomerate; but in shape, in size, in contour, in vegetation—in all that goes to make for vividness of outline and for beauty of effect, the mind cannot conceive of any picture to surpass their utter loveliness.

As the steamer—little more than a launch—moves through this sea of enchantment, there comes to view a great flat sand-bank, over which the tides ebb and flow, covered with gaunt serpentine roots of the mangrove tree. The next island rises perpendicularly from the sea—mounted to the sky—its slopes covered with the greenest of trees down to the utmost limit of its rocky edge. There, on the horizon, slowly becoming visible, is a tiny coral rock—an islet with five trees and 'yellow sands'—a fit playground for fairies. Next the Elephant Rocks loom into view—great strange monsters rising out of the sea like giant mammoths immersed to their thighs. Lucky is the wayfarer who spends the night under the shadow of these awe-inspiring rocks, for in one is concealed a more perfect inland lake than the most fertile of imaginations could conceive. Its entrance is out of the way—for not until the adventurer has been taken into a small cove and has passed around a projecting flange of the uprearing rock does he discover the gloomy narrow vault which leads to this wonder of nature. If it is high tide he may never see it; but if it is low, the eerie journey underground may be made by boat through a cave, multi-coloured from the living growths that spread over its walls—out into the silence of the grave. A great hollow like a crater's—perhaps a fifth of a mile round; precipitous sides—even the vegetation, grass, and shrubs, and bushes, de-

pressed at their unfortunate location; a palm tree or two curved into weird shapes, as if contorted by their struggles for freedom; the green calm of the waters—all contribute to an eerie feeling that some awful tragedy took place here in the days of long ago, and the spirits of the dead still haunt this mighty circle of gloom. Back into the sunshine again, and, to relieve the mind of its haunting sensations, over the side into the grateful coolness of the unfathomable depths. But those who visit these parts should beware of taking unnecessary risks. Sharks and swordfish there are, and not too pleasant are some of the tales that the local resident—when in garrulous mood—can tell of hairbreadth escapes and death invisible.

III.

As you journey south, hugging the coast of an island covered with trees from the topmost peak of its highest hill down to the water's edge, keep your eyes open for a Salon village or encampment. The Salons are a primitive aboriginal race that inhabit these islands. How they came there, it is possible only to surmise; but they were probably driven from the mainland by the hordes that entered from the south and east and north, and took refuge in these fastnesses of the sea. And the sea they have made their home. Their residences are their boats, which are of a type peculiar to these islands.

The following description of the way in which they are made is taken from local records: 'The stem of a tree of from eighteen to thirty feet in length is hollowed out and opened by being placed over a slow fire and gradually stretched, thwarts being inserted to keep it open. At intervals, along the two upper edges, long bamboo spikes are inserted, and on these were, as it were, impaled, one above the other, the long pithy leaf stems of a plant of the palm family, and the sides are thus increased in height by from two to three feet. The only tools employed are an adze, a cleaver, and an auger. A portion of the boat is covered by a roof of mats made of palm leaves. The sail, which is very large, is made of palm leaves sewn together edgewise; the ropes are of twisted ratan. The boats are extremely light, and, being admirably modelled, fly before the slightest breeze.'

Any buildings the Salons may erect on the shore are built on bamboo piles at the water's edge. And flimsy, small structures they are—no larger than a decent-sized hen-coop; the length of a man perhaps, four to five feet high, and nearly as broad as they are long. They are built over the water, so that access to their boats is easy; and a whole encampment can be dismantled and every resident settled in his boat within a few minutes. The Salons are wonderful swimmers and divers. It is said that they can stay as long as four or five minutes under water, but when

timed the period of immersion is generally much less than half of this. They are the chief agents for the collection of pearls, which are to be found in this region, although they are being superseded by the diver who uses modern appliances. They wear no clothes except a loin-cloth. Living on fish and rice, they eat opium, which they regard as a prophylactic against fever and chills, and as an aid to endurance.

It is only within recent years that they have been touched by the influences of civilisation, and one result has been the establishment of two or three encampments in Mergui, Victoria Point (the southernmost village of the district), and elsewhere, so that even the most casual of tourists who visits these parts can inspect these sea-gypsies at close quarters. The children are bright-eyed, but without any ideas of cleanliness, and are frequently covered with scales which give them a disagreeable appearance. Much could be, and has been, written regarding this strange people. Gradually their language, their customs, their beliefs, are becoming familiar; but it seems doubtful whether, as a race, they will long be able to withstand the encroaching influences of civilisation.

Of other interesting spots in this archipelago, the Hastings Harbour, lying westward to the sea from Victoria Point, is a *lusus nature*—one of nature's haphazard gifts to mankind—for few ports possess a more perfect anchorage than is provided by this harbour. Of vast extent, deep to the shore, having perfect entrances from all sides, completely protected from the south-west monsoon, one makes the inevitable comparison of Hastings Harbour with Rangoon, situated thirty odd miles up a narrow river, dirty and requiring constant dredging. Perhaps one day generations yet to be will describe it as the Scapa Flow of the Indian Ocean, in which India's navy may lie secure, and yet watch the approaches to the great ports of Calcutta, Chittagong, and Rangoon. It was used, it is said, by the *Emden* as a safe retreat during that warship's stay in Indian waters.

From here the return journey may be made by a different route from that by which the southward was made. Whatever way the steamer takes is bound to please, and to leave ineradicable impressions of ever-changing scenes of delight—the sun rising in a moment, as it were, over the mainland or sinking, a red orb, into a golden sea; a bluff of strange shape—trees and shrubs on a precipice, their foliage French-combed by the violence of the monsoon; coves in which the lotus-eaters might well have spent their days of happy ease; here a pearler and there a fishing village, and everywhere beauty indescribable, a haunting memory of that which will keep—

A quiet bower for us and a sleep,
Full of sweet dreams and health and quiet
breathing.

SIR ROBERT COTTON—A GREAT COLLECTOR.

By R. C. B. GARDNER.

I.

IT is probable that few visitors to the manuscript saloon at the British Museum realise how great is the debt which the nation owes to one man for the preservation to-day, in the national collection, of so many documents relating to the early history and literature of our country. This man was Sir Robert Bruce Cotton, a collector of most voracious appetite, the founder of the collection afterwards known as the Cotton Library, which passed to the nation in 1700, sixty-nine years after his death, and which can virtually claim to be the foundation of the great British Museum Library as we know it to-day.

An inspection of the MSS. exhibited in the saloon and the Grenville Library shows that as many as 11 Royal Autographs, 13 Historical Papers and Autographs, 8 Latin MSS., 10 English MSS., 6 MS. Chronicles of Scotland, 2 Biblical MSS., 12 Historical Documents and Charters, and 8 Illuminated MSS. come from the Cotton collection, and these form a very large proportion of the total number of exhibits. This high proportion of Cotton MSS. exhibited gives some idea of the great wealth of historical matter contained in the whole Cotton Library. Space will not admit of a description of more than a few of the exhibits, especially as full details of each are given in the guide published by the Museum Authorities; but as the guide contains no account of Sir Robert Cotton, or of how he came to begin his collection, it may be of interest to many to learn something of the life of this great collector.

Sir Robert, the son of Thomas and Elizabeth Cotton, was born at Denton, in Huntingdonshire, on 22nd January 1570. The family seat of the Cottons was at Connington, three miles from Denton, and the family had removed to a small house in Denton parish soon after the marriage of Thomas and Elizabeth—'in order to be more at liberty from the incommodiousness of their own seat arising from a great accession of new Domesticicks.'

The Cottons had inherited Connington from an ancestor, William Cotton, who was killed at the Battle of St Albans in 1461, and who had married Mary, daughter of Robert de Wesenham, and grand-daughter and heiress of the Bruces. The Bruces had inherited Connington from Robert de Brus, who married Isabel, daughter of David, Earl of Huntingdon, great-grandson of Waltheof, Lord of Connington, who had married Judith, niece of William the Conqueror. This brief account of Cotton's ancestry may appear to be a digression, but Sir Robert was inordinately proud of his descent from the

Scottish Kings, as will be shown later, and no account of his life is complete without a mention of his descent; for it is more than probable that the traditions which came down to him through such an ancient and royal line played no small part in turning his thoughts to collecting relics of the past, in MSS. and documents, in order that he might preserve for all posterity the written records of our race.

We know nothing of Robert Cotton's childhood until he entered Westminster School, probably about 1579, when nine years old. Here he came under the influence of William Camden, the great antiquary, who was then a master at the school, and there is no doubt but that his contact with Camden gave Cotton the first taste for antiquarian research, which would afterwards be fostered by his family traditions, as suggested above. In 1581, when eleven years old, he matriculated at Jesus College, Cambridge, taking his degree in 1585. Soon after this he settled in London, in a house in Westminster, afterwards known as Cotton House. When eighteen years of age he began to collect MSS. and charters—in fact, all old records that he could find. He became a member of the Society of Antiquaries, which had recently been founded, and of which the great Camden was a prominent and leading member. It must, one supposes, have been a compliment to young Cotton that the Society used frequently to meet at Cotton House.

Camden shortly after this started on his tour through England to Carlisle, and Cotton accompanied him, bringing back, on the conclusion of the tour, many Roman inscriptions and monuments which he had collected from near the Roman Wall. These may now be seen in the entrance hall to the library of Trinity College, Cambridge, where they were placed by Sir John Cotton, sixth Bart., in 1752.

In 1604, Robert Cotton, who had succeeded to the Connington estates on the death of his father, began to rebuild the house, and incorporated into the structure some portions of Fotheringhay Castle, which he had purchased at its demolition. Those portions removed to Connington included the entire room in which Mary, Queen of Scots, had been beheaded, and a portion of the stone cloister, or colonnade.

It was not long before this that Cotton had come under the notice of King James I., as they had many tastes in common. James knighted Cotton on 11th May 1603; and on account of his descent from the Bruces, called him 'cousin.' Thereafter Cotton signed himself 'Robert Cotton Bruceus,' and called himself 'Robert Bruce Cotton'—but lest he be accused,

in these democratic days, of snobbery, we must remember that J. G. Nicholls, in his *History of Leicestershire*—that greatest of all county histories—says he did so 'not in arrogance and ostentation, but in distinction to those of the name of Cotton of other families, and in a grateful sense of the Divine favour for that extraction, and to excite an emulation in his issue to follow the virtues of such glorious ancestors.'

Camden acknowledged Cotton's help in preparing a fifth edition of his *Britannia*, and Speed received valuable assistance from him in writing his *History of England*, which was published in 1611.

II.

Of the MSS. exhibited in the British Museum, the four earliest royal autographs are from the Cotton collection—namely, Richard I., Henry IV., Henry V., and Henry VI. The Latin and other MSS. include a Psalter, with canticles, hymns, &c., written in the eighth century, and with an Anglo-Saxon translation between the lines, thus making it the earliest extant version of the Psalms in English. Several more eighth and ninth century Latin MSS. are exhibited.

The English MSS. include the MS. of *Beowulf*, written about 1000 A.D., an epic poem in Anglo-Saxon, and the oldest poem in the English language; the *Anglo-Saxon Chronicle*, written about 1050 A.D., from which we derive most of our knowledge of our early history; the *Ancren Riwle*, thirteenth century; Layamon's *Brut*, thirteenth century; *Piers Plowman*, fourteenth century; and the only English MS. version of Sir John Mandeville's travels—late fourteenth century.

Among the MS. Chronicles of England we find a twelfth-century copy of Nennius' *Historia Britonum*; an eighth-century MS. of Bede's *Historia Ecclesiastica Gentis Anglorum*; and a twelfth-century copy of Simeon of Durham's *Historia Dunelmensis Ecclesie*. The passage of the last-mentioned which is exhibited describes the loss and recovery of a valuable copy of the Gospels during the wanderings of the monks of Lindisfarne at the time of an invasion by the Danes about 880 A.D. This identical copy of the Gospels is exhibited under the Biblical MSS., and is from the Cotton collection. The story of the loss of this book, known as the Lindisfarne Gospels, is a good example of the vicissitudes through which many of the Cotton MSS. have passed before finding a permanent and safe home in the National Collection. The book fell overboard while the monks were trying to cross to Ireland, and sank to the bottom of the sea. They returned to land, and after much lamentation on the part of the monks at such a grievous loss, it was revealed to them in a vision that they must seek for it when the tide

was low. Accordingly they went down to the sea, to find that the tide had receded several miles farther than usual, and after walking three miles, found the book, which apparently was none the worse for its immersion. Curiously, the book in question bears indications of its having at some time been soaked in water.

Among the charters exhibited is the Magna Carta, with burnt fragment of the Great Seal attached, which was found at Dover Castle by Sir Edward Dering, Governor of the Castle, and given to Sir Robert Cotton. The following letter, preserved among the Cotton MSS. (Julius, c. III. f. 191), is interesting, and one can imagine Cotton's excitement on receiving it:

Sr,—I received your very wellcome ltr whereby I find you abundant in courtesyes of all natures. I am a greate debtor to you: and those obligations likely still to be multiplied: As I confesse so much to you, so I hope to wittness itt to posterity. I have sent up two of your bookes which have much pleased me.

I have heere ye charter of K. John dat. at Running Meade: By ye first safe and sure messenger itt is yours. So are ye Saxon Charters as fast as I can copy them: but in ye meane time I will close K. John in a box and send him.

I shall much long to see you att this place, where you shall comand ye heart of your affectionate friend

and Servant,

EDWARD DERING.

DOVER CASTLE,
May 10th 1630.

The mention of the Saxon Charters suggests that possibly Dover Castle was the source whence Cotton obtained the charters which are now exhibited, and which form such a valuable part of the whole collection.

Isaac Disraeli, in his *Curiosities of Literature*, tells how Cotton once rescued a copy of Magna Carta from a tailor who was about to cut it into strips for measuring cloth, and cites Colomiès as his authority for this story.

Cotton was spared neither the criticisms of his enemies nor the jealousy of his rival collectors, for he was accused more than once of having enriched his own collection at the expense of other peoples'—purloining any books or MSS. to which he had taken a fancy. At the same time, however, he gladly lent books and, like many lenders, suffered from the non-return of those he lent. Selden is said to have kept many books borrowed from the Cotton Library.

This library, which was housed at Cotton House, Westminster, was much enriched by the private benefactions of Sir Francis Bacon, Lambard, Dee, and William Camden. The last-mentioned left to Sir Robert Cotton his great collection of heraldic and other MSS.

III.

Cotton took a prominent part in political affairs, and was several times returned to the House of Commons as a member of parliament. On account of his learning, and of the sources of historical knowledge he had in his library, he was frequently consulted by the Parliament and by individual statesmen. In 1604, Bacon interviewed him in order to learn his opinion about the Union of Scotland and England. In 1611 he was consulted by King James on the question of increasing the royal revenues, and Cotton wrote a tract—'The manner and means how the Kings of England have supported and improved their States'—and supported the proposal to create an order of Baronets. He was created a baronet among the second batch of those who received the honour.

Other important tracts written by Cotton were, 'An answer to such motives as were offered by certain Military Men to Prince Henry, inciting him to affect arms more than peace,' and 'A short view of the long life and reign of Henry the Third, King of England.'

In 1615 he was imprisoned for trying to protect Somerset, who was in the Tower on the charge of murdering Overbury. He was, however, pardoned after eight months, and released in 1616.

A feeling had for some years been growing up that it was dangerous to allow so many official and state documents to be in the collection of a private individual, and his enemies tried to prevent his having access to his own collection. He had by 1629 fallen out of favour with the Court by the publication of a tract entitled 'The Danger wherein the Kingdom now standeth, and the Remedy,' in which he had pointed out that the state was threatened by the growing power of the king, and that it was necessary for the king to put his trust in parliament; as a result of this his library was sealed up in November 1629. He was imprisoned, but although released in May 1630, on the occasion of the birth of an heir to the throne, his library was never restored to him. The loss of his library, and the six months' imprisonment, seriously affected his health. He twice petitioned the king for the restoration of his library, but in vain. His friend Sir Symonds D'Ewes described how his 'ruddy and well-coloured countenance' had been changed by grief into a 'grim, blackish paleness, near to the resemblance and hue of a dead visage.'

He survived his release from prison just a year, dying on 6th May 1631. He was buried amid great pomp at Connington, and his wife and son erected to his memory 'a fair monument,' which may be seen to-day, and on which are three coats of arms—one coat quartering 1. Cotton, 2. Bruce, 3. Earl David, 4. Waltheof, the others being Cotton singly, and Cotton impaling Brocas.

Of the great house at Connington, built by Sir Robert Cotton, little now remains beyond the stone colonnade from Fotheringhay, as it was dismantled about 1715 by Sir John Cotton, 6th Bart., who preferred to live at Stratton, in Bedfordshire. Stukeley, in his *Itinerary*, describes how, in 1722, he was travelling on the Great North Road, and 'I thought it piety,' he says, 'to turn half a mile out of the road to visit Connington, the seat of the noble Sir Robert Cotton, where he and the great Camden have often sat in council upon the antiquities of England, and where he had a choice collection of Roman inscriptions picked up from all parts of the Kingdom. I was concerned to see a stately old house of hewn stone, large and handsome, lie in dismal ruin, the deserted Lares and the Genius of the place fled; by it, a most beautiful church and tower; in the windows is fine glass, painted. A poor cottage or two seems to be the whole town once the possession of the Kings of Scotland.'

One is inclined to add *sic transit*; but though the glory of Cotton's home, inherited from the Scottish kings, has passed away, we have always with us, preserved in our National Library, treasures, historical and literary, worth many times more than their weight in gold, which will always stand as a monument to the passionate zeal for collecting possessed by this remarkable man.

Cotton's name ranks with those of Robert Harley and Thomas Bodley—and no greater honour could it have.

THE BACK END.

'HOPE springs eternal in the human breast;
Man never is, but always to be blest.'
I joy in that encouragement to hope,
Already blest by those two lines of Pope.

When we have reached the back end of the year,
And dull November's mists hang low and drear,
We think of what the coming year may bring,
And plant our bulbs to blossom in the spring.

But some there are, undisciplined to wait,
Who coming joys would fain anticipate;
They force their crocuses in autumn, and
Dame Nature's orders dare to countermand.

Well-meaning housewives, still more premature,
Roll up the carpet on the study floor,
Order the sweep, and dust the owner's books,
Putting them back where no one ever looks.

Spring-clean the house when spring is far away,
And do in autumn what is done in May.
Strive to enjoy the humours of the spring,
And show that there is 'good in every thing.'

Meanwhile the owner, looking for his books,
To find them, may be, 'in the running brooks,
Says to himself in somewhat chastened mood,
That 'better is the enemy of good.'

Better, perhaps, can never be the best,
'Man never is, but always to be blest';
Far wiser, then, to rest content with hope.
And at the back end read those lines of Pope.

C. J. BODEN.

Chambers's Journal

SEVENTH SERIES

ST OMER, 1914.

A REGIMENTAL OFFICER'S REMINISCENCES.

By Major T. A. LOWE, D.S.O., M.C.

I.

THE cathedral cities of England have had a peculiar influence upon the history of the British Army. It may be that there has always been some special analogy between a black coat and a red one (after all, the wearers of both are destined to vocations of service and self-sacrifice), or that the measured routine of the close accords in peace time, in some degree, with that of the barracks. Be the reason what it may, the fact remains that the cheerful notes of the trumpet or the bugle are often to be heard intermingled with the solemn chiming of cathedral bells. And there are few who would confess that the musical effect, especially when heard from a distance, is unpleasing to the ear; like the baying of fox-hounds or the merry click of polo balls, it is a music peculiar to the English.

Perhaps, then, there was a certain pleasurable familiarity about the atmosphere of St Omer during the last few days of October 1914, when the writer's regiment, tattered and exhausted, arrived there from the trenches. Rest and re-organisation was the proposed programme; and in the autumn sunlight the khaki figures moving about the cobbled courtyard of the French infantry barracks seemed to harmonise wonderfully with the cassock-clad priests and novices, who were to be seen everywhere hurrying to their devotions.

A description of the cathedral city of St Omer would be superfluous to the majority of readers of this journal. Everybody who served in France and Flanders during the Great War must at some time have seen it. Like all cathedral cities, it had its virtues and its vices, each carefully hidden from the other, and each—as in England—claiming vigorously the attention of that neutral population to which soldiers perforce must always belong. To the wearers of the red coat alone is it given to be truly catholic.

In the early days of the war life at St Omer meant one of two things: strenuous work of the most exacting kind at G.H.Q., or a space of rest and quiet if one happened to be a

regimental officer fortunate enough to find himself there in the feverish intervals of trench and battle fighting. St Omer had pavements upon which one could walk jauntily after the restricted paddling in muddy thoroughfares; there were brightly-lit shops in which goods from England could be purchased; there were cafés where excellent food and drink could be obtained. In fact, during those critical days of war there were many worse places in which a man might find himself.

When G.H.Q. of the British Expeditionary Force arrived in St Omer, I believe that the majority of the staff and personnel were able to accommodate themselves in about two streets. The huge proportions to which the establishment grew in later stages of the war were then undreamed of, and Lord French's headquarters were still what might be termed a mobile unit. There were no troops, with the exception of a handful of orderlies and servants, and the arrival of a battalion (even though a weak and exhausted one) was in the nature of an event.

But even at that time, so good was the organisation of the British Army as compared with other European armies, new clothes and equipment were quickly forthcoming. Messes for officers and sergeants appeared from nowhere, and soon the normal life of a regiment began—normal, that is, so far as the phenomenal rush of duties which fell to its lot to carry out could be so termed. It is of those duties that I wish to write, because, from a regimental officer's point of view, I believe they may be claimed as exceptional.

II.

The strength of the battalion was about two hundred, and, needless to say, the proportion of officers was a very small one; so small, indeed, that guard duties for a subaltern were matters of daily occurrence. There was the Commander-in-Chief's guard in the Rue Saint Bertin—an examining post guard, split into about six small detachments, stationed at the main entrances to the city; a German prisoners' guard at the old convent; and numerous minor duties which I cannot now remember, except, of course, that of orderly officer, which was the most unpleasant

of the lot, by reason of the fact that the individual detailed for duty was confined to an almost empty barracks.

St Omer was full of spies, and for that reason alone it was necessary to examine every individual entering or leaving the city, a most exacting task, but one which had the advantage of giving officers a working knowledge of the language. The orders for the sentries on duty at these examining posts by night were so numerous that it was practically impossible to get the men to learn them efficiently. Certain persons were allowed to pass on the production of papers, and certain other persons were to be detained. As the details fluctuated daily, and private soldiers were seldom at the same posts for two days consecutively, there was always a certain amount of mental fog apparent when questions were asked by visiting rounds. I remember asking one sentry what his duties were on the approach of a civilian, and being greeted with a recitation to the effect that he was to 'stop all midwives in the execution of their duty.' What he really meant, of course, was that doctors and midwives engaged upon work in outlying suburbs were to be allowed to pass on the production of certain papers. But then, we were an Irish regiment (one, alas! which has now passed from the pages of the Army List), and what Irish sentry, especially of that gallant illiterate type which so quickly became extinct in the early stages of the war, could be expected to remember such detail?

On looking back it seems hard to imagine what possible use such examining posts as these could have been in the military sense, but it can only be supposed that they served some purpose, and that spies without an intimate knowledge of the country were deterred from endeavours to enter the sacred precincts of St Omer. None seemed to be caught by the sentries, and only on one occasion did I see shooting taking place, and that was at an unfortunate citizen who had had the bad luck to shut himself out of his own back door. In order to try to get in by the front door, of which he had the latch-key, he worked his way round the gardens, and approached the post in the main street. His movements, striking the sentry as suspicious, were greeted by rapid fire, and the poor wretch only escaped annihilation owing to the excitement of the sentry, which caused him to aim wildly. I have since often wondered what the emotions of that poor old Frenchman must have been as he lay on the footpath, latch-key in hand, in front of his own hall-door, and listened to the bullets of his Allies ricochetting over him.

The German prisoners' guard at the convent was an interesting duty for a subaltern officer who had lately met his enemies under less comfortable conditions. Most of the prisoners stayed only a few days, during which time they were

interviewed by one of the few Intelligence officers which the British Army possessed. The majority of the prisoners that I saw had come in straight from the Menin Road fighting, and belonged either to the Prussian Guard or to some of the crack Bavarian regiments. They behaved quietly, obeyed orders implicitly, and saluted British officers when walking about the courtyard in a manner which would have brought tears of joy to the eyes of a drill-sergeant in the Chelsea Drill School at a much later stage of the war.

One batch in particular impressed me very much at the time. It consisted of two officers, and eighty-three other ranks, who had been captured by our own brigade of Guards somewhere about Ypres, in that colossal struggle between the finest regular soldiers of the two empires. Both the German officers spoke English (one of them had been to Cambridge as an undergraduate), and, as it fell to my lot to visit them frequently, it was interesting to hear of the latest fighting at first hand. That they were completely dumbfounded over their own defeat was the main fact which emerged, and their descriptions of the devastating rapid fire by which the majority of their comrades had been annihilated were cheering, to say the least of it. Perhaps I showed my jubilation too apparently; anyhow, I was politely rebuked by the Cambridge 'Boche' with the remark that the British Army's valour was but the 'valour of ignorance,' and that although it was to be admired as such, the laugh would shortly be with the Germans, who could not possibly be stopped much longer, by the handful of British troops which remained. Subsequently, at various times, I had cause to remember those words, because it certainly seemed that only by the 'valour of ignorance' was the defence of that extraordinary Ypres salient maintained. However, at the time, my Prussian prisoners seemed glad enough to be alive, and gave me no trouble.

One curious and amusing incident occurred in relation to those German prisoners, which, if it illustrates nothing else, illustrates the fact that between regular officers of any nation there must be a sort of unconscious freemasonry. A somewhat bumptious and very badly-turned-out British officer arrived from England, with orders to escort the prisoners to a concentration camp there. Who he was or what he was I do not know, except that it was apparent to all beholders that he was not a regular British officer. In appearance he was like a promoted warder of a gaol, and I must say he acted accordingly, for he was exceedingly rough in his manner, not only with the Germans, but with me. He asked me in a loud voice how many Germans there were, to which I replied, 'About eighty.'

'Don't you know how many prisoners you have?' he shouted.

'Eighty-five,' I hazarded at a guess. (There

had been no papers handed over with them, and, so far as I knew, no one had ever bothered to count them.)

One of the German officers came to the rescue by shouting an order in a loud voice, at which all the 'other ranks' doubled out into the courtyard, and fell in very smartly in two ranks.

The German subaltern stood beside me.

'Number!' he yelled.

They numbered in German like lightning, and when they came to an end, the officer saluted me smartly, and said, 'Eighty-five, sir.'

As a matter of fact there were only eighty-three, but the young German guardsman was determined not to let me down. The thing had been done so quickly that my opposite number from England had no other course but to take them over and cease his idiotic behaviour. I almost loved that Boche.

Spies as well as prisoners of war were confined in that convent, and several of them were sentenced to death, and executed within a few hours. The executions were carried out by firing-parties, and I must confess that there are few less pleasant jobs than shooting a man in cold blood in the early hours of the morning, even if he happens to be a convicted spy. The men of the firing-party were usually issued with a strong ration of rum beforehand, and, proved old soldiers though most of them were, they needed it.

III.

The Commander-in-Chief's guard was by far the most pleasant duty that fell to the lot of a subaltern officer during that extraordinary time. This guard, which consisted of an officer, two sergeants, and twelve privates, was quartered in the Rue Saint Bertin, behind the house occupied there for so many months by Lord French. Nothing could have been nicer than the way the comfort of all concerned was seen to by the A.D.C. detailed for the purpose. The officer was allotted a room in an adjoining house, and upon many occasions he was bidden to dinner at the Commander-in-Chief's table; the sergeants were allowed to forgather with the private detectives, who had a small mess of their own, while the men were continually supplied with extra food from the kitchen. It was the plum of all the duties which existed at St Omer at that time, and, fortunately, owing to the shortage of subalterns, one's turn on the roster arrived fairly quickly. But there were greater joys to come.

Early in November 1914 the King paid his first visit to his armies in France. Colossal as the importance of such an event was to the empire, it may be imagined that its influence upon the tiny force at St Omer was electrical in intensity. To greet his Majesty a guard of honour was requisitioned.

Of the composition of that guard of honour perhaps the less said the better. It was made

up mainly from cooks, clerks, and servants, the majority of whom were better accustomed to other implements than the rifle. Little time was given for ceremonial beforehand, yet the amazing fact remains that the King was received outside Lord French's residence by a guard which caused him considerable pleasure. As he moved through the ranks not a man stirred under arms, while the inhabitants of St Omer were completely awestricken by the precision with which the various movements were carried out. The band, unfortunately, had been annihilated at Mons, otherwise the parade would have been complete.

If the duties at G.H.Q. had been interesting before, the advent of the King made them doubly so. St Omer became the centre of activity for Europe. Not only did the Germans maintain their ceaseless efforts to obtain the Channel ports, but a large number of influential people from the Allied nations came to visit the King and consult with him. The first to arrive was President Poincaré, for whom the guard of honour was again turned out. He had had a long journey in a motor-car, and perhaps he was tired. Anyhow, he inspected the guard, clad in a blue overcoat and an extraordinary head-dress of knitted wool, which exactly resembled the old-fashioned night-cap beloved of our grandfathers. I fear the guard was not so steady under arms as upon the previous occasion, because all ranks were consumed with inward laughter (remember, they were Irish, and that, whatever his faults, the Irish soldier was always endowed with a priceless sense of humour), and for this reason the drill was a bit shaky. But the President seemed pleased—so much so, in fact, that he sent a staff-officer to ascertain the names of the officers of the guard. 'For the Légion d'Honneur, messieurs,' he informed us—awards which, though they cost us many drinks in the mess to celebrate, never materialised.

And perhaps it was as well that decorations for such very pleasant war duties did not materialise, or we should have been covered with ribbons in which, in the light of hard service, there would have been small pleasure; for that same guard of honour turned out to greet many world-renowned personages, and upon every occasion did a staff-officer of the nation concerned take the names of the officers on duty, always with the same assurance that a decoration of untold value would surely follow. What the business cost me in drinks I dare not record.

IV.

Much has been written about the Prince of Wales in France, and much more might be written, because it is a good thing that the empire should know of what sterling stuff her future emperor is made. Suffice it here to state that it was the writer's privilege to meet him on several occasions during that momentous visit to

St Omer. He arrived at G.H.Q. wearing but one star upon the otherwise unadorned khaki uniform of a Grenadier Guardsman, and the moral effect of his presence in the B.E.F. was nothing short of tremendous, particularly with his fellow-subalterns. Scarcely a day passed that he was not in the line somewhere, and the number of narrow squeaks he had from bursting shells and short-distance bullets was proverbial. At that time he lived at St Omer, but the Rue Saint Bertin saw little of him. Occasionally he would dine at the Café Vincent—always a cheering proceeding—and mix with his brother officers with that unconscious cordiality which endeared him to the whole Army. The Great War has often been called a 'subalterns' war,' and the term is an apt one, for the Prince set an example of gallantry and obedience to duty at the beginning, which was maintained by subalterns to the end.

Apart from the guard of honour to greet him, there were no special guards detailed for the protection of the King during his stay at St Omer. He would have none, so the small extra duty of providing a sentry over his quarters fell to the lot of the Commander-in-Chief's guard, about which I have already written. But one incident ought to be chronicled, purely as a matter of history, as it throws amazing light upon the democracy and good-fellowship which prevailed then, and always will prevail, in the Army. The King, as everybody knows, is an early riser. One morning the writer was visiting sentries, being officer in charge of the Commander-in-Chief's guard, when his Majesty walked out of the front door of his billet. 'Good morning,' he said cheerfully; 'can you find Prince Arthur of Connaught, please?' The time was 7.30 a.m., and, needless to say, the writer flew upon the errand, although the exact locality of Prince Arthur's billet was an unknown quantity. However, a friendly batman, carrying field-boots, directed the way to a bedroom, and presently a long figure asleep in a bed was being violently shaken.

'Are you Prince Arthur?' I asked, still shaking.

'No. I'm Robertson. Try the room above.'

The shock at having so roughly disturbed the Adjutant-General (I think that was his appointment at the time), was a great one, but, with unnecessary apologies, I crept upstairs to the room directed. Prince Arthur was in bed, and his clothes, covered with mud—for he had been in the line during the night—were lying about. I shook him quite as heartily as I had shaken Sir William Robertson. 'The King wants you,' I said.

Seldom have I seen an officer dress more quickly. He went off in his muddy clothes, too; but then, in those days mud was rather a distinction.

There is another event which happened during this time of which I must write, though it is a

sad one. One morning I was awakened in the small hours by the adjutant, who said, 'You are to take an N.C.O. and six men to report to Colonel So-and-So at G.H.Q.'

Somewhat heavy with sleep, I aroused my command and departed, to be met in the Rue Saint Bertin by a white-faced staff-officer.

'Are you the guard for Lord Roberts?' he asked.

'I expect so,' I answered. 'Where is he?'

'He is dead,' came the answer.

All traces of sleepiness vanished. Lord Roberts dead! Impossible!

Up the narrow stairs I followed the staff-officer, and into a tiny bedroom. On the bed lay the dead field-marshal. Silently a sentry was posted outside the bedroom door, and another at the hall-door in the street. Then a great grief overcame me, and I sat down on the stairs and sobbed like a child. The hero of one's generation had passed, and though the end was a fitting one, the loss was poignant and personal.

And thus, within a very few weeks, the mark of history was left upon the ancient cathedral city of St Omer. In the years that followed, millions of British soldiers either passed through or made a temporary home there, and even in the days of continual air-raids the inhabitants maintained a loyalty and hospitality to the British which was refreshing, to say the least of it. Doubtless there were profiteers and faithless ones among them, but if so they were not apparent to the casual visitor, while to the individual who was fortunate enough to dwell there for a space, the true sentiment of a great entente was the prevailing atmosphere.

There are no khaki figures to be seen strolling in the cobbled streets of St Omer now, but the bells still toll in the cathedral tower, and bugles from the French infantry barracks may be heard at the changing of the guard. The comradeship of France and Britain in 1914 still lives in countless hearts.

DECEMBER.

ONE rare, red rose in my garden grows,
Not doomed to die,
One flamelit flower, though December snows
In the garden lie.

On a blackened bough in my garden bare,
With fluttering wings,
A song for the lone one lingering there
A linnet sings.

Like a single ray in a shuttered room,
One bright star glows
On the bird and the bloom in the dusk and
the gloom
Of my garden-close.

Red rose, lone linnet, and steadfast star
Their vigil keep
In the heart that fain would follow her
To the fields of sleep.

WILLIAM DOUGLAS.

THE SHOP.

By OSWALD DALLAS

PART I.

I.

THERE was nothing flamboyant about the establishment. It stood at the corner of the junction of the two village streets, with a window facing each, the windows overshadowed by the projecting upper part of the building, black timbered and bearing the date 1723. The proprietor, Mr Thomas Smith, lived above the shop.

In the windows was displayed every description of merchandise required in a country neighbourhood—loaves of bread, packets of flour, tubs of margarine, note-paper and envelopes, and suits at forty-seven shillings and sixpence. It is marvellous how much money can be made out of a village store. Mr Smith had been in business there for five-and-twenty years, and had done well; so well that he could have retired and lived in comfort for the remainder of his days. But he had no thought of retiring; he had no grandiose ideas, and the life suited him. He was in perfect health, a hale, stout man of sixty, who had been a widower for nearly twenty years.

Apart from his shop, his only interest was his daughter. Pleasant Smith was a pretty girl of twenty-two, whom he regarded with a species of adoration. For his Pleasant nothing was too good, and he had spent much money on her. From the age of fourteen she had been at a first-class ladies' school, from which she had gone to Girton. It was when going to Girton that her views on her social position underwent a change, though the change had been simmering in her mind for some time before that. She decided that any connection with trade was something to be ashamed of, and that the name of Smith was plebeian. Thenceforth she called herself Bertram-Smythe, Bertram having been the maiden name of her mother. It was her cross that her father continued to address his letters to her in the name of Smith.

For a long time after going to Girton, Pleasant had seemed to be perfectly happy, but latterly, on coming home for her vacations, she had shown a certain amount of dissatisfaction with her surroundings, evinced, however, more in her manner than in her words. Her last two vacations she had elected to spend with college friends at Folkestone. This hurt her father, though he offered no objection.

It was when Pleasant finally left Girton that the crisis took place. She had expressed no desire for a career, and Mr Smith expected that she would settle down, and that the two would go on living together at Poundshurst. If the

thought ever occurred to him that his daughter would marry, he drove it away.

They were having tea in the afternoon following her arrival home when Mr Smith realised that something was wrong. For some time Pleasant had been very quiet, and sat playing with her teaspoon.

'What's the matter, dear?' asked her father. 'Aren't you well?'

'Oh yes,' returned Pleasant, 'I am well enough.'

Then an awful suspicion jumped to the mind of Mr Smith. 'Aren't—aren't you pleased to be at home?'

His daughter evaded the question. 'How long are you going to stay in Poundshurst, father?' she asked, looking down at her cup.

The old man regarded her in amazement. 'Stay in Poundshurst!' he exclaimed. 'Bless my soul! where should I go?'

'Go? Go anywhere from here. It is deadly.'

Mr Smith had never had such a shock since his wife died. It left him gasping as if he had received a douche of icy water. 'Away from here—away from Poundshurst! How—how could I leave the shop?'

'You could give it up,' replied Pleasant, still looking down at her cup.

'Give it up—give—give up the shop!' gasped Mr Smith. 'Good Heavens! what should I do then?'

'Enjoy yourself as other people do. You could well afford to retire now.'

'But I don't want to retire. Why should I retire? I am not such an old man.'

'You might think of me, dad,' said his daughter, a trifle sullenly.

'Think of you! Why, I am always thinking of you. Have I not done everything I possibly could to make you happy? I worked hard, always thinking of you. You'll be pretty well off when I die—not that I mean to die yet awhile.'

'I don't want you to die; you know I don't want that, father. But I don't wish to be buried in this dead-and-alive place all my life, and it looks as if it would come to that.'

'Nonsense, my dear. You may get married one of these days.' Mr Smith sighed as he spoke.

'Married? Here? Who is there to marry? What chance have I in a place like this?' Pleasant spoke hotly, with a gulp in her throat. 'And—and if there was any one who—who cared for me, do you think that he could come to see me here?'

'Eh? Why not? I brought your mother here, and we were very happy.'

'Oh, father,' broke out the girl desperately, 'won't you understand? Can't you understand?'

'I am trying to understand, my girl,' returned the old man, with a sigh. 'You would like some of your friends to come and see you, but—but the place is not good enough, eh? And you are just a little ashamed of the old dad? That's it, isn't it?'

'The—the shop, dad?'

'I see,' returned Mr Smith sadly. 'It is the shop. You have grown too grand for it. Perhaps you have grown too grand for your old dad too.'

'Father,' said the girl, 'you know that is not the case, but—'

'Just so. What was good enough for your mother and me, what has enabled me to educate you and make you what you are, is not good enough for you. You may be right; you may be right. I should have foreseen what would come when I sent you to that high-class school.' He sighed drearily. 'Well, I have never denied you anything yet, and maybe it is too late to start now.' Suddenly he looked at her sharply. 'Is—there any one, eh?—is there any one—?'

The girl fumbled with her teacup and reddened a little. 'Ye-es,' she answered in a whisper.

'Ah! And you never let me know,' said her father reproachfully.

'There was nothing to tell you, dad. He hasn't asked me. It—it was just—beginning. But I think he likes me, and I like him. But what does it matter?'

'Who is he?' asked Mr Smith, his voice softening.

'A gentleman—that's why——' She stopped and, bending over the table, burst into tears.

Mr Smith nodded slowly. It was the shop. Pleasant had been mixing with people of a higher social standing than herself, and had met this man. He could see the whole thing; and if anybody was at fault it was himself. But, though only a country shopkeeper, he had money, and his daughter was a lady, by education at least. To give up the shop where he had spent so many years would be a wrench, but Pleasant's happiness was of more consequence than that. 'Where would you like to go if we left here?' he asked.

His daughter looked up, the tears shining on her eye-lashes. 'Couldn't—couldn't we take a house at Folkestone, dad?'

'He is there, eh?' said her father, with a dreary smile.

Pleasant nodded.

II.

Mr John Wetherall had his office in one of the principal streets of Folkestone, where he carried on the business of auctioneer and estate agent. One forenoon he was seated at his desk drawing up an advertisement, when a young

man entered. The young man was tall, good-looking, and smartly dressed.

'Busy, Jack?' he asked.

'Rather,' returned Wetherall. 'Sit down.'

He went on with what he was doing; the two men had been brother officers, and were on sufficiently friendly terms to render formalities unnecessary. The visitor seated himself, lit a cigarette, and threw one knee over the other.

It is something to be said in favour of this democratic age that, given the ability, there is practically no limit to the height to which a man may rise. Jem Mason, who had been assisting in his father's grocer's shop in Reading, joined up when the call came, achieved the rank of lieutenant, and would probably have risen higher but for having stopped a fragment of shell, which resulted in his being invalided out of the army. Whilst he was on service his father died, the business passed into other hands, and Jem inherited a legacy of £1500.

It is a defect in the arrangement of things that neither the government nor private employers are disposed to find positions for demobilised officers commensurate with their rank in the army. To Jem Mason the return to the back of a counter held out no allurements, and to his previous connection with one he never referred. Having held the king's commission, he looked upon himself as a 'gentleman,' whatever that may mean, and had no idea of accepting a post which would lower his social status. Wherefore, he lived in a cheap boarding-house, existing on his wound pension, his gratuity, and the interest from his legacy, and passed as a man of leisure.

Presently Wetherall stretched himself with a sigh of satisfaction, and glanced at his friend. 'What's the matter, Jem?' he asked. 'You look hipped.'

Mason nodded gloomily. 'Everything is rotten,' he said.

'Ah,' returned Wetherall, smiling, 'the world is out of joint since a certain young lady left.'

Mason shrugged his shoulders with assumed indifference. 'I know to whom you are referring,' he said gruffly, 'but her going or staying has nothing to do with me.'

'Really? I fancy that the young lady had a different idea. You kept pretty close to her skirts all the time that she was here. I suppose one won't see you quite so often at the tennis courts now.'

'Don't talk rubbish. You know dashed well that I can't afford to marry. If I had been a plutocrat like you——'

'What I have, I have to work for, my son,' interrupted Wetherall drily. 'You might do the same.'

'I might, if I had the chance, but chances don't come in my way.'

'Nor to other people much. You've got to make 'em, same as I have had to do.'

Mason puffed moodily at his cigarette.

'The matter with you, Jem,' went on Wetherall, 'is that your ideas are a bit too high-flown. You want a nice easy position where the shekels would roll in without any exertion on your part.'

'But I work,' protested Mason. 'I was at work all yesterday.'

'Were you?' said Wetherall sceptically. 'Doing what?'

'I was at work on a picture.'

Wetherall laughed outright. 'Good Lord!' he exclaimed. 'A picture! Will you be able to sell it?'

'I don't know,' returned Mason gloomily. 'Of course, I know that art doesn't appeal to you—'

'It doesn't; that is, as a means of earning a living,' said Wetherall. 'A pleasant way of passing the time, I suppose, but there are dashed few of us who can do just what we should like to do. Still, to a chap who is willing to take up what comes along, life is full of opportunities. For instance, here is a devilish good chance for some one with *nous* enough to take it up.'

'What is that?'

'A flourishing business for sale. I have just been drawing up the advertisement.'

Mason yawned, stretched himself, and lit another cigarette. 'What sort of a business?' he asked, indifferently.

'A general store.'

'A—a what?'

'A general store in the country. Present proprietor giving up business. Made his fortune and retiring. A splendid opportunity for some one. It will go cheap.'

'A general store,' said Mason, with a fine assumption of ignorance. 'Do you mean a shop?'

'Precisely, old son; a shop which supplies all sorts of things to the nobility and gentry in the neighbourhood. *Vide* advertisement.'

'Great Scott, Wetherall! Are you suggesting that I should go behind the bally counter with an apron on and serve out treacle and candles?'

'I was not suggesting anything of the kind. I merely observed that here was a chance for some man of an enterprising character. If the old chap has made a fortune out of it, there is no reason why another man shouldn't.'

'But, hang it all! what do I know about shopkeeping?'

'Oh, I wasn't thinking of you. I was thinking of some chap with brains and energy that would be willing to knuckle down and work.'

'Meaning that I haven't the brains or the energy.'

'I have told you already that I wasn't thinking of you. You are an artist with a soul above all that sort of thing. It is a pity that you can't sell your pictures.'

Jem sat upright in his chair and threw his

cigarette into the fire. 'Where is this bally place you are speaking about?' he asked.

The question took the other by surprise. Never for an instant had he supposed that Mason would consider the thing seriously—Mason with his great ideas of what was a suitable occupation for a gentleman.

'At a place called Poundshurst,' Wetherall answered. 'Very beautiful country,' he went on, grinning. 'You could paint no end of fine pictures on Sundays and early closing days.'

Mason pondered for a while. 'I have a dashed good mind to go and have a look at the place,' he said. 'After all, what would it matter? It is right in the country, and nobody would know who I was. What is wanted for the business?'

'Not nearly so much as it is worth, seeing that there is no opposition. Twelve hundred pounds will buy lock, stock, and barrel.'

'Thanks. I'll run over to Poundshurst to-morrow.'

'Are you really serious about this?' asked Wetherall in amazement.

'Quite serious.'

'But you know nothing about the business.'

'I'll learn,' replied Jem Mason.

'Well, if you are really serious, I'll hold over the advertisement.'

(Continued on page 813.)

EXTRACT FROM AN OLD DIARY: WINTER.

SHRILL sighs the wind amang the boughs,
Wi' mony a plaintive wail;
Across the lift there darklin' rows
The blindin' sleet and hail;
Baith man and beast fae labour rest,
The cot and sta' within,
And ever fae the lowerin' east,
The nicht comes creepin' in.

Adoon yon howe the burnie roars,
Fu' drumly to the sea,
Chiding wi' wrath its teeming shores,
Sae anxious to be free;
Nae mair the harebell wags its crest
Abeen the restless tide;
Nae birdie carols by the nest,
Her partner at her side.

O, dreich and drear an' waefu' sad,
The sullen landscape seems.
O that the sun wad mak' it glad
Wi' his warm, cheering beams;
Come, simmer, wi' thy flow'ry breath,
And fling thy mantle wide
Ower bush and tree, ower linn and lea,
Ower ilka dark hillside.

Come as remorseless victor comes
Before the ranks o' war;
Sweep unrelenting winter forth,
And break his icy car.
Then ance again to greet the morn,
The laverock sall soar;
Ance mair the fields o' gowden corn
Sall yield their mellow store.

H. D. GAULD.

JEANIE DEANS'S DUKE OF ARGYLL

By J. A. LOVAT-FRASER

I.

OF all the historical personages that figure in Sir Walter Scott's novels, there is no one described with a more vivid and effective pen than John, Duke of Argyll and Greenwich, in *The Heart of Midlothian*. He was a man after Scott's own heart. He had faults and failings, but Scott does not speak of them. It is his intense patriotism, his eloquence, his high spirit, his charm of manner, his debonair gaiety, that are impressed upon the reader. It was one of Scott's projects in later life to write a biography of the duke, but, like other projects of his active and fertile intellect, it never materialised. The only biography of the duke is one published in 1745 by Robert Campbell, a political writer under Walpole's administration, and uncle of Thomas Campbell, the poet, which, though not without interest, is inadequate.

The duke belonged to a type of which there was more than one instance in the eighteenth century. On the one hand he was a politician fishing in the troubled waters of British politics at St James's, a frequent speaker in the House of Lords, steering his course among the cross-currents of political intrigue, a man of fashion in a periwig and a laced coat, who was extremely popular at the tea-tables and in the coffee-houses of London. On the other hand, he was a Highland chief, descended from Cailean Mòr, who lies in the kirkyard of Kilchrenan, among the heather-covered moors above Loch Awe. He ruled over a principality which stretched up the west of Scotland, a land of mossy moors and sky-blue lochans, of forests of fir-trees and thatched cottages, odorous with the smell of peat fires. Throughout his domain his word was law, and loyalty to him the whole basis of life. To his clansmen in the clachans of Argyllshire and Dumbartonshire he was 'Iain Ruadh nan Cath,' Red John of the Battles. He could put a great army of Campbell vassals in the field, gentlemen cadets of the ducal house, Loch Fyne-side lairds, pennyland men from Loch Awe, whose badge was the myrtle, and whose slogan was 'Cruachan.' In 1715 the Campbells could bring more than 4000 claymores into the field of battle.

II.

The duke was born in 1678 at Ham House, near Richmond. His father, the first duke, was not a person to be proud of, and his mother was a woman of violent temper, with whom he was sometimes on bad terms. At the age of twenty-three he followed an example set by a number of the nobles of that time, and went for

a wife into the city of London, which had become greatly enriched by the war with France. He married Mary Browne, the niece of a Lord Mayor, for her money, and was, as all men who marry for money deserve to be, very unhappy in his marriage, and soon separated from his wife.

In 1705 Argyll became Lord High Commissioner, and strongly recommended the union of Scotland with England. He had a difficult body to manage in the Scottish Parliament, which was slack and inefficient. 'I have always observed,' said Lockhart, the Scottish Jacobite M.P., 'if anything for the country's interest was to be attempted in a Scots Parliament, it must be in the beginning of the session; for in a little time the zeal and fervour of the members go off, they become weary with attendance, and steal home to their country houses.' Argyll managed his part with singular ability, and excited surprise by the strength and firmness which he showed in spite of his youth.

The opponents of the Union demanded that there should be an appeal to the constituencies before the Scottish Parliament agreed to the measure. Argyll strongly opposed this, insisting that the Scottish Parliament had always despatched the weightiest affairs of the nation without going through that formality. They had, he said, declared King James to have forfeited his crown, and had expelled the Bishops, who were one of the Estates of Parliament, without consulting the constituencies. He stated that, by the oath of Parliament, members were bound to act according to their consciences and judgment, even if contrary to the orders of their constituents. It was hard, none the less, that, in a matter so important as the loss of its independence, the nation should not have been allowed to have a say.

Argyll played an active part in those wars of Marlborough so well described by Thackeray in *Esmond*. He was present at the battles of Ramillies, Oudenarde, and Malplaquet, in all of which he showed extraordinary bravery and resolution. On several critical occasions he distinguished himself by his signal valour. Argyll, however, like Esmond, 'never could be made to love the Duke of Marlborough.' It is probable that Marlborough, who, like Napoleon and Wellington, did not care to encourage men who might become rivals, was jealous of Argyll, whose headstrong valour and bonhomie made him very popular. Argyll, who was a very proud man, would resent the jealous attitude of the parvenu duke.

III.

Argyll was all his life a very active politician. It would be tedious, however, to describe the political side of his career, and it is not the intention of the present writer to do so. His life was unusually full of ups and downs and of the changes and chances of party warfare. He was constantly changing sides, and repeatedly opposed measures he had supported, and supported measures he had opposed. He helped to carry the Union, and then tried to repeal it. He supported a standing army, and opposed it. He dallied with the Jacobites, and was bitterly hostile to them. He was successively a good friend and a bad enemy to the same men. He was the warm supporter and advocate of Sir Robert Walpole and the Court at one time, and their bitter foe at another. His ill-wishers constantly denounced him as

Restless, unfix'd in principles and place,
In power displeased, impatient of disgrace.

Disraeli, who had soaked himself in the history of those times, and was well versed in it, said that Argyll was largely responsible for thwarting the desire of Bolingbroke and the Tory ministry to bring in James Stuart as king at the death of Queen Anne. He and the Duke of Somerset, according to Disraeli, attended the Privy Council without being summoned, while Queen Anne was lying in a state almost of lethargy, and absolutely forced the queen to appoint the Whig Duke of Shrewsbury as Lord Treasurer. 'This,' said Disraeli, 'is one of the most dramatic scenes in our political history; the unexpected arrival of the two dukes, the queen's desperate state, Bolingbroke's baffled hopes, the troops summoned to London, the heralds kept in waiting with a company of guards to proclaim the new king the moment the throne was vacant.' The appointment of the Whig Shrewsbury meant the ruin of the Tory ministry. The accuracy of this dramatic story has, however, been impugned, and it is pretty clear that Shrewsbury was appointed through the instrumentality of the Tory ministers themselves.

In 1715 the Earl of Mar, who had been a member of the ministry which fell at the accession of George I., raised the standard of revolt at Braemar as a supporter of Prince James Stuart. Argyll was appointed to oppose in the field a rival who had often thwarted him in the closet. The principal event of the Rising was the battle of Sheriffmuir. The left force of each army gave way, leaving the right wing victorious, which gave rise to several humorous ballads. One of them is quoted by Lady Mary, the duke's daughter, in the scene in *The Heart of Midlothian* in which the duke presents Jeanie Deans to the duchess:

'Some say that we wan, and some say that they wan,
And some say that nane wan at a', man,
But of ae thing I'm sure, that on Sheriffmuir,
A battle there was that I saw, man.'

The duke was blamed for his dilatoriness in bringing the campaign to an end, and General Cadogan was sent, nominally to assist, really to spur him on. Cadogan's activity and zeal were strongly contrasted with 'the temporising and lukewarm conduct' of the duke. The probable truth is that Argyll, being himself a Highland chief, had no desire to carry fire and sword through the mountains. He was quite incapable of playing the part that Cumberland afterwards did. He did not, like 'The Butcher,' poison the memory of the Highlanders with hate and bitterness. He took an active part, in fact, in mitigating the sufferings of the Jacobite prisoners, and is said to have opposed the Highlanders being brought to Carlisle for trial.

IV.

In 1717 Argyll married his second wife, the duchess who figures in *The Heart of Midlothian*. She was Miss Jane Warburton of Cheshire, and had been maid of honour to Queen Anne. It is said that she was plain, ignorant, and lacking in breeding, and that her language and manners were coarse and rustic. Argyll, however, became infatuated with her, and, as soon as his first wife died, he married her. He remained devotedly attached to her in spite of her shortcomings. 'To say that he proved an excellent husband,' said his great-niece, Lady Louisa Stuart, 'would be speaking poorly. He remained throughout life a faithful, doating, adoring lover. My mother told me she had often seen him stop on entering the room, stand a moment or two gazing at the duchess as at the loveliest object on earth, then come forward and clasp her fondly to his bosom, upon which she never failed to look round and cry, "Do you see, you young folks? On such a day we shall have been married so many years. Will your husbands' love last as long, think ye?"'

In 1736 Argyll came prominently before the world in connection with the Porteous Riots in Edinburgh, which are so vividly described in *The Heart of Midlothian*. Captain John Porteous, the commander of the City Guard, had been greatly enraged by the conduct of the mob at the execution of a smuggler, and had, it was alleged, ordered his troops to fire amongst them, with the result that six or seven of the crowd were killed. He was tried and condemned to death, and the mob, which was most hostile to him, was looking forward with exultation to his execution, when, at the last moment, a respite arrived. The mob refused to be deprived of its vengeance, and, breaking into the Tolbooth Prison—the 'Heart of Mid-

lothian,' as it was called—where Porteous was confined, seized him and hanged him in the Grassmarket.

Immense indignation was excited in government circles in London by the conduct of the Edinburgh mob. Queen Caroline, who was acting as regent in the absence of George II. on the Continent, and the Council of Regency were extremely angry at what they regarded as contempt of their authority. An anecdote, quoted by Scott, alleges that the queen, in the height of her displeasure, told Argyll that sooner than submit to such an insult, she would make Scotland a hunting field. 'In that case, madam,' said Argyll, 'I will take leave of your Majesty, and go down to my own country to get my hounds ready.'

A penal bill was introduced which proposed to inflict various indignities on the city of Edinburgh, and which was keenly debated in Parliament. Argyll resolutely defended his countrymen, and denounced the measure as enacting 'a cruel, an unjust, and a fantastical proceeding.' One of his speeches is quoted at some length in *The Heart of Midlothian*. In the end the measure was reduced to one disabling the Provost from holding any future office, which he had no desire to do, and imposing a fine of two thousand pounds on the city for the benefit of the widow of Porteous. She was content to accept fifteen hundred pounds, and, as was said at the time, the whole of these fierce debates ended in making the fortune of an old cook-maid, for that was the good woman's original capacity.

v.

The story of the Porteous Riots is interwoven in the novel with the story of Jeanie Deans. That story, as is well known, is based upon actual facts. A certain Helen Walker, the daughter of a farmer at Irongray, in Galloway, did really walk to London, and did successfully invoke the assistance of the duke to save her sister's life. She lies in the kirkyard of Irongray, in one of the most peaceful spots in Scotland, under a tombstone placed there at the expense of 'The Author of *Waverley*.' The visit of Jeanie Deans, of whom Helen Walker was the prototype, to the duke in London, and her subsequent experiences are described in the novel with the inimitable pen of genius. The rustic simplicity of Jeanie Deans in her snood and tartan plaid; the duke with his lofty and distinguished manners and bearing; the queen with the goshawk glance that made the knee bend; Richmond with its lofty elms and green glades and alleys, are all depicted by a master hand.

It is not surprising that the novel was received with instantaneous enthusiasm, and that testimonies of admiration and delight followed its publication. No art, says Lockhart, had ever

devised a happier running contrast than that of Jeanie and her sister, or interwoven a portraiture of lowly manners and simple virtues, with more graceful delineations of polished life, or with bolder shadows of terror, guilt, crime, remorse, madness, and all the agony of the passions.

During by far the larger part of Walpole's sway, from about the year 1717 onwards, the government of Scotland was left very largely in the hands of Argyll and his brother, Archibald, Earl of Islay, who afterwards became third duke. The system ultimately became a vice-royalty in effect, although not in name. The Argyll family became the fountain of the royal bounty, and the channel through which all patronage flowed. Without its good will success in official or political life became impossible. There is a suggestion of this in Bailie Nicol Jarvie's talk during an ambitious moment. 'I have whiles thought,' says the Bailie, 'o' letting my lights burn before the Duke of Argyll or his brother Lord Islay (for wherefore should they be hidden under a bushel?), but the like of the grit men wadna mind the like o' me, a puir wabster body—they think mair o' wha says a thing, than o' what the thing is that's said. The mair's the pity.'

vi.

In 1742 Argyll began to fail. He was attacked by a paralytic disease, which was, as his biographer, Campbell, says, 'attended with a kind of reservedness that had some of the symptoms of a deep melancholy.' Horace Walpole says he was often melancholy and disordered in his understanding. To make matters worse, Lady Louisa Stuart says that his wife fidgeted and fussed about him with a tormenting assiduity which must have been the one thing wanted to complete his trials. 'Tease—tease—tease, from morning till night. "Now, my lord, do eat this." "Now, my lord, don't eat that." "Now, pray, put on your great-coat." "Now, be sure to take your draught." "Now, you must not sit by the fire, it's too hot." "Now, you should not stand at the window, it's too cold." . . . He never spoke one word in answer; seldom raised his head to look at her; but, for the sake of peace, usually did as she would have him, seeming quite unable to contend.'

On 4th October 1743, Argyll died. He was not buried in Kilmun, the ancestral place of sepulture, but in a vault in Henry VII.'s Chapel in Westminster Abbey. A beautiful monument to his memory, designed by Roubiliac, stands in the Poets' Corner.

The British dukedom of Greenwich, which had been conferred on him in 1719, became extinct at his death, but the connection with the borough of Greenwich is commemorated by its still bearing Argyll's coat of arms.

VII.

The picture of the duke, presented by Scott in *The Heart of Midlothian*, is too favourable and eulogistic. Lady Louisa Stuart wrote to Scott, 'You have drawn him to the very life. I heard so much of him in my youth, so many anecdotes, so often "as the Duke of Argyll used to say," that I really believe I am almost as good a judge as if I had seen and lived with him.' But there were dark shades to the picture. The present writer, who has traced Argyll through the Stuart papers, and the Harley papers, and the manuscripts of the Earl of Mar, and other sources of contemporary information, can accept Scott's portrait only with large reservations. Argyll had serious faults which go far to explain why his career was not more successful.

The duke was warm-hearted, frank, honourable, and magnanimous, but fiery, hot-tempered, rash, ambitious, haughty, and impatient of opposition. He had not the patience and cunning needed for the scheming politics of the eighteenth century. He was difficult as a colleague, wanting his own way always, and not realising the importance of compromise in the work of government. He never showed the slightest servility or obsequiousness to king, minister, or party. His sword leapt from the scabbard to avenge the slightest stain on his honour. He was perfectly free from dissimulation and his word was so sacred that it could be implicitly relied on. But he was autocratic and dictatorial, and as early as 1705 complaints were made of his writing to the Lord Chancellor of Scotland 'in such a strain as if he had been writing to one of his chamberlains in Kintyre.'

The duke inherited from his mother, Elizabeth Tollemache, a very high spirit, and Argyll's brother, Lord Islay, used to say that when, in discussing anything with the duke, he saw the Tollemache blood rising, he 'e'en quitted the field.' Swift once wrote to him, 'I have often thought that Homer's description of Achilles bore some resemblance to Your Grace.' But the description of Achilles by Horace comes much nearer Argyll than that of Homer. Horace's words were translated by Robertson of Struan into Scottish lines that describe Argyll exactly,

A fiery ettercap, a fractions chiel,
As het as ginger, and as stieve as steel.

Argyll was a finished courtier and gentleman. There are many testimonies to his dignified demeanour, his distinguished bearing, his animated conversation, and his charm of manner. He had, says Lady Louisa Stuart, 'everything to attract and charm the eye—personal beauty, an expressive countenance, a commanding air, and the most easy, engaging gracefulness of manner.' At the age of fifty-seven he is described as still

remarkably handsome. He had, in particular, striking powers as a conversationalist and raconteur. He told a story admirably, with particular energy and terseness. Scott describes him as relating the story of Jeanie Deans to Queen Caroline, 'with that precision and easy brevity which is only acquired by habitually conversing in the higher ranks of society, and which is the diametrical opposite of that protracted style of disquisition

Which squires call potter, and which men call prose.

Argyll was considered one of the finest orators in the House of Lords of his time. He is described as having been warm, impetuous, animated, fluent, elegant in diction, and highly declamatory. Lord Chesterfield, no mean judge, greatly admired his oratory, and praised it in one of his letters to his son, 'The late Duke of Argyll,' he said, 'though the weakest reasoner, was the most pleasing speaker I ever knew in my life. He charmed, he warmed, he forcibly ravished the audience; not by his matter, certainly, but by his manner of delivering it. A most genteel figure, a graceful, noble air, an harmonious voice, an elegance of style, and a strength of emphasis, conspired to make him the most affecting, persuasive, and applauded speaker I ever saw.'

VIII.

Like most men with the capacity of being very agreeable, he could also be very disagreeable. As Dictator of Scotland, he often showed himself difficult and testy. The gossiping Wodrow gives us some glimpses of his sullen moods. When the duke was in Edinburgh in the middle of 1726 he refused to be fêted or honoured. The Provost and Town Clerk of Glasgow waited on him to assure him of their affection for his family, but were snubbed and chilled. He went to Dumbarton on this occasion, but refused the treat that they had designed for him, 'though near forty pound sterling was laid out.' Wodrow records, with the indignation of a cleric, 'On sabbath they came not to church.'

In August 1729 he came to Glasgow, and stayed the night with the Principal of the University. The town had prepared a treat for him, but he refused it. The magistrates had an interview with him, and lamented that 'the town for some time had been under his Grace's frowns, which they wished to have removed.' Argyll said he had been told that they had declared that they would not have any one of the name of Campbell to represent them in Parliament. The magistrates replied that it was 'a hellish lye,' that they had opposed Campbell of Shawfield, but that they had offered their votes to Colin Campbell of Blythswood. 'Colin, was it so?' said Argyll, turning

to Blythswood, who was present. Colin said it was so, and Argyll was mollified, and peace was made.

Argyll was extremely patriotic, and always ready to defend his country and its rights and privileges with uncompromising vigour. He resented immediately any indignity to Scotland. But his patriotism had its limitations, and there were occasions when he acted in a way that seems somewhat surprising. In 1725 Duncan Forbes introduced a bill for disarming the Highlanders, and forbidding the wearing of the Highland dress. This bill was supported by Argyll and his dependants. Lockhart, the Jacobite, says that 'not so much as one Scotsman had the honesty and courage to appear on behalf' of his Highland fellow-countrymen. Several English members opposed the bill however, and got some of the clauses omitted, including that which prohibited the wearing of the Highland dress. Lockhart expresses his astonishment in his *Memoirs* at Argyll's support of a measure which was certain to lessen his consequence, even though the king could grant exemption to those he pleased.

IX.

Argyll was the subject of many eulogies from eminent writers in his time. Thomson of *The Seasons*, and Young of the *Night Thoughts*, both sang his praises. Pope, who was his friend, wrote the lines so familiar to all:

Argyll, the State's whole thunder born to wield,
And shake alike the Senate and the Field.

The duke was also the subject of a large number of ballads both English and Scottish,

many of which the present writer has perused in the British Museum. A Scottish song, 'Kist Yestreen,' commemorates Argyll's familiarity with Glasgow:

Oh, as I was kist yestreen,
Up the Gallowgate, down the Green,
I'll never forget till the day that I dee,
Sae mony braw kisses his grace gae me.

Another ballad, entitled 'The Duke of Argyll's Courtship,' gives the Scottish rustic ideal of a good time:

Ye shall hae barley bannocks store,
Wi' geese and gailzings at your door;
A good chaff bed upon the floor,
Ye shall hae plenty good Scotch kale,
And after that Scotch cakes and ale;
A good fat haggis at every meal,
If you'll marry me, my dearie, O.

Tradition has even assigned to Argyll himself the authorship of a racy ballad, sung to the Scottish air, 'Bannocks o' Barley.' Scott represents the duke, after bidding farewell to Jeanie Deans on their return from Richmond, as rolling off in his coach, humming a stanza of the ballad of which he was said to be the author.

At the sight of Dumbarton once again,
I'll cock up my bonnet and march amain,
With my claymore hanging dune to my heel,
To whang at the bannocks of barley meal.

Curiously enough the present writer has been unable to find this stanza in any of the published editions of the ballad. He cannot help thinking that the lines were the creation of Scott's own brain, and were unconsciously attributed by him to the ballad ascribed to Argyll.

THE CURTAINS AT CHÂTEAU CORBENIC.

PART II.

VIII.

INDEED, had I but known it, good fortune was coming my way. After wandering about the village and its environs till darkness set in, I returned to the inn, ate a hearty supper, and betook myself to the great kitchen, sat down among farm-hands and fishermen, and handed about my tobacco-pouch. If they resented my presence they made no sign that they did, and I soon found myself the centre of a small circle of habitués, who replied to my questions regarding the neighbourhood without any trace of that reserve I had been led to expect.

We chatted about all manner of things—the frequency of shipwreck on that coast, the poverty of the soil, all the topics dear to the heart of the crofter and the seafarer. But as the hour grew later, I noticed that the familiar subjects connected with the daily toil of the

company gave place to talk of a very different kind. In what manner, precisely, I cannot tell, but the chat turned upon local superstitions, those sombre beliefs which even a liberal measure of education appears to have no power to banish from the Celtic mind. I have often heard that the talk in a Breton inn or kitchen sooner or later veers round to the subject of the supernatural, and it may be that the presence of a stranger quickened and heightened the descriptions of the weird other-life which I was told existed in the *houles* or caves of the coastland and flitted about the old stone circles. Extraordinary tales of meetings with Goric, Couril, and Korrigan were circulated, until at last that hush which, after a while, inevitably falls upon even a cultured company when the unearthly is discussed, settled upon us.

Suddenly out of the hushed, uneasy silence a young fellow who had spoken little begged his

neighbour to accompany him on the road home. At this there was a general smiling and nudging of elbows.

'Of what are you afraid, Iouenn?' asked a graybeard. 'Bless you, lad, you haven't had enough cider to see even a Goric the height of your hand!'

'Have you ever passed St Blaise's Church after dark?' retorted the youth hotly. 'There's something strange there. Something in the tower you would not care to face.'

'The Church of the Ankou!' said the old fellow, changing his tone and crossing himself. 'Who would pass that at night?'

'The Ankou?' I asked, with a faint recollection of some forgotten legend. 'What is the Ankou?'

There was a moment's awed silence. Then the old man who had twitted the lad on his fears turned to me with a grave face enough.

'The Ankou, monsieur,' he explained, 'is the Demon of Death. He walks down the road ringing his bell at the hour when the spirit parts with the body. He never fails—the Ankou.'

'And does he haunt this particular church?'

'An image of him is kept there, as in many churches in our land, monsieur. The place has an ill name, especially at night. Its guardians, Coudre and Gwennolaik, are evil women. But, so far as I know, none have seen the Ankou there.'

'Yet I tell you that I have heard something there if I have not seen it,' insisted the young man. 'A woman's spirit haunts the tower. She croons songs in a strange language—a tongue like, and yet unlike, our own Brezonek. I passed St Blaise's church on Friday night and heard her. You do not believe me? Well, this is the tune she sang.' He whistled a few bars of 'Soggarth Aroon.'

I jumped to my feet. 'I will go past this church with you, *mon brave*,' I said. 'Come, let us get upon our road before it grows later. You will have nothing to fear with me.'

IX.

There was a good deal of whispering, and more than one dark look was cast in my direction as we stepped out into the night. It was dark as only night by the sea can be, but we kept close together, and while we trudged along I plied my new friend with questions. He told me that part of the church was occupied by a pair of old women for whom, to put it mildly, the whole countryside had a wholesome respect. If Coudre and Gwennolaik were half as fearsome as report made them, they were scarcely less awful than the evil spirit which was supposed to haunt the church they dwelt in, an ancient and now disused building in a desolate and unfrequented spot, which, in a land where legend flourishes, had gradually acquired a reputation as unenviable as any forest shrine in Burma.

On we stumbled through the night. My companion knew the way, and it was with difficulty that I was able to keep up with him. We could scarcely have walked more than a mile, which the darkness and the roughness of the road made a good league to me, when the slackening gait and the obvious nervousness of Iouenn told me that we must have entered the sphere of influence of the deserted chapel of St Blaise.

'Are we anywhere near the church?' I asked impatiently, for the darkness and the rough going were getting on my nerves, already rather frayed.

'We are near it now, monsieur,' faltered the lad. 'It is not more than fifty metres from the path. Let us hurry on.'

My rejoinder was a strange one. I sang the refrain of 'Soggarth Aroon!'

'Monsieur!' shrieked my companion wildly, 'what are you about? Would you raise the spirit?'

I don't know whether my answering laughter sounded more than uncanny in that weird place, but it seemed to have a peculiar effect upon Iouenn, whom I heard muttering in a prayerful manner. Then out of the silence came a woman's voice, raised in the same song as I had sung. With a howl of terror Iouenn took to his heels and plunged off into the night. The voice—a rich and beautiful soprano—thrilled on through the darkness, and with its sound to guide me, I stumbled towards the church of the Ankou.

X.

Luckily the short distance I had to make was without pitfalls, and by dint of wary going I soon found myself beneath the belfry. The singing continued. I searched for an entrance and found it readily enough. The decayed door had neither hasp nor bolt, and when I pushed it aside, I entered what was, if possible, an even deeper darkness than that without, flagged unevenly with stones, on which my rubber soles made little or no sound. I groped about in search of the stairway which I knew must lead to the belfry, whence the singing had come. I had matches, but did not want to use them unless it was absolutely necessary. But as I groped my questing hands came into contact with something cold as death itself. The only phrase by which I can describe the effect that icy contact had upon me is the time-honoured one, none the less useful, that my flesh crept.

In fascinated horror I felt my fingers playing on the ribs and joints of a skeleton. Then I suddenly realised what the thing must be. It was indeed a skeleton—but of iron! The Ankou, the horrible image of the Spirit of Death which had helped to give the place its evil name. This, the legend-mongers at the inn had told me, always stands as guardian of the

belfry in Breton churches, so that I knew the stair leading to it must be close at hand. But as I found it, as my hand was on the rail, a light flashed out, and I was confronted by two faces distorted by anger—faces which might have been those of the Furies themselves. The guardians of the place, I concluded, and stood silent before them.

They were indeed a fearsome pair, brawny, beetle-browed, forbidding. But I had a card in hand for them, evil as they looked.

'What do you want?' asked one of them harshly in villainous French. 'What do you seek here?'

'You know very well why I have come,' I replied in as stern and portentous a manner as I could. 'You have detained a lady against her will. She is in the belfry alone. You have maltreated her shockingly, and have tried to drive her to madness and despair at the bidding of her husband, your paymaster. The police are coming. They will be here in ten minutes at the most. If you value your freedom you will go at once. The key of the belfry, quickly.'

It was evident that my words had taken all the fight out of them. They glanced fearfully at one another, then the taller of the two handed me the key with a malediction. As I moved toward the staircase, they disappeared. I struck a match and by its tiny light made the best of my way upward. A door of thickly studded oak confronted me, and in answer to my knock a woman's voice bade me enter. I turned the key in the lock and went in.

XI.

Alma Wethered was there in almost complete darkness. Her surroundings I could not well see, but they appeared so gloomy and oppressive, that I marvelled she could have sustained existence in such a place.

'My name is John Benedict,' I said to the woman who crouched on the low truckle-bed in a corner of the high, black room. I sometimes laugh now when I recall that, extraordinary as were the circumstances, the tone of ordinary conventional self-introduction obtruded itself. 'I found your message on the curtains at Château Corbenic.'

'Thank God!' she said, almost in a whisper. 'You have come to take me away from here?'

I could scarcely see her face in the flicker of my third match, but I heard the tone of infinite relief and thankfulness in her voice. It was a wonderful voice, with just the least lilt of brogue in it—the kind of voice that charms at once, for the mere echo of which a man will die. 'Yes,' I said. 'You must come with me to Château Corbenic. We shall go to London to-morrow.'

'I knew some one would come at long last.'

She got ready in silence. She did not take

more than a minute to prepare her going, and this was not wonderful, seeing that she had neither hat nor cloak. And then, in silence also, we descended the stairs and left the house.

'You must be clever,' she said, taking my arm, as we reached the open air. I heard her breathe deeply. 'Yes, very clever to have solved my riddle in silk. You're the novelist, aren't you?'

'Yes,' I admitted. 'I met your husband by accident at the inn yesterday.'

'He came to see me,' she said with a shudder. 'He offered me my liberty if I kept silent about—about his Copper Bank. Do you know that he means to abscond? There is no time to lose if thousands of poor people are to be saved from ruin ir retrievable. I heard him one night discussing his villainess with another man—a man of his own kind. I threatened them with exposure, and he telephoned for his doctor, another of his creatures. I refused to give way, and next morning I was aboard his yacht, en route for Brittany. I was at Corbenic for five months. But he became suspicious of the old people there, and I was handed over to those terrible women. I have been here nearly a year. All writing materials were carefully kept away from me when I was at Corbenic. But the idea came to me that I might send my message. To have done so in ordinary letters would have been hopeless. Then I remembered Ogham. It was a slender chance. I was not relying on the average person, you see. One never should. The old people, honestly believing me to be crazy, suspected nothing, and humoured me in what they thought was the fancy of a disordered brain. It was an odd proceeding, I suppose, but—it appealed to me.'

In little more than an hour we were in my study at Corbenic, and for the first time I looked full into her glorious eyes.

XII.

I don't think the editor of the *Morning Mercury* ever experienced such a perplexing twenty minutes. He regarded us unfavourably at first, and while I was unfolding my story, snorted more than once. 'I know you by sight, Mr Benedict,' he said, when I had finished, 'and of course I quite remember Lady Wethered. But this—this exceedingly wild business! Like a chapter out of one of your stories, you know. And why do you come to me? Of course, if it's true—pardon me for the reservation—we shall be only too pleased to give it full publicity, but I should have thought that you would have taken legal advice in the first instance.'

'We certainly thought of doing so,' I said. 'But I am in possession of irrefragable evidence that Sir Stanley Wethered is about to make what is vulgarly called a good get-away almost at once, and I considered it better to come to you than to invoke the much more cumbrous

legal machine. I may say that Scotland Yard has already been informed, but that the authorities there are sceptical, and are contenting themselves by making enquiries. Otherwise we should not be here. Is Wethered to be permitted to abscond with the savings of thousands of poor people without a hand being raised to prevent him?

'I am afraid, Mr Benedict,' he replied, 'that your position as—er—as an imaginative novelist, you know. . . . But will you leave it to my discretion? I must really have a clear day in which to investigate. If I find that your—your assertions can be substantiated, I shall print your story,' he tapped the transliteration from the Ogham, 'say on Friday. Of course we must all observe the strictest secrecy meanwhile.'

On Friday morning I went to the private hotel where Lady Wethered was staying. I

unfolded a copy of the *Morning Mercury*. There were large headlines.

THE COPPER BANK

EXTRAORDINARY DISCLOSURES

LADY WETHERED'S ROMANTIC ESCAPE.

But justice sought Sir Stanley Wethered too late. For when its ministers broke open his room at the headquarters of the Copper Bank, they found him, with the dregs of some swift poison on the lips which had smiled so charmingly.

The curtains of Château Corbenic hang in my study at home, and when I listen to my wife's interpretation of them, delivered in that beguiling brogue of hers, and varying with every visitor, I feel that when all is said and done, *she* is the born teller of stories!

THE END.

NATURE'S BAROMETER.

By C. CORDLEY.

I.

IN the present advanced state of science, expert meteorologists can tell us with the greatest accuracy what the weather has been recently; as for foretelling its immediately future aspect, they are not infrequently wrong. Even the barometer has become somewhat unreliable in late years; but nature, as ever, is to be depended upon in this matter.

All outdoor pursuits, undertaken either for profit or pleasure—sport, games, agriculture, gardening, touring, holiday-making—depend so much upon the weather, that mankind must naturally have ever taken a great interest in its study, and, as a matter of fact, the popular ideas about weather prognostics are much the same to-day as those which were in vogue in the earliest ages. The observation of the state of the sky taught the early meteorologists when to expect good or bad weather; and the result of their observations formulated into short and pithy sayings made up, until comparatively recent dates, the science of weather prognostics. Beasts, birds, fishes, and even flowers, are more or less sensitive to coming changes in the weather and the temperature of the atmosphere, and by observing their movements some warning of these changes may be obtained.

The following are signs of fine weather: A low dawn; a gray sky in the morning; a rosy sky at sunset; sheep lying down early in the morning; if ponies on the moors make their way to the tors or other high ground about the 'dimpsey,' gloaming, or sunset, the following day will be fine; rooks going a long way from home to feed early in the morning; skylarks soaring and singing; swallows flying high.

Indications of storm and rain: The loud quacking of ducks; the calling of the 'yaffle,' or woodpecker, peafowl, guinea-fowl, &c.; pigs carrying straw in their mouths; dogs eating grass; rooks circling high in the air, then darting suddenly and quickly downwards; frogs changing colour from yellow to brown, and becoming unusually noisy; toads coming from their retreats and crawling about the grass and paths; sheep feeding early in the morning; small birds gathered together in flocks; spiders shortening and strengthening the filaments supporting their webs; sea-birds flying inland; wildfowl leaving the marshes for higher localities; swallows flying low; wild deer leaving their haunts and getting nearer habitations; cattle and donkeys turning their sterns to the wind; the shining of the glow-worm; robins singing in the morning; the cry of the missel-thrush, or 'storm-cock'; the pink-eyed pimpernel closing its flowers.

II.

Proverbial poetry, beloved and trusted in olden days, is not unworthy of attention and belief in these 'up-to-date' times:

If red the sun begins his race,
Expect that rain will fall apace.

The evening red, the morning gray,
Are certain signs of a fair day.

If woolly fleeces spread the heavenly way,
No rain, be sure, disturbs the summer's day.

When clouds appear like rocks and towers,
The earth's refresh'd by frequent showers.

Hodge will tell us that 'gramfer' told him that in a herd of cows, as they are on their

march towards their pasture in a morning, if the bull lead the van, and keep back his company that they go not before him, it is a prognostic of rainy or tempestuous weather; but if he be careless and let them go at random, the contrary. Or if they eat more than ordinary, or lick their hoofs all over, rain follows shortly. If they run to and fro, flinging and kicking, and extending their tails, storms almost invariably follow.

Before rain, dogs are apt to grow very sleepy and dull, and to lie by the fire. Before rain, moles throw up the earth more than usual. When the dew lies plenteously upon the grass in the evening, the next day will probably be fine; when there is little or no dew, probably wet. Writing two thousand years ago, the poet Virgil declared that the blowing about of feathers, or any light substances on the water, foretells rain.

Besides the pimpernel, there are, according to Linnaeus, forty-six flowers which are sensible of coming atmospheric changes. Many of these are tropical. When the chickweed expands boldly and fully, no rain will happen for several hours, at least; if it continues in that open state, no rain will disturb the summer's day; when it half conceals its miniature flower, the day is generally showery; but if it entirely shuts up, or veils the white flower with its green mantle, let the traveller put on his mackintosh. The different species of trefoil always contract their leaves at the approach of a storm; hence these plants have been termed the 'poor man's weather-glass.'

III.

Verily, it is well and desirable, as also convenient, to be able to foretell the weather; it is better to have the philosophy to take it cheerfully as it comes—good or bad, wet or dry, hot or cold, seasonable or unseasonable. Worthily old Thomas Tusser, in his *Points of Good Husbandry*, well sums up the position:

Though winds do rage, as winds will, would,
And cause spring tides to raise great flood,
And lofty ships leave anchor in mud
Bereaving many of life, and of blood;
Yet true it is, as cow chews cud,
And trees, at spring, do yield forth bud,
Except wind stands, as never it stood,
It is an ill wind turns none to good.

If the cock moult before the hen,
We shall have weather thick and thin;
But if the hen moult before the cock,
We shall have weather hard as a block.

If there is a rainbow in the eve,
It will rain and leave,
But if there is a rainbow in the morrow,
It will neither lend nor borrow.

A rainbow in the morning
Is the shepherd's warning;
But a rainbow at night
Is the shepherd's delight.

IV

People who base their homely predictions of the weather on old saws and proverbs are not without justification. Professor Humphries, meteorological physicist of the United States Weather Bureau, has investigated the folk-lore of the weather in the light of modern meteorological knowledge, and has found that much of it has a sound basis.

Professor Humphries points out that the appearance of the moon depends on the conditions of the atmosphere, and that proverbs based on it are well founded and valuable. The following proverbs have stood the tests of ages:

Pale moon doth rain.
Red moon doth blow.
White moon doth neither rain nor snow.

The following rhyme, embodying the deductions to be drawn from the state of the sky in the morning and at night, is also shown to have a scientific backing:

Evening red and morning gray
Help the traveller on his way;
Evening gray and morning red
Bring down rain upon his head.

This is one of the oldest proverbs dealing with the weather, and the words of Christ, as quoted in the Gospel of St Matthew, are recalled: 'When it is evening, ye say, It will be fair weather, for the heaven is red; and in the morning, It will be foul weather to-day, for the heaven is red and lowering.'

It is known among fisher-folk that fish can foretell the weather. For long before any barometer has indicated the approach of rain, one can see salmon and other fish behaving in the most excited manner. They roll about, splashing at the top of the water, and at times leap out of it. The reason of this is that the body of every fish, save the Pleuronectida, or 'flats,' and a few others, contains a large bag of very thin skin, called the swim-bladder. This bladder is tightly filled with air, and as soon as the slightest change occurs in the pressure of the atmosphere the air in his swim-bladder informs the fish of it. If it feels uncomfortably tight, then the barometer is about to fall. It is the discomfort caused by the enlarging of the swim-bladder that makes the fish so restless on the approach of rain, when it gyrates and leaps, as one may observe on any river containing trout and, especially, salmon.

All genuine observations go to prove that weather predictions based on solar, lunar, or other astronomical causes are without foundation. Certain almanac makers have thriven for many years on a widespread ignorance of the most palpable elements of physical law; most of their forecasts being truly 'lunatic.' Hence, we do well to consult nature's barometer.

Chambers's Journal

SEVENTH SERIES

A CHILD OF THE STONE AGE.

By GORDON CASSERLY, Author of *The Elephant God*, *The Jungle Girl*, *The Red Marshal*, &c.

PART I.

I.

THE mighty river Thames, eight miles broad, swept in majestic flood over the valley in which, untold centuries later, the city of London was to rise. The forest-clad banks that hemmed it in were the ridges on which the houses of Hampstead and Clapham now stand. A dense jungle of oaks, birches, and monster pines, creeper-bound and mingled with giant tree-ferns, cane-brakes and calamus, stretched down to its marshy margins, where huge alligators and long-snouted fish-eating crocodiles basked on firm mud in the hot sun, and beavers built their dams by every tributary rivulet. Hippopotamuses sported in midstream or wallowed in the shallows among the tall reeds. A herd of monster straight-tusked elephants, the bulls sixteen feet at the shoulder, lay contentedly in the river or stood, hock-deep, blowing the water over their heated bodies; while near them a troop of their smaller cousins, the shaggy mammoths, their twenty-foot long tusks curving in almost complete circles, came down to drink.

A two-horned rhinoceros, its thick hide covered with wool and long hair, scattered a group of saiga antelopes as it blundered clumsily down the bank, glancing this way and that out of its vicious little eyes, and half-inclined to charge unprovoked a great bison that was thrusting its broad muzzle into the stream and scaring a shoal of soft-shelled turtles.

A tropical scene—but the climate of Britain was almost tropical in that far-away age, since the great ice-sheet that had spread over England as far south as the Thames, and buried Scotland three thousand feet deep, had retreated towards the North Pole again. The only traces of it were the arctic animals that it had brought and left behind—such as the herd of reindeer, a pair of gluttons, a white fox, and a score of little lemmings that stole timorously down to drink, as if conscious that they were aliens now, all seemingly distressed by the heat, although the sun was sinking towards its setting.

Great apes lazily plucked the forest fruits, and troops of monkeys played in the tree-tops,

leaping from branch to branch and swinging across the voids to grip with ready paw or foot the meeting boughs. And high in a great oak crouched a pair of strange creatures, peering down into the dense undergrowth of canes, tall feathery ferns and tangled thorny bushes below them, or staring out over the wide flood. Apes they seemed from the low-browed skulls, the sloping foreheads and low crowns, the heavy jowls, the bodies clothed only with thick brown fur. But the long hair of their heads, the true-toed feet and the hands, as well as the muttered sounds of a low-toned conversation passing between them, showed them to be human. Man and woman in sooth, man and woman of the Palæolithic Age, born and destined to live and die hundreds of thousands of years before the dawn of history, the birth of civilisation. Animal compared with Man of to-day, yet very far removed from earlier humans that had flourished æons before them, humans incapable of speech and moving like the apes on all-fours.

Compared with their ancestors, these two had progressed some distance along the path of knowledge. They could speak, although their vocabulary was scanty and almost animal-like in the grunts and snorts that represented many of their wants and feelings. They walked erect. Instead of the broken-off bough, the stone snatched up in a moment of danger, that were the weapons of the first men, they were armed with spears—stout, straight staves of trimmed wood split at the tip and made formidable by sharp-pointed flints wedged into the clefts and there held in place by lashings of twisted strips of green bark. And swinging from the man's shoulder by a strip of deer-skin was a knobby club, into the gnarled head of which a sharp flint had been forced, to make a blow from it still deadlier. It was balanced on the other side by a hairy pouch hanging from another bandolier and filled with sharp-edged throwing-stones. A flint knife was thrust into it.

Apparently satisfied of the absence of any immediate danger from lurking foes, the couple moved on through the upper branches of the trees towards the river. Hampered though

they were by their weapons, they climbed quickly, the man moving more lightly and with more agility; for the woman was great with child. They were making their way to the water to drink, and chose the safer route and the fastest. Although Man had learned by now to walk on the earth, the ground below them, here covered with almost impenetrable jungle, was full of danger from the fearsome animals that roamed it.

II.

The England of that day was very different from the land that we know. It was not an island, but a peninsula of Europe linked to France by an ever-narrowing isthmus densely wooded, which lies now with its monster trees below the Channel. Its forests were filled with the terrible elephants, rhinoceroses, lions, and other dangerous animals that had superseded the nightmare horrors of the age of giant reptiles. In a previous epoch—a million, ten million, years before, who can say?—Britain had been a vast land forming the western portion of the Continent, reaching from Denmark to Spain, and stretching out into the ocean as far as the Faroe Islands. Where the North Sea rolls now was a great, undulating valley, through which the Thames, Medway, Humber, and Tyne flowed to form one river with the Rhine, Weser, and Elbe, pouring out its waters towards the Arctic. And the rivers of southern England and northern France joined in a broad, Atlantic-bound stream in the lake-studded country of hill, plain, and marsh between the Isle of Wight and Spain of to-day. Immense forests and grassy valleys stretched out far beyond what is the west coast-line of England now; through them roamed great herds of deer, around which prowled their attendant killers, sabre-toothed tigers, cave-lions, and hyenas. These animals had taken the place of the dinosaurs, plesiosaures, and other strange prehistoric beasts.

In one glacial epoch the old Britain sank beneath the sea until only the summits of the Scottish, Irish, and Welsh mountains showed above the water as scattered islets. When it rose again it was sadly diminished in extent. Ireland was an island then; and only the ever-narrowing isthmus joined southern England to Europe.

But of this the man and woman now moving timorously towards the river to drink and hunt for crayfish, newts, snakes, grubs, berries, anything to satisfy their hunger, knew or recked nothing. If they ever thought of it at all, to them the world had always been as it was, a place where life was very difficult for weak human beings in the midst of many perils. Against the great monsters that surrounded him, Man, low-intelligenced Man, but a step removed from the brute, was forced to struggle for existence armed only with the frail weapons

that nature put ready-made to his hand, the stone and the broken bough. His poor brains had to devise better means of defending himself, of procuring his daily food; and so far he had learned to increase the length of his reach only by spear and throwing-stone.

There was danger to him on the ground, in the water, in the air above, danger of beast, of reptile, of murderous fish and predatory bird. And so these two poor specimens of humanity climbed wearily through the branches like the apes that they resembled, and did not dare to tread the earth that was their heritage. As they neared the river their caution increased.

It was needed. A splashing in the water was succeeded by the noise of a heavy body crashing through the undergrowth, forcing a passage by sheer weight through the tangled network of creepers, canes, and high thorny plants; and below them passed a monstrous animal, a soft-nosed rhinoceros with a horn three feet long. They cowered motionless in a tree until the sounds of its passing onward had died. Then they climbed cautiously on, only to stop and flatten themselves against a tree-trunk as a fresh crashing beneath them told of more peril on the ground. As they peered down they saw an elk, with branching antlers laid back on its shoulders, bursting through the undergrowth in terrified flight. And close behind it came a great cave-lion, its glistening fangs bared in a vicious snarl as it strove to overtake its quarry. When the forest was silent again, the man and the woman resumed their interrupted journey, and at length reached a spot where the trees overhung the river. With infinite caution they climbed down to the oozy bank, where the woman began to search for shellfish, larvæ, insects, anything that would satisfy their hunger. But her companion urged her on; for he aimed to reach a beavers' lodge, hoping to surprise one of the little animals at work building a dam, and secure it by a thrust from his spear or by a blow from a throwing-stone. There was a stream not far off, he knew, where beavers were to be found, just at its junction with the Thames. So carefully, cautiously, they made their way towards it, now on the ground, now up among the branches. They avoided the open spaces where the great beasts flocked to drink. As they reached the stream close to the dam at which they saw the beavers toiling a rotten bough broke under the man's weight, and he fell heavily to the earth. A beaver sentry slapped the water with his flat tail, and at the warning signal all vanished.

III.

Hot and furious with disappointment, the hunter rose, bruised, but not seriously hurt, and scowled at the empty stream. Then he lay down to drink, while the woman remained

on guard, spear in hand, her swift-rolling eyes apprehensively searching the jungle about them on every side. When her mate's thirst was quenched she threw herself down and plunged her face in the water, while he watched.

Suddenly there was a denser blackness in the dark depths of the stream, a swiftly uprising shadow in it; and the intently staring man sprang into quick action and thrust with his spear, as an enormous turtle with a head three feet broad and a cavernous mouth studded with cruel teeth came to the surface and snapped viciously at the drinker. The sharp points struck deep, and flint and shaft transfixed the extended neck. The spear was torn from the man's grasp as the monster sank struggling convulsively. There was a swift commotion in the bloodied water, which surged and boiled as a number of ravenous, strangely-formed fish darted on the wounded turtle, which was unable to draw its head within the shelter of its shell owing to the spear through its throat, and tore to pieces as much of it as they could reach. But almost before it died the humans had sprung up into the trees again with the agility of monkeys—the frightened woman, despite her handicap, nearly as quickly as the man.

Back along the leafy ways they went, back to the higher trees farther inland, in one of which they had fashioned a rude home for the moment—just a rough platform of sticks and a frail overhead shelter of boughs. They were hungry, for they had been unsuccessful in their hunting all day; but the sun neared its setting, the darkness so full of terrors was coming swiftly, and it was wisest to reach their miserable repair ere night fell.

Huddling together for warmth on the few sticks bound by twisted withes forming the floor of their abode, they grumbled at their ill-luck, and, blaming each other for it, quarrelled fitfully for a time. Although by the achievement of speech they had out-distanced their ancestors, who were incapable of articulate language, their vocabulary was very limited. But they had no need for many words, for their ideas were few. All that they had to talk about usually was the daily imperative search for food, the dangers encompassing them, and the ailments that sometimes attacked even their strong frames.

Life, the world, held no beauty for them, no interest except the satisfying of their appetites. They had no regard, no affection, for each other; they consorted as the brutes do. Love had no existence in that age—the genuine love of a man for a woman, of a woman for a man, was something that was unknown to them or their species. An animal desire, a demand for possession, a jealousy of any interference with his property, were all that the man of that period could experience or understand. A need of

companionship at times was the most that either sex could feel. But love, true self-denying love which raises man above the other animals, held no meaning for human beings in the Stone Age. A woman could feel the mother's devouring love for her child, as the brute beast for its offspring, but for her mate nothing but the need of protection, the female's instinct of submission, and the call of sex.

And thus this man and this woman had no tenderness, no affection, no love for each other that needed expression in their limited speech. And so they only bickered and complained until slumber weighed heavily on their eyelids.

But through the night they slept fitfully, starting now and again into frightened wakefulness as a harsh roar dominated the noises that now filled the forest, or a wild shriek of mortal agony told of some harmless beast meeting its death.

There was ever-present peril to them from snake or climbing brute; and it joined with the ache of gnawing hunger to make them wakeful. When the pale light of dawn began to filter through the great canopy of leaves overhead they awoke little refreshed by their broken slumbers. A yawn, a stretch, a rubbing of the eyes was all their toilet, a grumble and a growl their morning orisons, as they started out on the airy ways high above the earth to their daily task—the satisfying of their appetite.

IV.

Swinging from branch to branch like monkeys, springing to a higher bough or dropping to a lower one with astonishing agility, the hairy man and his mate made their way through the trees, pausing now and again to listen or to peer down through the leafy screen to the earth below, always on the look-out for some harmless animal to kill for food, or on their guard against the dangerous beasts that would devour them. The man had taken the woman's second spear in place of the weapon that he had lost.

They came upon what was almost a clearing, a spot where the trampled earth was littered by fallen trees pushed down and stripped of their leaves and twigs by some herd of the monstrous elephants of that age. So recently had they been uprooted that the fast-springing jungle vegetation had not had time to cover them with its green pall. It would soon do so; for now the life-giving sun could reach the earth and quicken the tangled bush.

Erect on a lofty bough, his flat feet seeming to grip the rough bark like a claw, the male hunter listened motionless, and searched with keen eyes the gloomy depths of the woodland beyond the clearing, while the woman crouched beside him. When ear and eye had done their best the nose was called on to aid them, and the man threw back his head and sniffed the air like a hound—no dog ever had a keener

power of scent than humans possessed in that age.

Suddenly he stiffened. His sensitive nostrils had warned him of danger, for the faint breeze brought a heavy odour of beast. Then hearing helped; there came a crashing through the undergrowth, a sound that grew louder and louder as the invisible causes of it drew nearer. Man and woman concealed themselves behind the trunk of their tree. Suddenly there came into sight first one, then another, and another of a herd of the enormous straight-tusked elephants, marching in file with nodding heads and flapping ears, the cows with their calves leading, the bulls following. As they passed by slowly, feeding as they went, stripping leafy boughs with their snaky trunks from the fallen trees and cramming them into their huge mouths, a few wandered off to one side or the other in search of some succulent vegetation that they had sensed, but always came back again into the single-file formation of the herd.

When they had passed out of sight the man and woman climbed on again, keeping always to the branches and skirting the clearing. As they proceeded once more in the depths of the forest the female spied a nest on a bough above them, and both scrambled eagerly to it. It held four newly-hatched naked birds, which the hungry pair snatched up greedily. Tearing the chicks to pieces with hairy hands, they thrust the bloody fragments into their mouths. Another nest close by provided them with eggs containing chicks, which followed the others into their hungry maws.

As the man, who had taken the lion's share of the feast, was breaking the last shell a sudden sound smote his ears, and he paused to listen. The cracking of broken twigs, a scream of pain, a hoarse bellow, a stamping of heavy hoofs, told of a fight on the ground between big animals close by. Where death passed in the forest there might be pickings for carrion-eaters; and Man disputed with the vultures, the wild dogs, and the hyenas the scanty remains of carcasses left by carnivorous wild beasts.

So the human scavengers hurried on in the direction of the sounds of the fray, and quickly came in sight of the combatants. An enormous grizzly bear, with an agility hardly credible in an animal of its huge bulk, was dodging the furious charges of a cow-bison, rising on his hind-legs and striving to deal her a downward, back-breaking stroke with heavy paw as she rushed by. The cause of the quarrel was evident; a wounded calf, moaning in mortal agony, was trying to drag itself aside on its fore-legs, its paralysed hindquarters trailing powerlessly along the earth. At the cries of her crippled offspring the maddened mother paused in her fierce assaults to go to it and lick its wounds, moaning pathetically over it; but it sank lifeless on the ground, and with a bellow of rage she swung round and charged its slayer. The grizzly just managed to elude her deadly onset, but her horn tore a long raking wound in his flank. Furious with rage and pain, he struck at her savagely; and this time the blow fell on her hindquarters, and seemed to break her spine. She stumbled and fell, and the bear sprang on her with open jaws and extended paws to worry and crush her to death.

But a thunderous bellowing roar filled the forest; and the grizzly rose on his hind-legs, the red tongue hanging from his slaving jaws, to face a new and deadlier peril. The ground shaking beneath their tread, a herd of bison burst out of the undergrowth and swept down on him. For a moment the watchers in the tree saw the bear's bulky form erect and the big paws striking out, then he was lost to sight as the wave of avengers closed over him and the bisons slew him with thrusting horns and stamping hoofs. And when they had done with him and passed on, there was but a bloody mass of trampled flesh and broken bones left beside the dying cow, who dragged herself painfully to her dead calf, licked it feebly, and then died beside it. The sounds of the vanished herd died away in the distance, and the forest lay hushed and still again.

A CATARACT OF FISH.

By E. E. CADBY.

IT was during one of those ever-recurring Wanderlust-driven periods of my life, in days prior to the Great War, that I found myself one foggy morning off Hong-kong, that one-town island colony of the British Empire, and the third largest shipping port in the world. The bridge siren was 'hooting its dread' for all it was worth as

'Foot by foot we creep o'er the hueless, viewless
deep
To the sob of the questing lead.'

The appearance of the sun, however, soon dispersed the fog, and it was not long before the passengers for the port were comfortably housed in the several hotels of the city. And here it was, right on the quayside, that I came across my Cataract of Fish. Let me describe the manner of their coming.

There are thousands of Chinamen living permanently at Hong-kong who revel in a diet of fish, but it must be fresh-water fish, the nearest source of supply of which lies some ninety miles

away up the Canton River. Now the common or garden Chinaman has no gastronomic use for a dead fish, and the problem for the suppliers was how to convey the fish caught in the river off Canton over the long distance separating the two cities and deliver them all alive and kicking at Hong-kong. With the idea of learning all about it, I took passage in one of the big shallow-draft, beam-engined, paddle-wheel steamers that ply between Hong-kong and Canton. The vessel, like all boats both great and small that cater for the Chinese traffic, had human eyes painted on the bows—one on each side, the idea being that without such aids the boat would not know which way to go; or, to use their own pidgin English, 'No eye, no savee.' And on a boat that has no eyes a Chinaman will not travel. The lower-class native of China is very superstitious, and firmly believes, among a lot of other nonsense, that there is a real personal devil in every piece of machinery. One particular vessel had a great time owing to this idiosyncrasy, a high official having given it out upon his arrival at Canton that he had seen the machinery devil jump overboard during the night. The official was too highly educated really to believe what he is reported to have said, and it is surmised that he wanted to do his friend the skipper a good turn. Anyway, the report soon got about, and the superstitious natives made a dead set for that particular boat whenever they travelled, with the result that her owners simply coined money until her captain unfortunately put her ashore during a fog on the rocks outside Hong-kong.

The steamer on which I was travelling was named *Kowloon*, after the port and docks on the mainland of China, just across the strip of sea that separates Hong-kong from China proper. She did her 19 knots very comfortably, and was soon in the river on the way to Canton. The boat being quite differently constructed from the ordinary mail steamer excited curiosity, and the steady motion noticeable upon entering the river prompted a tour of inspection. There were three decks, all running the length of the ship, the uppermost for the saloon or European passengers, the next for the second-class (well-to-do Chinamen), and the lowermost deck for the third-class passengers—and the fish (on the return journey).

The last-named lot of passengers were an evil-eyed and dirty-looking crowd; and it was noticed that access to this lowermost deck was to be had only down a companion which could be instantly closed off by the dropping of an overhead iron gate, above which stood a Chinese soldier day and night, fully armed with a sword and a gun. The fact was that in those days Chinese pirates had a nasty habit of disguising themselves as respectable passengers, and then, when the right moment arrived, they would hold up the ship's officers, and rob the passengers of

all their valuables, decamping in a junk that might have been seen hovering near at the time of the seizure. This sort of thing had been carried on with impunity time after time, the flowing robe of the native lending itself very successfully to the concealment of arms about the person.

The comparative lawlessness of the land was brought home to the traveller as the steamer proceeded up the river and began to approach Canton city. Huge square, windowless, brick-built edifices were to be noticed 70 or 80 feet high, on the top of which were displayed a number of strange-looking articles, rocks, and jars. The jars, it seems, contained sulphuric acid, which, with other missiles, was for use against attack by robbers—the towers being public pawnshops.

Continuing our inspection round the ship, we came across a printed notice attached to the saloon mast, round which were stacked a number of ships' muskets, all of which were said to be fully loaded. This notice set forth that though the captain would do all in his power to guard against piratical surprise, the owners of the steamer would not hold themselves responsible for any untoward circumstance that might arise during the voyage, or whilst at anchor in the river off Canton. Not very reassuring for nervous passengers, but then timid persons should not travel in China. Even to-day there are plenty of apparently highly respectable trading-junks knocking about the China seas that only lack the opportunity to turn temporarily into the fiercest of cut-throat pirates. A Chinaman has little respect for human or any other kind of life, as may be imagined when it is learned that in this strange land a man will sometimes vent his spite against a neighbour by committing suicide on the other's doorstep.

Happily, nothing of an unpleasant nature occurred on this particular trip, and Canton was reached in due course, the last couple of miles being passed through what looked like Thames houseboats moored permanently to the river banks in regular streets, each craft forming a house and home for one or more families. This congregation of boats, which forms the suburbs of Canton, is reckoned to contain close upon 300,000 inhabitants, and is said to be as old as the city itself. Canton comes next to Peking in importance, its population by some being estimated at a couple of million; and, after silk, I suppose preserved ginger and chow-chow, packed in those bamboo-bound, old bluish-looking jars beloved of our youth, and fireworks would form the chief articles of export. The word 'chow,' be it known, is the Chinese for 'food.'

But to return to our fish. A stay of four hours enabled the *Kowloon* to unload her cargo and take in the homeward freight, including some ten to twelve tons of live fresh-water fish.

These were stowed in half-filled wooden vats without lids, about three feet deep, and as fish cannot survive in confined water spaces owing to the want of air, the water in the vats was kept aerated by continually filling them by means of a large watering-can, the vat meanwhile overflowing through a pipe into a second receptacle, from which the can was refilled as fast as it became empty. The cans were handled by coolies, who relieved each other throughout the voyage down the river. The fish evidently highly appreciated the efforts to keep them alive, and jostled each other as they crowded together with open mouths immediately under the life-giving stream of water as it fell from the nozzle of the water-can.

On arrival at Hong-kong a tubular net, some 20 to 25 feet long, was suspended from the ship's side to the special fish sampans below, and down this netway the living cargo was now bundled. Sometimes when half-way down an extra big fellow would stick fast, right across the fairway. Then for a few seconds would ensue a regular block, the falling fish rapidly accumulating into a thick mass of shiny, struggling and squirming scalybacks, until the increasing pressure from above carried all before it, and the whole crowd avalanched head over tails into the sampan, very much alive and kicking, and thence to market. And here at last we have our Cataract of Fish.

THE PASSION FRUIT.

By F. A. CAMPBELL.

THE *Passiflora edulis* is one of a family of graceful climbing plants, bearing a flower of about two and a half inches in diameter, and an edible fruit of the size and shape of a hen's egg.

The fruit has a tough skin, filled with a jelly-like substance, in which the seeds are embedded.

When ripe, passion fruit is in great demand in Australia for dessert, and also as one of the ingredients of those tasty dishes known as fruit salads. Fruit salad without passion fruit is a very poor affair indeed. The flavour of this fruit is as delicious as it is unique. There is no other flavour like it, and in time, as the fruit becomes known, a great future is before it.

Although not indigenous to Australia, it is grown there to a larger extent than in any other part of the globe; and in those districts where the conditions are favourable it returns a comfortable income to those who grow it.

Within the last year or two the pulp has been imported in air-tight tins to Great Britain and America, where it has found a ready and profitable sale. Whether it can be shipped as picked in the orchard, is as yet unknown, but it is probable that it could be landed in good condition in Britain if carried in refrigerating chambers.

Last season a lady took a few specimens with her to India and reported that, though somewhat shrivelled in appearance, they were quite sound and were much appreciated by her friends, to most of whom they were unknown.

At the present time there are in Australia only about two hundred and fifty acres of this plant under cultivation, of which two hundred acres lie in Victoria. To get the best returns, a cool, moist climate and a porous soil are necessary. Only a small part of the state offers these conditions.

The chief centre of the passion fruit industry is a district lying thirty miles to the east of Melbourne. This district is from 500 to 700 feet above sea-level, has a rainfall of about 38 inches per annum, and is blessed with a porous and fertile soil.

The cultivation of the passion vine is not one which presents any great difficulty. It may be grown from seed and planted out after twelve months. A small crop will be obtained a year after this, with an increase each year as the vines extend, attaining a maximum in their fourth year. With proper attention, and under favourable conditions, vines have been known to continue in bearing for over twenty years.

It is necessary after the first year to provide a wire trellis. This consists of four wires, the upper one being six or seven feet from the ground. The plants are placed twelve feet apart, the same space being allowed between the rows. The ground between these must be kept cultivated to kill weeds and conserve moisture. It is usual to plant and plough in field peas for green manure.

Compared with that of many other fruits, the picking and packing is not a heavy job. The fruit keeps and carries well, and there is a ready sale in the Melbourne market for all that can be produced. So far, even without export, the demand exceeds the supply, and the price obtained ranges from 15s. to 25s. per bushel case, according to quality and time of marketing. At this price the grower will receive from £60 to £80 per acre, so that a good living can be made from a few acres of this fruit.

In view of the steady flow of migration from Britain to Australia now setting in, the possibilities of this form of payable produce might well be brought under the notice of intending settlers.

NEMESIS.

By D. E. STEVENSON, Author of *Peter West*.

CHAPTER I.

I.

DR LEAN was awakened by the pattering of stones upon his window. This was the recognised method of calling the long-legged doctor when the matter was urgent, for an electric night-bell was an unaccustomed thing to the simple folks of Kintoul, and therefore to be regarded with suspicion.

Dr Lean got out of bed with deliberate haste. Would it be Mistress M'Taggart, he wondered, or Macfarlane? He was not expecting a call to-night. He leaned out of the window and saw, standing in a patch of bright moonlight, a small boy of about ten years old.

'What's wrong, laddie?' the doctor inquired.

'An accident. Maw said Ah was tae say will ye come at once.'

'Where to?' Dr Lean wanted to know.

The boy named a village about ten miles away across the hills.

'Neidway! Losh me! An' ye've walked all the way?'

The words reminded the youngster of his fatigue, and he swayed a little on his feet. Until now the excitement had kept him up and urged him forward like a goad. If his feet faltered he had only to shut his eyes and his sister's white face was before him, the flowing blood mingling with her golden hair. So he had struggled on over the moors, through the forest where the silver moon cast pools before his feet and the bogies watched him from the shadows of the trees. A man, this, for all his tender years and half-starved body—a man who may leave his mark on the world before he has done.

II.

The doctor's face disappeared from the window, and in an incredibly short time the front door opened invitingly, and small Jem Coutts found himself whisked into the warm kitchen and provided with a bowl of broth and a 'piece' to eat while the doctor dressed.

Dr Lean's horse was a flea-bitten sorrel, as bony and weather-proof as himself. It mattered little to either of the pair that they had been out together all day long, breasting the sleet and the sunshine and leaning against the winter's gale; neither hesitated for a moment when the call of duty roused him from a well-earned sleep.

The doctor climbed into the saddle and swung Jem up in front of him. It was fortunate for the doctor's nag that the boy had been starved all his life, so that he was about half the size

and weight of a normal boy of his age. But even so the extra burden told upon Rosinante as he climbed the steep path over the moors.

The hills and trees had the barren beauty of a winter's night touched with frost. They gleamed in the pure, pale moonlight with unearthly radiance, and Dr Lean could not help contrasting the pitiful sordid tale, which was being poured into his ears, with the radiant peace of his beloved hills. But it was the human element that had called him from his comfortable bed—the cry of a broken body, not the divine beauty of the universe—and Dr Lean urged his horse forward as he listened to the boy's story, for he feared that all need for him might be past by the time he reached his destination.

His kindly gray eyes burned fiercely in his weather-beaten face, and he lifted his head and sniffed the air like an old war-horse that scents battle.

III.

Jem's story was a disjointed affair, with many gaps and more repetitions. It was jerked out by the movements of the big horse, who picked his way with human caution over the rocky places of the moor, slid carefully down boggy slopes, and stretched his long limbs in a willing canter where the ground was level. Fortunately the doctor was good at piecing together the human puzzles of life, and by the time they arrived at the labourer's cottage which was Jem's home, he had the facts more or less clearly in his mind.

'Feyther' had come home from the 'Black Bull,' where he had been spending his week's pay, in his usual Friday evening humour. 'Mither' was 'feart to death' of him, and that 'jes' gar'd him waur.' Lean could feel the fragile body of the child shudder as the picture of his drunken father rose before his eyes. 'Mither' was evidently not the only person who had reason for fear.

'How many brothers and sisters have you?' asked the doctor, more to take the child's mind from its terror than from any keen desire to learn details of the Coutts family.

'There's jes' me an' wee Lucy—an' there's Kirstie.'

'Who's Kirstie? Another sister?'

'Naw—at least Ah dinna ken. She's jes' Kirstie. Naebody heeds Kirstie,' he added, as if that were ample explanation of her status. 'Ye see,' he continued, 'feyther was havin' his tea, an' wee Lucy coupit the table—an' the tea was coupit—an' he hit her—he hit wee Lucy.'

Oh, canna the horse gang faster, maister, for she's deein'? Ah ken fine she's deein'.

Lean drew his breath inwards with a little whistle of pain, and pushed on as fast as he dared over the uneven ground. He had passed through Neidway a few days back and had seen the golden-haired Lucy playing on the doorstep of the cottage. Could there really be a living creature base enough to strike a baby of five years old—a baby-girl with blue innocent eyes and golden hair? He felt a sudden rage against the man, a rage so intense that he was almost frightened. If the baby died. . . .

There was only one thing to comfort Dr Lean, and that was the recollection that Coutts was not a native of his beloved Kintoul district. This thought brought a sudden glow of relief to the doctor. The man—if such he could be termed—was a wanderer, a rolling stone, who had tried his hand at most things—so rumour had it—and prospered at none. They had been at Neidway only for three months, and this was the doctor's introduction to the family. He had heard a great deal about them from their neighbours, as was but natural in the gossip-loving community of a Highland village. Mrs Coutts was well spoken of, but for him—James Coutts—there was no word ill enough. He starved his children, ill-treated his wife, and spent all his money week by week at the 'Black Bull.' Even the men, his fellow-labourers, who were usually more tolerant than their wives, had no use for the sullen and drink-sodden ruffian who had taken up his abode in their midst. On one of his periodical visits to the village Dr Lean had seen a quiet, sad-faced woman drawing water from the pump which supplied the row of labourers' cottages, and had rightly concluded that this was the unfortunate Mrs Coutts.

CHAPTER II.

I.

NEIDWAY village lay high up in a niche of the hills. It was a bleak spot at the best of times, cold and wind-swept, and often cut off entirely from the outer world by drifts of snow many feet deep. The row of cottages where the Coutts family existed was situated on the far side of the village, about two hundred yards farther up. A cart-track, deep in mud, wound through a stunted wood, thick with undergrowth of tangled bracken and brambles.

Snow began to fall heavily as Dr Lean neared the cottage which was Jem's home, and he glanced anxiously at the gathering clouds. Weather is changeable from hour to hour in these latitudes, and the good man had unpleasant visions of being snow-bound in the lonely village among the hills. It was no good looking for trouble, however, and his first duty was

towards the child to whose succour he had ridden so far.

Mrs Coutts was watching at the door for the doctor, and when he had stabled his horse in a tumble-down shed he followed her into the house. She wasted no words but led him into the small dark kitchen, where her child lay on a truckle bed.

The doctor's keen glance took in the details of the miserably poor but tidy room in less time than it takes to tell. Two plain deal chairs and some boxes obviously used as seats were grouped round the small wooden table, upon which stood two bottles with unlighted candles in their necks. A cupboard with a broken hinge and a missing leg was propped up in the corner. This was all the furnishing that the room possessed, but the fire burned brightly and a black kettle sang merrily on the hob.

Jem, who was worn out with the fatigues and excitements of the night, was fast asleep in the doctor's arms, and his mother indicated a straw mattress by the fire which was evidently the child's bed. 'Pit him doon there, sir,' she said, 'while I light the candles—will ye see wi' the twa?'

'They'll do fine,' replied Dr Lean. He was a little surprised, for the woman's voice and manner of speaking betokened her higher in the social scale than he had expected. Mrs Coutts had obviously come down in the world—he pitied her from the bottom of his heart.

She lighted the candles with a coal from the fire, brought a basin and a clean, if ragged, towel, and poured out some water from the kettle. Meanwhile the doctor had discovered another person in the room—the slight figure of a young girl, who crouched beside the bed where his patient was lying. She was small and misshapen, with a pathetically vacant face and restless eyes. She leaned over the child with a protective motion as he approached.

'It's the doctor, Kirstie,' said Mrs Coutts in her quiet voice. 'The kind doctor has come tae make wee Lucy better.'

Kirstie looked up doubtfully, but the doctor's face reassured her, and she glided away like a little shadow and sat down on a low box near the fire.

'Who is that?' asked Dr Lean as he began to undo the clumsy wrappings about the little golden head which lay so still and helpless upon the pillow.

'Oh, just Kirstie,' replied Mrs Coutts softly. She tapped her head significantly and added, 'Puir soul, she's wantin'. . . .'

II.

There was no more talk at the moment, for the doctor's brain was in his deft fingers as he bathed the wound on wee Lucy's head and cut off some of the golden curls. Mrs Coutts watched him anxiously, and helped him by

holding the basin and handing him what he required.

'Will she dee?' she asked at last, unable to retain her fears any longer.

'Hoots, woman, no!' replied Lean reassuringly. 'Keep her quiet for a few days and she'll do fine. She's a healthy wee creature, and the wound is only a surface abrasion. It was the blood frightened ye—and you were right to send the laddie for me—but please God there is no cause for anxiety. Where's your husband?' he added in a different tone.

'He's gone doon to the village, mebbe.'

'Frightened of me, I suppose?'

'Ay—jes' that.'

'Well it's not his fault the bairn's alive—an inch lower. Losh me!' cried Lean with sudden fury, 'I'd give a lot to get my hands onto him—he ought to swing for this. The man isn't fit to live—it would be a better world wanting him.'

'Ay,' said Mrs Coutts, stirred from her resignation by the doctor's vehemence; 'it wud be, an' a happier wurld for some folks if he wus deed.'

The wound was cleaned now, and Dr Lean took a silver needle from his case and stitched the ragged edges neatly together; yards of white bandage were then wound deftly round the small head, and the operation was over.

Scarcely was this finished when the blue eyes opened sleepily.

'Oh sir, she's better already!' cried the grateful mother, whose ignorant mind swung from the depths of despair to the heights of hope at this visible sign of life in the hitherto unconscious child. She looked at the doctor with awe, as one who had accomplished a miracle and snatched her dear one from the edge of the grave.

'She's coming round,' Dr Lean replied gravely. 'But she'll need a lot of care, and that rests with you—I've done *my* bit; see and do *yours*.' Long experience had taught him the necessity for impressing ignorant women with the gravity of illness. They were apt to jump swiftly to the conclusion that there was no further need for much care or anxiety once the patient had taken a turn for the better.

It was snowing hard now, and Mrs Coutts set about getting a cup of tea for Dr Lean to speed him on his homeward journey. He sat and watched the simple preparations absent-mindedly. The cripple girl had vanished; she must have crept away when he was busy with wee Lucy, like a gentle, noiseless shadow.

'Is Kirstie your child too?' he asked suddenly.

Mrs Coutts shook her head. 'Ah dinna ken wha's bairn she is; she's a love-child o' James's, an' she aye bides wi' us noo. She's sae quiet and gentle ye'd hardly notice her. Whiles she hears an' understands when ye're no expectin',

an' whiles for days she'll no heed when ye spier. But she's a real help in the hoose for a' her saftness, an' she's unco fond o' the bairns.'

'I could see she was fond of Lucy.'

'Ay, she wud dae onything for wee Lucy, sae gentle an' guid. Ah cud aye leave her wi' the weans tae mind, for a' she's no' wise.'

'Perhaps wiser than one would think,' the doctor suggested as he sipped his tea; but Mrs Coutts shook her head and smiled.

'Naebody heeds Kirstie.'

III.

Dr Lean finished his frugal meal, and went to the window to have a look at the weather. It had stopped snowing for the moment, but the sky was still heavy with the promise of more snow to come. The moon shone in a sickly manner between the rifts in the wind-driven clouds. It would be wise, he decided, to make for Kintoul as speedily as might be, before any further fall of snow rendered the mountain paths impassable. Fortunately it was lying where it fell in a half-melted condition, so there was no fear of drifts.

The doctor turned to speak to Mrs Coutts, but she was not in the room, and then he saw a small figure crouching by the fire. The cripple girl had returned in the same silent manner in which she had gone, and had taken up her accustomed position on the upturned box. He felt interest in the girl, partly from a purely professional point of view, and partly from a subtler reason, more difficult to define. At present the professional reason was uppermost, and he longed to lift the curtain even for a moment to get a glimpse of the clouded, uncertain brain which lay behind.

'You have been out in the snow,' he said to her, patting the thin shoulder with a kind hand. 'You should take off your shoes, for they are very wet.' He spoke clearly and slowly, but the face which was raised to his was quite devoid of understanding. It struck him that he might have been speaking a foreign language, for all the sense his words conveyed. Yet the face was not bestial nor imbecile; it reminded him of a flower—a pure white camellia—innocent, and even beautiful in its strange, unearthly way, but blank and meaningless. The eyes moved restlessly like those of a small animal, but there was not even animal intelligence in their shallow depths.

Lean stooped and removed the poor leaking shoes with his own hands. They were clogged with the wet snow, and one heel was missing. 'Where *have* you been?' he asked her, without any hope of an answer, but merely as a protest against the madness of going out so inadequately shod. Their eyes met, and the doctor saw a sudden gleam of intelligence kindle the blank face into something approaching a human ex-

pression. It was as if the wind stirred a still pool till it rippled gently from bank to bank.

'Not fit tae live,' she said slowly, with the even and difficult pronunciation of one entranced. 'Not fit tae live—a better world wantin' him—a happier world—if he was deed.'

Dr Lean started back in surprise at this echo of his own hasty words upon lips which he had come to think of as dumb. Before he could recover himself the gleam of intelligence had vanished, giving place to the former expression of vacancy and inertia.

CHAPTER III.

I.

DR LEAN started homeward, leading his horse, for the snow was slippery and wet. Clouds were still scudding across the sky, and even the tempest-hardened trees in the wood creaked and groaned with the fury of the wind. 'Thank Heaven the snow is too wet to drift,' thought Lean, 'or there would be many a sheep lost to-night amongst the hills—aye, and maybe a shepherd too.'

He had not gone far before he saw two sets of footmarks in the soft snow—one track going in the same direction as himself, and the other returning. There was no difficulty in identifying them as Kirstie's, for the missing heel left a clear imprint of nails on the snow. Where could she have gone? he wondered; what strange whim of her shadowed brain had drawn her out of her warm corner by the fire on such a night as this?

The doctor was so much interested in Kirstie's movements that when the footprints turned off the track and struck into the deep mazes of the wood, he tied his horse to a tree and followed them. And now there was another set of footprints—the heavy marks of a labourer's iron-tipped boots, which went before the smaller ones but did not return.

Dr Lean laughed at himself a little grimly for his interest in the puzzle at his feet. Had Kirstie gone out to meet a lover? The idea was incredible, yet he could find no other solution to the mystery. He hesitated for a moment, and then went forward again, but more cautiously, for the man in the hob-nailed boots might prove an ugly customer to meet at the dead of night in a lonely wood.

It was strange that he had no inkling of the identity of the man—strange but true, for after his swift and vigorous denunciation of James Coutts, the uncouth figure had faded out of his mind, and it was not until he saw it lying across his path that he remembered the man existed.

The sudden sight of the bulky form sprawling in the snow startled the good doctor not a little, but it lay so still that he was emboldened to

draw nearer. The white light of the moon shone down upon the scene, and by its radiance the doctor soon saw that the man before him was rather to be succoured than feared. The figure lay face downwards, and all around the virgin snow was dyed a ghastly red.

II.

A very cursory examination showed that James Coutts was beyond mortal aid. The thin sharp knife which had brought him death was driven into his back up to the very hilt.

Kirstie had killed him—that much was clear even to the doctor's bewildered senses—little crippled Kirstie whom 'naeboddy heeded.' She must have stolen up behind him, her light footsteps muffled by the snow, and sprung upon him with incredible strength, driving the knife deep into his vitals. *Incredible*, was the doctor's thought; yet the hypothesis must be given credence, for the evidence was incontrovertible. He stooped and drew the knife from its human sheath, and saw, with added horror, that it was his own instrument. A long, sharp surgical knife which he had been using for cutting his stitches in the Coutts's kitchen. Kirstie must have found it lying on the table and picked it up when he was not looking. He realised suddenly that his own words regarding Coutts were to a great extent responsible for what had happened. He had said that the man was not fit to live, and the half-witted Kirstie had seized up the first thing she could lay her hands on and set forth to murder her father in cold blood.

The doctor shuddered involuntarily. Was the child with the flower-face a homicidal maniac, or was it the accumulated hatred of years bursting through its overstrained dam and sweeping all before it? But no; neither of these two explanations satisfied Dr Lean. He blamed his own chance words, whose vehemence, penetrating the dark recess of that vacant brain, had filled Kirstie with the *one idea*, which was immediately put into execution.

Lean stood for several moments, balancing the knife in his hand, while he sorted out the facts which were known to him and decided what action he should take. Coutts must have been wandering about in the woods—too frightened to go home till after the doctor's departure—when Nemesis in the form of his own imbecile child had overtaken him and sent him on a longer trek. Kirstie was merely an instrument of justice; in the doctor's eyes she was no more to blame for her deed than a child who kills a fly—nay, hardly so much, for the child might know that it was being cruel, whereas poor Kirstie had not even sense enough to know that. Dr Lean classed her as being capable of only one idea at a time, and only receptive of ideas at certain moments when the corner of the dark veil was lifted. He weighed very care-

fully his knowledge of Kirstie as perceived by himself and as revealed by Mrs Coutts—was it possible that she was a danger to the community? Her record of gentleness and self-effacement, her goodness to the Coutts children, and lastly her innocent, blank face disproved such a theory absolutely in the eyes of Dr Lean. Here was no maniac of homicidal tendencies—he would have staked his life on the innocence of her soul.

It had begun to snow again now, and the trail of footmarks was being swiftly obliterated. The doctor, with his queer mingling of matter-of-fact sense and Celtic mysticism, took this as a sign from Heaven, and was confirmed in his decision to keep his knowledge to himself. Heaven was covering up all traces of Kirstie's part in the crime—which, in his opinion, was no crime at all, but a swift and just retribution. It was not for him to betray God's instrument to the stern majesty of the law. If suspicion fell upon an innocent person he would certainly have to speak, but in the meantime he decided to hold his peace.

III.

Looking back on this adventure of his with the comfortable interval of a week between him and that ghastly night, Lean was ready to laugh at himself for ever having qualms at all about the matter. His strenuous life amongst the bleak hills had engendered in him a view of

right and wrong, clear and just, if slightly primitive. He lived far from the subtle and complex shades of the law as it is known in the more civilised—and perhaps less clear-sighted—places of the world. Life and Death were everyday words to him by nature of his profession; they held none of that fear and awe which they hold for those less used to their eternal mystery. And so he was able to take a wide—an almost godlike view of the happenings of that night. A wild beast had been killed, and, as he had truly prophesied, the world was a better place without him. What did the instrument matter?

Lean was sure that Kirstie herself had no recollection of what she had done. She was as innocent and flower-like as ever. The cottage at Neidway was a different place. An atmosphere of peace and happiness pervaded it, and Mrs Coutts went about her daily work with a lighter step. Coutts had had no friends and many enemies, so there was nobody to mourn his death.

The weather had become so inclement, the snow drifts so deep and treacherous, that few dared to venture far up into the hills, and after a cursory beat round, the minions of the law were glad to give up all search for the murderer who had escaped so miraculously from the scene of his crime. So the mystery of Coutts's death soon passed into oblivion—and the big doctor kept his knowledge to himself.

FLIGHTING IN THE GALIKO MARSHES.

By KENNETH DAWSON ('WEST COUNTRY').

THE sun was sinking in sullen splendour behind Mount Olympus, and, driven by the howling Vardar gale, the cloud-masses scurried like frightened sheep before the wolf-pack.

All day, and for the two preceding, the wild north wind had raged over the mountains and marshes of Macedonia, shrivelling with its icy breath, and driving before its resistless might the flotsam and jetsam of the air. Even in the sheltered harbour of Salonika angry white horses capped the gray-green waves, and out beyond the Vardar mouth the restless turmoil of the sand-stained sea was eloquent of the disturbed and sleepless vigil which had been the lot of the myriad wildfowl tossing amidst the maelstrom of waters.

It was ideal fowling weather. With the first quarter of the New Year's moon, then rising above the twin peaks of Kotos and Hortiach, away to the east, the frost had steadily increased in intensity, and in the course of a week the fowl population of the marshes seemed to have trebled, as the denizens of the inland meres were frozen out and driven seawards by the ever-increasing cold.

Fowlers' weather, indeed; and our hopes ran high as we cantered along over the frozen ground, which rang like iron under the horses' feet.

Whilst still some distance from our destination, X held out his arm and pointed half-right. A vast cloud of ducks had risen from the marshes, and, after a short flight, pitched again; and three times in the next ten minutes was the performance repeated from different parts of the flooded area.

At last we pulled up on the lee side of a big stack of coarse, marsh hay, which formed a welcome shelter for the horses during their cold wait. For a moment or two X and I sat on the horses, absorbed in the wonderful scene. Directly ahead, and not more than three hundred yards away, a sheet of shallow water, partially sheltered from the bitter wind by tall reeds, was black with duck, mostly silent and motionless, snatching the chance of a few moments' slumber whilst it offered. Away to the right in the near distance was a large company of widgeon, whose musical 'whee ohs' came pleasingly across the marsh. Farther still

in the same direction a large gaggle of perhaps two hundred geese splashed and preened themselves in the shallows, their powerful wings sending the spray flying as they ducked and played in lightsome mood. From the incessant gabble they were white fronts, well named the 'laughing geese.' Beyond the geese, and too far away to distinguish the species, were other bunches of wildfowl; and every few minutes one or more of these assemblies would rise, and, after circling round a few times, settle again. It was, indeed, a spectacle to gladden the heart of any fowler.

Then from the sea, a mile away, sounded two muffled reports, and a few seconds later, from the same direction, a mixed company of birds—widgeon, the sun glinting on their white bellies; mallard, square and powerful of wing; teal; and the long-necked, slender pintail, built like graceful, thorough-bred horses—came streaming up the marshes, beating against the wind, and low down, right over our destined hiding-places in the patches of tall reeds.

The sight stirred us into action. Quickly long thigh boots were pulled on, guns made ready, and, leaving the horses, X and I waded out into the shallow water. While we were still quite out in the open about a score of widgeon hurtling down wind, high, but just within shot, passed right over our heads, and my left barrel pulled one from out the skies.

At the shots the fowl on the sheltered lagoon rose with a roar audible above the shrieking of the wind, only to settle again half a mile away. The duck were plainly rattled after three days buffeting by the gale, and were as tame as such wild birds ever become. Those out at sea, too, would flight early after a restless day, and everything appeared ideal, save for the heavens, which were rapidly clearing of clouds, and particularly eastwards the blue sky promised a poor background for shooting when once the light had gone.

I left X in a small circular patch of reeds with open water all round, a very desirable situation, for his dead birds would be easy to retrieve, and even winged duck might be secured, an achievement which was hardly ever possible, even in daylight, should they fall amongst the dense cover of the reed beds.

My own stand was at one end of a large patch of reeds some hundred and fifty yards farther on. There was open water on three sides, and it was well situated for birds coming in from the sea, but it would be necessary to select shots at ducks coming down the marshes, leaving those which, if hit, would fall into the dense cover behind me.

Meanwhile, as soon as he saw we were hidden, one of the orderlies, according to instructions, rode about a mile up-wind, parallel with the water, until he came to a track which traversed the flooded area. Along this he rode for some

distance, the water being only a few inches deep. His progress was marked by clouds of duck rising in every direction. First to come were a big company of widgeon, mixed with teal and a few pintail. They were mostly too high, but I stopped a pintail, and saw X bring down, and retrieve, a widgeon.

The geese had stopped playing and splashing, and were watching the mounted man. Deeper and deeper grew the water, and still the big birds did not rise, and I wondered if the beater would be able to put them up. He stopped when the water was nearly to the horse's girths, and waved his cap. At the movement, with a mighty roar of wings and much splashing, the whole gaggle rose. Straight down the gale they swept, their laughing chorus borne on the wings of the wind until the air seemed to throb with the wild music.

X was too far inland, and the skeins into which the geese had split missed him, but one small lot of seven I saw would cross my front within shot. They were led in the apex of the V by a bird with heavy, black, breast markings, which distinguish the older geese from the birds of the year.

They crossed a good thirty yards, and perhaps a little more, away, and the old leader staggered at the right barrel, but it needed the left to make him crumble up and fall with resounding splash into the water.

Then a lot of nine widgeon, struggling up wind, and low down, gave X an easy right and left, and two beautiful drakes floated paddles up as the result of the shots.

Teal, more widgeon, and two shelducks came down the marshes, and for a few minutes we were busy, my share being two widgeon and a shelduck, which presented a singularly beautiful picture as it lay with wings outspread on the water in all the glory of its black, white, and chestnut plumage, and vivid red bill.

Night was coming on apace, and presently a fusillade from several gunners nearer the coast warned us that the ducks were coming in off the sea. The light was getting bad, and the silver slip of the moon shining in the blue-black of a cloudless sky presented the worst of all fighting backgrounds. However, the fowl were beating dead up-wind, and so were fairly low.

Mallard began to figure in the bag, and one after another two green-headed drakes and a sombre-coloured duck were added to my heap. X was also busy, and I heard two splashes at short intervals as a big company of widgeon came over him, making the night resound with their melodious whistling.

Snipe passed constantly, but were invisible in the dim light, and several single teal flashed like meteors just over my head, disappearing into the darkness behind too quickly to offer a shot.

Swish, swish, swish, on every side sounded the pinions of the incoming ducks, most of which passed me unseen and unshot at; but X was busy, for he can see like a cat in the dark.

Then, from away over the Vardar, came a faint sound like a pack of hounds in full cry. Louder it swelled, mingling with the melancholy notes of the jackal's evensong, and the tinkling sheep bells from the flocks pasturing on the outskirts of the marshes. Geese in hundreds, possibly thousands, and, from the sound, coming our way.

Rigid, with straining eyes, I stood striving to pierce the dark curtain of the night, and to catch sight of the big shadowy forms beating up wind. The chorus was well-nigh deafening, and then, suddenly, I caught a glimpse of ghost-like wraiths passing overhead.

My first shot rattled on the quills of one bird without apparent effect, but the choke barrel with BB shot proved too much for even anserine armour, and down it came, and lay

a black spot on the water, which still reflected the gleam of the afterglow.

We were right in the middle of the multitude of skeins, which passed overhead and on each side. X was blazing away as though at a big covert shoot at home, and four times in the next couple of minutes I fired double shots. The geese were just too high to make sure of, and although the big shot rattled like hail on their plumage, only three came down, and one of these was but winged and was never picked up.

All too soon they had passed, and with them the flight for the evening. I waited a few minutes longer on the chance of any stragglers, but none came, and so, gathering up the slain, with the heavy load over my shoulder, I staggered off through the mud and water to find X and make for home.

Ten geese, all white fronts, seven mallard, nine widgeon, four pintail, two teal and a shelduck made up quite a respectable bag for little more than an hour's shooting.

THE SHOP.

PART II.

III.

ON the following day Mr Mason took the train to Chillington, whence a motor-bus conveyed him within a mile of Poundshurst. The remainder of the distance he had to walk, but that he did not mind. It was a glorious forenoon; he had never been in that part of the country before, and he was charmed with its beauty. The quaint old-world village appealed to his artistic sense. It stood on a height from which he could survey mile after mile of landscape, entrancing in its loveliness.

'By Jove, what pictures one could paint here!' he ejaculated.

From a short distance away he stood and looked at the shop. A stout, elderly man was standing at the door, the sunshine lighting up his white apron. Mr Mason shaded his eyes with his hand to bring the scene into focus.

'Perfect!' he said to himself. 'That old chap just gives the necessary high light to bring out the subject.' He went forward and nodded condescendingly. 'Good morning!' he commenced. 'Beautiful weather.'

'Grand weather—grand weather, sir,' returned the other.

'Lovely stretch of country you have about here.'

'Glad to hear you say so, sir,' said the elderly man. 'I like it myself. Fine place, Poundshurst. Some folks think it dull, but, Lord, I have never found it dull. There's always something going on.'

Mason had no intention of stating the real object of his visit. If he decided to take the plunge, a contingency the thought of which rather amused him, he would get Wetherall to come and look into things with him.

'Do you keep tobacco?' he asked.

The old fellow smiled and rubbed his hands. 'Certainly, sir,' he answered. 'We keep everything that is likely to be called for. Perhaps I shouldn't boast, but we serve all the gentry within six miles of us. Lord Festing is one of our customers, and Sir James Waters. What tobacco do you require, sir?'

'Let me see what you have?' replied Mr Mason, entering the shop.

While he was choosing his tobacco, he looked all round him. Certainly the place appeared to be well stocked. His experience gained before he set up to be a 'gentleman' told him that.

'Been here long?' he asked, conversationally.

'I have had this business for a quarter of a century,' replied the old man with a touch of pride. 'I built it up. It was a hard job at first, but I stuck to it. I am giving it up now, and I am sorry. You see, sir, I have devoted my whole life to make the thing a success. What I'm to do when I leave it, I don't know.'

'Then why are you leaving it?' asked Mr Mason quickly.

'Ah! That's another question. There are domestic reasons.'

'I see,' said Mason. 'I wish you good morning.'

'Good-morning, sir, and thank you,' returned the old man genially. 'There is a very fine old church here, if you would care to see it.'

'Thank you. I mean to have a look at it,' said Mr Mason.

IV.

Jem glanced at his watch, saw that he had nearly two hours before the bus left Gillington, and took his way to the church, whose ancient gray tower rose among the trees. As he was entering through the lychgate he stood aside to allow a lady who was coming out to pass him. The lady looked at him and stopped. 'Why,' she exclaimed, 'Mr Mason!'

Jem stared, his eyes beaming, his pulses beating somewhat faster than usual. 'Miss Bertram-Smythe! This is a pleasure that I never expected. Do you live here?'

Miss Bertram-Smythe seemed a little uncomfortable at the question. She flushed slightly. 'I am—er—staying with friends.' Then she added hastily, 'What are you doing here?'

It was now Mr Mason's turn to be uncomfortable. The girl looked an aristocrat from her close-fitting hat to her dainty little brown shoes. What would she think if she knew that he, Mr James Mason, ex-officer and young man of fashion, contemplated taking over a country grocery store? 'Oh,' said he lightly, 'I have just run out from Folkestone to have a look at the country.'

'Motoring?'

'Er—yes.' His ride in the bus could certainly be stretched to bear that interpretation.

'Lovely country, isn't it?'

'Delightful.'

Conversation flagged. Miss Bertram-Smythe was wondering how she was going to get to her home over a shop in the village without Mr Mason seeing where she lived. Mr Mason was wondering whether he ought to offer to accompany her. It was beastly awkward, he thought, that she should have friends in the neighbourhood. 'Do your friends live near here?' he asked.

'Oh yes, quite near. That is to say, a mile or two out.'

Probably in one of the big houses that he had passed in the bus, thought Mr Mason to himself.

'I—I came out to do some shopping,' volunteered the young lady.

'Not a great variety of shops, is there?' said Mr Mason.

'No. Not very many.'

'I have only seen one, and that——'

'Yes—I—I know. It's a horrid place, Poundhurst.'

'Don't you find it dull after Folkestone?'

'Appalling.'

'But, of course, having friends here makes a difference!'

'Oh yes, of course.'

For one brief moment Miss Bertram-Smythe had been glad to meet the young man. Now she wished that he would take himself off. If only she could have invited him to luncheon, there was no knowing what might have happened. While in Folkestone he had appeared to be decidedly attracted. But the horrid shop! She could have cried with vexation.

Still they stood there, neither knowing what to say, each realising the difficulty of the situation. Naturally, the girl was the first to recover her wits. 'Er—Good-bye, Mr Mason,' she said at last.

'Won't you allow me to walk a little way with you?' asked the young man hesitatingly.

'Good gracious, no! I—I beg your pardon. I didn't mean that, of course. What I mean is—' She stopped, not knowing how to continue.

'Ye-es,' said Mr Mason.

'The—the people I am staying with are frightfully particular. They—they mightn't like it. It—it is difficult to explain——'

'I see,' returned Jem with a shade of bitterness. 'They might think that I wasn't quite in their class.'

'No, no, I don't mean that,' said Miss Bertram-Smythe desperately. 'I mean——'

'I quite understand,' interrupted the young man. 'Well, I won't inflict myself on you. I appear to have made a mistake, but it doesn't really matter. Good-bye, Miss Bertram-Smythe.'

He raised his hat ceremoniously, turned away, and took the road towards Chillington. 'So that's that,' he said to himself. 'I'm not good enough for her. It was all very well at Folkestone, but now that she is here with her swagger friends, she doesn't want to know me.'

Miss Bertram-Smythe returned home in a condition of intense sympathy with herself. 'I daren't let him know of the beastly shop,' she murmured. 'He would never speak to me again. And he is sure to find out. And I know that he was fond of me. It is all horrible.'

That evening Mr Smith had a very trying time with his daughter. That night the young lady's pillow was saturated with tears.

V.

For two days Mason cogitated over what he should do. It was evident that Miss Bertram-Smythe wished to have nothing to say to him, so that it mattered little what he did.

He went to see Wetherall. 'About that business that you spoke of, Jack,' he said. 'I went out to Poundhurst the other day.'

'Oh!' returned his friend with a laugh.

'I've a dashed good mind to take it.'

'Hum!'

'What the devil do you mean by that?' asked Mason.

'Nothing. I was wondering how long you would keep it.'

Jem was about to retort hotly, when he remembered that Wetherall had no knowledge of his previous experience.

'I could keep on with my painting,' he said lamely.

'My dear chap,' observed Wetherall, 'if you are going into business, you'll have to stick to business. You can't do that and play about too. Better give up the idea.'

'I'm going to take that shop,' said Mason firmly. 'I want you to fix things up for me.'

'All right,' returned Wetherall. 'We can run over and see the old man to-morrow, if you like.'

'The sooner the better,' said Jem Mason.

With Wetherall acting as agent, the matter was soon arranged. Mason was to take over the business from the first of the ensuing month, the house being included in the bargain, the furniture remaining at a valuation. Mr Smith and his daughter had taken rooms at Folkestone while they were searching for a suitable place of their own; the old man going backwards and forwards to Poundshurst every day.

When the time came for him to bid good-bye to the shop where he had spent so many years, Mr Smith felt very miserable. He was entering upon a new life which was strange to him, in which he could take no pleasure; but he consoled himself with the thought that it was for Pleasant's happiness.

Jem Mason started on his new enterprise with grim determination, yet with a certain soreness of heart. The purchase of the business and the contingent expenses had absorbed nearly every penny that he had. Almost he regretted what he had done, but it was now too late for regrets—he had burnt his boats. As for Miss Bertram-Smythe, he tried not to think of her.

That young lady in her new environment was by no means happy. She had hoped that she would meet Mr Mason in Folkestone, and that, now the incubus of the shop was removed, their former relationship would be renewed. But, though she haunted the tennis courts and other places where they would be likely to meet, she never saw him.

For a week after Mr Smith had finally handed over the shop, he wandered about like a lost sheep. For him the tennis courts had no attraction, and with the people whom he met he was not in sympathy. He was suffering from heart-hunger. Looking back on it, the little corner shop in Poundshurst seemed to him a paradise.

One evening he was sitting looking drearily out of the window, when he was startled by an impatient exclamation from his daughter, who was seated at a writing-table.

'What's the matter, dear?' he asked gently.

'I can't find my address book,' she answered shortly. 'I have hunted for it everywhere, and it is not to be found.'

'When did you see it last?' asked her father. 'Good gracious, how do I know?' she replied quite sharply. 'I only know that it isn't here.'

Her father sighed. He was becoming accustomed to such fits of temper from Pleasant. The coming to Folkestone had apparently not brought her the pleasure that he had expected. It looked almost as if his sacrifice had been in vain. His daughter sat with the end of the pen between her lips, a frown on her face.

'I believe I left it at Poundshurst,' she said at last.

'Never mind, my dear,' returned the old man. 'You can easily get another.'

'Another? What's the good of that? All the addresses of my friends are in the one that is missing.'

'Would you like me to run over and see if it is there?' asked Mr Smith.

'What on earth would be the good of you going? You would never find it.'

Mr Smith had been longing to pay a visit to the old shop where, as he now realised, he had been so happy.

'I could search, dear,' he said humbly.

'Nonsense! I'll go myself. Meantime, this letter will have to wait. It's a frightful nuisance.'

VI.

About three o'clock next afternoon Miss Bertram-Smythe found herself walking up the familiar road leading from the bus terminus to Poundshurst. As she drew near the shop she stopped to look at it.

'Thank goodness, I'm done with that, anyway,' she said fervently.

She entered the shop as a customer might have done, her head held high. She was glad that the new proprietor had never seen her. Then she remembered with a shock that she would have to say who she was in order to get permission to search for the missing book.

A young man, his back towards her, was engaged in making up a parcel of groceries. She tapped on the counter. The young man turned and came towards her; then he stopped suddenly, his mouth open, while a flush rose slowly to his brow. But only for a moment did his coolness desert him.

'Good afternoon, madam,' he said calmly. 'What can I do for you?'

Pleasant gazed at him, her face pale, her breath coming quickly.

'You!' she ejaculated. 'You! Here!'

'Certainly,' returned Mason, smiling. 'Why not, madam?'

'But—but—I don't understand. Here, working behind the counter!'

'Surely. Since I am the proprietor of the shop, where else should I be? We have some very fine bacon, madam. Real Irish; just

come in this morning. Also we have some delicious eggs.'

Miss Bertram-Smythe's face was now as red as a peony.

'And—and I took you for a gentleman!'

Jem Mason flicked a morsel of cheese from his spotless apron.

'Ay, madam,' said he, 'you consider the position of a gentleman incompatible with earning an honest living. I believe that there *are* some people of that opinion.'

'I believe the position incompatible with keeping a village shop,' returned Miss Bertram-Smythe hotly.

'I am sorry that you should think so, madam; sorry for several reasons,' said Mason placidly. 'Did you—er—say bacon?'

'No, I didn't,' replied the girl haughtily, and flounced from the shop. She was boiling with rage and injured pride. Outside she suddenly paled.

'Good gracious!' she exclaimed to herself. 'I wonder if he knows.'

VII.

Mr Wetherall fully expected that he would soon have a visit from Mason, asking him to get rid of the shop for him, but three months passed without his seeing his friend. Then, one day, the sale of the contents of a house took him within a few miles of Poundshurst. Finishing the sale early in the afternoon, he thought that he would take the opportunity of running out to see Mason.

Descending from his two-seater, he stared in amazement. The shop was barely recognisable. The windows were enlarged, and displayed an assortment of goods that would not have disgraced a London establishment. But what astonished him still more was the sight of Mr Smith standing at the door, supervising the loading of a motor-van. The old man was invested in a white apron, his face the picture of complete happiness.

'Ah, how d'ye do; how d'ye do, Mr Wetherall!' asked Mr Smith genially. 'Glad to see you.'

'So you are back here again, Mr Smith!' exclaimed Wetherall.

'Yes, yes, back again, as you see. I couldn't stand an idle life. It doesn't suit me.'

'Then Mr Mason is gone. I was afraid that he wouldn't stay here long.'

'Mr Mason gone? Oh, dear me, no. You will find him inside.'

Wondering, Wetherall entered the shop, which presented as great a contrast to what it had been as the windows did. Mason was behind the counter, busily making up packages, a pen behind one ear and a pencil behind the other.

'Hullo, Wetherall,' he said, looking up. 'I am glad to see you, old man. I've been mean-

ing to write to you, but we've been so frightfully busy.'

'Then you are getting on well?' remarked Wetherall.

'Getting on well? I should say we are! We are opening another shop at Chillington. Oh, by Jove, yes. We are getting on famously.'

'And—and you like it?' gasped Wetherall.

'Like it? Of course I like it. Why shouldn't I like it? Suits me down to the ground.'

'I see you've got old Smith here. Where does he come in?'

'Partners, dear boy, partners. He's got the capital and I've got the brains. Not that the old chap is a fool. Far from it, but his ideas were a bit old-fashioned. Wanted gingering up, if you understand me.'

Wetherall looked round him. At the farther end of the shop was a small office partitioned off, the upper portion of glass. There, bending over books, was a girl.

'I'll be finished in a minute or two,' went on Mason, continuing what he was doing; 'then we'll go upstairs and have some tea. The missus will be pleased to see you.'

'The—the—'

The door of the little office opened and the girl came out, her eyes fixed on a paper in her hand.

'Miss Bertram-Smythe!' exclaimed Wetherall, his eyes dilated with astonishment.

'Mrs Mason,' corrected Mason, with a laugh.

'But—but—'

'Yes, I know, old man,' said Mason in a low voice. 'You knew her in Folkestone as the fashionable Miss Bertram-Smythe, and so did I, while she took me—but I'll explain all that later.'

'Jem, dear,' asked the girl, looking up from the paper, 'have you sent out that order for Lord Festing?'

THE END.

THE BOWMAN.

THE tough yew fashioned his bow,

The gray goose feathered his shaft,

Where the shadowy green woods grow

The swift deer taught him his craft;

But the heart of the bowman—who'll gainsay

That his heart belonged to an older day!

Where the savage shouldered his spear,

Where the cave-man carried his club,

When the skin-clad hunted the deer

And the naked strangled the cub,

The heart of the bowman leapt and flamed

At the tap of a hoof in a land unnamed.

And to-day when the clean fish leaps,

And to-day when the red fox runs,

When the challenging grouse pack sweeps

Like a brown cloud over the guns,

Our heart is the bowman's heart awake

To the glint of a horn in the tangled brake.

SEVENTH SERIES

THE DEEP HOLE OF SIBERIA.

By BASSETT DIGBY, F.R.G.S., F.Am.G.S.

PART I.

I.

IT is difficult to put into a sentence or two a cameo picture of Baikal, the "Holy Sea" of Siberia. One can look at Lake Geneva, for instance, through the wrong end of the telescope, and sum up its chief characteristics in a few words. But this great land-locked trough of melted snow, up in the north-east region of Asia, is sixty-six times as big as Lake Geneva; and lenses have their limitations.

As long as England, covering the area of Denmark, it is the greatest fresh-water lake in Europe and Asia. It is the deepest lake in the world, and one of the coldest. It is fed by nearly a thousand rivers, creeks, and brooks; a single shallow stream takes away only a slight proportion of this great inflow of waters, down to the distant Arctic Ocean. Four thousand miles from salt water, its depths are peopled by a unique breed of seals. Only 1500 feet above ocean level, and extending as far south almost as lat. 51° N., I found its shores blocked in many spots by broad sweeps of pack-ice in mid-June, while butterflies swarmed among kaleidoscopic beds of flowers a mile or two back from the beach. The bodies of fishermen drowned in its sudden storms are nearly always cast ashore, as are those of strange deep-sea fishes shot up from the black abyss of waters by volcanic tremors a mile below the surface. Earthquakes rumble through the snowclad riparian mountains, and hot springs gush up through gashes in eternally frozen soil.

Baikal's very dimensions have always been a mystery to cartographers and geographers. The map drawn from descriptions furnished by the entourage of Leov Vassilich Ismaylov, who passed by on his embassy to the Emperor of China, in 1719-21, when the world was already pretty accurately reproduced in atlases, was utterly inaccurate; and the chart of the Jesuit priests at Peking, fourteen years later, leads one to conclude that the worthy fathers should have stuck to sky pilotry. In the 1875 edition of a standard handbook on Russia, compiled by 'an ex-British consul and second secretary to

the embassy at St Petersburg,' the literary diplomat announces that Baikal is 74 miles long by 67 broad. In cold fact, this freshwater sea is about 420 miles long, and from 20 to 50 miles wide.

Journeying east from Europe, you come to Baikal 40 miles on from Irkutsk. After leaving the Siberian capital you wind in and out of the forested gorge through which hurries the Angara, a mile wide and strewn with rocky shallows. Then, rounding the last screening cape, you come in sight of the outflow of the river, and beyond it, a magnificent mass of tumbled, snowclad mountains, the main range of the Khamar Daban, on the far side of the lake. A few moments later the trundling train, the engine of which is stoked with birch logs, stops at a station on a shelf of broken rock, blasted from the precipitous hill of marble that towers, in white cliffs, from the trackside.

The ferryman, in his clumsy sharp-prowed boat, had already started away with a load, but he came back for me though I was dressed as a poor peasant. There were eight or nine of us aboard. The ripples were almost lapping over the gunwale. We had to sit very still as Ivan Fedorovitch propelled us across the verst of swift waters with short chopping strokes. I could see every pebble on the bottom. It was difficult to realise that the stream was more than 20 feet deep. A little way below our course a few isolated rocks jutted out, among them the sacred Shaman Stone of the Buriats. On to this steep, up-flung reef—say this race of nature-worshipping nomads—go the spirits of the dead. If they have led worthy lives they acquit themselves safely in the ordeal. The shades of the wicked, however, rendered dizzy by the swirling stream, tumble in—and presumably get wet wings and spiritual colds.

We very nearly met with the fate of the bad Buriats, for Ivan Fedorovitch laughed so uproariously at a quarrel among the bare-legged women who sat astern, rolling cigarettes, that we drifted downstream and missed the reef by a matter of inches. 'Ahh Bozhemoi! Bozhemoi!'

squealed the ladies, briskly crossing themselves, while the men, with less pious exclamations, leant out and staved off our craft.

Over the turfey brow of a spur of the hills that wall in the southern source of the Angara, the road sagged down past the old Custom House of what used to be the Mongolian neutral zone, to a straggling village, one of the earliest Russian settlements on the shores of Baikal.

II.

Listvyenitchnaya is four miles long and seldom more than a couple of cottages deep, for it perches along a narrow strip of grassy foreshore, between the cliff and the water's edge. The little unpainted cottages of rough-hewn logs are very old, and cower low from the storms. The windows of many of them are flush with the ground.

The village used to be a pretty rough place, despite its air of rustic benignancy. A crowd of choice scoundrels flocked in from Irkutsk and Trans-Baikalia when news spread of the building of the ice-breakers, *Baikal* and *Angara*, some twenty years ago. The great *Baikal*, which was to ferry the Trans-Siberian trains across the Holy Sea, which is frozen for a depth of several feet in winter, was made in sections in the Newcastle yards of Armstrong-Whitworth, and put together here under the direction of three British engineers, Messrs Douie, Hardy, and Renton. 'Every civilised person in the place carries a revolver, and two if he is of a cautious temperament,' wrote Sir Henry Norman, who visited Listvyenitchnaya at the time. 'Nobody thinks of going out after dark, and every week some one is robbed or killed. The whole population is ex-convict or worse. The foreman of the labourers on the *Baikal* was residing in Siberia for having outraged a child; the man who conducted me to where Mr Douie and Mr Renton were at work was a murderer from the Caucasus; a short time before my visit another murderer employed on the ship had tried to repeat his crime, and had been consigned to chains again; the very day I was there, the police were looking for a man who was wanted for killing eight persons at one time.' Listvyenitchnaya may have improved since those days, but I noticed a considerable number of shabby police about the place.

Boat and barge building is the chief village industry, and many Chinese, tall, stalwart fellows, laughing and larking with their Siberian comrades, were at work on the growing hulls. As I paused to watch the boat-builders a child's funeral passed. Funerals are very simple functions in Siberia, so matter of fact and devoid of effort to obtain an effect of pomp and circumstance that they deeply impress a foreigner. Plodding through the dust came a young girl bearing a branch of a pink flowering shrub. A

few paces behind followed another, carrying a white coffin-lid wreathed in tawdry blue and pink paper flowers and streamers. Then a group of small children and kerchiefed women. Four of them supported a white coffin, in which I caught a glimpse of a little waxen face and a frail pair of alabaster hands folded over the breast. There was no weeping. There were no red-rimmed eyes among the mourners. As the party trudged stolidly on toward the graveyard some of the dead child's comrades began to lark about around the coffin-bearers. Hardly an interested glance was bestowed on the party by the village loungers. Half the children born in Siberia are spectators of life for only a hand-span or two of years.

In the dock lay a pair of waspish one-funnelled little steamers, the *Mikhailo* and the *Seraphin*. But the huge landing-stage and piers were deserted, already crumbling and tottering. With the coming of the railway round the southern tip of the lake Listvyenitchnaya has lapsed into the normal lethargy of Siberian villagehood.

It had been summer at noon—this was in mid-May—but a bitterly cold wind was blowing down from the mountains at dusk, as I returned to the outflow of the Angara. In a wooden hut, where the turf ran down to the beach of waterworn granite pebbles, the sort of pirate's den we read of as boys, the ragged red-shirted ferrymen were playing cards on an upturned tub, brandishing vodka bottles between pulls, to emphasise their contentions. Stumbling over coils of rope and skeins of fishing-nets, I groped my way into the smoky murk and besought their services. 'Have to wait till four more want to cross, Nietchevo,' muttered a ruffian, dozing on the brick stove. But after anxiously scanning the deserted track to Listvyenitchnaya I returned and compounded for solitary transportation at the cost of three passengers. Not rising from his seat on a chest, and continuing to play his cards with one hand, with the other the pirate chief, whose heavily-bearded features were as apostolic as his choice of epithet was the reverse, clutched an oar and prodded a heap of sailcloth. Out crawled a deaf-mute. He shambled down to the water's edge, rubbing the sleep from his eyes—and dropped his coat in the river. A certain great American, under stressful circumstances, used to hire men to help him swear. The deaf-mute ferrymen was not rich enough for that. I thought he would burst a blood-vessel when he found, as he wrung out the dripping jacket, that I was the only passenger. However, after referring the case back to the Admiralty Court in the hut, I eventually got away, and was landed at nightfall on the pier at Baikal Station. Here it was dark, but out across the heaving waters of the lake, forty miles east, the snow-clad peaks of the Khamar Daban were bathed in pink and gold, a magnificent rift of radiance

in the heavens, upflung for a hundred miles along the distant horizon.

III.

The southern part of Baikal cuts clean across the route of the Trans-Siberian railway. So steep are the mountain sides, and so numerous the beetling cliffs that fringe this abysmal trough, that for years the Russian authorities regarded a riparian track as impossible. Trains were run aboard the *Baikal* and ferried over the lake, some forty miles, to Misovaya, up the opposite coast. This plan worked fairly smoothly in summer, but in winter the ice proved a greater obstacle than had been expected. This great steel ferry of 4000 tons, displacing 19 feet of water, and driven by three 1250 horse-power engines, forged ahead through ice two or three feet thick, but was helpless in four or five feet ice. The passengers had to get out and walk, or crouch in crude peasant sledges for hours, in zero temperatures and a high wind. Not unnaturally, they objected.

Then the Russian Government sent out dynamite and Italian labourers, many convicts, and much vodka, seditious editors in chains, and zealous engineers in clover; and the impossible was achieved. Out of the living rock, now on ledges from which you could drop a fish-line 900 feet before touching bottom, now in league upon league of tunnels blasted through the flank of the mountain, was torn a track on which trains could pass, the completed link of Russia's stupendous chain of steel binding Moscow to the Yellow Sea.

The *Baikal* and the *Angara*, limelighted wonders of the engineering world a few years ago, when they were taxed to their utmost capacity by the troops bound for the war in Manchuria, are still in active commission between the Angara outflow and Tankoi, but it is freight that they carry now. Only on rare occasions, as, for instance, when the tunnels were dynamited in the war between Semenov and the Bolsheviks, are they put into passenger service.

Three hours' run, mostly through tunnels, brings you from the Angara outflow to the southernmost tip of the lake. All the way the mountains have dropped steeply into the sea. Only in two spots have narrow valleys, mere clefts in the forested heights, given foothold to a cluster of log cottages. At Kultuk, however, a few square miles of grassy lowland edge in between the lake and the mountain wall. A quarter of an hour later comes the busy little railway settlement of Sludyanka, and you are running under the flank of the Khamar Daban. Now the tracks run a little farther back from the water, through a strip of woodland. To landward, tier upon tier of forested hills, and, beyond them, snowy mountains, a desolate region with not a village and hardly a wagon-

track between you and the Mongolian frontier a hundred miles south.

Opposite Listvyenitchnaya is the village of Tankoi, innocuous enough to eastbound travellers, but a snare and a pitfall to the westbound, who are swooped upon by Custom House officials in search of loot from Cathay. Once they nearly confiscated three hundred hairy but innocent caterpillars of mine as a suspected breed of silk-worms.

Misovaya, on a headland reached three hours later, is a pleasant village with a past. It was the first inhabited spot east of Baikal in the old days when the caravans from Irkutsk had passed through the mountains to Kultuk and northward along the shore. In winter it was the point of arrival and departure for traffic across the ice. Hardly a generation ago the bulk of the overland tea came through it when the new 'Kup-yetski Trakt' was cut through the mountains to Kiakta, diverting the traffic from Verknie Udinsk. It was an important base in the days of the war with Japan.

There is not even the smallest inn now, and the great timber piers, one of which is nearly half a mile long, are in a state of collapse, frequented only by a few fishermen, who sell their wares as soon as they are drawn from the water.

The most interesting thing in Misovaya, perhaps, is the 'Kup-yetski Trakt' (Merchants' Highway), the short cut to Mongolia. Wandering on the mountainside, I had trouble in finding it. Had I not had plenty of experience of Siberian roads I should not have recognised it—a mere strip of rutted dust, three or four paces wide, among the bushes lining the course of a foam-flecked brook. I followed this stream for a day, revelling in the flowers and fragrances of spring, which always comes to the sheltered valleys around Baikal a month before the steppe and the taiga (woodland) are freed from the clutch of winter.

Ferns in abundance were shooting up, and among them mauve and pale blue violets and clusters of budding lily of the valley. Dwarf pink primulas and wild carnations starred the turf in the open spaces among the bushes. White wood-anemones and orange kingcups blossomed among the alder stumps. Clumps of purple flag struggled for nourishment in the sand, vetches of cream and heliotrope and tufts of pink and white saxifrage nestled among the rocks. In the birch undergrowth lay thickets of wild currant and raspberry, rooted in cool couches of yielding moss.

Most of the butterflies were our own and their cousins: gorgeous purple Camberwell Beauties and busy little Green Hairstreaks, ragged Commas and dawdling Meadow Browns, small Green-Veined and Wood Whites, Orange Tips and Small Tortoiseshells, sombre Ringlets and pearl-speckled Fritillaries. Wherever the

sun flooded through a rift in the gloomy roof of cedar branches they came dancing down to flirt with their gay counterparts of colour who were chained to mother earth by a stalk.

But the taiga was silent. I missed the triumphant bird chorals that rings through our woodlands in May. Only the occasional tapping of a woodpecker or the fluted 'woot-woot, woot-woot' of some unseen songster broke the stillness.

Misovaya lives on familiar terms with the wolves. The old fellow in whose cottage I slept told me that they slink through the village street most winter nights, searching for straying dogs or succulent dust-heaps. I didn't meet any—but a dozen graves in the pretty mountainside garden of the dead had been clawed up not so long ago, and gnawed bones and hanks of hair lay scattered around the fallen wooden crosses.

(Continued on page 836.)

NUMBER TWENTY-FIVE.

By NORMAN HAYES.

The following are extracts from letters written by Miles Sadler, Music Master at Bingley Hall School, to his friend and colleague, Thomas Elmsley, Science Master at the same school. The letters were all written from Monte Carlo.

10th January.

WHAT did the London Specialist say! Just what the School Doctor said! Told me my nervous system was thoroughly upset. Thank goodness his prescription was not one of either potions or lotions, and contained no stupid restrictions as to diet. 'Knock off your work, and forget all about it for three months in some sunny, cheery climate'—that was the prescription.

'What about a quiet little spot on the Riviera?' I ventured to suggest.

'Quiet? Why, in Heaven's name, quiet?'

At this I became suddenly bold. Visions of the Russian Ballet, operas, and concerts passed through my mind.

'What about Monte Carlo?' I said.

For a tantalising moment the old medicine-man considered, and then—'Monte Carlo? Well, why not?' he said, with a chuckle.

Now, after a week's sojourn here, during which I've spent the hours of daylight basking in glorious sunshine, and the evenings in re-tasting something of the pre-war joys of the Russian Ballet, I cordially echo my medical adviser's words, 'Well, why not?'

14th January.

What a life! What a life! If only you were here to enjoy it with me. I'm feeling as fit as a fiddle—as a dozen fiddles! Fiddles, did I say! Ah, my boy, you should just hear the Casino orchestra fiddles in 'The Mastersingers' overture, or in the 'Pathetic' symphony. That's 'some experience, believe me, Bud!' as our friends across the Duck-pond might put it.

I amused myself yesterday for a couple of hours before dinner, in the gaming rooms, watching roulette. Quite entertaining.

16th January.

Mr Miles Sadler, whose ill-health recently gave his many distinguished friends grounds for grave anxiety, is now well advanced on the road to a complete recovery. During the past week his sleep has been peaceful and undisturbed, and he has partaken with enjoyment of solid and liquid refreshment at frequent intervals. No further Bulletins will be issued.

(Signed) { JOHN BUZZFUZZ, M.A.D.
WILBERFORCE PIFFLE, A.S.S.

Permit me, my dear Elmsley, to supplement the foregoing official *communiqué* by saying that as an invalid I am now a positive fraud. As for nerves, I simply don't believe I possess such a thing as a 'Nervous System.' Talking of systems, it's rather pathetic to see the men and women—some look really quite intelligent—who sit round the roulette tables working out their so-called 'systems.' How absurd! Of course it's merely a question of luck—pure and simple—*n'est-ce pas?*

18th January.

Two wet days in succession, and as a consequence I've spent quite a lot of time strolling about among the players in the Casino. I must admit the roulette interests me. Odd thing how certain numbers seem to 'bring up' certain others in their wake. A coincidence, you say? Yes, I suppose so.

20th January.

Talked to a man in the Casino yesterday and mentioned my observations as regards the sympathy that seems to exist between certain numbers on the roulette wheel. He told me that this is a well-known fact. Surely 'fact' is too strong a word! I saw the same chap playing later on, and he won quite a nice little sum on what he called a system of 'numerical affinities.'

23rd January.

Weather continues rather cold and cheerless. Have amused myself by devising a little scheme.

of my own to take advantage of this 'affinity' idea. I tested it at a table to-day without actually staking anything. Had I been playing I should have won 110 francs.

25th January.

Put my system to the test last night and left the Casino the richer by seventy francs.

26th January.

Gave my system another run to-day. Didn't win anything, but left off all square, after being a bit down. Fancy I can tighten up my plan of campaign a little further. We'll see.

1st February.

Glad to get your letter and to know that my promising young pupil Bainbridge acquitted himself so creditably at the organ last Sunday in the School Chapel. . . . As regards your taunt that I made merry in a recent letter about gamblers with 'systems,' my remarks were directed towards those who think they have infallible systems. But to play without any system whatever is sheer folly. Perhaps you will be interested to know that my system brought me in forty francs yesterday and sixty francs to-day.

4th February.

Of course I'll tell you of my losses as well as of my winnings. As a matter of fact, I lost last night—130 francs. No. 25 was the chief cause of my failure. I've always known it was a weak spot in my little game. Must look into it.

6th February.

Can't see how I can profitably cover No. 25, but perhaps it doesn't really matter. To-day I won 110 francs. What nice pleasant chaps these croupiers are—they really seem glad to see one win.

Whom do you think I ran across in the rooms to-day? F. G. Mowbray! Fancy that staid, pompous old chap in such surroundings. I think he read something of the surprise I felt in my look. He told me the sight of these ridiculous gamblers amuses him for an odd hour or two. He doesn't gamble, he says, but occasionally throws on a ten-franc counter 'just to amuse his wife.' I guess his wife's amusement must have been simply hilarious a few minutes prior to his noticing me, as I happened to see him pick up a couple of 'Mille' notes, and quite a varied selection of oval and circular metal and bone tokens, as the result of a winning coup he had just made.

10th February.

Had a long yarn with a gray-bearded old boy in the rooms to-night. He plays roulette on some geometrical figure scheme—stakes out a triangle on each dozen! I really had to laugh—

well, wouldn't you have laughed? Happily, old 'Flight of Ages' (he's a person of very venerable aspect) took no offence; said he thought my amusement was quite natural. All systems to his thinking are equally ludicrous, but his contention is that one must have some system and stick to it.

11th February.

Lost 70 francs yesterday and 130 to-day, but stuck steadily to my system. It's extraordinary how a single 'uncovered' number in a system can trip one up some days. Yesterday and to-day '25' was simply all over the rooms. Near and far the cry was the same. '*Vingt-cinq, rouge, impair et passe!*' until I began to have a sense of positive shame in knowing that this wretched number, so constantly in the public eye, was *uncovered*, and that it was I who persisted in leaving it in so indelicate a state.

Interested to hear about Pethwick and his sister coming out here. My recollection of Pethwick in the old Oxford days makes me fancy he'll feel rather out of his element in this place. His sister was a Girton girl, wasn't she? Yes, certainly I'll look them up on their arrival.

13th February.

Your facetious enquiries after the state of my Nervous Systems duly noted, and they provoked a suitable measure of hilarity on perusal. Thank goodness my physical nervous system is functioning so admirably that it can withstand the rude shocks it has to suffer from the other—to wit, my Roulette System—which still gives me occasional nasty jars.

14th February.

St Valentine's Day, and a silly fancy prompted me to back '14' *en plein*, and to my gratified astonishment up '14' came! First time I've won an *en plein*. An amusing, but rather a 'heady' experience. No more such excursions from the beaten path of a well-ordered system, said I to myself, said I, as I pocketed my winnings. Promptly resumed my system, and would you believe it? up came '25', which happens to be on the opposite side of the wheel to '14.' 'Lot's Wife,' thought I, and a momentary temptation came to me to 'look back' and put a counter once again on No. 14. 'No,' I muttered to myself, 'Pillars of salt defend me!' Have a system and stick to it! Have a system and—

'*Quatorze, rouge, pair et manque!*' the croupier suddenly cried. 'Dash it all, I will have one more shot at it!' I growled, and I staked a louis on '14,' and up came '25'! My dear Elmsley, from then on I was lost for the day so far as orthodox play was concerned. What a shameless gambler's path I pursued, giddily careering

over the board to pick up *en pleins, Chevauz, and Transversales*. Frankly, it was much more entertaining than sticking to a system, and as a result of my dissipated adventures I ended up thirty-five francs to the good.

19th February.

Had a card from Pethwick. He and his sister expect to arrive on the 25th. Asks me to find them rooms in some *quiet* hotel, as he hopes while here to put the finishing touches to a book he is writing on 'Political Economy'! Monte Carlo and Economy! Pity his subject isn't Social Extravagance—then he might have studied it in a dozen entertaining halls of mirth and gladness here.

21st February.

Ran across old 'Flight of Ages' (you remember the patriarchal old boy I told you of previously) last night in the rooms. He was very much grieved when I told him about my St Valentine's Day escapade at roulette. My luck on that occasion, he said, was a grave misfortune, as such experiences invariably lead to subsequent orgies of reckless gambling and thereafter ruin!

'No, no, my dear young man. Play in circles, or squares, or rhomboids—for myself, I prefer triangles—or adopt any other method of play you fancy, but have a system, and *stick to it!*' and then he suddenly added, 'That is, of course, if you really *must* play.'

23rd February.

'Have a system and stick to it!' How absolutely sound old 'Flight of Ages's' advice was. I played my system to-day and won—after several temporary set-backs—140 francs.

25th February.

Pethwick and his sister arrived to-day, and I escorted them to their hotel. He is the same old thing, and looks, well, just as clever as he actually is. Miss P. is quiet, but not shy. One of those people, I fancy, who don't talk too readily, and who don't deal much in 'small talk.' They both like walking, so we may see something of each other from time to time.

28th February.

Your jests about my 'Nervous System' begin to grow rather threadbare. My dear fellow, did I ever say that my system was *infallible*? On the contrary, I've always admitted it had its weakness, due to the indelicate condition of No. 25, which still remains—and I greatly fear must continue to remain—'uncovered.' But is the regrettable immodesty of one member of a community to be allowed to prejudice the blameless virtue and respectability of the remaining thirty-five? Isn't it rather to be hoped that the moral example of the majority will, in time, accomplish its beneficent work and win

back the transgressor to the paths of virtue and propriety? In the pursuit of this glorious missionary enterprise, surely it is my opportunity and privilege to play a tireless and self-sacrificing part?

2nd March.

Had a glorious walk with Pethwick and his sister by the upper road to Roquebrune and over the hills to Gorbio, where we lunched. From there we climbed up to Sainte Agnès and then dropped down into Menton. We had tea at the Menton Casino and *watched* the dancing. Fancy my feelings listening to quite a good little orchestra playing jolly dance tunes, and longing to take the floor all the while. Pethwick told me he doesn't dance—makes him giddy; and from the half-amused look on his sister's face as she watched the dancers, I could guess her thoughts on the subject of One-steps and Two-steps, and what Pethwick calls the various 'menagerie' stunts—Fox-trots, Bunny-hugs and the like.

3rd March.

Life is full of pleasant surprises, my dear Elmsley. Yesterday 'Mademoiselle Vingt-cinq' was a model of propriety, and never once caused me a moment's embarrassment at the tables, and as a consequence I won ninety francs. But you won't guess my latest surprise! The brainy Miss Margaret Pethwick, far from being of her brother's opinion on the subject of modern dancing, is awfully keen on it, and dances supremely well. Last night at the Café de Paris we had some ripping dances together.

'But why didn't we dance together yesterday at Menton?' I asked her.

'I suppose because you never asked me,' she replied with a smile. By the way, she has got quite an attractive smile.

5th March.

Confound Mademoiselle Vingt-cinq! She's nothing but a bold vulgar hussy, and if she continues flaunting herself in the public gaze of the occupants of the gaming-rooms as she did yesterday, I shall be compelled to make a pretty vigorous protest to the authorities. Her shameless indiscretions yesterday cost me 230 francs!

9th March.

No, I wouldn't describe Miss Pethwick as good-looking or pretty, but she is certainly attractive. Dark hair and eyes, pale complexion, and one of those rather large mouths which I always think are so much more expressive than the small variety. Talking of looks, what hard-faced chaps some of these croupiers are. Of course it's their business to rake in your money (or rather counters) when you lose—I lost 110 francs yesterday—but surely they needn't do it with such an air of brutal satisfaction!

14th March.

Miss Pethwick is very keen on music and adores the Russian Ballet, so we've done a couple of concerts together, and spent several very jolly evenings at the Ballet. We are also quietly and systematically sampling all the places where dancing is to be had.

16th March.

Lost 100 francs at the tables to-day, and feel I must now begin to consider my financial situation afresh. I still fancy my system is sound *in the long run*, but is the 'run' a bit *too long* for my purse, now that one is frequenting *Thés Dansants*, Russian Ballets, and concerts, with such pleasurable results! If only I could cover No. 25!

18th March.

I received a characteristic little note from the Head yesterday with kind enquiries as to my health. Ominous solicitude! It foreshadows a recall to scholastic duties, of course, and—my dear Elmsley—the thought of work has become inexpressibly distasteful to me. As a matter of fact, for the last few days I've had a slight return of nerves. Not sleeping too well, and I find myself unaccountably irritable. Went to a cinema a couple of nights ago. Very stupid, I thought it, though some people seemed to find it exceptionally good. Odd how people's tastes differ. I was at the Russian Ballet last night, but for once I found the performance strangely lacking in *verve*. By the way, Pethwick and his sister are away spending a few days at San Remo. Pethwick's idea, I fancy! What restless dispositions some chaps have—must always be on the move!

20th March.

Rain to-day—the first we have had for three weeks, and not a gleam of sunshine. Very depressing!

'Quite a pleasant change, isn't it?' a woman at the hotel said to me.

I confess, my dear Elmsley, this popular notion that there is always and of necessity something desirable about 'a change' strikes me as ridiculous. Presumably this woman came out here like the rest of us to find sunshine. She gets rain and an overcast sky, and promptly talks about 'a pleasant change.' This same female, I may remark, is no mean judge of good wines, and she takes care always to be supplied with the best. I suppose if the *Maitre d'hôtel* gave her a bottle of red ink some day, she would drink it with relish on the theory that it was 'a pleasant change.' Then take a chap like Pethwick. Must push off for a few days into Italy for 'a change,' and he must needs drag his sister along with him, who possibly had no fervent desire to go at all. I had a card from them last night to say that they may return to-morrow.

23rd March.

Rain gone, and glorious sunshine again, and as a consequence, I feel much cheerier and quite fit once more. The Pethwicks returned yesterday. To-day we had a ripping walk. Brother Pethwick was unable to join us as he had to work on his book—and we arrived back in time to have tea and some dancing at the *Métropole*. The Pethwicks enjoyed their trip to Italy, but Miss P. told me she was quite glad to get back to Monte Carlo. 'You see, there was no Russian Ballet at San Remo!' she said.

25th March.

The *Adriatic* anchored in the Bay to-day. What a topping picture a big liner makes when lit up at night—as the advertisements say, 'a veritable floating palace.' After the Russian Ballet to-night, Margaret Pethwick and I sat out on the Casino terrace looking far across the water towards the distant lights of the Italian coast, while close in lay this amazing 'floating palace' in a shimmering pool of light, the reflection of her own gaily-lit deck-sides and portholes.

I suppose the sheer beauty of the scene and of the night affected me in some queer fashion, as I suddenly grew unusually confidential, and, to my surprise, found myself telling Margaret Pethwick all kinds of funny little intimate things about my people and my work. Then, if you please, I must needs babble on and tell her about what you so wittily (?) dub my 'Nervous System.' Of course a clever woman like Miss Pethwick must have thought me every kind of a silly ass, but she didn't say so, and in fact she was jolly nice about it, and asked me to explain the idea to her. Now, my dear Elmsley, what do you think her first comment was? 'But what if No. 25 turns up?'

'If? If? It simply isn't a question of "if"; it's *always* turning up,' I said petulantly.

For a time she studied my little roulette card in her hand, and then she said, 'You might get some one to work the system with you who could look after "25."'

'I wonder,' I replied.

'Yes, what you really want is a *partner*,' she said, and as I chanced to look up at her from the card we were both studying, I encountered that wonderful smile of hers.

I suppose it was the smile that in an instant banished all thought of my blessed 'system' from my mind, but it was surely Margaret's own last words that suddenly told me what indeed I wanted, and had been wanting, unknown to myself, ever since I had first met this dear woman at my side—*A Partner*.

'Margaret,' was all I managed to say, but I have a distinct impression that as I spoke, I took hold of a woman's two hands, and that the woman let me retain my hold.

Now, dear old chap, this is just where I insist on setting down a neat little row of asterisks—so—

* * * * *

Even a best friend, and you are my very best friend, must be left outside the further confidences of that wonderful evening's happenings. One thing remains to be said, and that is, that I count on you to be my best man on a certain eventful day in the not very distant future. I think I ought also to add that Brother Pethwick is awfully nice about it all. He is more than ever tied to his work now—Heaven reward him!

30th March.

Your witticisms during the past eight weeks have been so tireless and painstaking on the subject of a certain roulette system which it has been my good fortune to discover, that it will surely come in the nature of a happy release from your labours to learn that that same 'Nervous System' must henceforth cease to serve as a target for your shafts of wit. To-day my system is no longer a glorious uncertainty, since it has been at last perfected by the opportune advent of Margaret. When I tell you that it was on the 25th of last month that I first met Margaret, and that it was on the 25th of this month that she agreed to become my wife, and when I further add that Margaret will be twenty-five years of age on the 25th of next month—on which same auspicious

date we are to be married—you will surely scarcely ask me if I have at last succeeded in covering No. 25. To-morrow Margaret and I play my system in partnership, once only, for the first and last time, as Margaret thinks gambling is really rather a stupid way of spending one's money.

31st March.

My dear Elmsley,—We played The System to-day. I was responsible for my section of the wheel, and Margaret backed '25' *en plein*; and—will you believe it?—up came '25'!

The laugh with which both Margaret and I hailed the joyous event rather shocked the decorum of the croupiers and officials around, and, I fear, quite upset the geometrical problems closely engaging the attention of my dear old 'Flight of Ages,' who happened to be seated in front of us at the same table.

As we were leaving the Casino I said to Margaret, 'Don't you think we ought to give our system one more run to-morrow morning before we leave for Paris?'

The emphatic manner in which Margaret replied 'No!' convinced me that further discussion was useless. But why this resolute opposition to a safe and certain means of making a fortune, I ask myself?—Yours,

MILES.

P.S.—Perhaps Margaret is right after all. I had quite forgotten that to-morrow will be the First of April—All Fools' Day.

WILD ELEPHANTS IN BURMA.

By an OLD RESIDENT.

I.

NEARLY seventy years have elapsed since Rangoon came under British rule. Laws and regulations for the protection of elephants were soon put in force. It was certainly highly desirable that their extermination for the sake of getting ivory should be prevented. Elephants were also a necessity for the Moulmein teak timber trade then being developed, largely by a class of retired captains of the mercantile marine, who had settled there soon after its acquisition by Sir Archibald Campbell in the first Burmese War of 1826. Rangoon was also captured by him in the first Burmese War, but was given back to the Burman king on the conclusion of peace, and only Moulmein and the sea-board down to Siamese territory in the south were retained by us.

The authorities in India seem to have been ignorant of the comparative value of the two ports. The river Salween, on which Moulmein is situated, is navigable only for some eighty miles from its mouth. Above that a chain of

rocks extending for several miles in the bed of the river makes navigation impossible for even the smallest canoe, though the river is useful for floating timber from the forests which exist far above the rapids. The Irrawaddy from Rangoon is navigable for steamers and large craft for 800 miles to the north, almost as far as the Chinese frontier. Along its banks are some of the largest and most populous towns and villages in the whole province, including Mandalay, which was made the royal capital after the second Burmese War, and Ava, the former capital, now a comparatively deserted village with only a few pagodas left—reminiscences of its former royal magnificence. It is curious that such a mistake should have been made in 1826, for Sir Archibald Campbell had personally seen the advantages which its fine river gave to Rangoon, as he had ascended it with his army, and peace was eventually made at Yandaboo on its banks, at no great distance from the Burmese capital. Perhaps it was hoped that by restoring the most valuable part of our conquests to its former possessor, we should be more likely to

induce the Burmese to live at peace and in friendliness with their powerful neighbour.

For about twenty-seven years there were no overt hostilities. Then their rulers thought the time had arrived when they might safely try again the fortunes of war, and the second Burmese War commenced. This period found India under Lord Dalhousie, who was fully alive to the mistakes committed in the first Burmese War, and determined to avoid them in the second. Rangoon became a British port, and its history since then and the many years of prosperity it has enjoyed emphasise the mistake we made in restoring it in 1826. What remained of Burma under a Burman king was also fortunate in possessing a ruler who kept it at peace for over thirty years, and determined that in his time, at any rate, there should be no more wars with the British. He received Colonel Phayre, the ruler of British Burma, in a friendly spirit, though he could not consent to do so without the Colonel's complying with Burmese custom and removing his shoes when entering the royal palace. In the year of the Indian Mutiny King Mindoon (as his name was) subscribed to the fund for the relief of sufferers, and a few years later he gave a contribution to the first Protestant church erected in Mandalay. He sent his son Theebaw, who succeeded him, to Dr Marks's S. P. G. school. He was a strict Buddhist, however, after the old school, and would allow no reforming of its tenets.

At length this best of Burman kings, of whom there are any records in the last three or four hundred years, died, and there was the usual slaughter in his numerous family of those who might be possible competitors for the throne, in spite of the strong protests of the British envoy. Some saved their lives by escaping to British territory. Theebaw, though he had no prior right to the throne, was chosen as his father's successor. He happened to be married to a strong-minded woman, Supyalat, of royal descent, and she had strict notions of the disadvantages of the wholesale polygamy which had hitherto been the practice of Burman kings. He had to marry her sister in addition to herself; but any other women whom Theebaw fancied were soon put out of the way, and for some time Supyalat was the real ruler of what remained of Upper Burma. Intrigues, interference with trade, and an attempt to fine a British timber corporation £300,000 for alleged defrauding the Burman Government of its revenues on teak taken from its forests, soon brought on the third Burmese War. Within a few weeks of its commencement Theebaw and his queens surrendered to the British commander, and the whole of Burma came under British rule.

Theebaw and his retinue were deported to India, where he has since died. The ex-Queen Supyalat was permitted to return to Rangoon, where she lived as a British pensioner not far

from the famous Shway Dagon Pagoda. If Supyalat could be persuaded in her old age to write her reminiscences, they might give an interesting account of men and things in the early portion of her eventful career.

II.

Upper Burma has long been noted as the home of wild elephants. Before its coming under British rule large captures used to be made in King Mindoon's time by means of *khedda* operations. They have been tried since by the British Government without any great measure of success, and their cost has been very heavy. Both in Upper and in Lower Burma privately worked *kheddas* have been tried and are even now in operation.

The elephant is a most valuable animal, and it is difficult to see how the teak timber forests of Burma could have been worked without its assistance. Steam-worked machinery in some of the larger timber-yards and saw-mills has in a measure displaced elephants in Rangoon and Moulmein, but this would be impossible in the forests, where during the last thirty or forty years the logs have had to be dragged by elephants to the nearest waterway from longer distances every year. And when they reach the waterway the assistance of elephants is again necessary to prevent jamming, and to push them to where they can float to the seaport, either on the Salween or the Irrawaddy. It is not easy to see how machinery could act as an effective substitute for the intelligence of the elephant in such work as this, on uneven ground, at places often a hundred or more feet distant from each other.

Elephants are the largest of living terrestrial mammals. The female commences to breed after fifteen years, and the period of gestation is from eighteen to twenty months. A single young one is usually produced—occasionally two. Up till the middle of the nineteenth century it was generally supposed that domesticated elephants did not breed, and that consequently all that existed were those that had been reclaimed from a wild state. More intimate acquaintance with their habits showed that this was a mistake. In a small village of about fifty houses, where some twenty elephants were kept, principally for transport purposes, though some were occasionally hired to foresters for dragging timber, the writer saw about half-a-dozen small elephants out feeding with their mothers. The males of the herd would feed together in a part of the forest a few hundred feet away from the females and the young ones. The last-mentioned would scamper about between their mothers and the other female elephants, who seemed to take as great interest in their protection as their own mothers did.

Under our system of protection wild elephants

seem to have increased enormously all over Burma. Some steps will have to be taken before long to afford protection to villagers, for, however valuable an animal an elephant may be, the lives of the cultivators who yearly produce food in abundance are of infinitely greater importance to themselves and their families, and also to the State. Some villages in the Katha district have within the last two or three years had to abandon their cultivation owing to the depredations of herds of wild elephants. What they consume for food is a comparative trifle, but they seem to take a malicious pleasure in trampling down and destroying what they cannot consume. In a single night the labour and care of many months is thus brought to naught. The villagers also complain that whilst in former years a herd could be frightened away by the whole village turning out, shouting and beating empty oil tins or cooking pans, this remedy is no longer of use. Mere noise, which was formerly effective, has ceased to be of avail. The elephants have apparently become aware of the fact that the villagers have no guns, and are not easily frightened away without weapons of the kind.

It should be remembered that the Imperial Forest Service has something like 30,000 square miles of country, a large proportion of which is wholly unexplored and destitute of inhabitants. Such an enormous territory affords an excellent and secure breeding-ground for wild elephants, and though they take so long to bring forth their young, a century in such primeval jungle will naturally increase their numbers to an enormous extent.

The Burma Forest Department officials are amongst the complainants, as well as poor cultivators. They say that their young plantations of teak and other valuable trees suffer yearly from the attacks of elephants and other wild animals. If they would confine their depredations to forest reserves and the enormous expanse of uninhabited country the Forest Service has taken up, there would not be so great a ground for complaint. But when they invade and destroy cultivation in old and long cultivated lands something should be done to protect human lives and human industry, which yields food not only for the producers, but also for the export trade of the province. Possibly some British sportsmen might be inclined to try Burma as a field for their operations if they knew that within a short distance of Pegu, forty-eight miles from Rangoon on the railway line, a herd of elephants appeared quite recently in December and very nearly caused the death of a veteran Anglo-Indian hunter who had been out after elephants perhaps twenty times before, and had often succeeded in relieving the villagers of the elephants destroying their crops in the vicinity of a town of 17,000 inhabitants and within fifty miles of Rangoon. On the last

occasion he was charged by a female elephant with two young ones, but succeeded in saving his life by throwing himself into a declivity from the tree under which he was standing. This, no doubt, saved his life at the cost of a broken collar bone and some dislocations. He was carried by his followers to the railway station after the elephants' retreat, and twenty days after the occurrence and treatment in the Rangoon hospital was convalescent again. Except where human life is endangered female elephants are not allowed to be shot in Burma. The rule would seem to admit of some modification where they are so numerous and destroy so much property as they do in Burma.

III.

With almost every article risen in price within the last few years, it would be remarkable if elephants proved an exception. In Burma, where something like 5000 of these useful animals are owned by timber firms and the Government Forest Department, a fully-trained timber elephant is worth Rs. 8000, about double the price which obtained fifteen years ago.

Khedda is the name given to the method of catching elephants in stockades erected for the purpose. There is a regrettable high mortality among the animals captured, and forest officers write that the methods adopted by some of the licensees appear to have been barbarous and cruel in the extreme. During nine months ending 31st March 1920, 751 elephants and 79 calves were captured in Burma; 139 elephants and 14 calves died, and 39 head escaped, whilst 15 were released.

The science of elephant catching by *kheddas* appears to be in a more advanced state in South Tenasserim, where the local Karens are eminently suited to this work, and where unduly cruel methods are not in vogue. The operations are there conducted by erecting a narrow rectangular stockade of stout poles, lashed to as many growing trees as may be available. The stockade, which has a trap-door at the forward end operated in the manner of a portcullis, is invariably erected across the regular tracks along which the herds of from eight to ten usually cross the Siamese frontier and head for the coast. This generally happens about the termination of the rainy season, and continues for several months. From the mouth of the trap-door two long lines of lighter-built stockade are conducted forward for several hundreds of yards at an angle of about 60° to one another, and their inside faces covered up with boughs and shrubs.

The operators wait for a herd to approach along the track, and when, by skilful manipulation, they have proceeded a sufficient distance inside the two arms of the outer stockade, they hasten their entry into the trap by illuminating lines of previously prepared oil lights in their

rear, and, if necessary, to the sides, and by shouting and firing off guns from the required direction. The portcullis is dropped as soon as the operator considers the whole herd has passed into the stockade, or that it would be risky and dangerous to keep it open longer for reluctant or dilatory members of the herd. In some instances licensees build stockades round salt-licks, closing them in their rear when a herd has entered in sufficient numbers.

It has been suggested that stricter inquiries should be made into the capabilities of applicants for licences to capture in *kheddas* before granting these, in order to avoid unnecessary cruelty in the operations. It would seem that in many cases licences have been issued to persons who merely finance the *khedda* operations.

A conservative estimate of the life of timber-working elephants is said to be ten years, and for baggage-carrying elephants twenty years. They are too valuable to be otherwise than humanely treated by owners, and the Government Forest Department takes the greatest care of them. They are fed twice a day, and worked, as a rule, only in mornings and evenings, when the heat is not great. The demand to make good casualties is, however, considerable. When the beasts get too old for service they are either handed over to the Veterinary Department or turned loose in one or other of the more distant reserved forests.

In view of the enormous cost of elephants, it

is thought strange that the officers of the Forest Department do not utilise mules in their stead for carrying baggage. They have been largely employed in all British campaigns for more than a century, and their adaptability for pack transport has been proved over and over again, both in our own and in foreign armies. Wellington used them for commissariat transport in Spain in the early part of last century, when they carried 200 lb. in a mountainous country with bad roads, doing from ten to fifteen miles a day. In the Abyssinian expedition the load was reduced to 100 lb., and they did fifteen miles a day. An elephant is supposed to carry over 300 lb., but when the difference in cost is considered, the mule is the better pack animal. The rate of progress of mules and elephants is about the same. The latter, however, require the services of at least two men each, whilst one man can look after several working mules.

The mule, like the ass, enjoys an extraordinary immunity from disease. After the campaign in Egypt in 1882 it was found that the English horses suffered extensively and severely from a kind of malarial fever, from which the mules, which had gone through the same hardships, were entirely exempt. When we bear in mind that the authorities have had great experience of the value of mules on our Indian frontier, it seems strange that they should be so overlooked by the Burma Forest Department in favour of the costly elephant.

ANTONIO STRADIVARI AND HIS COPYISTS.

By A. J. ASTLE, Author of *The Principles of Golf*.

I.

TO judge by the number of letters forwarded to the writer, it is evident that his article on 'Strad' violins—which appeared in the April 1923 issue of *Chambers's Journal*—has aroused a certain amount of interest. Seventeen readers of the *Journal* wrote to the Editor asking for information concerning instruments owned by them. Every one of the violins in the possession of the correspondents contains a label supposed to be that of Antonio Stradivari, and information as to the genuineness—or otherwise—of the instrument was requested.

In most cases the description of the violin and a reproduction of the label as forwarded by the owner were sufficient evidence to condemn the instrument as a copy. Several of the violins were sent to the writer for examination, but a brief inspection resulted in an adverse verdict.

After the lapse of nearly two hundred years (since the death of Stradivari) it may be taken for granted that almost all, if not all, the genuine 'Strads' have been identified. Any person who is familiar with the appearance of

the real 'Cremona' varnish could scarcely fail to take notice of a genuine specimen of Stradivari's work, even were this to come before his eyes in circumstances the most unlikely. If an amateur of experience happened to be passing a pawnbroker's shop and he noticed a number of violins hanging in the window, one genuine 'Strad' and the remainder ordinary fiddles, his eyes would at once pick out the genuine instrument.

It is always possible—but not probable—that another 'Strad' may come to light after being put away for many years and forgotten. So there may be other readers of *Chambers's Journal* who own, or may come across, a violin labelled 'Antonius Stradiuarius' (or Stradivarius), and would appreciate some suggestions which might enable them to pronounce an opinion as to its claims to be the handiwork of Antonio Stradivari, the greatest of all fiddle makers.

During his lifetime, Stradivari's model was copied by many of his contemporaries, but these copyists inserted their own labels. After his death, the imitation of his violins continued, and sometimes copies of his label were inserted.

It is probable that the intention was to supply as exact an imitation as possible; so, to make the facsimile complete, a copy of Stradivari's label was included.

In such cases the copyist usually placed his own label elsewhere in the interior of the violin, and he is absolved from any attempt to deceive. These may be termed the honest copyists, and, although their work cannot be compared with that of Stradivari, the violins made by them are of considerable value; a good specimen may be worth hundreds of pounds.

To the expert, it is the appearance of the instrument which is the guiding principle, and the label only serves to confirm his opinion. When both the violin and the label are spurious, it usually happens that there is something wrong about the ticket which proves it to be a forgery.

II.

As the demand for violins, and especially for 'Strads,' increased, fiddles were made in large quantities, and these 'trade fiddles,' as they are styled, were fitted up with forgeries of Stradivari's label. Hundreds—probably thousands—of these imitation 'Strads' are in existence, and every one of the violins sent to the writer for judgment belongs to this class.

At the time when these worthless 'trade fiddles' with forged labels were being turned out wholesale, the copyists generally chose a date to put on the label which comes within the period usually considered to be Stradivari's best; that is to say, the labels were dated seventeen hundred and something. Should any reader possess or know of a violin (at present unidentified) which bears a Stradivari ticket dated anywhere between the years 1667 and 1699, the instrument should be examined by an expert; there is a reasonable chance of its being genuine.

Another test. Subsequent to the year 1698 Stradivari printed the first figure of the date only, and filled in the other three figures in his own handwriting. This fact is of importance, since, either through ignorance or carelessness, the forgers generally printed the first *two* figures of the date, filled in the other two with the pen, and made no attempt to imitate Stradivari's very characteristic handwriting. Should the 17 on the label be printed, it may be taken for granted that the ticket is a forgery and the violin an inferior copy.

A Rhodesian correspondent wrote to say that he has a violin with a 'Strad' label, but the name is spelled with a 'v' and not a 'u' as mentioned in the article to which he refers. A reply was sent to him to the effect that, during his lifetime, Stradivari changed the character of his label four times; the last occasion being about the year 1730. Upon this ticket—which is printed with larger and thicker type than his previous labels—he spelled his name (latinised)

with a 'v.' Upon the ticket in the '1727 Strad viola' in the possession of the writer, the name is spelled with a 'u,' so it is obvious that if the name be spelled with a 'v,' the date upon the label must be subsequent to 1727. Such facts afford a further test for genuineness; the style of the ticket, the model and workmanship of the instrument, and the date, must all agree.

III.

In his book, *The Violin*, the late Mr George Hart divides Stradivari's working life into five periods.

The first period (1668-1685) produced violins of rather small model, delicately constructed, and following the pattern of his master, Nicolo Amati. The instruments of this period are made and finished with great care, and are covered with a transparent varnish of a yellow or light orange colour.

The next period (1686-1694) proves that Stradivari was beginning to exercise his power of originality. He flattened his model somewhat, and in the carving of his heads (scrolls) he followed the dictates of his own fancy.

The period between 1695 and 1700 produced the model known as the 'Long Strad.' This type of violin has a slightly longer body than have his earlier instruments, but the narrower width gives it the appearance of being longer than it really is.

During the year 1700, Stradivari appears to have realised his powers, and produced a design essentially his own, and this has not been equalled by any other maker. To this model—with slight modifications—he adhered right up to the end of his career. From 1700 onwards, his instruments vary in detail, but no further drastic alterations are manifest.

In the year 1704, Stradivari made the 'Betts' Strad, one of the best-preserved and most perfect instruments in existence. This violin rivals the famous 'Messie' Strad both in beauty of appearance and wonderful state of preservation. Many years ago, this violin was sold over the counter to a London dealer, a certain Mr Betts, and the price paid was one guinea. The value of this violin to-day would not be less than three thousand pounds.

For beauty of wood, exquisite workmanship, and quality of varnish, the violins produced between the years 1712 and 1716 are perfect specimens of Stradivari's work. The 'Dolphin,' the 'Messie,' the 'Cessol,' and the 'Emperor' were all made during this period.

Through the early 'twenties' of the eighteenth century, Stradivari made no change in his model, yet there is a marked difference between the instruments of that period and those made only a few years earlier. The delicate lines and rounded curves give place to an outline which is somewhat 'rugged,' and the general appearance of these violins is more massive.

During the late 'twenties' and early 'thirties' of the eighteenth century, Stradivari's work was subject to another characteristic which assists in establishing the date. Stradivari's fingers were losing their certainty of touch, and the outline of these violins is still more square in appearance. A typical violin of his last period is the 'Munts' Strad, dated 1736, in which year Stradivari attained the age of ninety-two. When cutting out the groove for the purfling (the inlay round the edges of a violin), it is obvious that Stradivari's hand was unsteady, and his graving-tool often slipped and cut outside the line. This violin is evidently the work of a very old man, yet almost up to the day of his death Stradivari continued to labour, and only when the call came to him to pay the debt of nature did he forsake his beloved work-bench.

IV.

It is the appearance of a 'Strad' which appeals to the eyes of an expert, and more especially does he take notice of the varnish. Not one of Stradivari's imitators has succeeded in preparing and applying a varnish which is comparable with that of the master, and the most noticeable feature in connection with Stradivari's varnish is its perfect transparency. The colour of his different instruments varies from a yellow to a dark red, but the special characteristic is the way in which the varnish brings out the grain and markings in the wood. The waves and curls in the sycamore wood used for the backs and sides of Stradivari's violins glitter through the varnish, and the effect of the thicker coats which remain on instruments in a fine state of preservation is to emphasise rather than to veil these markings.

Some authorities—including Charles Reade, who was both fiddle-lover and popular author—contend that Stradivari used two kinds of var-

nish, one description for the first coats, and another for the finishing coats. Others are of opinion that only one kind of varnish was used, and believe that Stradivari applied coat after coat of a varnish prepared with pure gums and linseed oil; the colour being determined by the proportion of a dark red gum included in the mixture.

It so happens that the 'Strad' viola in the possession of the writer has a unique feature which tends towards the establishment of the theory that Stradivari varied the general colour of his varnish, and not only that of the finishing coats.

Upon the 'table' of the viola, between the left-hand edge and the finger-board, is an undissolved speck of the deep-red gum used by the master to colour his varnish. The general colour of the viola is bright orange, and the speck of red gum shines through the coats of varnish like a ruby.

If any reader possesses, or knows of an instrument, be it violin, viola, or violoncello, which contains a label supposed to be that of Stradivari—or without such a label—and is aware of something unusual about the appearance of the varnish, especially in the way of transparency, the matter is worthy of investigation by an expert. It is possible that another 'Strad' may be identified and added to the list of the genuine specimens of Stradivari's work which are known to exist.

At the present time, many amateurs and professionals are busily engaged in making violins, but they are copyists of the old masters, and especially of Stradivari and Guarneri del Gesù. Many years will have to run their course before it can be established that these violins will bear the test of time, and prove that the instruments of recent date can be compared with those constructed with such loving care by Antonio Stradivari of Cremona.

A CHILD OF THE STONE AGE.

PART II.

V.

THE man and woman had followed the tragedy with interest. Now they looked at each other and grinned with pleasure, for below them lay the materials of a feast such as they had never enjoyed in their lives. But as they started to climb down they saw that already the odour of blood had begun to attract others. Out of the bushes stole timidly a prick-eared, reddish animal with bushy tail, a wild dog that, glancing anxiously around and seeing no danger, rushed at the carcass of the calf and began hurriedly to tear it to pieces.

With a grunt of rage the man above drew a sharp-edged circular flint from his pouch and

hurled it with such force at the intruder that, striking the dog on the head, it cut deep into the skull. With a terrified yelp the bleeding animal sprang back and bolted howling into the undergrowth. Then the couple in the tree descended quickly; and, reaching the ground, the man drew out his knife, formed of a long flattish flint, one edge chipped sharp, the other round, thus fitting into the palm of the hand. With this he hacked off strips of flesh from the calf, crammed a lump into his mouth and bolted it voraciously, and threw some to the woman. Squatting beside the carcass, they tore off and devoured the raw meat like the starving beasts that they were.

Too absorbed to think of anything but

satisfying their hunger, they never sensed the stealthy approach of the fierce beast that on velvet paw stole upon them through the dense cover. Bursting out of it with a swift rush, it sprang on the man as he leapt in alarm to his feet. He was hurled violently to the ground on his back, the spears dropping from his hand; and the brute, its sharp claws buried in his flesh, stood over him with open mouth.

It was that most terrible of all killers, the sabre-toothed tiger. From the upper jaw the sharp canine fangs that gave it its name curved down inches long below the lower jaw. Holding its prey down, it glared savagely at the terrified woman, then lowered its head to sink its formidable teeth in its victim and tear his throat open. The wretched man, crushed and helpless under its weight, felt all the bitterness of death. He gave himself up for lost.

A miracle happened. When the man was hurled to earth the deer-skin bandoliers that he wore had been displaced by the violence of his fall, and the hairy pouch flung up on his neck and chest; and the tiger's fangs snapped on the bag full of flints, instead of closing on his yielding flesh.

With an angry snarl the brute opened its jarred jaws and raised its head. And as it did so the woman, desperate at her man's fate, dashed wildly forward and with all her strength thrust her spear into its throat. The weapon, driven with the force of her weight behind the blow, sank deep into the tiger. With a coughing roar it struck at her with its great paw. As she staggered back the stroke all but missed her, yet enough of its force reached her to fell her, half-senseless, to the ground.

The wounded tiger reared up on its hind legs, striking at the spear lodged deep in its throat, then leapt away and flung itself in agony to the ground, blowing blood and froth from mouth and nostrils. Coughing, spluttering, howling in pain, it rolled over and over, breaking the shaft off short, but only driving the spear-head deeper into the wound, from which the blood spurted like a fountain. Then, moaning, it crawled away into the undergrowth to die.

The amazed man scrambled to his feet and sprang like a monkey into the nearest tree, forgetting the woman who had saved him. She, lifting her aching body painfully from the ground, stumbled to a gnarled oak near her, and strove to drag herself up into safety. But so shaken was she that she failed again and again; and only after subsiding helplessly on the earth and lying there again almost unconscious for a time did she recover sufficient strength to enable her to climb the tree and crawl slowly through the branches back to their miserable repair, where she found the man stanching his wounds with chewed leaves.

He greeted her only with an inarticulate grunt, and continued his task, as she sank on the platform of sticks of their frail dwelling.

That night her son was born.

VI.

There is little ease or rest for the new-made mothers among wild animals or savages; and there was no more for the woman in that early age in England. This one was allowed no repose; for on the first day of her child's life she had to bind the infant on her back with deer-hide thongs and set out to find food, not only for herself, but for her man, who, although his hurts were but slight compared with what she had suffered, considered himself too ailing to hunt and lay at home groaning miserably. So, carrying the baby, she had to forage for their meal, looking for birds' nests in the trees or climbing down cautiously to the ground to gather nuts or search for snails, the larvæ of beetles, caterpillars, anything that would serve as food. Ever on the alert against a sudden attack from wild beasts, she moved always in fear of her life, which now she felt to be more precious because of the babe on her back.

When she returned to their shelter—to be greeted with a grumble from her companion, dissatisfied with the fare that she brought him back—she squatted on the rude flooring with her child clasped to her bosom, crooning to him and talking to him in the mother-language that is older than speech. For the first time in her life she felt pleasure in an existence that had hitherto been so difficult and joyless for her, for she now had something to love.

Stern as life was for the babe, he flourished like the hardy little animal that he was. Bound naked on his mother's hairy back, he accompanied her everywhere and took his share of the risks that she ran daily in the struggle to exist. The instinct of the wild told him from the beginning to be silent as he was carried high up in the trees or down on the ground, when his parents hunted for food or fled in terror from the pursuit of some murderous beast. From his birth he never cried; and, on the many occasions on which they were forced to hide suddenly and lie quaking with fear until some danger passed by, he never needed the mother's restraining hand over his mouth to keep him from uttering a sound that might betray them all to their death. Lying on the flooring of the shelter, he remained for long hours silent and still, like all babies seeming to be trying to puzzle out the reason for his existence. On his mother's lap he gazed up at her with a smile always; and her ape-like face was transfigured with the beauty of maternal love as she caressed him tenderly.

The father paid little heed to him; although, as the days passed, he used to stare at him with puzzled curiosity, as if the boy were of some

strange species. For the child differed from its parents in that its head was rounder, with a higher brow and crown that left room for a bigger brain than theirs; his features were handsomer and his chin more marked. In fact, although his skin was hairy, he resembled the apes less and modern human beings more; and when he grew old enough to walk he did so on straight legs and erect. In reality he was of an improved, of a higher type; but to his parents he seemed to be somewhat deformed, and his mother sorrowed in secret over his defects, although she fiercely denied to her husband that there was anything wrong with the boy.

His health was good, and he suffered little from infantile ailments. But the perils of the wild menaced him always; and his life was nearly cut short before he was three months old. His parents had wandered away from the river to uplands where the forest thinned and was dotted with patches of open country. There were grassy downs over which herds of three-toed horses, small shaggy beasts with beards and stiff manes, of antelopes, and of deer roamed. Tigers, cave-lions, bears and hyenas, as well as packs of wolves and of dogs, preyed on them.

Here in the open the man and woman needed to be as little encumbered as possible when they looked for scraps from the feasts of these dread slayers, or tried to kill the young of the harmless animals for themselves. For in their case the hunter might easily become the hunted, if any beast of prey caught sight of them. As they would then have to trust to their fleetness of foot they must be little burdened.

They had built an uncovered platform high up in an oak on the edge of the forest; and before going from it to hunt over the downs they used to strip themselves of anything that might hamper them if forced to flee. One day, as usual, the woman had left the baby tied on the platform by strips of deer-hide; and the man discarded one of his two spears, leaning it point upwards against a branch. Then they started out, always keeping near the edge of the forest in order to be able to take refuge in a tree if attacked.

Luck was with them, for the man soon succeeded in spearing a fawn as a herd of deer passed by the bushes in which he was concealed. Here was food enough for two days; so the couple at once turned their steps homeward. They came in sight of their tree, and the woman shrieked and ran madly towards it. Over the tree circled a great bird, with cruel, curved beak and clenched claws drawn up to its breast, planing on wings fifteen feet from tip to tip. Even as the mother rushed forward it swooped down on the baby, falling like a stone straight for the platform. But just as

its sharp talons were extended to seize its prey it met its fate, for it impaled itself on the point of the upright spear, which, with the force of the great bird's weight, was driven deep into its breast. Its fluttering wings caught on the boughs above the platform, and the struggling eagle was held suspended by them and the weapon a few feet above the sleeping child. It was dead before the wild-eyed mother could climb to the shelter and snatch up her baby, amazed and delighted to find him untouched.

VII.

Throughout his infancy the same good fortune attended him. He was luckier than the children that his mother bore after him; the next two lived only a few weeks, and the third cost her life and died with her.

So before the boy was four years old he had to depend solely on his father, who had developed a surly affection for him and tended him in a rough fashion on which the youngster seemed to thrive. He grew up hardy and active; and by the time that he was twelve he could climb like a monkey and outrun his parent after a deer—and slay it, too, with the light spear that his father had made for him.

They led a solitary life; for in that remote age the population of Britain was very small indeed. The widely-scattered inhabitants, tree-dwellers and hunters like themselves, were the descendants of the few survivors who had been left on the mountain-tops when the land was almost totally submerged, or of those who had fled to the south when the ice had covered the rest of the country; or else they were immigrants who had made their way over the narrow isthmus that joined Britain to France.

So it was seldom that the father and son saw other human beings; and these were chance individuals or families leading a life as isolated as their own. Men did not war with each other in those days, and those the couple met were not hostile. It was only in these meetings that they needed names—Artan, the man called himself, Koto the boy.

The years went by, every day spent alike in the search for food, and marked only by fresh perils, which the two accepted as the usual order of existence. Once on the banks of the Thames the father was nearly eaten by a crocodile. Another time Koto all but died in the coils of an enormous serpent.

Danger met them everywhere. Even in the trees they were not safe. In the boy's fifteenth year they narrowly escaped death in an encounter high above the ground. They were making their way through the upper branches when they saw two hairy monsters which looked like large copies of themselves, squatting on the bough of an oak near them, plucking the acorns. They were gigantic apes, far larger than the gorillas of to-day, and of a savage and quarrel-

some disposition. Their kind was fortunately rare in the Thames Valley; but Artan, knowing what terrible antagonists they were, tried to hide, and signalled to his son to do the same.

It was in vain; the apes had seen them. They stood for a moment upright and drummed on their immense chests with their hairy fists, roaring loudly, then swung through the branches to the attack. Artan would have dropped to the ground and trusted to his legs if he could, knowing that in a hand-to-hand struggle these brutes could pluck spears or clubs from the strongest man as easily as he would disarm a child.

But the apes were below them. He and his son were carrying three javelins each, their only weapons. When one of the hairy monsters was directly beneath him the man hurled a javelin with all his force at it. Its head was bent forward, and the point took it in the nape of the neck, just where the spine enters at the base of the skull. The blow was mortal. The ape collapsed, and its heavy carcass fell crashing through the boughs, and struck the earth with a dull thud.

But its mate leapt back into another tree, and then came at him on the same level. Artan threw a second javelin at it; but the brute caught it in mid-air, snapped it with one great paw, and flung it aside. Another met with the same fate; and if Artan had been alone his fate was sealed. But when the ape was occupied in catching the flying weapon it did not see Koto, who was on a higher branch, aim a javelin at it. The point pierced its throat, severing the jugular. Spouting blood, the ape staggered, clung desperately to a bough, slowly relaxed its grip, then dropped lifeless, its body falling across a lower bough and hanging inert there.

VIII.

But even without constant peril from wild beasts men did not live long in those days, for the hard struggle for existence exhausted them. So with the passing years Artan began to age. He used to grumble at the cold, and complain that the climate was changing, that the sun gave less heat than when he was young.

He was right. Another glacial period was dawning for northern Europe, and the ice was slowly spreading south from the polar regions.

At that epoch men knew nothing of clothing or of fire. As with the brutes, their hairy hides had to suffice them for warmth. But for many generations they had not had to reckon with such cold as now gripped England. Old people naturally felt it more than the young, and Artan suffered greatly. Crippled by rheumatism and prematurely aged, he was seldom able now to accompany his son in the chase. Koto, loving his father—an unusual virtue in the world of that day—grieved when he saw his misery as he crouched shivering on

cold nights on their airy platform, and wondered how to help him. Chancing, one day when an icy wind was blowing, to notice what warmth it gave him when he wrapped around him the skin of a deer that he had just killed and flayed, it occurred to him that something of the sort might keep his father warm. He thought about it until it ended in his making for Artan the first clothes that had ever been worn in that part of the world.

Similarly, when he killed a hyena in its lair, in a rugged height that to-day is Richmond Hill, it struck him that the beast's dry cave would be a pleasanter and warmer shelter for his aged parent than a tree. So he brought his father to live in it, and they became the first cave-dwellers. But Artan did not enjoy his new residence long; and Koto, now a man of twenty, felt very lonely in the big cavern after his father's death.

In the forest below the hill lived a family of tree-dwellers, whom Koto often watched from the entrance to his cavern. One of the members of it was a young female, well-formed and not uncomely, in spite of her hairy skin. Once or twice he had come suddenly upon her gathering berries and roots in the woods, and at sight of him she had fled in apparent terror, which the slowness of her flight, and a lingering backward glance, somewhat discounted. It seemed to him that she might prove a pleasanter companion in the cave than Artan.

So the girl began to find gifts of fish and flesh, of honey and wild fruits, laid in her path, and once a strange object which she snatched up more eagerly and examined with deeper interest. It consisted of a number of prettily-coloured shells pierced and strung on a strip of deer-hide—the first necklace, the first ornament ever made for a woman in Britain. She instinctively realised its use and hung it about her throat.

While she was knotting it she was suddenly seized from behind, lifted from the ground, and carried rapidly away towards the hill. And, as she was borne helplessly along, pressed against a strong man's breast, she looked up into Koto's face—and forgot to scream to her family for help.

THE END.

ON THE LANDING OF MARY QUEEN OF SCOTS AT LEITH.

LEITH, and a driving rain along the pier,
A princely galleon, and the gathering cheer
Of countless loyal hearts for one whose heart
Was still in France—not here.

Leith, and a bitter wind on that fair brow,
A salt sea-welcome, turned most bitter now
In thy sad memory, poor hapless child,
We well remember how.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

NOW is the time for telling tales; little ones, fireside tales. No time is this for ugly stories such as often fill the papers in these times—tales which, true as they may be, are hot and sticky from the law courts, tales of crime, murder, cheating in many forms, and misery of every kind, seeming to be promoted by a sort of principle that no news is good news unless it is bad news. The soft and kindly-tempered social atmosphere of Christmas has a purifying, a simplifying action on the minds and moods of most of us. Harshness of competition is suspended, the strain of life relieved, materialism and worldliness are lessened for a while, and fears neglected. In the peculiar exaltation that arises, the almost exaggerated friendliness exerted on every side, furthered by pleasing hospitality, soft music in the air, big fires, busy enthusiasm in the kitchen departments, and, specially, the bounding vitality of the children, what is sentimentally romantic in us is stirred as at no other time. Simplicity, domesticity, sentimentality, and romanticism are factors working keenly on the psychological situation. And there is a glow of religion, with imagination and a tendency to harmless superstition. The local or family ghosts emerge from empty spaces, and their tragic histories are told. These, anyhow, are the worst of the season's tales, ending on an awesome note. The others comprise the histories of a number of princes of the 'charming' class, adorable beauties of loveliest innocence, slayers of giants, feline creatures shod in boots like humans, the marvellous adventures of great Crusoe, and best of all, perhaps, in being most closely attached to sentiments concerning the impossible, the achievements of Aladdin. Fine tales they are, and could not be better told than as we all have heard them in our time, by the fireside in the nursery, and then on afternoons or nights of gala, in the elaboration of the gorgeous pantomime. In the disordered, hectic condition of the world there has been a decline even of the old pantomime, in which were retold the famous stories of soft beauty with adventurous chivalry, and, for climax, the sparkling success of love and good against evil most demigod, presented viciously with forked tails

and lightning. An idea is entertained that people now do not believe in anything, and therefore cannot even attune themselves to these delicious fancies any more; while, for the tranquil fireside of home the jazz-banding dances of hotels are often substituted. This, anyhow, is the children's loss; and, as we believe that the old people who shuffled off from earth before the dawn of this present century had, in a general way, the best time ever gathered from this world, so, perhaps, the children of thirty or forty years ago had the serenest experiences for the youngest folks.

* * *

A philosophic company, lately discussing points like these, was positive that the boys of that period had more satisfying pleasures than their post-war successors of to-day. They, too, were less feverish, more practical, and though youth has always a simple, earnest faith in the future, it was more real in Victorian days than now, when the uneasiness of the fathers has had some hereditary repercussions on the sons. The boys of that golden age, for whom the airships of Jules Verne were wonders of the fancy purely, and not the plain and threatening facts of the present time, had a better enjoyment in the tales of Fenimore Cooper, Talbot Baines Reed, Captain Marryat, and the others of such kin who stacked their shelves; and they were keener on making things, models of many kinds, and in acquiring peculiar manners of craftsmanship. They were the owners and breeders of pigeons and rabbits—they 'kept' them, as was the term—and, looking back, are we not sure that certain human virtues were cultivated by this practice of intimate, personal sympathy with those tame dumb creatures? For myself, I made things. I kept in succession rabbits, pigeons, and a dog, and when they died they had state-funerals, and were interred in my own small garden, with tombstones at their head and flowers upon the fresh-laid soil, while the home-made banner, coloured with crayons on a piece of calico—the same that was flown on exulting days when our father homeward came from travels—hung at half-mast from the six-foot stick that was really a piece of garden cane. In this private cemetery were also laid to rest certain robins and sparrows

found lifeless in the garden during such winters of snowy severity as somehow do not seem to happen now. Their bodies were enclosed, with some appropriate written statements of date and circumstances, in tin canisters, and all these proceedings were of such tender spirit that, in retrospect, one wonders at the goodness of those signs of childhood and laments the failure, in whatever measure it may be, of the promise that was made. Upon inquiry I cannot find that the young of to-day preoccupy themselves with any such affairs, nor that they build huts for themselves, with fires to warm their bodies—marvelling delightedly that smoke should ascend their chimneys—nor enjoy such rude comforts as thus they might create for themselves, better than the more ordered pleasures of the real home. Perhaps, in their advanced knowledge, they put away the childish things before the proper time. No longer do they believe the old impossibilities that made a charm of childish credulity. I doubt if the youngest now accept the old-time explanations of storks and cabbage bushes to account for the advent of babies, whose arrival helps to joy and wonder in the household. Parents inform me that their tender offspring now openly deride the declarations made to them on the eve of Christmas concerning the most gracious Santa Claus and his manner of midnight coming, a sack of pleasures on his back, by way of the chimney. They demand instead delivery of the goods in the plain manner of parental gift beforehand, with threat, in case of non-compliance, of keeping vigil until the moment of the stealthy and deceitful packing of the stockings hanging on the beds.

* * *

This is unfortunate. One might argue seriously that it is not even for the good of the country and the people. Again the War has been the cause. The new scepticism of elders has insidiously percolated through to the fresh minds of childhood and youth. Cinemas, aeroplanes, the wireless radio, and such achievements, leave small room for imagination upon vaster wonders, for here are the mysteries and the impossibilities all brought home in a cardboard box. What more evidence should we need that all childhood has been metamorphosed in precise accordance with the spirit of this material age than the strange affair of a small American boy, nine years old, Jackie Coogan his name? He was received with screaming cheers by thousands of Londoners the other day, and the women, as usual, fought to get near to him, because he is the most popular and successful juvenile cinema performer, and thus early in his artistic career has earned the equivalent of something like a quarter of a million sterling. Master Coogan graciously expressed his pleasure at the reception accorded him, and subsequently inquired upon the value in American money,

according to the current rate of exchange, of a German note for some thousands of millions of marks with which he had been presented. Upon a sage so acute, the 'King of Kids,' as he is called, this is a thinnish kind of joke to play. At nine years of age Master Coogan has received a public welcome from London of a magnitude not accorded to victorious generals or soldiers home from the war, and the world has lavished upon him riches that it gives not to generals and heroes—gives to none except prize-fighters. As an artist Master Coogan may pleasantly reflect, when old enough to think, that in reception and fortune he has achieved infinitely more than the artists, the poets, the musicians that our country has produced, their mortal remains resting in the national shrine. These men, indeed, famous in their way, no doubt, good and great according to the pre-cinema standards of the multitude, had no receptions, and less of fortune than Master Coogan will acquire by one new film. They crept into their London quiet and unattended, and their living was often of a modest sort, because London gave them few riches, while the United States had, perhaps, not been invented, and 'international rights,' which account for some of Jackie's quarter-million, would have had no meaning for them. How can our nine-year-olds believe in Santa Claus, knowing of this gorgeous production in juvenile materialism, this Jackie Coogan! Aladdin, indeed, they may accept for experiment and investigation with a view to fetching him along from wonderland to rich reality. We who believe in the old things, like old times and friends, feel that the young are not better for the transformation of their conditions. Is not something in the nature of a revivalist movement among the children needed!

* * *

Two sorts of tale-telling are better than the rest when the voice is used and emotion touched by ambient and circumstance. One is when it is six or seven of the evening, and the children are night-gowned beside the fire, and the mother, in the voice and manner with which Heaven endows mothers only, and for these occasions, spins such a versed yarn as that of the fine lady who, on her white horse, so well caparisoned, rode to Banbury Cross, or of the pigs that went to market while others stayed behind, or the further legends of those bewitched years. And the other kind of story-spinning brings one back from the earliest of life's memories to the latest, for very recently I was perched sometimes on a ledge of rock on various afternoons between five and six listening to the most remarkable public tale-telling in the world, in the most romantic setting. I was the only European among perhaps two hundred Arabs who daily made a special assembly of themselves, and seemed

almost to constitute a veritable church at a point just outside the walls of Fez, near—significantly near, as I thought sometimes—to the Bab Guissa, which was the scene of most bloody fighting between the French and Moors at the time of the native revolt against the French in 1912. Few Europeans come through this gate; it is off the tourist's and the official beat, and the guides seldom tell their patrons of what happens there every afternoon, though to me it was the most charming living scene in old romantic eastern Fez. The tale-tellers of Morocco are a feature of the country. They are to be found in most of the big towns, usually conducting their sittings in the souks or near to one of the 'babs,' or big gates, with natives of all sorts and ages squatting round them in a wide circle, listening intently, absorbed, enchanted, as the tale-teller, in a soft, persuasive tone, echoing something of the glamour of the histories, drones on for an hour or two at a time. It is often the same teller in the same place until he dies, and about his succession there is something of the careful selection and importance of an imperial change. A remarkable old tale-teller sits in the big native place at Tangier. I first listened to him there more than twenty years ago, and now, leaning heavily on his stick, he is almost blind, but spins his romantic yarns of adventures among sultans and spirits with a suavity more mellow than before. Each city has special character in its story-telling and tellers. At Saffi, along the coast, the Saffi so nicely ordered with a peculiar charm of delicate colouring, I find the tale-tellers always standing and rather vigorous, gowned like professors, in soft shades of green and quiet mauve. Down in the wild, half-barbaric Djemma El Fna at Marrakesh, the most bewildering, uncouth, fascinating public place in all the world I know, savage with some thin elements of civilisation hanging on to it more or less by force, there are many tale-tellers, with particular audiences for each, and the stories that are told are rawer and have little to do with fairies.

* * *

But outside the Bab Guissa, there is an ancient charm about the scene that one might expect of classic Fez. Here walls and ramparts, something between one and two hundred feet in height, are crumbling, and just at this spot there were long ago some excavations among old palace ruins, while around are huge mounds and boulders ascending to heights above where a Mussulman cemetery is laid. In the fading distance are fields and olive groves. A grand, half-natural amphitheatre is thus formed in a corner, and the tale-teller sits himself on the level floor below his audience distributed in units promiscuously upon the mounds, the boulders, and bits of the ruins, while some are perched high on the tops of the walls, on craggy points,

some stretched their length on ledges, all making up a scene that does not correspond to any ordinary human manner. My imagination is touched with a fancy of old fables, wherein birds and beasts assembled for conferences upon their affairs. The company gathers here shortly before five o'clock. They come ambling through the Bab Guissa in ones and twos, with a slow solemnity as of those proceeding to a place for religious rites. They select their favourite spots for sitting. The younger Arabs close up in a half-circle near to the place where the story-teller will establish himself, and patiently they wait. Presently the old man, Ham Dris, plods up the hill, bearing the solemn dignity of a high priest, and, as he seats himself, the low, slow chattering among the people, attired in their brown jilabas and white burnous, assorted in their strange and several coigns, is hushed. Ham Dris, facing the ruins and the towering walls, wears a loose jilaba striped in gray and white, a big turban bunched upon his head, and his face is brown-skinned and white-bearded, grave but kindly. Before he begins, the gherrab or water-seller threads among the listeners, creeps along the boulders, climbs the rocks, and from his pig-skin draws a metal cupful for the thirsty who offer him the coin. Then, after the preliminaries, mostly in silence, Ham Dris makes a movement and sets attention to intensity. He holds his hands together in front of him. Expectation strains. And then he begins in his low, mellifluous voice, slowly at first, then less slowly, and soon he warms to the romance he tells. With clear accent his voice carries over the mounds and rocks across to the warm, red walls and to the broken tops, along which the setting sun slants golden bands. From every point we can hear him well; I have tried them nearly all. No other sound is to be heard, save somewhere in the far distance the faint notes of a musette played by an Arab boy in a field of corn, as I have seen and heard him out there sometimes, the sound now floating here like a murmur of the pipes of Pan. In a very few minutes the first tale is finished, another short one follows, and then we enter upon the grand romance which holds us to the end. After a while there is an interval. The venerable Ham Dris, rising from his seat, meanders over the mounds and up the rocks to chat with some of his elder friends, the gherrab draws more water for the thirsty, and now a seller of sweet stuff moves in and out, and in a low corner by the wall there is smoke and fire, Moorish tea-making rites being thus engaged. This is an all-Arab function; it is not a place for Europeans. At first I held myself at a distance with proper wisdom and respect, but I returned often, approached timidly, made some friends, and showed myself respectful and appreciative. Eventually I seemed to be admitted to the community, Ham Dris smiled a welcome to me,

and one day, on rising for the interval, he came over and sat by me, told me some of the secrets of his tale-telling, the ages he had done it, the question of succession, and many other things. Then he returned to complete the sitting, and afterwards, in the gathering violet gloom, we crept through the Bab Guissa and home again.

* * *

You may wish to know, perhaps, what kind of tales they are that Ham Dris tells. Children should like them, but in the present taste of modern Britain they might not be considered much of tales. Generally, eager and adventurous youth, by ruse and strength, is getting the better of the spirits of evil, called djinns, which are everywhere. Robbers enter the apartments of a princess, but, by dexterity and artful tricks, she overcomes them, and brings them to utter discomfiture. That was the opening tale one night. Followed the story of a young Mohamed, who called at a house for a drink of water, and was told by the woman there that no water could be had, since the chief of the djinns was holding himself by the banks of the adjacent stream and hindering all from approaching. The hero boldly strode out there, grappled with the djinn, and drowned him, as it seemed, though one did not imagine a djinn could be really drowned. At least, he was made to disappear suddenly, and water was restored to the house. Our company was immensely enthusiastic upon this little tale. The next story was in the nature of a grand, long epic, comprised of many twining versions upon a familiar theme. Young Hamid is poor and all forlorn. By some chance he attracts the attention of a courtier, and is

admitted in a lowly capacity to the sultan's service. Becoming well favoured, he exhibits bravery and skill, he leads an army, and lo! in time he seeks the hand of a princess, the sultan's daughter, in marriage. And then, naturally, some trouble begins, as it must if there is to be a story, although the sultan is not wholly averse to the pretensions of young Hamid, grown so handsome, now so bold, immensely useful to the state. The princess sighs as a princess should. Meetings happen that were forbidden. But at last some problem of a trial and the quest of a ring arises, and Hamid marches off to far countries, here and there, adventures all the way. On and on, through risk with skill, overcoming the djinns in every place, and the languishing princess for remembrance always. The tale was not finished at my last attendance; it possessed the essential qualities for long continuance, after the manner of the cinema dramas, in many parts. Perhaps I shall hear it again when I return, but leastways I know that Hamid would surely triumph, and that no djinn or devil would ever overcome him. Yet I have certain fears about the sultan and the princess. These sultans are unreliable, and sometimes even the princess is a wretched little minx. It would surprise me little to hear from Ham Dris the dismal truth that when Hamid, weary but glorious, and with bounding hope, at length reached the palace again, he heard nothing that was to his advantage, but faced cruel and maybe mortal suffering. For, after all, Morocco is the same always, djinns or not. Romantic is Morocco, with rare beauties of scene and act like this, but it is cruel always, harshly, terribly, inhumanly cruel. Remember that.

THE DEEP HOLE OF SIBERIA.

PART II.

IV.

OFF Misovaya a few miles lies the deepest abyss of Baikal. If you glance at the map you will see that the Olkhon Island, running out from the west, and the mountains of Sviatoi Nos (Holy Cape), on the east, form a line of division that threatens to cut the lake in two. They very nearly do, in fact, for the intervening water is shallow and a submerged reef links them up. North of this barrier the greatest depth is only slightly more than 200 feet. South lies the abyss.

Small wonder that until not many years ago this strange inland sea had the reputation in the country around of being bottomless in parts! Even Siberian fishermen, a leisurely breed, balked at pulling up hundreds and hundreds of yards of line every time they thought they felt a bite. Fishermen do not

habitually carry a mile of tackle—the south trough of Baikal runs to more than a mile. No extensive scientific attempt to secure reliable soundings was made until the summer of 1896, when the Russian Government equipped an expedition under the leadership of Drizhenko, a naval officer. It sailed bravely out on the good ship *Innokenti*, and promptly lost its costly Danish deep-sea sounding apparatus, with most of the wire, while taking its very first depth. It had to put back to port to rig up another.

The expedition sailed all round the shores of the lake, taking soundings, checking up old maps and making several new determinations of latitude and longitude, and magnetic observations. Dr Dybowski and M. Godliovski, Polish political exiles, had already found, some years previously, by sounding through a hole in the ice, a depth of 747 fathoms, and since then

an engineer, Bogoslavski, had taken a sounding of 791 fathoms. With the exception of the deltas of the Selenga and a few other rivers, and the vicinity of the small Ushkanwi Islands near Sviatoi Nos, Drizhenko found the 100 fathom line to run very near shore, especially along the north-west coast.

Drizhenko's water temperature readings were interesting. His thermometers registered 48° F. to 56° F. at the mouths of the great rivers in summer, and even 67° F. in one bay. In the exposed parts of the lake, however, the water was very cold, 38.1° F. to 38.6° F. Even in the river mouths the higher readings were obtained only to depths of 180 feet, a mere veneer of warm water below which the lake remained at a practically uniform temperature of 38° F. to its bottom.

V.

A few miles from Misovaya, just south of the Selenga delta, at a point about a third of the way up the eastern shore, the Trans-Siberian railway regains its eastward path, turns abruptly inland and pushes on now to Manchuria and the Pacific. This delta is the only spot on which you can journey on level ground for twenty consecutive miles to be found within several days' walk in any direction. Naturally it was one of the first places in Eastern Siberia to be farmed, and now a great deal of it is under cultivation.

The Selenga, nearly a thousand miles long, rising in the Mongolian hinterland of the Saidnask range, is Baikal's chief feeder. A swift shallow stream, in its lower reaches about a verst (two-thirds of a mile) wide, it used to be a mighty watercourse in prehistoric days, as is shown by the water-worn cliffs that now flank it, miles away over the turfed alluvial valley through which it flows. Off the mouths of the great Mongolian river is one of the chief haunts of the fishermen who let down their nets into the Holy Sea of Siberia. The Baikal fishermen work chiefly in *artels* (co-partnership groups) of a dozen or two. Occupied elsewhere, perforce, in winter, a group of villagers club together, buying and making their boat and nets and gear. They arrive at the lake in May, soon after the break-up of the ice. Two or three days' work suffices to build a rude hut or two at the water's edge, to serve as their base. Then, taking various duties in rotation, they are ready for the season.

The fisheries of Baikal are very valuable. Sturgeon and salmon are important; but it is the Omul, a herring-like fish whose technical name is *Salmo autumnaris*, which constitutes the main catch. It is netted in vast numbers, especially in August and September, when it ascends the Selenga, the Upper Angara and the smaller rivers. The lake contains one of the strangest species of fish yet discovered, the

Golomynka (*Callionymus Baikalensis*). Found nowhere else on earth—in water, rather—the golomynka is only 4 or 5 inches long. But for the head, skin, a slender spine and other hair-like bones, it consists of a kind of blubber, into which the little fish dissolves promptly on being exposed to gentle heat. It is rarely seen alive. In stormy weather, chiefly during the summer gales of the northern part of Baikal, shoals of them are thrown up to the surface, dead and dying, and are found, piled in heaps, along the shore. If longshoremen find them in time they boil them into oil, which is in considerable demand by the Chinese of Manchuria. Gossip around the lake, handed down from father to son, attributes many of these sudden appearances of golomynka to mysterious disturbances along the bed. Certain it is that curious volcanic phenomena are present. Sulphur springs are found in many spots along the shore. Huge masses—almost hills—of lava occur in the north-west, and mild earthquake shocks are often felt. Though hundreds of good-sized streams flow into Baikal, only one river, the Angara, flows out; and that carries off much less water than is brought in by the Selenga, and only slightly more than is added by the Upper Angara, flowing in at the northern tip of the lake. The lake bed and almost all the shores are rock. Owing to the cold temperature and brief summer hardly any water is lost by evaporation. It seems evident that some unknown agency, probably rifts in the earth's crust below, account for the excess of inflowing water. Underground streams, numerous or of great dimensions, must drain off toward the Arctic. From the lie of the land I am inclined to think that it is the underground leakage of Baikal that supplies the bulk of the source waters of the Vitim and the Lena.

The surface of Baikal varies in altitude only three or four feet between the melted snow-floods of spring and the drought-level of autumn. In 1818, however, the waters rose suddenly, in the course of a few days, by several yards, and remained at this new height, pointing to a blockage of the unknown channel of drainage. Almost imperceptibly, over a period of ten years, they sank to their normal level. Contemporaneously with this sudden rising of 1818, the river Ireti, a Baikal feeder, overflowed its banks. This flood was subterranean in origin and instantaneous, an enormous volume of water welling up from the mountain source, accompanied by loud, thunderous sounds and spurts of sulphurous vapour.

The following spring, on the evening of 17th March, an earthquake shook the Trans-Baikal clear down to Kiakhta, on the Mongolian frontier, 200 miles south, where doors and windows rattled and there was a violent rocking of the ground.

VI.

Of the Trans-Baikal coast north of the Selenga delta we have no account from a British traveller, nor, so far as I could ascertain, had any Briton ever journeyed through that territory. The only notes about it to be found in our language are a few translated excerpts from the journals of Pallas and Georgi, the Russian explorers, who went through a couple of hundred years ago.

With my friend, Herr Adsbol, a Danish resident of Irkutsk, I went up there to investigate, as far as the Bargusin coast, opposite the northern end of the island of Olkhon. We wished to keep along the shore all the way, but found this plan not feasible on account of the numerous unfordable, swift streams that tumble into the lake in spring from the range of mountains north of the delta. So, from the Selenga delta we penetrated inland a hundred versts, and then bore north along a forest track leading toward Bargusin. After twisting and turning through ascending valleys for fifty versts, we came abruptly to a wall of snow-capped, forest-clad mountains that barred our path. The track made a detour, and passed up a valley in the forest that led up to the divide; then it turned toward the lake. At Baikal we thought we should emerge into steppe-country, and we looked forward eagerly to our first glimpse of this unknown northern coast. But in tier after tier, mound after mound, dell after dell of gigantic lichened larches and cedars and pines, the forest went on and on to the very brink of the water. Of the water? No; rather, of the ice, for pack-ice lined the shore in both directions as far as we could see, though the standard books on Siberia aver that the ice disappears in early May. This was the second week of June!

It grew suddenly colder by the lake-side. Birches were hardly budding yet, and butterflies, which had been plentiful up in the mountains, seldom put in an appearance. The mountains receded a few miles now, and low, pine country ensued, studded with masses of lichened rock and treacherous swamps. The shore was flat, and pink, flowering shrubs lined the track, thrown up in glaring relief against the background of dazzling white ice. Ants and eagles were almost the only creatures that stirred about us, though the forest hereabouts is well populated by beasts evil and formidable. We encountered solitary hunters, now and then, looking for bear. They carried old army rifles, which are cheaper than shot-guns in this part of the world.

In the hinterland of Bargusin, one of the first trading-posts established by the Cossack conquerors of Siberia, we found some Tunguses and several hundred families of Buriats, the race of natives inhabiting the circum-Baikal region.

Of Mongol stock—moon-faced, yellowish-brown folk—numbering a quarter of a million, the position of these people is analogous in many respects to that of the North American Indian. But instead of being cooped up in training settlements and reservations, and deprived of their lands, they are given exactly the same rights and esteem as the Russian settler, and with him they dwell together in amity. Nominally Christian in districts populated by Russian settlers, and nominally Buddhist lamaists in the southern Trans-Baikal, they are a pagan folk, worshipping the gods of the mountain and forest and lake, between whom and themselves shamans (medicine men) act as intermediaries. They sacrifice horses and sheep to the gods, and build sacred cairns on prominent hill-tops and crags, placing thereon votive offerings of tobacco and sugar, bread and sweets, copper coins, old hats, and what-not. To boughs thrust into these cairns, or to wayside bushes at the summits of mountain passes, journeying Buriats tie gay-tinted rags torn from their clothing. When a Buriat dies his body is taken into the depths of a forest, and after his burial his cart or sledge is smashed up and left on the grave.

North of the Bargusinsk Buriats we found nomad Tunguses roamed the lake-shore, fishing and hunting. They live in portable *auls*—big, upside-down bowls of trellised wicker-work, covered with felt. Their boats are birch-bark canoes, sewn and wood-tarred. These Tungus tribesmen, who range over practically all northern Siberia, gain most of their food, drink, and clothing from reindeer, herds of which they keep in domestication. It is they who hunt the Baikal seal, the only breed of fresh-water seal in the world, spearing it through holes in the ice.

THE END.

THE WAUKRIFE LASS.

DREEPIE-CUM-DRAWLIE fa's the rain,
Drap by drap on the window-pane.

The hills are happed and hidden frae sicht,
Coorin' doon in the lap o' nicht.

And me wide-ee'ed i' the mirk my lane,
Dreepie-cum-drawlle fa's the rain.

'Weepie-cum-wailie!' cries the win',
Back and fore in the bield o' whin;

But a' the winds can ne'er ding doon
My hert that soars like a lark in June.

For hope and joy are my next o' kin,
'Weepie-cum-wailie!' cries the win'.

Creeple-cum-crawlle! lang and late,
Time gangs by wi' a slow-foot gate;

But time nor tide can ne'er mak' free
Wi' the love o' ane that's dear to me.

My hert sings low like a bird to its mate,
Creeple-cum-crawlle! lang and late.

BARBARA ROSS MCINTOSH.

A GUEST FROM THE HIGHWAY.

By ELLA S. BOSWELL.

I.

LONELINESS is depressing at all times; at Christmas it becomes painful. There is the consciousness that all around are homes, decked with holly and ringing with children's laughter, given over to the family festival.

Sara Learmonth was angry as well as lonely. She had elected to spend Christmas at her country house, and nobody was able, or, as she suspected, willing, to keep her company.

Seafeld Priory had been shut up since her father's death. War work and then famine relief work had kept her abroad and filled the gap left by the exacting old man's departure. A breakdown in health sent her back to London, where idleness soon became weariness. She found she had dropped out. Nobody really wanted her, and no work that could fill her empty days and emptier heart came her way. It was then she thought of home. In that little Scottish town a place was waiting for her. There she could be Lady Bountiful to her heart's content. Money and position gave her the right.

The idea of an extensive house-warming charmed her. Great was the disappointment when all the invitations she sent out brought refusals. Perhaps she was too late in making her plans; perhaps the Christmas party failed to attract. Anyway, Sara Learmonth, who had set out in such high hope of a Merry Christmas, found herself alone in the rambling old house with the ghosts of the past—memories of the masterful old father and of the lover with whom she had quarrelled, largely at that father's instigation.

London friends having disappointed her, she fell back on neighbours, and invited them to a dinner-party on Christmas Day. The morning's post on the 24th of December brought the last two refusals. Everybody was already engaged. She felt this cruelly unfair. Had she not provided Christmas treats for the neighbourhood—the school children, the Cottage Hospital, and the poorhouse? Even her servants were to be allowed friends to supper. Cheerful voices from the back regions would be audible in the silence as she sat alone. What a home-coming! That Miss Learmonth of Seafeld Priory should have to choose between dining in solitary state or sending out into the highways and hedges for guests hurt her pride.

She looked at her beautiful house, remembered her chef and her priceless cellar. People were fools to refuse such a dinner as she could offer. Abden was ungrateful for her kindness.

It never occurred to Sara that some of the

blame rested on her own shoulders. Loneliness had hardened her, or, at least, frozen her sympathy. There was no real warmth in either her invitations or her charities, and people felt the lack of it. Only when looking at the portrait, painted in the days when she loved Dr Harry Lingard, she dimly felt the difference between her past and present self did not lie in years alone. Sargent had caught the lovelight in the dark blue eyes, and the happy smile on the soft red lips—both had long since vanished.

'A trustful fool, who had made herself cheap and reaped a just reward,' she told herself scornfully. But yet, for a few short weeks, that girl had tasted the joy of life. A sudden lump in her throat warned her against sentimental memories. 'This won't do,' she decided. 'I must have some one. I'll give Abden the snub it deserves. I'll have a guest from Bellwood House.' Bellwood House, indeed! People who live on charity shouldn't be squeamish. She carefully directed her letter to 'The Poorhouse.' It was a request that the most presentable inmate should be sent to share her Christmas dinner. 'I'll only have one,' she resolved; 'more would hang together and leave me out. I'm entitled to something, if it's only a pauper, for myself.'

This time an acceptance came back by the messenger. The superintendent was sending Henry Smith. He appeared suitable, and being lame as well as weak from recent illness, did not mind missing the treat her generosity had so kindly provided the same night. Sara smiled acidly. Her own benevolence had almost caused another refusal.

II.

Having triumphed over opposition, the mistress of Seafeld Priory at once began to regret her folly. She saw she had let herself in for a horrible evening. Well, as soon as dinner was over she could tactfully suggest that Henry Smith would like to get back in time for a share in the Bellwood House festival. Even if he did not take the hint she could make sure of his leaving by ordering the car at nine. Dinner was to be at seven-thirty, to allow the servants to have their supper at eight-thirty. Really, she was too considerate—no wonder people thought her of little account.

Sara Learmonth sat waiting for her guest. She was looking her best in a gray velvet gown that displayed her beautiful neck and arms, and toned with her becomingly arranged gray hair.

At forty she was still a handsome woman; only the hardening of her expression and the thin line of her lips, that had once curved so softly,

really showed the ravages of time, or, it would be truer to say, unhappiness. At first, she had thought it would be considerate to wear an afternoon frock. Henry Smith could not be expected to appear in a dinner jacket. But the gulf between them, as to clothes, was so great that anything she wore must be a glaring contrast, so it seemed better taste to dress as usual; besides, men, even paupers, liked pretty clothes—why withhold an innocent pleasure?

Certainly it was well that some one was coming. Even during her short time of waiting memory crowded out the printed page of the book she was trying to read, and substituted a living one—living, yet dead—there lay the sting. In this very room they had sat as happy lovers. Here, too, they had quarrelled over his neglect at a hunt ball; quarrelled and parted. She shivered. At the time she had felt so sure he would come back and ask forgiveness. Instead, he had thrown up his assistantship. Just for a few mad moments she had been tempted to be the one to ask forgiveness, to humble herself rather than part. Her father had spoken his mind plainly, driving home her sense of wrong. She could actually hear the hard voice asserting that 'no young scoundrel should neglect the daughter of Adam Learmonth without paying for it.' She saw the suffering girl who held her head high and hid her misery so resolutely, as if she had been a separate personality; yet that suffering lived on in her heart, deadened by time, but never forgotten—a root of bitterness that distilled poison. Oh! why had love been so cruel! This was folly—she mustn't give way. Most likely he was dead, or married. Doctors always married; their patients expected it. Solitude was playing strange pranks with her to-night.

III.

'Mr Smith.'

The butler's impassive voice was a welcome interruption. Graciously she rose and came forward to receive the shabby-looking man who limped into the room, leaning on a stick. His dark, threadbare clothes were carefully brushed; he was carefully shaved, and apparently clean. That was something to be thankful for.

'It's very kind of you, Mr Smith, to come and share my Christmas dinner,' she said with gracious condescension. She really was thankful he had come, also that he was presentable, all things considered.

'Such a command could hardly be disobeyed,' he said, scarcely touching the jewelled hand she held out.

Sara's eyes narrowed as she looked him over. Was he sarcastic or over-complimentary? 'I sent an invitation. I hope it reached you in the same form?'

'Oh, it was quite possible to—er—respectfully regret that a previous engagement, &c. You supplied the way of escape. As a matter

of fact Daddy Campbell did refuse—I was second choice. At first the chance of port wine attracted him, but finally he decided "he wasn't muckle acquaint wi' the quality, and would be better at the treat."'

'I said a suitable guest. What was the superintendent thinking of?'

'Daddy Campbell is our oldest inhabitant. The superintendent considered he had a right to the chance. He's almost stone-deaf, and his one remaining tooth makes articulation difficult. You were rather venturesome, weren't you?'

She drew herself up. 'I hope I should have done my duty to Daddy Campbell. He shall have a whole bottle of port as a reward for his commonsense. Do sit down.' She indicated a luxurious chair, and he sank into it with a smothered sigh.

'You seem very lame,' Sara remarked to fill a pause.

'Yes. Rheumatism after shrapnel.'

'Oh, you fought in the war?' Involuntarily her glance took in his lined face and his gray hair that was thinning at the temples—she guessed him about sixty.

He smiled. 'I'm not quite so old as I look!'

'Haven't you a pension?' she asked, to cover her discomfiture. This man seemed to be able to read her thoughts.

'No, ma'am.'

The 'ma'am' hurt. She wanted to be kind—sympathetic—and he made her feel insolent. A soldier, too; she had been very friendly with the boys out there.

'I was only wondering if nothing could be done. I worked among soldiers—I would do anything I could for them still.'

'Thanks.' His tone had changed in response to the real feeling in her voice. 'I wish more people were like that. Most of them have short memories.'

'I wonder if we ever met. I was over in France nearly all the time. What were you?'

There was a slight pause. 'Stretchers-bearer.'

Sara noticed the pause. 'Surely you weren't a "Conchie"?' she asked in dismay.

'No; you can give me dinner with an easy mind. I joined up at the start, only too glad to get the chance. All the same, I liked rescue work for our own boys better than killing the Boche.'

'I'm sure you oughtn't to be at—at Bellwood House. It must be a mistake about your pension. Let me take the matter up.' She found herself pleading to this waif.

'No, thank you. The Medical Board considered my case. It is rheumatism, not actually the wound, that causes my lameness. Moreover, I could work if there was any work going.'

'What sort do you want?' Sara continued doggedly. He shouldn't stand in his own light.

'Any clerk work—just the kind so many ex-soldiers are after. I heard of a job at the mills. Walked most of the way and got drenched. Result—pneumonia. I crawled to the poorhouse just in time. The superintendent has been awfully decent. Let me keep his books, and things like that, so as to do something in return. I must move on now I'm fit.'

'Oh, but you mustn't go like that! I'll take you as my secretary until something better turns up.'

'Thank you; but I—I shouldn't suit.'

IV.

In the pause that followed, dinner was announced. Henry Smith rose and offered his arm. The wrong one, but it was not a mistake; his other hand was needed for his stick.

The wide fireplace in the dining-room was piled with blazing yule logs, and in front of it a small dinner-table, set for two, had been placed. A red-shaded lamp cast a ruby glow on the hothouse flowers and holly with which it was decorated.

They took their places, and Sara soon noticed that the array of knives, forks, and spoons was no puzzle to her guest. He lifted the right ones unerringly. During dinner, with the servants in attendance, their talk was of their war experiences. They had been quite near each other at times. Now they spoke as comrades; discomfort on her side and hostility on his seemed to have vanished.

'There are sounds I'll never forget,' he told her. 'I've heard the wounded moaning like a flock of sheep when the lambs have just been taken away. Oh, pitiful! And work as fast as we could, there appeared to be no end to the stream of misery.' He broke off suddenly.

Sara was helping herself to grapes, intent on cutting up the bunch, but all the same she knew that stretcher-bearer had camouflaged R.A.M.C. Then she pushed the dish across to him. 'Yes,' she said, 'it is sound that lingers longest in the memory.' Her eyes had told her nothing, but for some time the tone of his voice had been stirring her frozen heart most strangely. At first he had been breathless and husky, which she attributed to his illness; now she felt a growing certainty that it was intentional.

A cut on the left side of his face drew his mouth slightly crooked, and the tooth-brush moustache partly hid his upper lip. If only she could see his eyes, but he kept his eyelids lowered as if the light hurt him—or was it to prevent her seeing their colour?

V.

They returned to the drawing-room for coffee. But Henry Smith did not resume his luxurious chair. He stood gazing at the portrait of the young Sara over the fireplace. Then, becoming aware of attracting attention, he gave her a

nervous glance. As she had expected, the eyes were sea-gray. Harry's eyes in the old man's face.

'Nothing like a Sargent, to my mind,' he said coolly, evidently to explain his interest.

'You're clever to recognise it,' Sara told him.

'Isn't it a Sargent?'

'Yes; but that vase of chrysanthemums hides the signature.'

'Ah, so it does! But he's unmistakable.'

'It's no use—Harry!' She rose and stood beside him.

Now he looked her full in the face, and his mouth twisted into a bitter smile. 'That was a bad break-down, but you'd lulled me into security. No matter, it won't be long to nine o'clock. Your chauffeur told me not to keep him waiting.'

'Oh, how abominable!'

'He naturally objects to leaving a Christmas supper to cart a pauper home.'

'Oh, Harry! Why didn't you come to me? I would have taken you in and nursed you.'

'Come and beg, you mean? I'd have died first! I'm only here to-night because I didn't wish to explain. Somebody had to come, and nobody fancied the job. I chanced it, in return for kindness. I thought I was pretty safe.'

'You forget I loved you.'

'Yes—as a woman loves her pom—petted one moment, slapped the next, and always on a string. A man can't stand that kind of treatment.'

'Couldn't you have explained my mistake to me gently?'

'Gently! A sledge-hammer wouldn't have knocked it into Adam Learmonth's daughter!'

Her lip quivered. 'Perhaps that's true. My mother died when I was a child—naturally I saw everything with my father's eyes.'

'He was against me from the first. Didn't think a doctor's assistant a good enough match for his daughter.'

'I didn't agree with him there.'

'Yet you threw me over for a trifle.'

'You neglected me at that hunt ball. It was a public slight!'

'Well, he avenged you! Came round to my boss and clinched the business. I was to be sacked at once, and he'd pay a month's screw. After that he hunted me from one place after another. Brought his influence to bear so as to force me to go right away. I finished up in Skye. Solitude and wet motor runs. Drink caught hold of me. A panel patient died while I was on the burst and I got the sack. Serve me right, too! Only I can't forgive the hand that pushed me down. I think the death would have happened anyway—but the breach of trust is always there.' A spasm of misery crossed his face.

'Oh, how terrible! I only knew vaguely that there had been trouble. I wrote to what

I heard was the address. The letter came back.'

'I wish I'd got it. I was so desperate I nearly put an end to myself. War came in time to save me. It looked like a better way out.'

'But instead you came through. Won't you let me help you now?'

'Take money from a woman! Never!'

'Men always refuse us that equality. But there's an alternative. I owe you reparation.' She paused and steadied her voice. 'Shall we go back to where we parted and begin afresh?'

'Impossible. I was young and hopeful then—now I know I'm a failure. If I must accept charity I prefer it on a broader basis. I'm one of a crowd at the poorhouse.'

Sara shivered. 'You're cruelly unforgiving,' she said bitterly.

'Do you want me to lose the little self-respect I gained through the war?' he countered.

'Oh, no, no!'

'Then be content with having made a generous offer. It has wiped out some of the bitterness.'

Sara couldn't answer. She turned her head away, fighting down her tears.

A loud blast from a motor horn broke the silence. Harry Lingard stiffened and frowned.

'There's my summons,' he said.

'Wait here. I'll drive you myself,' Sara exclaimed; and before he could protest she had vanished.

VI.

He stood very still, his eyes fixed on the portrait. The might-have-been had him in its relentless grip. Then a renewed hooting brought back the present with full force. He was a broken man, waiting to be run home to the poorhouse. By his own choice he had shut the door of Seafield Priory against him after to-night. Never again would he gaze at the portrait of the girl he had loved.

'I'm quite ready.'

He turned and saw Sara standing in the doorway wrapped in magnificent furs; the contrast between them made him writhe. Sullenly he followed her to the hall, where she paused to speak to the butler, who was waiting with a basket, so he stepped outside alone.

'Hurry up, daddy! What the blazes d'yer mean by keeping me waiting?' bawled the impatient chauffeur. Then he saw his mistress.

'Get down, Thornton. I'm driving myself. Take your dismissal from to-night—for insolence.' She stepped into the car, and the departing guest took his place beside her. The butler handed in the mysterious basket, and they were off.

Then a magic change came over the bitter man and the lonely woman; they felt unaccountably young, and Thornton had made them comrades. A sense of adventure stirred their hearts. They had stepped into fairyland instead of an expensive car.

'It's jolly—this!' he said, drawing the rug round her, 'and you were a sport to drive me, turning out into the cold——'

'Cold! It's lovely! A real Christmas night I wanted a treat so badly, but I never expected to get it.' She sighed contentedly.

'Mightn't we take a longer round? We'll be there in no time at this rate.' Sara turned the car as directed.

'Thanks! I've a good mind to put in for Thornton's job. A car's a sheer delight.'

'I wish you would,' she answered with a happy laugh.

'Even if I was spotted?'

'I don't care!'

'Confound it, we're almost there! Look what Thornton dropped on my seat, when you scared him.' He held out a sprig of mistletoe. 'Sara—may I—just for Christmas?'

'It's fate!' she said shyly.

Their lips met.

'Harry—it—it wasn't reparation—only, I was too proud to call it—love. I've never changed. I'm so lonely—nobody wants me, and I'd expect so little now—if you'll only forgive me.'

'Forgive! That's a queer way to put it!' he answered tenderly. 'Anyway, we've found each other again.'

'Oh, I'm so happy! What a Christmas! She drew a deep breath. 'And to think I nearly spent it alone. Here we are.' Regretfully she slowed down.

'Come in and say a word to them all, and see how they're enjoying your treat,' he urged.

'I've brought a finishing touch—the port wine.'

'My dear, you're a wonder! Fancy thinking of that in spite of the shock I gave you. May they drink our health?'

'Oh, Harry, yes! But it was you suggested the port——'

Each put a hand on the basket, and together they passed happily into Bellwood House.

TO MAIDENS.

(How to keep their Youth.)

In lustrous orbs that lure the light,
And tresses soft as summer night,
Exult, sweet maids; nor grieve to know
That these their glory, those their glow
Ere long must lose. There's naught can last;
The bud succeeds the blossom fast,
Vesper follows hard on noon,
December dogs the steps of June,
And dimples turn to wrinkles soon.

Yet there's a way that still ensures
Your charms may be for ever yours:
While yet they blossom in their prime
Go, mate you: dally not with time!
Then in your younglings' tender eyes
Ye shall your own sweets recognise,
And in your children's children view
With fond delight the flowers that grew
So fair aforetime once in you.

WILL HILL.

THE CULT OF BOOK COLLECTING.

By G. H. GRUBB.

I.

[T has been said that now we have wireless, with its thousands of enthusiasts, with the prospect of tens of thousands of others taking it up in the next year or so, book reading and book buying will be even less indulged in than in the past. I do not believe it. It is my definite opinion that, as a result of the use of wireless, more people will come to know and appreciate books, because I hope that, by way of broadcasting, folk will be *told* about books, whence they will proceed to read, to love, and then to buy books. There will be periods always when books seem to be cold-shouldered; but they never remain outside long. And why? Because of the real deep interest of a book, the educational value in it, and the entertainment in it—all these things are so superlative that, in the end, be we ever so lukewarm at times, a book must and does conquer.

Books are the perfect things, and rightly selected, which is in no sense an easy task, never quarrel with us. The saying goes that it takes two to make a quarrel; which is very true. But the good book never quarrels, and if we are prone to quarrel, as, of course, most of us are, the quiet voice of the delectable book soon turns away our wrath. Once a book lover, always a book lover. And when I hear captious persons saying that those strange creatures—the description is not mine—who collect first editions are maniacs, then, indeed, I am more than prone to quarrel with them. This habit of getting hold of the first impressions of books which may become of precious value in the future is in no sense a mania. I would not describe collectors of ceramic vases, or old violins, or Cromwellian clocks, or scarce stamps, as maniacs. All blessings rest upon them for the joy of their art. Certainly there are a great many people who buy these first impressions in the hope that the few shillings spent upon them may bring, in the years to come, many pounds. It is their hope that they may find, shall I say, a book like *Almayer's Folly*, which was published at 6s., and is now worth £12, 10s.; or, mayhap, here are some silly folk who dream of finding another folio Shakespeare—there are only two or three known copies—for a pound or so, and of selling it to some passionate American collector for a hundred thousand dollars. That is pure commercialism, and although they are in no sense wicked persons, they are not the true bibliophiles. Your true collector may start his way, but before long he becomes deeply absorbed in books of all kinds. And then he buys to keep. It is one of the hardest of things to

sell a book when once you have become a book lover. The indentures of service may never be cancelled.

Gambling always has a fascination, even for the most circumspect of us. I suppose it is because life itself is more or less a gamble. Some of us would be much tempted to turn over the pages of the book of fate and discover our future; but that way lies a good deal of insanity. Nine-tenths of us, I suppose, would like a perfect security against the years before us. I wonder if this is good for us? Personally, being a very ordinary person, I grant you that it has a weird appeal, but I have a sneaking regard for the gamble in the future. There is a good deal of salt in that. And it is something like that in the collecting of books. You can never tell what is going to turn out the ace of trumps. As in horse racing, there is a deal of entertainment in spotting, or rather trying to spot, the winner of to-morrow. Only, I would rather study the stars in the literary firmament, than the 'possibles' in the paddock.

This collecting habit is a praiseworthy one. It calls, or at least it should, for close and concentrated study of current literature; it brings one from a consideration of the market, to a more personal association with books themselves. In the search, a search which is full of the most enlivening possibilities, for the worth-whiles, or at least those which we, sometimes ignorantly, believe to be worth-whiles, there must be an eventual reading of books, and that is the greatest triumph of all. Collecting thus justifies itself. To collect for profit is a natural inclination; to come to collect for joy, at the expense of many other but less desirable luxuries, is the quintessence of intellectual and even emotional fervour. It supplants everything; it provides against the grayness of life an insurance than which I know nothing better.

Of course, expert as you may be, you may easily come by nothing, although, as your prowess of literary evaluation protrudes from your mentality, you will become a more competent judge. On the other hand, as H. M. Tomlinson once wrote in a delightful article in *The Nation* of the old days: 'A ten shilling note, carefully planted, may in a few years increase a hundredfold.' Mr Kipling's *With Number Three, Surgical and Medical*, published in Santiago in 1900, probably at a not very high price, fetched at auction, once on a time, £128. Or again: an incomplete set of R. L. Stevenson, made up of about twenty-seven volumes, none of which was issued at more than 10s. 6d., was catalogued, not so long since, for £350. These are the treasures for which

collectors look. Once a shrewd boy friend of mine found in a box, in a little drab street, a first printing of *If Winter Comes* for a shilling, and sold it for ten an hour later.

II.

Whether it is a mania or not, the collecting of first editions has come to be a part of the book-buying life. I hope it will not only remain a distinct interest, but that it will increase. I feel sure it will. It is not only a most enjoyable interest, but it is something that ought to be encouraged by all those whose definite object is to widen the distribution of books, and to increase the love and reading of them; for there lies wisdom. Life teaches us wonderful things; things both sad and happy, but we must not lose sight of the fact that books may bring us a joy than which there is nothing more contenting. For we may pick a book which shall provide us with hours of happiness, and we may partake of its luscious fruit again and again. We may go on roaming the shelves of our enjoyment, travelling in imagination the physical world over and over again; but what is even more enchanting, we may explore the untold fields of intellectual wealth, of which there is no limiting compass. Out of collecting will come a reverence, on which may be built a world, the experiences in which provide a rich reward, and a definite mental enlargement. It is a hobby; yet it is greater than a hobby. There is a science in it supremely educating. It makes for a bigger view of things, and offers a culture which, in its turn, gives a conception of the art of life so fine and so precious as to change a one-time angular view into a completing circle of perfect envisioning. I may be claiming for the bibliophile extravagant perquisites, but I have seen the narrow eliminated and the broad established.

What can give us more lasting entertainment than an evening spent among the books which have gradually been added to a library built up from one volume, and out of a limited income? This is so often the experience of the book lover. That rare item which had been, after much hunting, discovered in some byway of the town is like unto a sparkling jewel. We handle it with care, and keep the pursuing dust from it; we double wrap it in a jacket, and keep the fingers of visiting jackals from it. That is reverence forsooth! To own a library of a few hundred choice volumes is a possession of value which no mere insurance company could cover with all its reserve funds. I take a pride, of which no one may rob me, in handling that little collection of mine in a thousand different ways. Every now and again each book is taken down from its abiding place with full gentleness, dusted, and valued. The pencilled figure that I place in the back of it merely represents the

prosaic market value. But I have a private mark in my heart for it which no one knows, and which I cannot even define myself. There is a riot of pleasure in making sure that its place on the shelf is the right one. Some good folk make a catalogue, while others may find the book without the candle-light. Have you ever tried to do that in the dark? It is the test of the bookman—although I would not be so foolish as to say so, if your library runs to thousands.

III.

As the library grows, so grows a pain; the pain of prospective parting. It is a dreadful business. To this day there are books which, in my youthful greenness, I yielded to persuasive friends. *They haunt me.* There was a delightful two-volume edition of *Tristram Shandy*. I see it almost daily, yet it is not in my house. There was an old edition of *Elia*, the like of which I have not seen again. And although I have six editions of Lamb, not one of them fills the gap of that dear old volume. Where is it? And I could speak of early editions of Conrad, of De la Mare; I weep for a copy of *Never too Late to Mend*, and of Herrick and of Campion. The waywardness of young youth; the wild-oat sowing! And thus is one's middle-age contentment the deeper and the sadder in its completeness. For years have I sought to tell the story of what books mean to me, but never yet has it been possible to do so. One must go on searching for expression, satisfied to say the little word, hoping that it may yield corn in due season. If books radiate joy and culture and a fair breeze in a land of spiritual sunshine for those who understand, so do they comfort the ignorant. They build up wrecked souls; they educate; they are tremendous forces in the development of the individual and the community at large. And these blessed virtues may arise out of the collecting mania.

Let us encourage the man to try to sell. Let us encourage him to do it again and again. Comes a time when the Lord of Hosts will persuade him that he is trafficking in something beautiful; that in consorting with the money-changers, and making for himself a golden harvest, he is missing the radium which is hidden within the pages. His eyes will be opened. I have yet to find a mercenary collector who remains a mercenary collector. I have yet to discover a man whose heart is so solid that a book may never pierce it. In due time, and perhaps through much penance, he finds a satisfying pleasure in his book, so completely satisfying, that down on his knees he goes and prays for emancipation from the greed of profit. Then and there starts his sorrow for the books which he has cast upon the world. Yet he need not despair. They will reach out to some other wandering soul, sick of life and weary of struggle. Back comes the judgment of the wise man. He

inds that instead of suffering, by reason of the lessened material profit, there arrives a deep sense of literary and artistic values. He no longer buys books, and collects books, for a rise, but he buys them because he wants them. He adopts them, and cares for them, reads them, and makes of them companions. They are the salt of his earth, and the sojourners in his house. For once, and at last, the word 'sell' is a curse in his soul. He collects with an exquisite fancy, for which he seeks a definition in vain. He brings friends to his shelves, and makes of all a joyous, happy family, and as he gazes upon his humble handiwork, in gathering together a community in which there is no greed and no jealousy, he praises God for the men and women of genius who have created them, one and all.

And this 'mania' is international. There is no language bar. It is growing and deepening

here; it is spreading through Europe; it is becoming a cult in the Colonies. In America it is widening space. The proof of all this is to be found in the keenness with which collectors, great and small, are watching for the scarce things. Specialist book-sellers are coming into existence, who follow no other line of interest than that of supplying the wants of all these good folks. Only in recent years have whole catalogues been devoted to modern first editions. In my early days, these first printings were scattered through the catalogues of antiquarian book-sellers. But the size of editions in those times was not on the magnificent scale of to-day, which suggests that book-selling is a larger thing. I don't suppose that more than a thousand, or at the most, fifteen hundred copies of Conrad's early books were printed. They were all published at a few shillings; now they may cost many pounds.

THE MONTH: SCIENCE AND ARTS.

CLEAN MILK.

IT will be news to many that the milk they consume may contain many millions of bacteria in a thimbleful. According to a recent report of the National Institute for Research in Dairying, close on 18 million colonies of bacteria have been counted in a cubic centimetre (a cube measuring about $\frac{1}{8}$ th inch each way) of average milk. As would be naturally supposed, cleanliness is all-important in this matter. What can be done with the best buildings and equipment and absolute cleanliness is indicated by tests on the milk from one farm for two years. Only on three occasions did the number of colonies of bacteria in a cubic centimetre rise above 10,000. The cleaning of the empty milk-cans, the handling of which causes such a distracting din at country railway-stations, is of vital consequence. Tests on 500 cans showed that the number of colonies of bacteria in a cubic centimetre of washings from those which were apparently clean and dry varied between 6,200,000 and 170, and this for cans which were supposed to be washed and steamed at the dairies before being returned to the farmers. Some of the cans tested had not been washed, and in these the bacteria were uncountable, even in $\frac{1}{1000}$ th of a cubic centimetre of washings. Others, badly washed, contained between 5 and 18 millions to the cubic centimetre. Investigations into the best means of cleaning the milk-cans showed that the temperature of the steam used must not be less than 210° F., that the steaming must be continued for three minutes, and that the cans must be covered during the process. Some interesting experiments were carried out to find out whether scalding with so-called boiling water would be effective. It was found that 'two gallons of

actively boiling water, when carried up a short flight of stairs, experienced a drop of 13° F., and a further drop of 32° F. during half a minute's scalding of a ten-gallon churn.' Licences are now granted for the sale of three grades of milk, for which higher prices are charged than for milk from unlicensed producers. The three grades are as follow: (1) 'Certificated milk,' which is produced from herds that do not react to the tuberculin test and are subject to veterinary inspection, and which must be bottled on the farm, while the number of bacteria colonies per cubic centimetre must not exceed 30,000, and $\frac{1}{10}$ c.c. must not show the presence of the *Bacillus coli*. (2) Grade 'A (Tuberculin Tested)' is similar to the certificated, except that it may be sent by rail in sealed vessels to be bottled by the dealer. It must not contain more than 200,000 bacteria per c.c., or *B. coli* in $\frac{1}{100}$ c.c., on delivery to the customer. (3) Grade 'A' milk is produced by cows which are subject to veterinary inspection, and may be sent by rail in sealed vessels to be bottled at the dealer's premises. If sold in the raw state, it must not contain more than 200,000 bacteria per c.c., or show the presence of *B. coli* in $\frac{1}{100}$ c.c. If sold as Grade 'A' milk (Pasteurized), it must be treated as specified, and the bacteria must be reduced to 30,000 per c.c. It is hoped that in the long-run all milk sold will be of one of these grades, but at present this is impracticable, owing to the lack of trained persons in the industry.

A SIMPLE LOCK FOR 'PRAM' WHEELS.

That some form of lock is needed for the wheels of 'prams' which are left unattended is proved by the number of accidents that occur. We ourselves have seen two prams simultaneously run off the pavement and upset when the

women in charge had left them to watch the results of a street accident. Fortunately the babies were not seriously hurt. Pram-wheels are sometimes chained; and several forms of clip have been invented to hold them from turning when so desired. One of the simplest, which has been recently brought out, consists of a tube provided with a clip for attaching it to the frame or the spring of a pram near the rim of a wheel. A bolt slides in this tube, and is normally held back by a spring. When it is desired to lock the wheels the bolt is pushed forward by a milled head and given a half-turn, which causes a pin previously housed in a slot to engage with the front end of the tube and hold the bolt in the projected position with the end between the spokes. To unlock the wheels the milled head of the bolt is turned until the pin reaches its slot again, when the spring pulls the bolt out of engagement. One good feature is that the spring prevents any rattling of the device when the pram is being wheeled; others are the simplicity, the effectiveness, and the very moderate price of the invention.

A PROPELLING RUDDER FOR BOATS.

Most people have watched a man 'sculling' a boat with an oar over the stern. The oar is moved to and fro and given a quarter turn at each end of the stroke, so that the blade passes through the water at an angle which projects a stream backward, and therefore sends the boat forward by the force of reaction. Many attempts have been made to improve on the oar for this purpose, these mostly taking the form of a rudder with an after-part, hinged at the forward edge, and allowed a limited angular motion as the rudder is moved to and fro. This simple system has never proved successful, the results in propulsion being very feeble in proportion to the work required to operate the rudder. Improvements have been made recently, however, which have resulted in a much higher efficiency. The moving after-part is retained, but instead of being hinged at the forward edge, it is pivoted vertically at from $\frac{1}{4}$ to $\frac{1}{3}$ of the length back from it. There is also another but narrower propelling plane ahead of it. The chief improvement, however, is the introduction of springs instead of stops to limit the movement of the planes. The advantages over the older form of propelling rudder are: (1) less lost motion at the end of each stroke, because the plane, being pivoted well back from the forward edge, takes up the correct angle much more quickly; (2) the spring control, which enables each plane to assume the most effective pitch-angle to suit the extent and speed of the rudder's movement in relation to the speed of the boat. The device gives the best results in light skiffs, which are easily propelled, and on smooth water. With it the inventor recently propelled a skiff containing two passengers

down the Thames from Reading to Richmond, a distance of 60 miles counting backwater. In this type of craft the rudder is worked by wires from a ball-bearing upright with crosshead attached, fitted with a yoke at the base which is mounted on a thwart. A very simple device is provided for locking the planes in line fore and aft, when the rudder can be used for steering instead of propelling. For proceeding lazily along inland waterways with a minimum of effort many people will like this rudder. On the other hand, some would prefer sculls or paddles. Those taken with the idea should, therefore, try the device before buying it.

ELECTRIC LIGHT FOR COUNTRY HOUSES.

It is generally conceded that electricity forms the best source of artificial light for country houses; for, in addition to the convenience of being able to turn on the light without using matches, it can be employed for working vacuum-cleaners, washing-machines, and other domestic appliances which are driven by electric-motors. One or two electric generating-sets in which a petrol-engine supplies the power have been described in these notes. Recently, a small set has made its advent which runs on paraffin. The outfit consists of a dynamo and a paraffin-engine, mounted on a cast-iron bedplate with their shafts in line. They are not rigidly connected, however, the drive being through rubber collars, which allow a certain amount of 'give and take,' and eliminate vibration and shocks that would cause deterioration of the dynamo. The engine is designed so as to run without attention, the lubrication and cooling being automatic. Moreover, owing to a trough being provided under the crank, into which oil is continually pumped from the bottom of the crank-case, the level in the latter may vary within wide limits without affecting the lubrication. Other features worthy of note are roller and ball-bearing throughout; a balance-weight on the crank, which is much more effective than the usual lump on the fly-wheel for balancing the moving parts; and magneto ignition. The engine starts on petrol, and is changed over to paraffin when it has become hot. No cranking is needed, the dynamo, which for this purpose runs as a motor on current from the battery, starting the set when a button is pressed. A battery and a switchboard are, of course, required to complete the installation, but these items and the dynamo possess no features of particular interest. This electric generating-set may be obtained of a size large enough to supply 75 lamps of 30 watts each, and it will light 17 sixteen-candle-power lamps for a penny an hour.

A MAT-FIXER FOR POLISHED FLOORS.

Most of us have, at one time or other, 'come a cropper' by stepping on to a mat which has slipped on a polished floor. An ingenious clip

has recently been invented which will hold a mat firmly in position, and this without making holes in the floor or in the mat. It is based on the assumption that mats on polished floors are chiefly used in doorways, thus offering a wood-work surface close to each end of the mat. Each clip is formed by a strip of spring steel about one inch in width, having one end, which is provided with four holes for screws, bent up at an angle of 45°. A quarter of an inch at the other end is turned down at a right-angle and serrated, the better to grip the mat. The bent-up end of the clip is screwed to the door-post, one clip at each side, at such a height above the floor that the other end has to be pulled up with a fair amount of force to place the mat under it. With one of these spring clips at each end, a mat is firmly held in its place close up to the door, where it prevents the entry of draughts. The clips have a bronze finish, are neat in appearance, and offer practically no obstruction to sweeping.

A NOVEL DUPLICATOR.

Large numbers of duplicators have been invented from time to time, most of which possess certain drawbacks, although they are capable of turning out useful work. A recent invention in this line is quick, clean, and effective, while the number of copies that can be printed is unlimited. The duplicating surface is of opal ground glass. Handwriting, sketches, plans, and maps are copied direct, but typewriting has to be stencilled. Naturally, special ink has to be used, and this must be allowed to dry on the original document before the duplicating process is begun. When dry, the original is placed face downwards on the glass, and covered by the lid of the duplicator, in which is a pad. This lid is given a light pressure downwards by a spring clip at each end, which is left on for a few seconds. After the lid is removed the glass plate is rubbed over with a certain fixing fluid, but the result still remains invisible. The printing ink, which may be of any colour, is now applied, and copies to be taken are rolled face downwards over the inked impression, the latter being inked with a roller for each copy. When enough copies have been taken the impression can be washed off the glass plate with a special preparation, leaving it ready for new matter. The original can be used as often as required by placing it in contact with an ink pad, which restores the first freshness of the surface. When typewriting has to be copied the stencilled sheet is laid over the glass plate and backed by an ink pad, the effect being to make an impression on the glass such as was made by the writing. The remainder of the process is similar to that already described. One interesting variation or extension of the process is the possibility of dusting the copies while wet with gold or silver powder, whereby permanent writ-

ing or typing in gold or silver letters is produced, which has a very smart effect, especially upon coloured papers. The predominant feature of this duplicator is the quickness with which all the operations can be carried out, no waiting being necessary except a sufficient time for the ink to dry on the original.

A ROLLER WASHER.

Except for the invention of washing-machines, many of which have been described in these notes, few attempts have been made to improve upon the old-fashioned dolly. Lately a roller-washer has been brought out which works upon an altogether different principle. This contrivance bears in appearance some resemblance to a flat-iron, although it is slightly larger, and has a rectangular base. This base consists of an inverted sheet steel trough, in which are fitted five fluted wooden rollers, the spindles consisting of brass rods which are riveted into each side of the trough. When the trough is pushed backwards and forwards by the handle it runs on the rollers, which project below the sides. The handle is in a similar position to that of a flat-iron, and it is made of beech wood, as are the rollers. This device is pushed quickly backwards and forwards over the garment to be washed after it has been well soaped, the operation taking place on a flat board or on the bottom of a sink. The effect is that the dirt is squeezed out by the ribs on the rollers. By laying several articles one over another, such as two pairs of socks, or four handkerchiefs, the results are equally good, while they are arrived at much more quickly. Valuable lace or silk articles are treated by placing them between the folds of a towel or a cloth after lightly soaping them. This roller-washer is strongly constructed of steel plate which is coated with zinc to prevent corrosion. It should, therefore, have good lasting qualities. The price, moreover, is very moderate.

A PORTABLE COMBINATION BABY-CHAIR.

One would hardly suppose the wicker baby-chair with a tray in front of it to be susceptible of much improvement; but an attempt has been made recently, if not to improve it for its original purpose, at least to render it suitable for other functions. In addition it has been so designed as to pack into the box-seat, which can be carried by a leather handle. The essential feature of this combination baby-chair is a rectangular box. When the lid is opened a tray is exposed, which can be slid out into the usual position after the front of the box has been opened downwards on hinges at its bottom edge. This front carries a rest for the baby's feet. Hinged at its back edge, the lid forms a back, while safety catches prevent its shutting accidentally and nipping baby's fingers. The legs are detachable, and each is made in

two lengths, with dowels and safety catches at the joints, to give the chair two different heights. Fixed near the corners and secured by wing nuts inside the box, the legs are raked outwards to give a firm support to the chair. For the full height as a chair, or when the contrivance is used as an occasional table or a workbox (as it may be), a shelf with metal clips at the corners holds the legs together. This shelf and the lower parts of the legs are removed when a low chair is desired. A cushion covered with rexine fits into the bottom of the box for baby to sit on. Except the legs the chair is made entirely of three-ply wood stained and french-polished. The legs and the shelf, as already mentioned, pack into the box-seat for carrying. This invention solves the difficulty of providing a chair for baby when on holiday.

A MOTOR PUSHER FOR LAWN MOWERS.

One of the lingering functions of the horse, or, rather, the pony, the hauling of big lawn mowers and heavy rollers, is now being increasingly usurped by the petrol motor. Two motor lawn mowers have already been dealt with in these notes. In these the motors are embodied in the machines. A motor pusher has now been devised which can be attached to any lawn-mower (up to 28" cut) in a few minutes, and thus save scrapping a satisfactory machine already in use. This contrivance consists of a light steel frame carried on two small wheels, with wide, grooved treads which grip the grass. An air-cooled two-stroke petrol motor is mounted on the frame, and drives the wheels through a counter-shaft and two chain reduction gears. Every effort has been made to secure quiet running, two silencers being provided, while compared with toothed gearing the chain drives are practically noiseless. The push is transmitted through a universal joint at the front of the frame to a tubular steel crossbar which is provided with clips to suit the frame of any lawn mower. A clutch is provided on the counter-shaft by which the wheels are started and stopped, the control lever being clipped to one of the mower handles. A throttle control is mounted on the other handle. This motor pusher takes up so little space that there is plenty of room for it just behind the mower without interfering with the gardener's feet. Two outstanding advantages of the separate pusher over the motor lawn mower are:—(1) its much lower cost, assuming an ordinary lawn mower to be in existence; (2) its applicability to rollers, and to the driving of pumps and other appliances requiring power. The elimination of a horse or a pony for heavy rolling is a valuable feature, especially for gravel, as the wheels, which can be supplied rubber-shod for this purpose, supplement the action of the roller, while the hoofs of a pony, even when protected, sometimes do considerable damage.

The makers claim that this motor pusher saves much of the cost for mowing and rolling by horse or man power, and this claim is amply supported by testimonials from well-known persons. The capacity of the pusher with a 24 inch mower is said to be a thousand square yards in 15 minutes, at a cost for petrol of 1d.

NO MORE MISTY SHOP WINDOWS.

It is difficult to prevent the 'steaming' of shop windows in cold, damp weather. One sometimes sees gas burners used for this purpose, but the results are not very satisfactory, for the simple reason that moisture is one of the products of combustion from gas flames. Besides, where a shop window is full of dainty inflammable goods, gas is out of the question, on account both of the risk of fire and of the damage done by the burnt gases. Some shop-keepers overcome the difficulty by keeping their shop doors open, and maintaining the same temperature inside as prevails in the street. But this plan is very hard on the assistants, and is not at all comfortable for customers. What is wanted is a thin stream of warm, dry air flowing upwards over the inner surface of the window. This is exactly what is produced by a small electrical device which has been recently invented. The heating element consists of a thin steel tube, inside which is the actual heater in the form of a bar. A pair of flexible leads convey the current to and from the bar. Surrounding the tube are strips of three-ply wood covered on both sides with galvanized steel, which makes them practically fireproof. These strips do not meet at the corners; three narrow spaces are left, therefore, for the cold air to enter and the heated air to pass directly on to the glass. Made up in 4-foot or 6-foot lengths, these heaters are fixed along the bottoms of the windows, and the hot air from them keeps the glass clear of condensed steam or frost in the coldest weather. A six-foot heater consumes $\frac{1}{4}$ of a unit an hour, and, of course, helps to warm the shop; the cost, therefore, is very moderate.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (a) a reply dress is sent, or (b) a stamped and addressed envelope or post-card, be sent to the Editor, *Chambers's Journal*, 339 High Street, Edinburgh. (If this condition is not complied with, no reply can be sent.) To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

* * TO CONTRIBUTORS.

All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.' For its return in case of ineligibility, a stamped and directed envelope (or postage-stamps) should accompany every manuscript.

To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

CHRISTMAS 1924.

AFTER FUENTES DE OÑORO.

By G. APPLEBY TERRILL,

Author of *The Museum at Night*, *The Admiral's Shore Days*, &c.

PRELUDE.

IT is December 16 to-day—December 16, 1861.

I do not need the almanac, which is before me on my library desk, with a shaft of pale sunlight falling across it, to remind me that this is December 16. I have been waiting expectantly for to-day. I have been somewhat lonely during my wife's absence in London, despite that Marcia, our youngest child, who is still unmarried, has given me the sweetest attention.

My wife has been paying a visit of a few days to son Dick and his wife and family. It was her intention that they and she, and daughter Ruth and her excellent husband and children, should travel down all together for our Christmastide *réunion* here at Falanthill. But in her letter, received by me yesterday, she writes that she is coming before the others, as they cannot leave town until the 17th or 18th, whereas she extremely desires to be at home with me on the 16th—and I am to expect her by the railway train reaching Falanthill at forty-five minutes past midday.

I knew—though Mary, my wife, and I made no reference to it when we bade one another good-bye—that, under Providence, she would be back to me by December 16. She would not let me be without her on December 16. I *knew*—and Marcia wondered yesterday why I

said I knew, until I imparted to her that her mother and I first met on December 16—December 16 of the year 1812.

My memory, in my seventy-eighth year, is very clear and dependable. I have my wife's confirmation of this. She even declares that I am more than her equal, when we amuse ourselves by recalling the minutest details we can of events and circumstances which we witnessed together very long years ago—and she, nine years my junior, is universally admired for the unerring accuracy of her strong, serene intellect, which Time has taken nothing from.

She pays me a compliment, of course. None the less our countless recallings of the evening of December 16, 1812, and the countless times that I have told her of my life and thoughts during many months preceding that—months leading back to another date, May 5, 1811—have etched that period with extraordinary distinctness and minutiae of detail upon my mind. I cannot be too glad; it is one of my great pleasures to look at it, with Mary, or in some such inactive hour as this—when I am waiting for the carriage to come round to take me to the railway station to meet Mary.

It is true that the period opened with disaster for me, and led through months and months of wretchedness; but Mary (though I little knew

it) was at the end of it—and so no part of it can detract from my pleasure as I view it.

May 5, 1811 (over fifty years ago!) was the commencing day. That was the day on which General Masséna cannonaded us, under Wellington, somewhat heavily at Fuentes de Oñoro—and I received the wounds which utterly changed the course of my life.

CHAPTER I.

Glancing at myself in the days before Fuentes de Oñoro I smile, partly with impatience, partly with approval, at the youngster I see; for in some ways I was a very stupid young man, in others a sensible.

My father, who died when I was only two years old—my poor mother dying a month after him—left me a most considerable fortune. He was a merchant, of unpretentious family; and although he bought a house in fashionable Park Place, St James's (merely because he liked the situation), and this estate at Falanthill, he never, so I understood from my guardian, endeavoured to consort with persons of aristocratic position.

As a boy, I lived here at Falanthill with my guardian when I was not at school. The house in Park Place was left in the care of a manservant and his wife. The only occasions on which I set foot in it were those when my guardian brought me to London for my annual inspection by old Mr Michaels, our family physician. Very desolate the house in its shut-up state seemed, and we never stayed more than two nights. In later years if I went to London, which was rarely, I stayed at an hotel. Thus I remained quite a stranger to Park Place.

But by the time I was one-and-twenty several young men of my acquaintance were worrying and importuning me to open up my house there, to display my money, and to seek the acquaintance of the residents, several of whom were of the nobility, whilst well-nigh all of them were of the most exclusive fashionable world, the veritable *beau monde*, the veritable *haut ton*—so these fellows dinned into my ears. My money would be my passport; for its sake even these select people would consent to know me, they argued. This made me exceedingly angry. I refused to open the house, and finally silenced all suggestions of it. I knew that my advisers were rather contemptible, that their object was to enjoy my hospitality at Park Place, and scrape into a polite circle with me (if I got thither); but their insulting inference that my money would be my only passport rankled with me, and for years afterwards I harboured (very unfairly) a resentment towards fashionable society; and indeed, at the time when I was being most importuned, I frequently expressed in forceful terms a distaste for knowing such persons as the *haut ton* residents of Park Place;

this in the hearing of my servants at Falanthill, which procedure not only was unfair and ill-mannered, but excessively foolish, as I was to discover long afterwards.

Apart from my resentment, elegant company, drawing-rooms, and conversaziones were the last things that could interest me—in the days before Fuentes de Oñoro. Even the ordinary diversions of men of wealth, fifty-odd years ago—gambling, guzzling, and running after every pretty woman—made not the slightest appeal to me, I am pleased to think.

My interests in life were entirely restricted to activity in sport and my military career—sport having the larger share. To be boxing, cricketing, wrestling; to be riding a desperate finish in a horse-match, to be running a desperate finish in a foot-race; to be straining muscle and nerve in any friendly contest that called for speed of fist or speed of foot, for strength of body, for skill in horsemanship—those were the pursuits in which I found my happiness. And I like to assure all young men that there is nothing to equal them for keeping a man's body healthy and his spirits bright—his spirits bright in hard and weary times. And we knew some hard and weary times out in Portugal and Spain with the Old Duke (as he was afterwards called).

Although I had ambition to make a name in the army, I elected to go, on entering it, into a comparatively obscure Rifle regiment instead of into one of the dashing brigades affected by persons of means, where an officer is more within the ken of eminent commanders. I made the choice in order that I might be with one or two athlete friends, of slender purses, who were gazetted to the Rifles. I never regretted the step; and on campaign they and I struck up friendships with fellows, among the officers of regiments that marched and quartered with us, who had our own tastes—and throughout my time in the Peninsula I had my sporting contests whenever conditions allowed.

Indeed—though this affair was a pure bit of merriment—Norman Seys (of the 79th), a very dear friend of mine, and Laurie Whittuck (of the 71st), a delightful fellow, and I played a few minutes' cricket so late as the evening of May 4, the day before the heavy fighting at Fuentes. A tree was our wicket, a broken sapling was our bat; but I fully believe that we should have kept on until darkness—or an infuriated Provost-Marshal—closed the play, had not Laurie, with a splendid but unfortunate hit, sent our only ball into the river Turones.

That was my last game—that little piece of foolery, in the evening, by the Turones. It was destined to become in every way a sad memory. Both Norman and good-humoured old Laurie were dead by the May of next year. As for myself, next day I was simply shattered.

This occurred when the Light Division (General Craufurd), which included my Rifle

[Christmas Number.

people, had fallen back as reserve to the First Division, after holding General Montbrun's cavalry nicely at bay. Masséna's cannon opened, and presently I was hit, losing my right leg from the knee and my left arm as the consequence.

The ball which carried off my foot and shin had first splintered a small tree which was near me. Those who picked me up found that a fragment of this, which must have struck me as I reeled before dropping senseless, had broken and practically severed my arm. Chips and particles of white wood, falling after I was down, lay on me like snowflakes—some one told me many weeks later.

I had few moments of full consciousness until I found myself lying in a convent bed far behind our lines a month afterwards. But I had one distinct memory then—a memory of opening my eyes, perhaps many days before, and discerning that I was in a mule-cart. To some extent I was protected from the sun, but I could see the deep blue sky, and the heat was intense. I felt, almost immediately, that I was dying, that I was suffocating, that my brain was on the point of bursting. I could not prevent terror blending with my agony. On the harness of the mules in front of me were gay blue-and-yellow worsted knots. They were the common adornments of mules, but they seemed, in their gayness, to be a cruel mockery of my suffering and panic. And ere I lost consciousness I told myself that I died hating blue and yellow more than anything else in the world.

I knew that I was to live when I awoke in the convent. But, finding in what state I was to live, finding for the first time that my leg and arm were gone, that my athletics were finished, I sank into black despondence. I was to be a slow-moving cripple. Could there be a more horrible contrast!—though, as a soldier, I might have expected it. But, somehow, I had not expected it; and life, worth calling such, seemed suddenly ended for me. My depression was so black that it is marvellous that it did not stop my recovery and send me sliding down the path up which I was being lifted by gentle convent sisters and the surgeon.

My voyage to England gave me no relief from my wretchedness. I was indifferent, when I was brought ashore at Plymouth, as to whether I lived or died. Yet some grain of common-sense caused me to go to London to put myself under the pleasant and skilful care of old Michaels. As he wished me to be under his eye for an indefinite time I decided to live in my house at Park Place, and thither I went, having sent down to Falanhill for some of my domestics, not forgetting Pyrke, my head groom, a nice, very honest fellow, and a fine cricketer, whose talk of cricket, I imagined, would cheer me a little. But it was to prove incapable of doing that. For some fifteen or sixteen months

1924.]

after Fuentes de Oñoro I remained in a state of gnawing wretchedness.

My bodily health rallied. By the springtime of 1812, a year after the action, I was gaining strength fast. But there was no brightening of my spirits. Could I have looked forward to returning eventually to the army my future would not have appeared so black. Had I been a general officer there would have been a prospect that I should return despite my disabilities—to sit a quiet horse amid the bustle and exposure of campaign, with a sense of again living an active life, because of the stir about me, and the scorch of the sun, or the nip of winter winds, on my face—had I been a general officer! But I was not; and for a maimed lieutenant of Rifles the army had no place.

What aided to keep my spirits at their lowest when, with my health improving, they should have risen was that the cup of the timber leg which, early in 1812, Michaels brought into my drawing-room with considerable glee, so agonised and threatened to inflame the stump of my leg that, for some time thereafter, Michaels, and two other surgeons whom we consulted, were of opinion that two or three years would pass before I should be able to wear this wooden peg.

Since my left arm was at Fuentes I could use only one crutch. With this I moved about my rooms or about my little garden behind the house in a slow, laborious manner—balancing upon the crutch, making a hopping step, pausing unsteadily upon my only leg while I moved the crutch, then balancing and hopping again. My mind acquired the perverse habit of recalling vividly that or this foot-race which I had run in whilst I was making this poor progression of mine. I would almost feel again the 'fluff' of air against my face as I sped fast, the swift touch of my toes (of each foot) upon the turf. I would almost see again the apparent speeding of the green turf beneath me, as one always saw it though one's eyes were on the winning-line. And then I would realise that I was hanging upon my crutch and in some danger of falling because my only leg had made a reckless stride forward to win the race. And often at that, in a sudden semi-frenzy, I would come very near to whipping up my crutch and hurling it through the nearest window, if I could do that ere I toppled over. However, I retained sufficient strength of will to spare my windows. I would but set my lips tight, then take my hopping step, and so move onward.

I passed a very great deal of my time sitting at one or another of my drawing-room windows, on the first floor, looking down into Park Place and observing my neighbours leave and enter their houses, envying them all, men and women, young and old, because they were blessed with the power of being able to walk—of being able to run, if minded. I did not conceive of any circumstance that would provoke the older

gentlemen, very stiff of dignity, or the ladies with their silks and gauzes and pretty, weak airs, to dream of running, until one forenoon a spring shower burst with utter suddenness and heaviness upon Park Place. Even then the old gentlemen but quick-marched; but the ladies ran, with a strength and nimbleness of foot that I never should have believed possible.

At times into Park Place came some one-legged soldier or seaman, stumping bravely along on his wooden pin at an admirable rate; and heartily I envied each of these honest lads. And at times there came, draggingly and suffering, on crutch or crutches, some poor lad as shattered as I, doubtless looking for the 'Sick and Hurt' Charity which—I had heard—was opened in Arlington Street; and in a manner I envied these boys also, because they (though of necessity) dragged themselves along the streets, a thing that I, with stupid sensitiveness, shrank from doing.

If ever I left the house—except for the garden—Pyrke drove me in the curricule. I derived no enjoyment from these excursions. In my disconsolate state I felt that they accentuated my helplessness. The horses, being little worked and well nourished, were a rare mettlesome double-handful for Pyrke; and I could do no more than sit beside him and watch him master them, and know that I was bereft of power to control them.

So, then, for most of each day I sat at my window—sometimes reading the sport intelligence and war intelligence in a newspaper, sometimes talking with Pyrke, but generally sitting alone, with my newspaper thrown aside, staring into Park Place, watching my neighbours pass along.

A feeling of intense loneliness had gradually and steadily added itself to my troubles. Pyrke with his cricket stories was quite incapable of abating it. Cheery old Michaels, whose presence certainly could afford me relief, had his books too full of sick persons' names to be able to spare many half-hours for visiting me once my health was re-established—and, so far as I knew, I had not a single friend in London except Michaels. All my other friends, my fellows of the cricket field, the boxing ring, and the bivouac, my dear friends! were still fighting their way through Spain, or in their graves there. By the June of 1812 I knew that both Norman Seys and Laurie Whittuck were gone, one from wounds, the other from disease. I sobbed for a long while in my chair after reading the name of each in the newspaper lists.

In a manner I knew my neighbours; that is, Michaels had told me the names or titles of most (and had spoken of their social eminence), and I, observing them month after month from my window, had become very familiar with the features of many—familiar with their individual little mannerisms and habits of gait, with the very tones of their voices, which I heard when some greeted others. As my loneliness grew

upon me I wished exceedingly, even yearningly, that I was acquainted with some of them. I had lost my old resentment against elegant society. I found myself rather admiring the dignity, stiff though it was, of the sober-garbed old men among my neighbours; and, totally unaccustomed though I was to admiring women, I could not but admire a little some of these ladies with their delicately pretty faces and their sweet genteel ways. To the wounded young men who came now and again home to Park Place my feelings of comradeship went out. But, stationed at my window, I remained a stranger to all and every of my neighbours of Park Place—pondering of how considerably it would lighten my days if some of them had the habit of giving me a nod of greeting from the road, of coming in to talk with me, of welcoming me to their houses had I the courage to go thither with my hop and my crutch.

None of them had ever come to my door to leave compliments, though doubtless almost all knew that I was within, broken. I did not know whether it would be a breach of etiquette for them to make some inquiry for me.

I had a fund of crude shyness in my nature in those days. I had been little aware of it when I was in my natural element, amid men of my own tastes—with myself sound-limbed and high-spirited. But I was very aware of it in Park Place. I had an idea that Michaels would be not unwilling to present me to some of my neighbours, but shyness utterly held me back from asking him, caused me indeed to give, with considerable embarrassment, a quick turn to our conversation if I thought I perceived that he was going to touch on the subject. These elegant persons, if they spoke to me, would almost surely find that, with my rough tastes and neglected manners, with my ignorance of music, painting, literature, and the rules of very genteel conversation, I was unendurable. So, much better to keep apart from them.

Yet I yearned to know them, to be saved from my loneliness, as I watched them from my window—getting to know their faces so well, getting to recognise the faces of their relatives and friends who walked occasionally into Park Place to visit them.

And throughout this time, to the September of 1812, my spirits remained in such a monotony of gloom that, even to-day, I find myself wondering that I did not sink and die under my melancholy.

CHAPTER II.

BUT in the beginning of September my spirits began to mend—and thereafter mended rapidly.

The reason was that I had suddenly determined that, at whatever suffering, I would endeavour to use my timber leg—and Michaels

[Christmas Number.

though he counselled delay, did his utmost to aid me in the matter, devising pads and bandages for the stump, and lotions with which to combat inflammation.

I commenced by wearing the leg for only a few minutes each day, walking a dozen times up and down the drawing-room with it. I lengthened and lengthened the period of wearing; and though for a while the pain was exquisite, and often would recur to some degree as I lay in bed at night, no bad result followed.

By the end of September walking was much less painful. For half-an-hour on end I would walk in my garden behind the house, still hanging a little upon my crutch to spare the stump some of my weight, yet using the peg alternately with my foot in a splendid manner. Striding thus, passing and repassing my flowerbeds, looking sometimes, as carelessly as though I were walking on two feet, at the sky above me, at the sunlight falling upon the houses near me, I reflected that I had come back into life—that a pleasant life lay ahead of me after all. In time I should be able to walk fast, in the streets, wherever I liked, without a crutch.

On the 3rd of November, having discarded my crutch, bearing slightly upon a stick, I walked out of my doorway into Park Place, and thence away into St James's Street, and onward for twenty minutes, clad in a black civilian coat and long trousers (that my peg might be much hidden by the trouser-leg); and, for the first time since Fuentes de Oñoro, I experienced real happiness. Indeed, my spirits would be buoyant as I stepped and stumped along various streets in the days of that November. It would cause me sheer exultation to overtake and pass some sound-limbed person, even though he were a no more formidable rival than a stout and elderly gentleman making his way along St James's Street to one of the fashionable clubs, Almack's or Boodle's. There were some circumstances, however, which tended to cloud my satisfaction of those days—circumstances which had to do with my neighbours. I had noted, when first I walked from my house into Park Place, that such of these as I passed observed me with some curiosity, as a person of whom they had heard but hitherto had caught but a glimpse (when I started upon, or returned from, one of my curricule outings). I had noted also, in the case of the men, that the scrutiny I received contained something more than a quality of coldness which a stranger might expect to discern. It contained something that hinted of hostility. I had not expected this—but day after day I felt that I perceived that touch of hostility in many glances.

I was very conscious, if under scrutiny, of my wooden peg projecting beneath my trouser-leg. I was very conscious of the sharp tap with which it struck the ground in contrast to the soft fall of my foot; and the thought that I

was surveyed with unfriendliness was quite sufficient to rouse my fighting spirit. I returned glances as cold as, and more openly hostile than, the glances I received.

But one Sunday morning I saw coming towards me an elderly gentleman, Lord Henry Clunas, a man of grave, handsome face and erect figure, whose winning courtliness of manner in greeting his friends I had very frankly admired from my window. I saw from his eyes that actually he intended to speak to me—doubtless to felicitate me upon my recovery. In my amazement at perceiving his purpose, in an access of frantic shyness, I lost my head in the most foolish manner. I looked sharply, blankly, before me, quickened my pace, and made as though to pass him—expecting, none the less, that he would speak. But his hand, which he had lifted half-way to his hat, sank down, and we passed.

I knew how deeply I had affronted him. My walk was quite spoiled; and I lay awake long that night troubled by the matter. The next day, seeing him, I at once went out of my way to pass near him, turning my face to him with well-nigh a smile of recognition. But he looked very sternly before him. And in future each of us looked steadily past the other.

After this incident I saw, beyond any possibility of doubt, uncompromising hostility in many faces, and I guessed that the thing had been spoken of—particularly when Michaels said to me, in queer tones, 'I hear you have not formed any acquaintanceships yet, young man.'

'I have not,' I answered shortly, sullenly; and turned the conversation.

My fighting spirit did not flag. I either answered glances with interest when passing my neighbours, or, as an alternative, looked ahead of me with my chin up and my lips set, with truculence in the way in which I stepped and stumped, yet with the thought in my mind that, with my wooden peg, my empty sleeve, and my stout walking-stick, I doubtless was failing to get much defiance into my gait.

However, I had no real heart for this kind of thing—after my months of misery. I was prepared to fight, but I wanted friendship about me, not antagonism—*friendship*. At Falanthill (but a little village in those days) I should have at least Mr Le Hunte, the pleasant parson, to spend hours with me, and tenants and villagers to wish me well as I walked. I decided to go to Falanthill—but not for some weeks, lest I should seem to have retreated pell-mell. I decided that I would sell the London house and be done for ever with Park Place.

But it was destined that some chance words should set me on a path that was to lead me not only to friendship with my neighbours in Park Place, but to some one infinitely of more account than they. The man who spoke the words would have appeared the least likely

person to influence my fate. He was merely a very poor, very broken soldier whom sometimes I spoke to in Arlington Street.

CHAPTER III.

HIS name was Humphry (late of the 14th Dragoons). He told me one afternoon that he was a distant relative of a Mr Ozias Humphry, a very well-known painter of miniatures, he said, who had died about two years before. He added that, without any doubt, a gentleman such as I knew Mr Ozias Humphry's name and miniatures very well.

I knew nothing whatever of miniatures except that they were little pictures—usually portraits, I thought; and at the time I believed that I had never heard the name Ozias Humphry. But that night, as I lay half asleep, the face of the broken soldier and the name Ozias Humphry drifted into my mind; and suddenly and clearly I recalled that my dear, dead friend Norman Seys had mentioned, one long bygone evening near Corunna, that he had a brother Francis who was a miniature painter in London, and had been a pupil of Ozias Humphry.

I thought no more of Ozias Humphry, but, being thus reminded that Norman had a brother, I decided instantly that I would seek him out, and have a long talk with him of Norman. I debated, with feelings between pleasure and great sadness, that I might find Francis Seys so like his brother that I should seem, in a way, to be with my friend again.

Next morning, before I dressed, I sent Pyrke to make inquiries as to where Mr Francis Seys, the painter, lived; and in less than twenty minutes he knocked at my bedroom door to tell me that Mr Seys was lodging in Russell Street. After breakfast I wrote a short letter to Seys asking whether I might visit him, and explaining why I wished to, and sent it by Pyrke, who presently returned with a letter from Seys, which gave me a very pleasant invitation to come that afternoon, but started a far from pleasurable train of thought in my mind. The handwriting—as I had immediately seen—was weak and very curious; the spaces between the words being irregular, and gaps occurring in the middle of several of the longer words, as though the writer, having lifted his pen, had somehow lost sight of the first part of such words when he resumed; and, indeed, at the end of his letter Seys apologised for his writing, stating that an affection of his eyes, from which he frequently suffered, was rendering him almost blind to-day.

I reflected with consternation that for a painter this malady would be a peculiarly grave affliction.

In the afternoon, which was cold and overcast, with a trace of fog and a hint of rain in the air, I set out for Russell Street, stepping

along at a fine brisk pace with my peg and my foot. I recalled that Norman Seys had spoken of his brother as making a large income by his miniatures. Francis Seys's reference to his eyes gave me no reason to suppose that I should find him in other than comfortable circumstances. But, after a maid-servant at his lodging-house had conducted me up two flights of stairs, I entered a room that was very poor-looking, and discovered Francis Seys to be very poor-looking too—and worse, with his appearance of illness and pain. He was dressed untidily in an old coat and knee-breeches, with his stockings loose and wrinkled about his slight legs. His face was pale, sunken-cheeked, and his eyes seemed to be in an exceedingly painful state. They were watery and very contracted, with the lids puffed, reddened, and twitching incessantly. Across his forehead was a bandage, moist with some medicament, which evidently had lain across his eyes until he pushed it up to receive me. (This medicament, he told me presently, was in part the cause of the painful aspect of his eyes, though it was beneficial.)

He was standing by a meagre fire, which smoked in a hearth-place of dirty white marble, and left the air of the room quite cold. His windows were uncurtained, doubtless to afford a better light for painting; but their bareness added to the really miserable appearance of the room, with its uncarpeted floor and its scanty furniture of a few chairs, a bureau, an easel, and a table with some palettes, brushes, and colours upon it.

He came to me with a smile. Thus far I had detected no resemblance at all to his brother; but when he spoke I had a strange, sad feeling of being carried back to the past, for his voice had exactly the sound of his dead brother's.

'Lieutenant Midwood?' said he.

'Mr Seys?' said I; and, slipping my hat and stick onto a chair, I heartily shook his hand.

He led me to the hearth, and set chairs for us; and during the next hour we spoke of little except Norman—I speaking of his life in the Spanish Peninsula, Seys telling me of their schooldays and early manhood days together. He had replaced the bandage over his eyes, but eventually he pushed it on to his forehead again, and, rising, took a bottle with a little brandy and two glasses from a recess, asking me to pour the brandy, since his sight to-day would not permit him to do it with certainty. Our raising of our glasses to each other's health (and to Norman's memory) led me naturally to inquire as to his eyes, regarding which he had given me no particulars. He told me about them, and in doing so disclosed his circumstances, and I found that in every way his state was truly wretched.

Two years before, he had reached the highest point of his popularity as a painter of miniature portraits. The most fashionable persons sat to him; he painted a dozen miniatures a month, being paid from thirty to fifty guineas for each,

[Christmas Number.]

out spending every guinea that he earned. Then his eyes, from some inherent weakness or from strain, perhaps from both, had commenced to trouble him. There would be days when he could hardly endure to keep them open because the light hurt them, and days when he would find his sight very clouded, so clouded at minutes that he would be unable to distinguish the lineaments of a portrait-face in a miniature. At first, such days were of rare occurrence; they became much more frequent. Aware that these troubles might soon put an end to his painting days, he became preyed on by anxiety—*anxiety* which told on his body, causing him to lose strength. With the decrease of his vigour his eyes swiftly became worse. Often he could paint only on two or three days a week, and then but for a little time, working in great pain, with the daylight pricking at his eyes. After an hour, frequently after only minutes, the light would begin to stab agonisingly, and his sight would be almost completely blotted out. The day's painting would be finished, and perhaps for hours after he had laid down his brush his eyes would see little but vapour. Spectacles did not aid him; doctors could not, beyond allaying his pain somewhat with medicaments. They adjured him to abandon painting immediately if he would save his sight. Having put aside no money, being in debt even, he would not abandon; he struggled on. But it was evident, some months before I met him, that the end of his painting was very close. Patrons were deserting him fast, not only because he rarely could paint, but because several of the pictures which he completed were deemed unsatisfactory by those who had sat for them.

At the time I was in his room he had scarcely a patron left. He had been unable to paint for three weeks. He had made an attempt that morning, but he had done no more than almost ruin a portrait, and he had been nearly blind ever since. He assured me, with a disconsolate smile, that he had not seen my face plainly enough to know really what I was like. . . . During the past month, he added, he had been forced to sell most of his furniture and all his good clothes to pay off certain creditors.

The fire on the hearth was extinct save for a speck of fading red when he stopped speaking. Outside the naked windows day was darkening into night. The room was in dusk. I gazed at Seys, his lean face silhouetted against a window, his bandage over his eyes, and I meditated with some shame that here was a poor fellow who had more reason for considering his life at an end than had I in my former misery.

Abruptly, as though guessing the dusk, he pushed his bandage up and rose, and groped on the mantelshelf and picked up a tinder-box. He lit two candles on the bureau, shading his eyes with one hand, and putting aside my protest that he should not light up the room. Then
[1924.]

he swung the shutters across the windows and returned to his chair, leaning back in it and pulling the bandage over his eyes.

'I spent May and June in Dublin,' he said, after a moment's silence. 'Do you know Dublin?'

'No,' I answered.

He nodded. 'I thought the change might benefit me, and that I might get some work there—if my eyes would let me do it. It was an unfortunate expedition. A wretch of a woman cheated me—when I could least afford to be cheated!'

'Cheated?' I asked.

He nodded again. 'Cheated and robbed me. . . . She was to give me a hundred guineas for three portraits of herself. I was six weeks in doing them. My eyes were very bad—I could not work for more than a few minutes each day. I worked at nothing but those portraits—no one else offered me work—and I did my utmost to make them very good. I wanted to be sure of satisfying her. I most badly needed the hundred guineas. She was not to pay me until all three were finished; she would not agree otherwise; and from the first I was half afraid that she would find some pretext for cheating me. She was a pretty woman, but her blue eyes were not honest. I always felt that. I strove to make those portraits too good for any fault-finding.' The finger-tips of Seys's hands, which lay on the chair-arms, tapped quickly, angrily, upon the wood.

'They were good portraits. Not much below my best work—though I did them in such pain. She—she was *entranced* by the first and the second, so she declared; and she carried them away without leaving me a guinea for them. And she was entranced by the third.' Seys moved his shoulders, and smiled glumly. 'She would have carried that away, promising to pay me next day. But I stood against that. I would not let her take it. Very well, she would come for it to-morrow with the money, she told me in a fury. But she did not come, and two days afterwards I learned that she was nothing but a rogue, and had cleared out of Dublin by night with a cloud of debt-writes after her. . . . A heartless wretch! She knew how my eyes were; she knew how I was struggling in great pain to earn her hundred guineas. Heartless!—and so pretty! I will show you her picture.'

Once more he pushed the bandage from his eyes. He stood, and went towards the bureau. He stopped for an instant when near it, placing a hand over his eyes. 'They stabbed me suddenly—the candle flames; stabbed me through bright mists, you know, Midwood. That's the sorry state I'm in,' he said.

'Sit down, man,' I said. 'Let the picture be. Sit down and cover your eyes.'

But, with a certain obstinacy which I had already noted in him, he shook his head. He

stood by the bureau, and, with face averted from the candles, with eyes so screwed that they well-nigh were shut, pulled open a drawer. From it he took two small unframed ovals, white on one side, brightly painted on the other—as I could see from where I sat. With one in either hand he peered at each, eyes screwed. He placed the ovals on the top of the bureau and lifted two more from the drawer. 'I made copies, on ivory, of some of my favourite studies,' he said; 'equal to the pictures themselves. I meant never to sell them, but I shall be forced to—when there is nothing else left to sell. . . . This is the Dublin wretch. I painted *her* on ivory.' He spoke of a miniature which he was holding to his eyes. He put the other oval which he held into the drawer; and then, keeping his face still much averted from the candles, he extended his hand to the miniatures on the bureau, picking one up. By mischance the edge of it touched the face of the other, and was drawn lightly across it. Seys clicked his lips, hastily transferred the miniature he had lifted to the hand which already held the Dublin lady, and picked up the third picture, and raised it to his eyes. 'Is it scraped?' he asked, with a note of helplessness. 'I truly cannot see.'

I got up, stumped over to him, and took the oval—the shining colours of which portrayed, against a dark-blue curtain, the face and upper part of a middle-aged, whiskered man, the face being so natural in its expression and whole appearance that I, looking wonderingly at Seys's workmanship rather than for a mark of scraping, felt that the portrait must be a very true likeness. Then, after a second or two, I said, 'No, there's not a mark.'

Seys muttered a word of relief and, when I had put the picture into his hand, laid it within the drawer. Then, moving his head sharply as though the candle rays had caught his eyes again, he took one of the two miniatures which he held and proffered it to me, bringing my eyes down from his face, which I had been regarding pityingly since his flinch. I took the little picture, with the barest glance, with scarcely any interest in it at the moment.

Seys placed the other in the drawer, shut this, and walked to his chair. He sat down hastily, pulled the bandage over his eyes, and lay back with a sigh of suffering, pressing a hand upon the bandage—and I for some instants surveyed him, or, preoccupied with him, glanced with pity around his cheerless room. The fire's speck of red was turning dark. The room was but half lit by the two candles. A shutter had swung back from one of the windows. I could see raindrops on the glass; could hear them ticking against it. A current of air, coming past the shutter to where I stood, was bringing a keen chill into the dull coldness of the room.

'Blue eyes that would play you false,' muttered Seys suddenly. 'You can see it, Midwood,

eh? I saw, yet let her cheat me. Maybe I was fool enough to be—to be touched by her pretty, dishonest face. It is pretty, eh? But dishonest—look at the mouth and eyes.'

I looked. For the briefest instant it was the beauty of the little picture, as a picture, which held me—the beauty of Seys's craftsmanship, which, for all my ignorance, I knew was superb. I marvelled that, in his pain, he could have commanded himself to limn with the fineness and precision that were shown. Actually separate threads of the golden hair which lay against the cheek of the sitter were delineated, it seemed to me. And in her blue eyes were twin spots of light which wonderfully suggested life. Almost as I noted them the eyes seemed to shine with a doubled appearance of life, drawing my attention wholly to them and to the nature of the face; and one of my thoughts was that, somewhere and more than once, I had seen this face in life and believed it beautiful, as now, looking on it at leisure, I saw it truly was—and it was faithfully portrayed, I could be sure.

It was an uncommon face. It was long and slender, and lower of forehead than one would have looked for, considering its length; but the effect of this was strangely pleasing, since there were understanding and wisdom most plainly depicted in the face. The brows were level, the blue eyes were large; far from being false eyes, they looked to me steadfast and honourable. And the mouth, sweetly chiselled, sweetly firm, far from being dishonest, seemed to tell of honour.

I smiled a shade, for I realised that I was going beyond admiring this face, I was letting it attract me. Indeed, it was attracting me very much more than any woman's face had ever managed to, if my memory served—and it was a cheat's face! She was much, much younger than I had expected, the Dublin wretch. Poor Seys—I debated—having been cheated and robbed, imagined that her true character was written in her face. It was not. Only honour and steadfastness, and sweet, grave wisdom were written. What a face for a thieving cheat! What an invaluable face for her!

I took a step or two down the room, still looking at the face, ruffling my brow as to where I had seen it. I felt that I was a trifle disloyal to Seys in not conceiving a dislike of the face. But I couldn't do it. Whimsically—for, of all unseasonable results, my study of the Dublin wretch's long, sweet face, with its big blue eyes and golden hair and apurious honour, had put a queer touch of exhilaration in my spirits—whimsically, looking at the yellow hair and blue eyes, I recalled to myself that, ever since the day when I lay shattered in the mule-cart, I had made a point of hating blue and yellow whenever I saw the colours together. But I found that I could not hate them in this case.

And then I remembered where I had seen
[Christmas Number.]

her, and knew why my memory had been so strangely tardy. The reason of that was not that I had not seen her since early summer; and the reason was not that I had but glimpsed her twice from my window as, slender and tall, she went somewhat quickly by; the reason (almost an illogical one) was that then her face was framed in a bonnet. Her pictured face was framed by no bonnet. But it was the face I had glimpsed, once on a sunlit day, once on a day of soft rain.

'Seys,' I said, 'she was in London in July. I saw her come twice into Park Place, to visit at some house, I should say. I didn't see whose.'

He lifted the bandage from his eyes, looking towards me, but distinguishing little of my face, I feared. 'Are you sure?' he asked.

'Ay—very sure,' I answered.

Then: 'July?' he said. 'Oh, July! Haven't you seen her since then?'

'No,' I said.

'Then she's flown, long ago,' he said disappointedly, wearily; 'finished her cheating in Park Place, and flown. I wonder whom she robbed?'

I stared down at the face. 'I wonder where she's flown to?' I said.

'She may still be in London,' said Seys, sitting up in his chair. 'She may be! I never thought she would come to London. They said in Dublin, afterwards, that she was notorious here. . . . I'll lodge information to-morrow—set the runners looking for her. . . . I don't know her real name, but I'll show them her picture. I'll have her jailed—if she can be found. I'll have her jailed tight. There are a dozen things that they want to jail her for, here in London—from what was said in Dublin.'

I shrugged my shoulders. 'What's the good?' I said. 'You won't get your money by it if there are so many claims against her.' And I glanced up at him.

'No, I sha'n't,' he said pensively. He sank his chin upon his hand, and his eyes roved in a sightless way along the room. Suddenly they returned in my direction, and I saw eagerness in his pale face. 'You may see her again; you have a far better chance than I, Midwood,' he said. 'Take that picture of her. Do you see a little case—violet silk inside—open on the bureau?'

I glanced. 'Yes,' I said.

'Put it in that, and into your pocket, and ever you see her, show it to her. Thrust it up to her face, and tell her you know of her robbing me. I want you to frighten her, Midwood—frighten her into giving you some of my guineas, if only five or ten; or frighten her into coming with you to me to pay me something!' He leaned back a little weakly.

In his chair, plainly feeling an effect of his shemence. 'I would be most grateful to you, Midwood,' he said. 'You might frighten twenty guineas out of her—and they would be of extreme use to me.'

1924.]

My cheeks had gone hot. I had been very near to interrupting him with violently angry words because he dared to imagine that I would bully money out of a woman. I restrained myself; and then I felt angry with myself for having so nearly spoken harshly to him, who looked so pitiable and frail. I pursed my lips, and looked once more at the miniature, at the steadfast, radiant eyes, at the beautiful, honourable face. And at last, and suddenly, my anger flared against this face, because it could look thus and cleverly hide a rapacious, thieving, utterly mean soul.

'I'll watch out for her, Seys,' I said, almost venomously. 'I'll say things to her that will make her wilt! Ay, I'll turn her sorry and sick that she plucked at you.' And I knew that I was speaking sincerely.

He nodded with a pleased light in his face, thanking me, and wishing I might speedily find the bird. I walked to the bureau, placed the miniature in the little violet-silk lined case, and the case in my pocket. Oh, I was sincere. If ever I met this woman—this girl—I'd give her a tongue-lashing, as she deserved for showing such a face to the world. But, take a penny from her frightened hands! What a thought! Seys should not lose by my neglect, however. If I met her (perhaps even if I did not) I would pay him his hundred guineas, pretending they had come from her. Then she would have one enemy the less.

Presently, having persuaded Seys, not without trouble, to accept a trifling loan, I left. As I stepped and stumped very smartly through the rain I found my spirits exuberant. The rate at which I could walk in these days was splendid!—And my vigil for the Dublin wretch, though I was little likely to meet her, was a curiously interesting diversion.

CHAPTER IV.

[T was not in Park Place, it was not in London, that I met her. It was in a roadside inn, 'The Five Bells,' eleven miles from Falantheil, that we came face to face. Thus, strangely indeed, did fate run.

This was some two weeks after my visit to Seys, being on December 16 of the year 1812. I had been looking forward to a very lonely Christmastide in Park Place. Michaels, who had dined with me on the previous Christmas Day, was to be away in the country; and from Seys I had received a note, written in well-nigh happy phrases, telling me that a former patron, just returned from India, was taking him into Kent for the Christmas. (And with gladness I reflect that Seys lived many happy years with this patron, turning his art from painting to horticulture and preserving a remnant of his sight till his death in 1840.)

So, with Michaels and Seys to be out of town, I was faced with an empty dining-room. My spirits would fall a little, even when I was walking, from thinking of it. I would rally them by glancing alertly round for the Dublin wretch; then I would debate that doubtless she was out of town, and perhaps a thousand miles away, and my spirits would fall fast. Returning into Park Place, I would discover, as often as not, a group of my neighbours conversing blithely. The ladies would give me a cold glance, the men an inimical one; and though my mouth would be set stoutly and truculently, those glances would not help my spirits.

On the evening of the 14th I decided that I would pass my Christmas in the friendlier air of Falanthill—to the flutter of my household, part of which was to go with me, and part to stay. The next day Pyrke and I started homeward in the curricule, with a coach-load of my domestics (fluttered even yet) preparing to follow us; and just on dusk of the day after, December 16, the curricule, breasting a hill, brought us in sight of 'The Five Bells'; and I told Pyrke to pull up there so that we could fortify ourselves with a meal for the last cold, dreary miles of our road, most of which would be byway and very slow going.

I perceived with considerable surprise that there were two large travelling-carriages and a berlin and a spick post-chaise, all horsed and betokening company of some consequence, outside 'The Five Bells.' And, on entering, I had to press my way past a number of gentlemen, talking, glass in hand, to Forrest, the landlord.

Forrest, having given me a small private room for my meal, and having brought the first cover to me himself, told me, anent the company, that it consisted of persons who were going to a great reception at Sir Nevile Breadnell's house, some miles off. The bridge over Danby's Stream had collapsed, however, and they were waiting whilst Sir Nevile's men finished a makeshift bridge for their carriages.

I began my meal, making but leisurely way with my one hand. The best part of half-an-hour went by; then, quite suddenly, I heard women's voices outside my door. There came a tap, the door opened a little, a voice—very sweetly it sounded—asked 'Dick?' and a face looked in—the long, sweet, steadfast-eyed face of the Dublin wretch!

I did not think of her as a cheat at the moment, yet I behaved with extreme discourtesy. That is, I believed that if I made to stand up my awkwardness and the scrape of my wooden peg upon the floor would cause even her steadfast eyes to glance uncomprehendingly below the level of my table and discover that I had a timber leg; and though my loose sleeve was obvious to her, I shrank exceedingly at this moment from letting her know how maimed I was. Her blue eyes, reflecting the light of the candles on the

chimney-piece, were upon my face. They had expressed surprise and courteous distress at finding me instead of some one she sought. Perceiving me so rudely sit, they expressed more surprise, and transient displeasure.

She wore a brown bonnet, her golden hair gleaming within it; and as she opened the door wider she showed herself to be in a long brown cloak embroidered with lighter brown. I saw, with surprise, that it was merely to make a ceremonious withdrawal that she had opened the door more. Taking her hand from it, she gave me a shade of a curtsy, her blue eyes quietly unfriendly, and her voice, when she spoke, cold, yet so sweetly sounding!

'Oh, sir, I crave your pardon,' she said. 'I thought my brother was here.'

And then she had turned, and was closing the door, speaking to a lady, whom I had discerned behind her, in pensive tones, as though, even before the door was closed, I was totally separated from them—forgotten. I had affronted her; she had shown her indignation. She had scathed me in the quietest manner; but for her eyes, the scathing would barely have been perceptible. Yet I, conscious of my rudeness, watching the door gently moving to shut, felt that she had given me a monstrous crushing, had made me look a veritable oaf. And I remembered (and should have been ashamed to find myself remembering it vindictively) that she was a cheat. What right had she to 'lady' it despidingly over an honourable man, as I hoped I was? I remembered, and, exactly as the door was shutting to, I called swiftly, angrily, 'Wait, you! Come here!'

The door opened quickly. I saw amazement, intense anger, in her eyes. I saw that her face had gone quite white. But her eyes in their anger were still steadfast. Her face in its whiteness had no tremor. 'Surely you could not have been speaking to me!' she said quietly.

'I was speaking to you,' I answered. I put my hand quickly to my coat, uncertain as to whether the miniature was in the pocket or in the pocket of another coat. I felt the case, took it out, placed it on the table, and opened it. 'I wish to speak with you about this,' I said, nodding at the miniature lying, with its colours shining, upon one of two squares of violet-coloured silk.

She looked towards it. I saw her level brow knit a thought as she discerned something familiar in its colouring. She moved—moved nearly to the table; and then, with an intake of her breath, she looked at me, burning indignation in her eyes. 'Who gave you this?' she asked. 'How dare you have this?'

We had come to the point—and I felt that something was wrong. I answered her gaze stoutly, but the great indignation in her eyes, the honour in her face, looked too real to be explained away—superb hoodwinker though she

[Christmas Number.]

might be, I felt that something was wrong. But, after my rude, raucous words to her I had no choice but to go on, I deemed. Conscious of a touch of hotness at my cheeks, I said, 'Mr Francis Seys lent it to me. Why did you cheat and rob Mr Seys?'

'Cheat—rob—Mr Seys?' she asked slowly, gazing at me in purest, truest astonishment. Her lips had turned white, and suddenly her steadiness failed. With a sharp breath, putting her hand to her lips, she turned and walked quickly across the room and through the doorway. I heard the other lady speak to her, and I heard her say whisperingly, gaspingly, 'Some strange villain!' And then she was gone from the doorway, the other with her, and I heard them call together in the passage, 'Dick! Dick!' and again, 'Dick! Dick!'

I sat frowning, convinced now that something was very wrong, and wondering what to do. Their voices died away; perhaps half a minute passed, and I had come to no decision. There suddenly sounded a man's voice at the end of the passage, and then the swift patter of a man's shoes, and into my room swung a broad, fair-haired young fellow in a blue dance-coat and black smalls, with his fists already doubled, and 'smash' written on every line of his infuriated face.

I recognised him instantly, despite his fury, as the Honourable Mr Lambarde, a nephew of Lord Henry Clunas, who frequently resided with Lord Henry in Park Place. But he gave me scant time for recollection. Without the slightest pause at my threshold he came straight for me, flinging himself three-parts across my small table from the fury with which he drove his right fist at me. I swerved my head, and, though sitting, drove three lusty ones upon his ear before he could recover himself, amid my meal, from missing me. As he straightened he paid me back with two heavy blows on the left side of my head, which I, armless on that side, could ill protect. Then, ere I had straightened from the buffets, he was round on my side of the table, and had hit me again twice. I struck him on the chin as he drove the second blow, and then clutched his coat, hoping to jerk him from his balance. Thereat, with both hands, he grasped me at my neck, whipped me out of my chair, and shook and swung and whirled me—[striking but weakly at him now, and feeling queerly helpless in his extraordinarily strong grip. The table went over with a crash and a ringing of broken things; I was being swung and shaken into dizziness, but I was conscious of people running into the room. Then I felt my antagonist lift me high—and, with what seemed all his strength, he flung me from him into an angle of the room.

My wooden peg touched solid board first, and he impetus of my body drove my leg stump against the bottom of the cup with dreadful force. The pad which I wore could not save me
1924.]

from hurt; I felt the bone of the stump pierce agonisingly into the flesh. For an instant I stood well-nigh upright, on peg and foot, stupefied; and then I dropped to the floor, the bone seeming as a white-hot knife that moved quivering in my stump. In that moment I knew that it would be months before I should be able to endure my wooden leg for walking. Lambarde, in a few bullying seconds, had robbed me of the pleasure which was so dear to me. He had flung me into months of renewed wretchedness. (But in this last I was wrong.) My fury seethed against Lambarde. I believe it was only my fury which prevented me from swooning.

I felt myself picked up. I touched the floor with my peg, and cried out quite loudly from anguish. Then I knew that I was in a chair. I discovered that my eyes were shut in pain, and I opened them.

I found Forrest and a gray-whiskered gentleman leaning over me. I saw at a little distance blue-coated Lambarde, hot-faced, scarlet-eared, panting, looking at me, with her, in her brown bonnet, beside him, speaking to him, her colour high, not gone, in her anger now; for, despite the calm movement of her lips, I could tell she was angry. Beyond them, blocking the doorway, stood a medley of folk—four or five gentlemen in topcoats or dance-coats, two ladies, and countrymen, and servants. Only for an instant, though, did my eyes go to these. My gaze returned to Lambarde and to her as I heard his voice, strong and penetrating.

'I didn't know he was short of a wing and a leg, sis, till the last. You didn't tell me, and I never looked below his phiz. . . . You'd never have thought he hadn't two mauleys, sis—he hit so fast. And I was too hot to see anything till near the finish. . . . I saw then, but I couldn't keep from "falling" him hard. Laying his tongue on you!'

She looked from him to me. I saw that her eyes were full of great distress; that her firm, sweet mouth was all shadowed by distress.

'I ought to have known his phiz when I came in, but I was so hot I didn't,' said Lambarde, lower voiced. 'You don't know him, sis?'

She shook her head, seeming little heeding, but rather to listen to Forrest as he asked me whether I would take a cordial, and to me as I answered no.

'He's a black-tempered fellow, with sacks full of money, who lives in the Place,' said Lambarde, lower still. 'You've heard, sis? The fellow who turned his back on Uncle Henry, and thinks people in the Place want to put their hands in his money-sacks, and uses a black tongue about 'em. You've heard. And now he's laid his tongue on you! I haven't done with him yet, by a long measure.'

'Yes, you have, Dick. You have done with him,' she said quietly, commandingly, her distressed eyes on me.

Some of the things which Lambarde had told her of me—amazingly unjust things—I could not account for. But I spared no thought for them; I had another matter to speak of. Thus far I had leaned back, spent, in the chair. Now I sat forward, catching my breath because of the access of suffering which a slight movement of my leg stump caused. I met and held Lambarde's eyes, and spoke, with my voice rather jerky, rather breathless, from pain. 'I'll fight you in a quarter of an hour,' I said. 'I'll not wait till morning. Pistols you must choose, because I'm lamed past swords. Forrest will give us lanterns in the stable.'

'Fight, eh?' said Lambarde. 'Oh yes—you're an officer, ain't you? Pistols'll answer.'

His sister (as so obviously she was) turned her face quickly to him. 'Why say that, Dick?' she asked. 'You know you cannot fight this—this officer, who is so—so wounded. You know it would be against your honour.'

Lambarde moved a shoulder, wrinkling his forehead. 'I ain't able to choose, sis; he calls,' he said.

I made an essay to get up. The dart of excruciating pain when my peg pressed ever so lightly upon the floor caused me to fall back in the chair, with my lips set very hard for some seconds. And, except for the whispering of some persons near the door, no one spoke. 'Forrest,' I said then, 'you'll have to carry me down. . . . You'll have to tie me to a post.' I gave a quaver of a laugh at that, a breathless, half sobbing laugh, for my pain made it half a sob.

No one else laughed. In such faces as I saw were only great distress (that was in hers), ill-temper and uncomfortableness (these were in Lambarde's), and (for the rest) considerable anxiety. And, after an instant, the gray-whiskered gentleman beside me bent and said, 'Since you are hurt and cannot stand, sir, you must not think of fighting'; whilst, from the doorway, a voice, with much sympathy, called, 'No, no, sir. Don't fight to-night!'

'I'll fight,' I said.—'Forrest, where's Pyrke? We've a pair of light road-pistols in the curicle. They should do.'

Forrest neither moved nor spoke.

I saw Lambarde, touched by his sister's hand, come a step to me. 'Fight me in a week. Put it at that,' he said.

'I'll fight you now!' I retorted, sitting more straightly, breathing heavily from suffering. 'You gave me no true chance. You flung me about, shook me as though—as though I was a rat. Oh-h, I'd have *smashed* you—two years ago! But I had no true chance—now. And you've hurt me—lamed me afresh! But I don't believe you could beat me with the odds fair—with pistols. We'll see.—Forrest!' I said, turning my head, 'will you aid me up! Don't stand like a stone image, man!'

'Forrest!' It was her sweet-sounding voice

—Lambarde's sister's—which said this; quite low, but seeming so clear after my heavily breathed words.

'My lady!' said Forrest.

My lady! Married!—I found myself thinking, with a momentary, queer detachment from my other thoughts. No, *my lady* didn't mean she was married, for hadn't Michaels told me that Lambarde was an earl's son? Therefore she was my lady, an earl's daughter, was my sweet-and-honourable faced 'cheating wretch!'

In shame, recalling collectedly for the first time my conduct which had led to the fracas, I looked from Forrest to her, discovering that in the same instant she looked from him to me, with something which I could not understand—some expression which seemed to ask my pardon, intermingled with the trouble in her face. Her face had lost its high colour now; indeed, it appeared white in its framing of golden hair and brown bonnet.

'I was about to forbid Forrest to aid you, sir—but I have no right to,' she said quietly. And then, 'Instead, sir, I ask you not to fight my brother. It would be extremely to his dishonour, do you not think?—since you have been wounded—in fighting our enemies—one knows. And you are hurt now. It would put such a mark on him—to fight you. Do you not think that you should consider this, and say you will not fight? I think so.' She paused; I did not speak; and then she said, 'I ask you very earnestly to take back your challenge, sir.'

She had made no gesture of appeal. She had stood very still, her eyes steadfast on mine, but at the end her voice had tremored very slightly with urgency. I wished that I could do as she asked. I found that I was beginning to wish it yearningly. Her blue eyes were holding mine. But she was asking too much. It was not the loss of my walking which intervened between me and her request; I would not have refused her for that! It was the ignominy that her brother had subjected me to—the ignominy of my being picked up by Forrest and the gray-whiskered gentleman.

'I ask your ladyship's pardon,' I said reluctantly, and with a queer sense of some of my shyness rushing to me, 'but I must fight Mr. Lambarde.' At that I descried plainly, for a fleeting moment, something which hitherto she had kept out of her eyes despite their distress: I descried a shadow of great apprehension.

'I did not give you all my reasons for asking sir,' she said, her voice almost calm, nothing more than a hint of a tremble in it. 'You might take his life. I am his sister.'

Those steadfast, honourable eyes of hers gravely reasoning with mine, with the reflection of the candles' light in them, with deep trouble. From the moment I saw the apprehension, which she again was keeping from sight, I had wavered wavered badly. I was well-nigh beaten now.

[Christmas Number.]

but I made a fight for it. 'I'll not take his life,' I said. 'I'll do no more than touch him.'

'Provided you don't miss him,' said Lambarde sneeringly.

'Pray *allow me*, Dick!' she said, with a swift inflection of anger, turning her face for an instant to him. Then she looked at me again, and, with her face appearing very white now, said, 'I ask you, sir, not to fight my brother. —I will ask you to spare *me*—from a dreadful minute while you fight, from we cannot tell what more!' For the first time there was a tiny trembling, a tiny fluttering, of her sweetly-firm lips. 'If you killed my brother—and you night, for all your care—you would give me sorrow for all my life! Can you wish to do that?' She asked this with a little accent of surprise; she was unconscious of it, I knew. I thought it wonderfully pretty, then called myself heartless for noticing it at this time when I was going to call her brother out; for again I fully meant to, after that sneer of his. My words might have seemed provocative, but I'd received too much from him. All this was but a brief moment's reflection. 'Can you wish to do that?' she had asked. And then, a little hesitatingly, but with her eyes so honest, she said, 'If my brother killed you—as might be—I should remember it always—in sorrow. For I made you enemies! I ask you very untreatingly, sir, not to fight!'

I heard Lambarde mutter in protest at the pleading which had crept into her voice, but she paid no heed to him, she was intent for my answer; and, to my unhappiness, I saw reproach (though I was sure she was not aware of it showing) and actual suffering in her eyes when I spoke. 'I ask your ladyship's pardon again,' I said humbly, doggedly, 'but I must make Mr Lambarde stand fire; I must make him see that he's no better man than I with the odds fair, else I'd feel ashamed whenever I thought of how he used me, my lady.' I looked aside from her eyes. She did not speak. 'I ask your pardon for another thing—worse than this,' I said, with my voice shaking a little and my cheeks slowly going hot. 'You can't ever pardon it, my lady; but I ask your pardon while so many folk can hear. By a mistake I affronted and insulted you, most insolently insulted you. I thought you were another person—a debtor. I deserve to be shot through and through for so affronting you. . . . But I don't deserve to be used as Mr Lambarde used me, my lady,' I said, facing her again, my own voice pleading, 'and he must stand to a shot for that.'

She looked at her brother, entreaty in the turn of her head.

'I *can't* do anything—he calls,' said Lambarde, very impatiently. 'And I've had my fill of standing here being talked about! We'll fight, and finish it; fight up here, sitting on chairs, if he likes—it's no odds to me!'

1924.]

'Be quiet, Dick!' she said under her breath, swiftly, startledly—fearing, I knew, that this notion would smooth the road to the fight. She looked away from her brother, but not at me. I could see her eyes, though—could see that, candle-flame lit, with her cheeks so white below them, they were pensive for a bare moment. Then, with a little lift of the upper lids which seemed to tell of a decision, she looked not at me but at the gray-whiskered gentleman beside me.

'Mr Hagart,' she said, 'I have borne in mind that no one would stop Mr Rose from calling out and shooting Mr Floyer last month, though there was a score of gentlemen in the room who were all against the meeting, and though poor Mrs Floyer went on her knees to them. And I have borne in mind that it was the same at Maunsey Manor last February. No one had the right to come between the parties—all the gentlemen said . . . I am not going on my knees for my brother'—she smiled, a little wintry smile, but the first I ever had seen her give—'I am not going on my knees; but I am not going to be discouraged from asking you and other gentlemen to prevent this meeting, by strength if needful, until I can get Sir Neville here. He is a magistrate, is he not? He will arrest my brother and this gentleman, if needful . . . I can rely upon you, Mr Hagart?'

I saw the gentleman rub his whiskers. I knew that his face, turned towards her, was perplexed. 'Even by strength, Lady Mary?' he asked; and I remember that he glanced at Lambarde's figure. At the doorway two or three voices rose suddenly, loudly, in altercation, then dropped; and one of them said, 'We'll see to it for you, Lady Mary—Smith, Rippon, and Heber, Lady Mary.' And I saw three gentlemen, all youngish, push themselves to the front of the group.

'Thank you very truly, Sir Horace Heber, Mr Smith, Mr Rippon,' she said, turning her face. And Lambarde muttered hotly at them; and I felt at one with him, in the face of this show of force.

I saw Pyrke's face suddenly appear at the back of the group, neck craned.

'Pyrke!' I shouted. 'Come here to me! . . . Mr Lambarde, sir, you must help us get down to the stable. You should be able to account for two of those fellows . . . Pyrke!' I shouted in exasperation, seeing one of the gentlemen order him back; 'Pyrke! Don't let any one stop you, man!'

Pyrke pushed forward. I saw the gentleman strike at him with his fist, knocking his head backward, and drive through the group at him. I pushed myself out of my chair in grim fury, thinking no more of Lambarde, meaning to fell the man who had so attacked Pyrke. I bore upon my wooden leg—and it was as though a burning bayonet were thrust upward through

my leg stump. I cried out, twice or thrice, and reeled to fall, dizzy to the point of sightlessness. I felt the gray-whiskered gentleman, Hagart, grasp my arm. I swung round him. I felt two other hands come to me, small, gentle, yet strong. They pressed at my breast and shoulder because there was no arm for them to grasp; Lambarde's sister's hands (Lady Mary, they had called her).

I was guided to a chair. As my vision cleared I saw that her face was quite close to me—so beautiful and grave and harassed. And tender! Because of my pain!

I thanked her, thanked her for assisting me—very breathless from my pain. And then—poor, stupid, obstinate young man that I was!—I said, weak-voiced, breathless, 'But I must fight him!'

She smiled sweetly, a little entreatingly, soothingly—as to a child. 'Oh no, no,' she said. 'Why, your voice was friendly to him a little moment ago, when you asked him to help you. I thought you were turning friends. I know you will turn friends.'

How could I resist more? 'I'll not fight him since you wish, my lady,' I said.

She thanked me; then she lifted her face, looked towards the door. 'Sir Horace, the matter is concluded,' she said; 'but I thank you very truly again. Will you put me under another obligation by asking persons to go from this room? I think that, if there is anything more to be said, it can be more happily said if this gentleman and my brother and I are alone.'

When the room was left to us, and she, with a little sigh, with a little friendly smile to me, had sat down; and Lambarde (after he and I had argued in a quite amicable manner; for he wished to send post-haste for a surgeon to examine my hurt, whilst I preferred to wait until I reached Falanthill) had sat down, there were many things to be said, we found. And that half-hour during which we three spoke together was far and far the happiest I had known since the day of Fuentes de Oñoro. It mattered not that I was in considerable pain; it mattered not that some of the things we spoke of were embarrassing subjects for me—there was a sense of friendliness (rarely pleasurable to me) in the room, and she, with her colour returned, sat opposite me, often with a thought of friendly smile in her eyes, with a touch of smile about her sweetly-firm mouth.

That Lambarde and I sometimes put fingertips to our bruised heads, and caught each other at this, and smiled, helped, rather than hindered, matters between us two.

I had recalled exactly the circumstances in which Seys gave me the miniature. I told them of his blindness that day, of his holding two pictures in one hand, of his probable slight agitation because he had been near to injuring a miniature—thus making it plain how the mistake had arisen. Seys, believing he was

giving me the picture he had intended to, had given me his copy of a portrait of her.

Lambarde, reluctantly, but urged by me, explained his recent words anent my unpopular character in Park Place, and very surprising to me was the explanation. I found that my old servants, remembering my expressions of resentment against the fashionable folk of Park Place, spoken so long before, had more than faithfully repeated them (as my current views) to my neighbours' domestics; and the information had travelled upstairs, thus preparing a very cold reception for me during the months in which I sat in wretchedness; and when I emerged my answering hostility and my shyness did the rest.

I noted sympathy shine in her eyes as I told Lambarde something of my life and loneliness in Park Place.

They were to spend Christmastide at Southampton, not a great many miles from Falanthill, she and he. Their parents were there—the Earl and Countess of Elastoun. She was the Lady Mary Clunas Lambarde—she, with her sweet, steadfast eyes.

I told them—meaning no reproach, they knew—that at Falanthill I should get about busily on a crutch, until I could walk with comfort, to strive to avoid any return of my despondence and sense of extreme loneliness. I did not think, when presently—on the news that the bridge over Danby's Stream was ready—they left me to go to Sir Neville Broadnall's, that they would carry with them any memory that I might feel lonely at Falanthill.

I did not dream that, three days after, I should see them come, post-chaise, a-canter, up my drive to give me a greeting, and that, on the afternoon of Christmas Day itself, I should see them coming again, post-chaise, a-canter, to smile to me as old friends and to pass an hour with me.

Ah-h, not then, nor for six months after, did I dare dream that *she*, the Lady Mary Clunas Lambarde—a toast in England and Scotland, from Caithness to Cornwall, by Jove! and wise as she was beautiful—not for six months after did I dare dream that she could ever think of taking a battered relic of Fuentes de Oñoro for her husband—a stupid, loutish fellow until sweetly she tutored him!

And now I am going to meet her train, which reaches Falanthill railway station at forty-five minutes past midday.

Forty-nine years ago we met; forty-eight years and three months ago she married me, and we settled for the time in Park Place.

I think—yes, I can hear them opening the gates of the stable-yard for the carriage to pass out. Yes, and I can hear Marcia coming to hold my overcoat for me, and to tell me (I predict) that I must not stand on the platform if the wind is keen, but talk with Mr Hames, the stationmaster, in his office.

[Christmas Number.]

THE RACE THEY RAN.

By E. R. PUNSHON,

Author of Promise of Dawn, Old Fighting Days, &c.

CHAPTER I.

I.

CONSTABLE MICHAEL LAING rode moodily up to the poplar bluff he had been aiming for, dismounted, and tied to a convenient tree his horse, a fine powerfully-built black animal with white hind fetlocks, tall, with the short back, strong flat-boned legs, and good sloping shoulders of the ideal saddle horse. To get the black assigned to him for his own use Michael had toiled, struggled, intrigued, with a zeal and energy that, turned into other channels, would have brought him swift promotion in the force, and probably made him a millionaire outside it. But in his heart of hearts Michael no doubt believed it preferable to remain a 'straight duty buck' with the black, rather than become a sergeant at once with an inferior mount. While as for being a millionaire, well, to become a millionaire one had to work all day in an office, and this price had always seemed to him too high to pay. So, rejecting the business opening a justly offended uncle had offered him, he came west and joined the Royal Mounted instead. And already, having served barely three years, he was inclined, such is the instability of human nature, to resign from the force and try something else instead; for, while one might at times get a bit of special duty like this that he was now engaged on—though he had small hope this particular enterprise would prove of any interest at all—yet as a rule the monotony was 'something fierce.'

When he joined it was under the impression that life in the Royal Mounted consisted in riding magnificently up and down the prairie, with occasional interludes of fierce encounter with wild Indians or professional 'bad men.' But to ride, magnificently or otherwise, up and down an excessively vacant prairie had soon palled. Indians were no longer wild, but always tame, and generally consumptive; and though men were as 'bad' no doubt on the prairie as elsewhere, their badness seldom rose to more romantic heights than those of cheating a neighbour in a deal, or of some dispute over haying rights or straying cattle.

'For two pins,' announced Michael precisely to a gopher that had popped up from its hole a few feet away, 'I'd get right out.' Apparently
1924.]

much startled by this announcement the gopher instantly vanished. And then the office work, Michael mused despondently. It was to get away from that he had enlisted, and now he found himself overwhelmed with it—monthly returns, mileage returns, daily diary, four copies at least of every little voucher. Why, thought Michael bitterly, every M.P. wants a private secretary. . . .

Suddenly he sat upright, his eyes very bright, and he said softly to himself, twice over, 'Hul-lo, hul-lo!'

For there, far down the trail, had just come into view a small-top buggy, travelling fast in the direction of a little isolated shack just visible in the distance, the only habitation, indeed, all that far-flung level countryside showed to Michael's keenly watchful eye. Now, his instructions were that some time to-day a load of whisky was likely to be delivered at that solitary and quiet-looking shack, thence to be distributed in due course to the Indians of the neighbouring reservation, a transaction always likely to result in much and variegated trouble; and the sudden appearance of this swift-moving buggy interested him.

II.

The shack was inhabited by a young Englishman named Allan Tench, who some three years before had bought this ranch at an inflated price, and had done with it sufficiently badly. But only lately had he come under the suspicion of Authority, when it grew plain from sundry small riots, and an attempted murder or two, that the Indians beyond the hills were getting secret supplies of whisky. The calm eye of Authority, surveying all the settlers in the district in turn, had gradually focussed itself on Allan Tench, known to have been in financial difficulties of late, and known also to have somewhat inexplicably relieved himself recently from the more pressing among them. Inquiries began to be made, though not with much success, but then certain information came to hand, and, to test it, Constable Laing received somewhat hurried orders. The information in question was to the effect that a load of whisky was to be delivered at Tench's shack that day, and Laing was to 'investigate,' in the favourite official phrase; in other words, he was to find out if there was any truth in the story, and, if

so, to arrest Tench and any one else concerned in the transaction.

Constable Michael Laing, though yearning for any break in the monotony of his life, was not over-pleased at receiving these orders, for he was convinced that Authority had discovered only a mare's nest. Tench was a pleasant-spoken, friendly fellow, with whom Michael had played more than one keenly-contested game of billiards in the Wilder House in town, with whom he had often chatted of 'Home,' and of things and places they had both known, and whom he could not associate with so mean an offence as selling whisky to Indians. But, of course, orders had to be obeyed; so here he was, sitting in the shade of the poplars, determined to watch all day if need be, and make sure nothing suspicious occurred.

Even the appearance of the buggy, which had at first startled him a little, failed on second thoughts to disturb him much. Some neighbour driving over on a visit, or to borrow something he had run short of, perhaps, Michael decided, though it was true he could not remember that there was any settler living in the direction from which the buggy was coming. That trail, so far as he knew, was used only by settlers going into the uninhabited districts towards the United States border in order to cut their hay there. But where, then, did this buggy come from? Also, he thought, it was being driven at a speed that appeared to indicate a certain unusual haste. And then, as it came nearer, he made out that it had left the trail and was taking its course undirected across the prairie.

This seemed extraordinary, for there was certainly some one sitting in the driver's seat—he was sure of that, now that it was nearer; and as it came nearer still, he was able further to assure himself there were two people in it, seated side by side. But why was the buggy being allowed to wander like that across the prairie, where at any moment it might bump into disaster? The whole thing seemed to him odd and suspicious, though if it were whisky smuggling, it was whisky smuggling of quite an original turn. 'Great Scott, they're fighting!' he cried out aloud in sudden excitement. In fact, he could see plainly now that the two little figures in the front seat of the buggy were struggling together. Evidently they were too busy scrapping to pay any heed to the eccentric course their buggy was taking unchecked across the prairie, where disaster threatened every moment.

Michael was on his feet now, wondering what to do. If he showed himself, he betrayed the fact that a Mounted Policeman was wandering about the district for some unspecified purpose, and any possible whisky smugglers would take prompt alarm, when he might bid a fond good-bye to all hopes of bringing his mission

to a successful conclusion. He decided to await events, and, for the moment at least, to remain hidden in the poplar bluff. Of course, if the fight grew serious he might have to show himself, but after all a Mounted Policeman was not bound to interfere every time two fellows started in to hand each other love-tokens with their fists. Besides, the tingling thought had come into his mind that perhaps this mysterious buggy contained the very load of whisky he had been sent to look out for, and that the quarrel was between two of the smugglers over some detail of their enterprise. If so, it was coming to him the way pie comes from plate to mouth.

III.

The buggy, still pursuing its devious course across the prairie, was now about half-way between him and Allan Tench's distant shanty. His keen eyes could make out distinctly that at the rear of the buggy two large boxes or cases were strapped on. That looked interesting, he thought. Probably the whisky. It was a point that would be easy to determine when the buggy came to be unloaded at Tench's shanty, if that were indeed its destination, as now Michael thought seemed likely. The two figures in the buggy were still scuffling, and he wished to goodness the fools would stop their scrapping and get right down to business. For Michael Laing was beginning to grow excited, and even to scent promotion in the air.

Suddenly, across the great stillness of those vast and vacant lands, there came, thin and shrill to his ear, the sound of a distant cry for help.

'Lord, it's a woman!' exclaimed Michael, greatly startled, all his theories and ideas at once totally overthrown, since it was hardly likely that a woman would be concerned in any whisky-smuggling affair. He sprang to the side of his big black horse, mounted, and rode into the open, for no matter what the result to his mission, he felt that now he must find out what all this meant. 'Something mighty queer,' he thought.

He had on his brown stable jacket, since the scarlet uniform coat is a trifle too conspicuous for 'investigation' work, even apart from those burning questions of wear and renewal that always smoulder or blaze, as the case may be, between the men of the force and the soulless creatures who reign in the quartermaster's department. Nevertheless, stable jacket or scarlet coat, a Royal Mounted Policeman is soon recognised, and Michael was not much surprised as he galloped over the prairie to see one of the figures in the buggy jump down suddenly to the ground and set off running at full speed towards the wooded slopes of a hill not far away.

[Christmas Number.]

Michael measured the distance with a quick eye. He could easily ride down the fugitive if he wished to, but first he must find out what had been happening. He touched the black's flank with his heel. As if rejoicing in the chance to exercise his mighty strength the horse bounded forward. With great leaps they swept on towards the buggy, from which the tall form of a girl was slowly descending. On the ground she turned to face him. Her eyes were very bright, her cheeks a little flushed, but otherwise she did not seem much disturbed. She stood still, waiting for him, and he pulled up the black and leaped to the ground, hat in hand. 'She's beautiful,' he thought, and for the moment clean forgot everything else, as though the impact of her loveliness drove from his mind every other thought.

She was tall for a woman and bigly built, with the exquisite fresh complexion, unspoiled by powder, that British girls at their best sometimes display. Her hair, a trifle disarranged so that a few loose curls strayed across her forehead, was of a very light shade of brown, so light that it seemed almost golden where it caught the sunshine, and her eyes were so bright and clear and deep they appeared to him twin pools of light. Perhaps in the streets of a town, with other women to compare her with and against a different background, he might have found her beauty less compelling, though always she must have seemed an unusually pretty and graceful girl. But at this moment, as she stood there in the flooding sunlight, with the free breeze blowing by and all the wide expanse of the prairie stretching around, he thought her the most lovely thing the world had ever known.

IV.

Michael remained quite silent, hat in hand, not uttering a word, for he had forgotten everything except her presence. She put her hands up and began to arrange her hat, which had been pushed to one side, and her hair. He had an impulse to beg her to leave those straying curls as they were, lying across her forehead and her cheek, and a faint smile flickered for a moment at the corners of her mouth, because she had quite a good idea of what it was that held him so still and motionless.

In a voice that seemed to him as fresh and as sweet as the dawn she exclaimed, 'Oh, thank you so very much! That awful man ran like anything the very moment he saw you coming.'

'I'll get after him. He hasn't hurt you, has he? I'll bring him back in quick sticks,' exclaimed Michael, and was about to spring back into his saddle when she checked him with a gesture.

1924.]

B

'No, no, please don't, please,' she urged; 'please . . . I only want never to see him again. . . . I couldn't possibly.'

'I'll only hammer him,' Michael promised. 'You won't need to prosecute or come into court or anything like that—I'll only hammer him so his own mother wouldn't know him from a custard-pie she had dropped downstairs.'

'Oh, please. . . no,' she protested, looking a little shocked and horrified, and yet laughing a little as well, a combination Michael would have found irresistible even if his powers of resistance had not all long since deserted him. 'Please,' she insisted, 'I would ever so much rather not.'

Michael sighed but submitted, remembering he had always heard the ways of woman are incalculable. However, he found himself more than well rewarded when she smiled at him and said softly, 'Thank you. It was nothing, really,' she went on. 'I was silly to be frightened, only he was so horrid. He kept trying to put his arm round me, and the more I pushed him away the more he tried, and he let the horse go just where it liked—I thought we should upset—and then he put his face so close to mine I couldn't help crying out.'

'Only wish . . . ' yearned Michael, with a longing glance towards the culprit, who, finding himself unpursued, was now proceeding at a more leisurely pace towards the refuge offered him by the wooded slopes of the neighbouring hill. 'Who is the skunk, anyway?' he asked.

'He said his name was Dillon—Pat Dillon,' she answered.

'I know him,' exclaimed Michael, in secret a little startled, for it was the name of a man suspected of being implicated in the whisky smuggling which he had come out to 'investigate,' but with which it was evident all this could have no concern—angels do not smuggle spirits. 'I always knew he was pretty low-down, but I didn't think he was quite that mean. I'll remember. Last year I nearly "vag'd" him, and if ever I get a chance again I'll take it so quick he'll come to think greased lightning's no better than a crippled snail.'

He paused, and looked at her, and hesitated, not quite daring to question such a divinity outright. But she understood and answered, 'I came by train last night, and he offered to drive me out to my brother's. He had a note from Allan, so I thought it would be all right. Allan said he couldn't come himself. Allan is my brother—Allan Tench. Is that his house over there? That man said it was, but perhaps he wasn't telling the truth?'

'Oh yes,' Michael answered, though slowly and in a tone that reflected something of the inner disturbance he experienced; 'yes, that is Allan's place all right.'

She gave him a sudden quick glance from those clear deep eyes of hers, and he realised

that not only did she divine something of the inner uneasiness he felt, but also that she shared this with him.

CHAPTER II.

I.

FOR a moment or two they stood like this, motionless and silent, each aware of a vague distress, and each aware that the other felt it also. Could she know, Michael wondered, of the suspicions gathering about her brother, and was it that knowledge that had brought her to the prairie?

Abruptly and a trifle nervously she asked, 'May I be awfully rude? I am wondering—you are not a soldier, are you?'

'I'm a policeman,' he answered; 'The Royal Canadian Mounted Police—you've heard of them? My name is Laing, Michael Laing.'

'Oh yes,' she answered, 'I've often heard of them. And my brother, in his letters sometimes . . .' She paused without finishing the sentence, and glanced towards the distant shack; and again Michael thought he saw a passing shadow of uneasiness cloud the clear depths of her eyes.

He became almost certain the girl was in some way disturbed about her brother. And certainly it was more than strange that Allan Tench had not only not gone to the depot to meet her himself, but had delegated that duty to a man of the character of Dillon. There was something there, Michael thought, that needed explanation, and for the first time he began seriously to think that perhaps Tench was guilty. But, in any case, Michael knew well that his own chance of success in his mission was ruined. All and sundry concerned in the business would know now that one of the Royal Mounted was in the neighbourhood, and that the force was on the alert, and for a time at least all smuggling would cease. So he need not trouble his head very much about the task confided to him, since that was a failure, and he could devote himself to the more pleasant duty of escorting Miss Tench to her destination. He asked if he might drive her back to the trail, and tying the black horse behind, he took his seat beside the girl.

They chatted quietly as they drove along. She said it was her first visit to the country, and that her boat had got to Montreal only the Monday before. One or two remarks she let fall confirmed him in his belief that she had come, in part at least, because of some disquiet she felt about her brother.

'His ranch doesn't seem to have done very well,' she remarked, 'but in recent letters he told us he had been making more money lately.'

'Has he? He's been lucky, then,' answered Michael, wondering to himself if that extra

money had been made honestly or by whisky smuggling.

'We were so glad,' the girl went on frankly. 'You see, when he came out, the idea was if he could show good enough results to satisfy my trustees I was to join him—I have a tiny capital of my own. So I was ever so glad when he said he was doing better. But when I wrote about coming out he said it wasn't the ranch exactly—isn't it a very good ranch, Mr Laing?'

'Oh, I don't know,' answered Laing vaguely, unwilling to tell her his private opinion that it was not the ranch, but the rancher, that was not 'very good.' 'You see, there's a lot of things that make all the difference—sheer luck and the way prices go and one thing and another. But if Allan wanted to sell out I don't know that I should mind quitting the force and buying. I've just about enough capital for that.'

'So had Allan when he started,' the girl remarked, 'but I'm afraid he hasn't now.' She grew silent after that, and then as they approached the shack their arrival was announced by a clamour from the dogs. The door opened, and Allan Tench appeared. He was a tall, slim, young Englishman, handsome and pleasant looking, though his weak mouth and small receding chin did not suggest any great force of character. He was shaved, which was not too usual with him, and looked much tidier and neater than was generally the case with him in these days, though Michael's keen glance noted at once his bloodshot eyes and a slight though perceptible trembling of the hands.

'If he isn't smuggling whisky, he's drinking it all right,' Michael thought; while Allan, who had begun to shout a boisterous welcome to his sister as he emerged from the shanty, broke it off to stare, pale and trembling, at Michael, as if greatly disconcerted by seeing him.

'Dillon—Dillon—where's Dillon?' he stammered out.

Michael, looking hard at Allan, did not answer; but the girl broke out, 'Oh, he was horrid, Allan; horrid. You can't imagine—he was awful; and then, when he saw Mr Laing coming, he just ran like anything.'

'I can't congratulate you on your choice of an escort for Miss Tench,' Michael could not help adding.

Allan, who seemed more composed now and had more colour in his face, showed a proper indignation when he heard what had happened, and vowed he would thrash Dillon soundly next time they met. He also apologised profusely for not having gone himself to meet his sister, but to Michael's ear these excuses sounded very unconvincing. He became confirmed in his conviction that Miss Tench had come out from England because she was uneasy about her brother, and that to her brother her visit was anything but welcome.

[Christmas Number.]

II.

Michael helped Allan to carry into the shack the girl's boxes, that had been fastened on behind the buggy. They were two enormous trunks, with her name and destination printed on them in big letters; and Allan, who seemed all at once in high spirits, made several jokes about their size and weight, and the amount of baggage a woman thinks it necessary to carry about with her. His sister did not seem to appreciate this badinage very much, though point was given to it by the fact that she had also with her a hat-box and two substantial leather bags. Even Michael, who would almost as soon have thought of criticising the way an angel made use of its wings in flight, could not help feeling that she had come well provided. But she seemed slightly touchy on the point, and made a sharp retort to her brother that effectually silenced him.

The luggage disposed of—and certainly it seemed nearly to fill the little shanty—Michael said he would stable the black, if he might, and Miss Tench made some remark about the animal that showed she understood horses, and appreciated its fine qualities. This was to touch Michael in his tenderest spot, and he almost forgot his shyness as he expatiated on the black's good points.

'Though Allan's got a dandy mare, too,' he added. 'A bay, and she's a real beauty. Hasn't he ever told you about her?'

It seemed he had, and the girl was quite looking forward to seeing so wonderful a creature. They all went down to the stable together. The mare was a lovely animal, with eyes at once gentle and full of fire, and with the short, strong back, fetlocks full of spring and vigour, and the powerful quarters that denote speed and endurance. The mane and tail were long, and Miss Tench was so loud in her expressions of admiration that Michael grew almost jealous for his black, which was, he was convinced in his heart, much the better animal.

'You'll have to let me ride her, Allan,' Miss Tench exclaimed.

Allan laughed with a kind of brotherly contempt. 'Not yet awhile,' he said frankly. 'Wait till you know a bit more—riding here isn't like pottering down a country lane at home.'

The girl looked quite indignant, and if only he had dared, Michael would have offered her his black then and there. She seemed to understand this, for she smiled at him, and began to pet the black, and then Allan suggested that they had better go back to the shack and get something to eat. 'I dare say Mary's ready for eats,' he remarked.

So her name was Mary, Michael thought. He might have known it; what other name fitted so well her sweet freshness?

1924.]

'I'm ready for drinks anyhow,' she retorted, laughing. 'I'm just dying for a cup of tea.'

They went back to the shack together. Allan had managed to get quite a respectable meal ready, and to it they all did full justice. Afterwards they sat talking for a time, or, at least, Allan and Mary talked, while Michael sat by in silence. Then he said he must be going, and thereon Mary thanked him once again, and very prettily, for the help he had given her, and said she hoped they would meet again. He answered with a perhaps somewhat uncalled-for emphasis that he hoped so too, and as he was going he took an opportunity to whisper to Allan, 'Say, that buggy is Dillon's outfit. He's bound to come for it, and then you'll get your chance to hammer him.'

'So I shall; that's so,' agreed Allan, but with no conviction in his voice.

III.

Mary came to the door of the shack to wave a farewell as Michael rode away, but in spite of his delight and gratitude for this mark of favour, he was in a somewhat gloomy and depressed mood. It was not so much that he had entirely failed in his mission, though he knew that, now his presence in the district was known, he might as well beat an immediate retreat for all the good he was likely to do. True, he had, or thought he had, a good excuse to offer to his superiors, since he could hardly have remained in hiding while a woman was crying out for help. But even the best of excuses are looked on with scant favour in a force not much accustomed to fail, and he knew that nothing much but bare routine duty would be likely to come his way for some time to come.

However, it was not the probable nature of his reception by his superiors that was troubling him, but the conviction, strong in his mind, that there was more behind all this than he had been able to discover. Something was certainly troubling Mary Tench. What? What had been Allan's real reason for not going to meet her? The excuses he had put forward had been palpably feeble. And if he had not wanted to go himself, why had he chosen a man of Pat Dillon's character to take his place? And though Dillon's character was so unsavoury, it seemed a little strange he should have ventured to insult the girl like that in actual sight of her brother's shack. He must have known he was inviting the thrashing Allan was quite capable of administering, and every one on the prairie would agree he had more than deserved. And Allan's attitude had been strange, too. Certainly he had been angry and indignant, and yet with a sort of fear in his anger—or was it just a knowledge of impotence to avenge the insult? But, then, whence could come such impotence? Dillon was neither formidable nor important, a

little unconsidered rat of a man who had never counted for much in the life of the prairie.

Odd, too, that Allan had seemed so disturbed on recognising Michael, and yet had never once expressed any surprise at seeing him in the district. Worry as he might, however, Michael could think of nothing to explain all this that seemed so odd to him, but that, perhaps, he thought now, was odd only in his own imagination, and in reality needed no explanation.

'I should think whisky smuggling did come in somewhere,' he mused, 'only for—her. She never would, for one thing, and how could she, anyway, when she's only straight out from home?'

His thoughts wandered from the problem troubling him to her, to her graciousness, to her beauty. He began to ask himself how soon, and how plausibly, he could manufacture an excuse for seeing her again, and so became lost in delicious dreams, from which presently he awoke to discover that it was near sundown, and that he had taken the wrong trail, and was some miles out of his way.

Greatly annoyed, he turned the black's head and rode across the prairie in the direction of Allan's shack. He was tempted to make for it and ask to be put up for the night, but shyness prevented him. Miss Tench would hardly be in shape for stray guests yet, and there was no hardship in camping out in this weather. He rode on, therefore, towards the poplar bluff, which, earlier that day, he had selected as his hiding place, whence to watch Allan's shack for the delivery of the suspected whisky. From it, now, he would be able to watch the lights in Allan's shack, and guess which one was hers and watch it till presently it was extinguished.

He rode on, therefore, towards the bluff, and as he approached it, there reached him through the quietness of the evening a strange and unexpected sound, that of shrieks of boisterous laughter, as though there were those hidden who were screaming together over what they thought the best joke they had ever known.

It was odd to hear those shouts of rough, loud laughter coming from the stillness of that hidden place across the quiet of the prairie, and Michael sat still and frowning on his horse to listen and to wonder. He heard a clear voice cry out, and he knew the voice for that of Allan Tench: 'I tell you he helped tote it right in, he did, while she looked on.'

Then the laughter broke out again, and Michael slipped down from his saddle.

CHAPTER III.

I.

THE laughter still continued as Michael cautiously, yet swiftly, drew near. The sun had set long since, but a brilliant moon was shining from a cloudless sky, and flooding the

prairie with a clear, thin light that yet had about it some unearthly quality of doubt and magic, so that familiar things took on unexpected shapes, or hid themselves in shadows of a deep and baffling complexity.

The poplar bluff Michael was approaching rose from the silvery prairie like some great strange castle of darkness the thin moonshine had no power to penetrate. The wild laughter coming from it Michael had heard before had now died down, but those last words still seemed to echo in his brain. Who was the 'she' Allan Tench had spoken of; and what had the 'he' he mentioned helped him 'to tote right in'? And why did all that seem so amusing to these merry-makers of the night, who chose the depths of a poplar bluff for their jesting? And what connection with them had young Allan Tench? And was his sister with him; or had he left her alone in his shack during these first hours of her visit, while he enjoyed his fun out here?

Softly Michael stole nearer, and he heard a voice say loudly and clearly, 'Say, then, the girl knows all right?'

And Allan Tench's voice answered contemptuously, 'Of course she knows. . . . Do you think she's as big a fool as he is?'

Michael stood still abruptly. He had the impression indeed that he had run up against some solid obstacle of which the impact had bruised and dazed him. Yet before him was nothing save the dark shadows of the night, and he thought confusedly, 'The girl isn't a fool—what girl? But he is—what he!'

Still more cautiously, but now more slowly, he drew nearer yet. He could smell tobacco, and when he heard next a gurgling sound, as of liquid being poured from one receptacle to another, there came to him distinctly the pungent odour of spirits. He put his foot on a dry twig and it snapped loudly, but they were not listening, and they heard nothing. He could see them now, three of them, sitting round a small fire they had lighted, for the night air was chilly. Two were plain in the moonshine that fell upon them clearly through a gap in the trees. Of these one Michael recognised at once as Pat Dillon, and the other he knew as an Indian half-breed, named Walter Wing, long suspected by the police of complicity in the whisky smuggling known to be going on. The third man, sitting in the shade under a tree, Michael could not distinguish, for the shadows hid him like a cloak, but he knew well it must be Allan Tench. So he was sitting there, drinking whisky over a camp fire with the very man who, but an hour or two before, had insulted his sister! Or had it been an insult. Michael wondered darkly, or just a friendly flirtation he had interrupted, and her cry for help a mere piece of feminine coquetry she had never dreamed would be answered? It seemed

[Christmas Number.]

to him his soul fell from him, deeper and ever deeper, into bottomless depths of misery and despair.

At any rate she was not one of the party. That was something. He wondered moodily what he was to do. Arrest them all, he supposed. It was his duty, and there would be a certain savage satisfaction, or so he thought in his present mood, in letting all the world know of his own weakness and folly.

Dillon was speaking now. 'It beats all. There ain't never been nothing like it on the prairie, never. One of them Royal Mounted fellows giving a hand with boxes packed as full of whisky as they'd hold, and helping store 'em away like the best little whisky-runner ever was.'

So that, Michael reflected, was why Mary Tench had had so much baggage with her. Those two big boxes of hers had not been full of feminine frippery; had been evidence of no such womanly love of finery as he had supposed, but had been quite simply full of smuggled whisky, that he himself had meekly helped carry into Allan's shack. What a fool he had been! What a laughing-stock he had made of himself! Infinitely worse, what a laughing-stock he had made of the force as well. How he had dragged the reputation of the Royal Mounted in the dirt. No wonder these men had screamed so with their laughter. All the prairie would laugh like that when it knew; the tale would never be forgotten.

One of them was speaking again. 'Boys, it's the best joke on the Royal Mounted there ever was. . . . Think we can hold it when it's so mighty good?'

'Got to,' said Allan Tench from his place in the shade. 'We can't afford to tell it round—not even if it is darn funny.'

II.

Michael still stood silent. He was digesting the knowledge of how he had been fooled, and finding little pleasure in the process. That girl! How easily she had taken him in. No doubt she was laughing still. The thing was bitter to him, almost beyond endurance.

He was so close to them now they could have seen him if they had looked, and must have heard him had they not been so busy with their laughter and their whisky. They were talking again, but in his humiliation and his misery he hardly heard. Suddenly one of them, for some reason or for none, threw half a cupful of neat whisky into the small fire by which they were sitting. At once there leaped up a tall strong column of flame, before which every shadow all around vanished away, giving up its secret of what it hid.

Clearly showed the form of Allan Tench, crouched at the foot of the tree where he sat; clearly showed the tall, grim, silent figure of

Michael standing watching the three, who had not dreamed any other human being was within miles of them.

Though he was as startled as they were by the sudden illumination, Michael did not move, but stood still and impassive.

With a howl of wonder and dismay Pat Dillon leaped to his feet. 'Look there! look there!' he clamoured, and turned to run; and, howling too, in sheer dismay, the half-breed leaped to join him in his flight.

They were three to one, and armed, and the spot was lonely enough, but one does not offer resistance to the Royal Mounted Police. Even the most desperate crook knows better than that, for behind each uniformed figure stands at his call all the power of the Dominion of Canada, and behind that again all the slow weight of the British Empire. But quick as Dillon and the half-breed were to take to flight, Michael was quicker still, as he leaped from his impassivity to seize them. 'I arrest—,' he cried as he sprang, and his words were cut short by the contents of a pannikin of whisky flung full in his face. But his tiger-like leap had brought him level with the two fugitives, and he caught Dillon by the collar and the half-breed by the arm.

The half-breed struck out furiously, Dillon tried to wrench himself free, and for a moment or two they fought furiously. But they had been taken by surprise, and Michael was not only much the biggest and strongest man of the three, but was also releasing in physical exertion all that passion of despair with which his whole being had been flooded. They were like children in his grasp, and though the half-breed struck him heavily across the face, he hardly felt or heeded the blow. He caught Dillon round the waist and flung him so heavily to the ground that he lay there motionless and half stunned, and then, seizing the half-breed by the arms, Michael shook him savagely, whirling him round and round like a top. 'Fight, would you, heh?' he growled; 'had enough, heh?'

The half-breed very emphatically had had enough, and when Michael released him at last, he fell in a heap on the top of his companion.

Michael took a pair of handcuffs from his pocket and manacled their right and left wrists together, and then dragged them to their feet and to the nearest tree, round which he fastened their free arms with another pair of handcuffs, so that they stood facing the tree and embracing it, with no possibility of being able to get free again, since the Royal Mounted handcuffs hold securely.

'There,' Michael growled; 'now you can wait while I go get your pal.'

'You aren't going to leave us here like this, constable?' wailed the half-breed.

'I am so,' Michael answered grimly; 'it'll give you a chance to have your laugh out—best joke you ever knew, heh?'

Heedless of their protests, he hurried away to where he had left his horse. The brave beast was still standing in the same spot, with the reins hanging loose, for thus he had trained it to wait when he left it so. He mounted, and at a sharp gallop rode round the bluff and out into the open prairie, heading in the direction of Allan's shanty, whither he suspected the fugitive would have fled.

He could see nothing, brilliant though the moonlight was, but through the quietness of the night he could hear distinctly the sound of galloping coming back to him from the direction in which the shack lay. Evidently Allan was making for home as fast as he could ride, and possibly he hoped to destroy the whisky and all evidence of guilt before Michael, hampered as Allan would expect him to be with his two prisoners, could get there.

'But he'll have some job to do it if that's his idea,' Michael thought grimly.

Allan had had a long start, as it had taken Michael some time to dispose of his captives and then regain his horse and mount in pursuit. Indeed, he had nearly reached the shack before Michael got well started. But now, with long and splendid strides, the gallant black bore Michael across the prairie, straight as an arrow and as swift. When he reached the shack he dismounted and tried the door. It was bolted, and he hammered on it for admission. There was no answer, and as he knocked again and shouted, demanding admission in the king's name, he heard something moving at the back of the building. He ran round quickly, and was just in time to see the great bay mare being ridden away full speed into the moonlit night, along the trail that led, Michael well knew, to the United States border, eighty miles away.

That had been Allan's idea, then. He meant to make for the border; and knowing that the pony on which he had ridden out to the poplar bluff had no chance against Michael's black, he had come back to his shack, not with any hopeless idea in his mind of destroying the whisky and the evidence against him, but to secure the bay mare he had always declared was the fastest horse in the province.

'All right,' said Michael to himself; 'we'll ride for it, then.'

CHAPTER IV.

I.

ONE glance Michael gave towards the shack, and saw, or imagined that he saw, a shadow moving within. That would be the girl, he supposed. A fierce and bitter anger surged up

in him as he told himself she should see that even a dupe and a fool might yet be able to ride. 'I'll ride her brother down for her, anyway,' he said fiercely to himself. 'She shall see it's not all so easy as she thought.'

He writhed again as he remembered her clear and candid eyes, and the soft, enchanting voice of which she had made such good use to bewitch him and befool him; and he thought again with bitterness how smilingly she had looked on while he, of the Royal Mounted Police, worked at helping her brother store the boxes of smuggled whisky he had supposed held her hats and frocks and fal-lals.

He ran back to where he had left his horse standing. The Royal Mounted ride with a long stirrup, but, though every second counted, Michael took a second or two to shorten his, since he knew well what kind of a ride lay before him. Then he hurled himself into the saddle and started in pursuit. A light leaped from the shack window as he clattered by, and he said to himself grimly that Mary was watching—well, she should see!

The fugitive had a good start by now, and Michael did not commit the mistake of asking too much of the black at first. He knew his task would be no easy one, for it is always true, on land as at sea, that a stern chase is a long chase, and he remembered he must keep something in hand. But, all the same, it was like the wind he rode, crouching low, both hands firm on the reins.

Faintly in the distance before him he could see the fugitive, riding hard. On the well-marked trail the hoofs of their horses beat a thunderous refrain through the quiet, still night, and all around lay the silent prairie, drowned in the silvery moonlight.

Not more perhaps than three or four hundred yards separated pursuer and pursued, now that they were each fairly in their stride, and not by an inch more or less did it seem that this distance varied as they swept on their wild way.

They came to an Icelander's farm and saw all the family, wakened by the barking of the dogs, run out to watch them thundering by, like phantoms in the pale moonshine. One or two of the dogs raced barking with them for a moment or two, but were out-distanced at once; and then again, the Icelander's patch of cultivation left far behind, it was across the primeval prairie, aloof in all its majestic solitude, that this mad race continued.

One more settler's shack lay in their path, however, and he, too, roused by the thunder of their galloping, ran out, wide-eyed, to see them pass. Like a vision they fled by and were gone, and almost that lone settler would have believed his sight had deceived him, and he had dreamed it all, but that he could hear for long the rhythmic hammer-beat of that fierce gallop.

[Christmas Number.]

ing. 'Lordy,' he said, 'them's in a hurry all right; life and death that might be.'

But, indeed, it was for more than that those two rode this night.

II.

The trail, that hitherto had been fairly firm and well marked, died away. It was on the prairie itself they rode now, rough and broken in reality, though from a distance it looked so smooth, and riddled with the holes of gophers and badgers and what not, and with a thousand other traps and obstacles threatening disaster every hundred yards or so.

In the daylight these things were visible to both horse and man, and one could gallop one's fastest and yet avoid them, but all that was very different in the thin, deceptive moonlight, that threw over all the world its cloak of magic change, altering entirely shade and colour, by which, as much as by form, the eye is trained to recognise surrounding objects. Impossible, then, to tell whether that black patch upon the ground was a gaping hole or merely an outlying shadow; impossible to say where the willow-bushes ended and their shade began; impossible to be certain at what moment utter disaster might not overwhelm horse and rider together. But, the same distance ahead, the fugitive rode still with the same reckless speed, and behind still Michael galloped in a pursuit as reckless.

Yet so far he had not gained an inch. The bay mare was proving herself fully the match of the big black, and if sometimes for a moment Michael imagined that he was gaining a yard or two, soon it would be plain to him that he had lost it again.

Overhead the great, yellow moon swung through the skies on her path from east to west. Here and there on the horizon stars shone through their silvery rays, and the short summer night was passing as still, hour after hour, pursued and pursuer galloped on at the utmost speed of the straining bay and the gallant black. They roared down a long, wooded slope, and neither gained or lost an inch; they swept up a long and steep ascent, and still the same distance parted them; they came to a deep ravine, that even in the daylight should have been crossed with caution, and neither slackened speed one jot or tittle as they crashed their way down and up its wooded slopes and across its rocky and difficult bottom. But generally the prairie was bare and level, with few obstacles to hinder them, though it must have been by a miracle, repeated every hundred yards or so, that they both of them succeeded in avoiding the gopher-burrows and other pitfalls with which the ground was studded.

They came to where a wide creek crossed their way. Few horses care much for water-jumps, and horses bred on the prairie less even than
1924.]

others. But the bay cleared the creek magnificently and with scarce a check to her stride, and Michael gave the black no chance to hesitate. He felt the brave brute rise beneath him like some mighty bird and clear even that wide creek with a good yard to spare, a wondrous jump. But now there was a long ascent to face, steep and very rough, and on it for the first time Michael began to be sure that he was gaining. When at last they came to the top of that gruelling ascent, and were both once more on level ground, the distance between pursuer and pursued had been diminished by a good half.

Now it seemed to Michael that success was sure. The bay had done splendidly indeed. Michael would never have believed she could have shown herself so nearly a match for the black. But the black was after all the bigger horse, and, in the long run, strength was telling. He could see the bay was losing her beautiful swift action, so smooth and easy; her stride faltered at times now, even though she always recovered again at once. But all that told a tale, and he patted his own good steed on the neck, and whispered a word of encouragement. Understanding well, the black seemed to gather all its strength for one more, one final effort, and from beneath its flying hoofs the ground flew by.

It was a splendid effort, and into Michael's soul there seemed to enter the very ecstasy and essence of all speed. He clean forgot his errand, so wild an exhilaration now possessed him as he rode, a part himself of the living speed they were. No motor-car counting its odd miles a minute, no aeroplane winging its way through space, could ever give one-tenth the thrill of speed that Michael knew now as he felt the great black rise and fall beneath him, and the mighty leaps they made, and the keen air whistle by, and felt in every nerve and muscle how they spurned the earth away. Speed incarnate they seemed, he and the horse together, and now they were not twenty yards behind the bay, and gaining with almost every stride.

III.

He could see the fugitive more plainly now, crouching low on the mare's neck, and urging her on and on, to greater efforts still, with a sort of vehement despair. Splendidly the mare answered, but her strength was nearly done; and when Michael, in his turn, called upon his black, the response was instant. Inch by inch and foot by foot, so they gained as they swept on.

Yet still the fugitive would not acknowledge defeat, and ever urged on the labouring mare. Her tail had seemed all through the night to float out straight behind like a great rudder to help and guide her on her way, but now her

rider's cap fell off, and Michael saw spread out into the air long cloud-like tresses that streamed behind, and rose and fell with every leap the bay mare made.

'It's her—her,' Michael muttered as he saw this, and it did not seem to him that he was in any way surprised, but rather that he had expected it all the time, all through that wild, mad ride.

He struck his heel into the black's flank and called once more for one more effort. As though he knew it would be the last the black obeyed. Nearer and nearer they crept—if, indeed, that can be called creeping which went to such a thunder of hoofs and such a madness of unchecked galloping. Another foot he gained, and yet another, till now the black's foam-flecked nostrils were almost on a level with the bay mare's floating tail, and now at last he was so close, they were riding well-nigh side by side.

The fugitive turned her head and looked at him. Their eyes met, hers wild and strained and still defiant, for not even yet would she admit defeat. Once more she tried to urge the mare to a further effort, and, nearly done though the splendid creature was, she answered. Once more for a yard or two they shot ahead, but only for a yard or two. The mare had no longer power to equal the black's long matchless stride that had not yet begun to falter or weaken, and that soon again brought Michael level; and in the east shot heavenwards a ray of light to tell the dawn was coming as drew to its end the wild race he and she had ridden all through the moonlit night.

Yet it was not to be the end that now seemed certain, for even as Michael put out his hand to seize the bay mare's reins, and as the bay's rider looked at him with great eyes of despair and terror, that oft-repeated miracle, which had guarded them so far from the hidden dangers of badger hole, and gopher hole, and a hundred others, failed for once to operate. Right in a badger hole the big black put his foot, and went over like a shot rabbit, and Michael knew only he was flying through the air, as if a giant hand had plucked him from his saddle and tossed him up like a ball. For a moment his whole being was concentrated in the breathless question, 'What next?' and then the reply came in a shattering crash that hurled him into unconsciousness.

CHAPTER V.

I.

WHEN Michael came to himself the sun was high in the heavens, and for a time he lay still, conscious chiefly of the pains that seemed to shoot through his body in every direction, and trying vaguely to remember the events of the past night, and of that tempestuous ride of

which very slowly the details were returning to him. And presently he began to realise that this impression he had that his mouth was full of red-hot cinders was due in reality to thirst. He found himself muttering, 'Water. Water.'

There was no answer, and he stirred slightly and looked around. It seemed that he lay alone in the midst of the enormous prairie that stretched around in every direction, mile upon mile and league upon league, immense, indifferent and aloof as the eternal seas themselves.

A kind of panic came upon him. He tried to get to his feet, but was far too weak and ill. He tried to shout for help, but his burning mouth and swollen tongue would hardly emit a sound. Never had he known such loneliness as this; never had he realised till now as he lay like this between the heavens above and the earth beneath how small a thing is man. 'I must buck up,' he muttered; 'no good quitting—none.'

He wondered what had become of Mary Tench. Quite possibly she had ridden on without realising what had happened; or perhaps she had not cared, or merely been glad of the chance that had brought her safety. Anyhow, no sign of her was visible; and again with terror he realised that he must die there, with none but sky and prairie to watch, as they would watch with equal indifference the death of any of the insects whose passage troubled for an instant their immensities.

But now his still confused mind became aware of another fact. He perceived that as he lay his face was sheltered from the sun by a piece of some fabric that was stretched above his head and supported on four twigs, like a kind of miniature awning. This puzzled him immensely, and for a little time he forgot everything else in trying to grapple with the problem of who had put it there, and why.

He supposed she must have done so. Even to his dazed mind that was clear. Then, in that case, she had seen what had happened, and must have paused and dismounted, and put up this kind of rough shelter before riding on. Kindly meant, he supposed, though it might have been a truer kindness if she had put her hands about his throat and strangled the life from him. Or had she had the intention of sending help? And if she did, would it arrive in time? Or, indeed, in that enormous expanse, would they ever be able to find him at all? To find the proverbial needle in a haystack would be as easy a task.

It occurred to him that she must have shown unusual forethought, especially for a newcomer from England, to have thought at that time in the early dawn, before the sun had actually shown itself, of giving him shelter against its rays. And, when he gazed at it

[Christmas Number.]

again, he thought it looked as if it had not been long in position. Was it possible she was still somewhere near; or had the impossible happened, and some one else ridden by?

His thoughts were clearer now, though the pain he suffered grew no easier; and, though that sensation he had of his mouth being filled with red-hot cinders was growing steadily more pronounced, he lifted himself with difficulty and pain into a sitting position and looked around.

Nothing but prairie around and sky above, and at a distance of about three or four hundred yards a low growth of willows that marked, he supposed, the existence of a slough. The horses had vanished; the girl had vanished; loneliness and desolation possessed his soul. And then he noticed that the willow bushes round the slough, at the point nearest where he lay, were moving visibly, though there was no wind. 'Something there,' he thought, wondering what it could be, for the bushes were so low either of the horses would have been visible at once, and yet the movement was too violent for it to be caused by any small animal, such as a jack-rabbit or even a wolf.

He watched wonderingly, and saw a form emerging almost on a level with the ground, like some creeping thing. With utter amazement he made out that it was a human form—that of a woman—of a woman crawling on hands and knees. He perceived it was the girl after whom, all through the night, he had ridden in wild pursuit.

'What on earth is she doing?' he muttered, forgetting his sufferings and even the anguish of his thirst as he watched her coming crawling thus through the bushes.

II.

When she was free of them, he expected to see her stand upright; but she continued in the same slow and painful way, dragging herself over the ground on her hands and knees, and presently he was able to distinguish how she trailed one leg behind her in a manner there was no mistaking. 'My God!' he cried aloud then, with horror and with fear, as he realised that she also was injured, badly injured.

Her horse must have fallen, too, he supposed, and her leg had been hurt, most likely broken, from the helpless way in which it trailed behind her. Then she was as helpless as he was, and they two were alone in the midst of the prairie, doomed to die there side by side, of hunger and thirst and exhaustion.

He lay and watched, as inch by inch she dragged her toilsome and painful way towards him. Once or twice he tried to make an effort to drag himself to meet her, but that his weakness and his injuries would not permit. But he forgot his own pains as he watched how bravely she struggled on, though every inch of

progress was won only with agony and grief. More than once she stopped altogether; once she was still so long he thought she had fainted, as perhaps she had; but presently she resumed her slow and painful progress, and when he thought that she was near enough to hear, he called out with all the strength he could summon, 'Hullo, hullo.'

She heard him and lifted a hand in response. He noticed that it was all torn and bleeding. The effort of raising it seemed to exhaust her. She was motionless a long while, and then began to crawl forward again till, at last, she had, as it were, writhed her way close to him.

'Hullo,' she said, and lay still, breathing heavily.

'Hullo,' he answered.

They said no more. She was evidently spent, and he noticed, with anguish, that her exhaustion was so great she had not even energy enough to brush away the hideous, buzzing flies that settled on her torn and bleeding hands.

Painfully, and with difficulty, he dragged himself nearer to her, and, tearing down the piece of stuff she had stretched between four twigs to shelter him from the sun, he used it to drive away the flies from her hands.

She lifted her head when she felt him doing this, and muttered, 'Thank you—but it doesn't matter. How do you feel?'

'Oh, I'm fine,' he answered, throwing all the strength he still possessed into his voice, so that it might sound firm and loud. 'I say—is your leg broken?'

'Yes,' she answered, her features wrinkled with pain.

'That's bad,' he muttered. 'How was it? Did you have a fall, too?'

'Your horse rolled on top of you when you went down,' she answered. 'I tried to get you away—I thought you would be crushed to death. I tried to help your horse to his feet, and he kicked out, and his hind hoof caught me on the ankle, and it's broken the bone, I think.'

'Let me look,' he said.

'It doesn't matter,' she answered indifferently. 'What's the good?'

But he insisted, and managed to drag himself to her side. The ankle bone was sticking out through the skin.

'That's bad,' he said; 'a compound fracture. I must try to bandage it. What made you crawl all that way over there?'

'You kept asking for water,' she answered. 'I thought there might be some behind those bushes.'

In spite of himself the anguish of thirst he suffered showed itself in his eyes. She shook her head slightly and looked away. 'It's dry as a bone,' she said. 'I chewed some leaves,' she added. 'I brought some back.'

She had put a quantity of leaves plucked from the willow bushes inside her blouse, but her

long and toilsome passage as she crawled back from the slough had left little freshness or moisture in them. Yet he accepted them gratefully.

'The horses—what became of them?' he asked.

'I drove them off,' she answered. 'I shouted at them and threw bits of earth and things till they went away. I thought they might go back to their stables—or some one might find them straying about—or something. If only I could have got into the saddle I think I could have stuck on, perhaps—but I could catch neither of them; and if I had, I don't think I could have mounted.'

'No,' he agreed gravely; 'but, anyway, you did all you could.'

She made no answer, and when he looked again he saw that she had fainted.

Every movement was torture, and, indeed, Michael nearly fainted himself, but he dragged himself nearer still, and made some sort of effort to tie up her broken ankle, though there was nothing he could use for splints. But he did his best, and, at all events, what he did kept the flies away. It seemed to him an amazing thing that, in the midst of this vast loneliness, flies should buzz and swarm like this, an added torment.

In a little while she opened her eyes again.

They did not speak much. They lay still, side by side, while from above the relentless sun poured down on them its torturing rays. A cloud would have been a Paradise, but not one dimmed the hard brightness of the sky. Even a breeze would have been something, but the hot, still air oppressed them all the day, like a material thing, and never for one second did the swarming, crawling flies cease to buzz and bite, till at last it seemed easier to endure them than strive any longer to brush them away.

Once he put out his hand and took hers. She let it lie in his, and so they lay like two resting children, and the thoughts of both were of cool shades and of running waters. But they did not speak of these, for they knew that that way madness lay. And once the girl whispered, 'How much worse it would have been—alone.'

'Yes,' he answered from the depths of his heart; 'at least there's that.'

CHAPTER VI.

I.

ALL through the long day they lay there thus, side by side, hand in hand for comfort, while from above the sun poured down on them its burning rays. Thirst tormented them; their injuries were an agony to them;

flies gave them no rest. The movement of the sun from east to west was so slow, it seemed like whole years that they lay there. Their only help was that they had each other's company, and could still, in tiny ways, give to each other comfort, courage, and endurance.

When the ceaseless battle with the flies was too much for her, and she moaned and gave up and lay still, letting them crawl and bite as they wished, it was his hand that drove them away again, and his whispered words that recalled her courage. When he began to grow a little light-headed with the heat, it was she, in spite of the agony every movement gave her, who dragged herself into a sitting position, and fitted up with his coat and the twigs she had used before a trifling shelter for them both. It was for his sake, too, that she kept back the tears of despair so often flooding her eyes, and for her that he proclaimed aloud hopes he never felt.

'Those horses,' he said several times—'dead sure to be found. Then folk'll know what's happened, and they'll be around mighty quick. Won't take them long to get here once they're started.'

'How will they find us?' she asked, as her eyes, grown deep and hollow, all their brightness dimmed, wandered round the vast and empty space in which they lay.

'Oh, they'll manage that all right,' he declared cheerfully. 'Trust them for that.'

But he knew well the chances were that even if the horses did make their way back to the settlement they would do so very slowly, and that it was only too likely he and the girl would be dead long before any rescue expedition could start. Even if it did start promptly, there was not much chance that it would succeed in finding them. In all probability their bones would whiten side by side for years to come, till some pioneer of the future would find them, and wonder to what forgotten tragedy they bore witness.

'It's a sideways sort of ending,' he muttered with a twisted smile, as he thought of all his hopes and plans so suddenly cut short. 'Rummy to come through a war to finish like this . . . and for you,' he added to the girl, 'that's not been a week in the country.'

'Two weeks ago,' she mused, 'I was walking down the Strand in London. Now I'm here,' she said, and laughed a little.

II.

But as the sun drooped in the west and drew near to setting their torments were relieved a little, and Michael began to feel his strength revive, now that those fierce and burning rays no longer held him down, nailing him, as it were, to the ground with shafts of light. The cool breeze that sprang up seemed to relieve also to some degree his parched and swollen mouth, and he stirred presently and sat upright.

[Christmas Number.]

He looked across at the pale, wan face of his motionless companion, who, even as she lay quiet, seemed in the last stage of exhaustion.

'We can never stand another day like this. Do you think you could get as far as the slough again?' he asked.

'What for? What's the use?' she muttered. 'Let's stay here.'

'If we could make it,' he answered, 'the willows would shelter us from the heat to-morrow. Besides, it's going to be cold now it's sundown, and I could build a fire, maybe. Can you try? I would never dare ask you,' he added softly, 'only you've been so brave.'

'Brave? Me?' she said, and smiled faintly, for that seemed to her a flattery so gross as even to become amusing. 'Oh!'

'We could make it if we tried,' he urged again, 'now it's cooler.'

'Oh, if you want to,' she said petulantly. 'I think it's silly.'

But he coaxed and urged, and presently they started. Infinitely slowly, inch by inch, upon their faces, like two huge and blundering worms, they dragged and writhed and wriggled their painful way, on and on, inch after inch, foot after foot, with such effort and such suffering as at other times they would not have believed themselves capable of enduring.

When they had covered perhaps half the distance they had to traverse the girl heard Michael laughing to himself. Thinking he had perhaps gone mad, and greatly afraid, she called out to him to stop. He checked himself at once. 'I'm so sorry,' he said. 'I don't know what got me. I was thinking of the way we rode last night—the two of us, how we rode—hell for leather, all right, my word . . . well, and now here we're like two broken-backed worms wriggling along on our noses.'

'I don't see anything to laugh at in that,' she said irritably.

'I'm sorry,' he answered; 'it just seemed to come over me all in a heap. You know, I thought you were Allan.'

'I meant you to,' she answered. 'We planned that. He said you would arrest him—he said it meant prison—because of all that whisky in those boxes they pretended were mine.'

He was silent then, for these last words of hers explained much. He might have guessed it, he told himself. What a fool he had been all through, to be sure. Why had he not guessed?

They had crawled another twenty yards or so before he said, 'Those boxes—the two big ones. They had your name on them, but they weren't yours?'

'No,' she answered between gasps, as she dragged herself wearily and painfully on. 'They were both filled with bottles of whisky. When that Dillon man met me, he drove me first to a shack I thought was Allan's. But it wasn't.

1924.]

There was a man there, and those two big boxes with my name painted on them, and when I asked why, and what it meant, they wouldn't tell me. Dillon said I must ask Allan, and Allan would explain everything. I was very worried, and I kept asking questions, and I think now that was what made him angry and upset, and why he was so rude. He said I was in it now like the rest of them, but he wouldn't explain what he meant. Only he kept saying I was one of them now, and I got angry, too, and said I would never have anything to do with him, anyhow. And then he was horrid and awful, and when I cried out you came. Later on, when you had gone, I asked Allan what it all meant. He didn't want to tell me, but I made him. He said there was no harm smuggling whisky, and prohibition was all wrong, anyway; but from what the other man said I think they mean to sell it to Indians, and that's worse, isn't it?'

'Much worse,' agreed Michael grimly; for, indeed, to sell whisky to Indians is a little like selling murder.

'I told him he must give it up, or I would go straight home,' she continued. 'I put on my riding things ready to start right off. I said I wouldn't even stop one night there unless he promised. So he did, and he went out to tell his friends, because I said I wouldn't have them there. And then he came back galloping as hard as he could, and said the police were on them. He said it meant ten years' imprisonment for him if you caught him. The only thing I could think of was that I should jump on the mare and ride off as hard as I could. We hoped if you saw some one galloping away you would think it was Allan and follow. Then Allan was to burn all the whisky, so that there should be no proof against him, and he promised me he would never do anything like that again. And when I rode away you followed, as we hoped, and, anyhow, Allan's safe. He said if I got you away for an hour it would be all right.'

'I thought you were Allan,' Michael said slowly. 'I might have known better. If I hadn't been such a fool, I should have known you weren't likely to be mixed up in a thing like that. What made you ride so far, so fast? We were riding more than an hour, I guess.'

She hesitated, and even in the pale moonshine he saw her pale cheeks flushed. She spoke very softly—her voice sounded tiny and yet very clear, 'I felt I must never let you . . . catch me.'

What was there in those few words to fill all Michael's heart with a sudden overwhelming joy, a joy that flooded his whole being, so that this moment always seemed to him the happiest of his life? Crippled, broken, in anguish, tormented by a dreadful thirst, near

to utter exhaustion, with small hope of escaping the slow death almost certainly awaiting them both, yet he had great joy when he heard what she said, and he would have changed places with no other living man, no matter in what perfect security or in what blissful bodily ease.

In a voice almost as low and soft as her own Michael said, 'But I did—I did catch you.'

She made no answer.

They had both ceased for a moment their toilsome and difficult progress. He dragged himself a little nearer to her. She lay quite still as he leaned over and kissed her pale cheek lightly.

Then he said, 'Now we'll get on.'

CHAPTER VII.

IT took them perhaps another hour to reach the slough, and then they were both glad to lie still for a time to get back a little of their strength. The temperature had fallen rapidly since sundown, and Michael gathered together a few twigs and some dead branches, with which he made a small fire they found very comforting. Their thirst, too, though it was still severe, tormented them less now that the heat of the day was over, and they even slept a little.

The next day, too, the shade of the bushes, sheltering them from the direct rays of the sun, was a great comfort to them both; and Michael kept their fire going, feeding it with dry wood, and then putting on grass and leaves so as to maintain a column of smoke that rose high into the air, and was visible for many miles.

'If there is any one mooching around,' he said, 'or if those horses got to the settlement, or if Allan has guessed something's wrong and has started out to find us, then that smoke will be a guide. Oh, we've lots of chances yet,' he declared; though to himself he added, 'That is, if we last out.'

And of this he could not help but feel more than a little doubtful, for he knew his own weakness was extreme, and the girl's exhaustion was only too plainly growing greater with every passing hour.

He knew well their only hope was that this column of smoke he had made might be seen. And it was indeed the smoke that saved them, for it served as a guide to the relief party that otherwise would very certainly not have found them in time, and perhaps never at all. It was composed of Allan himself, of two other ranchers,

and of two of Michael's comrades of the Royal Mounted.

It was the early morning of the next day when they found them, and both Michael and Mary were in the last stages of exhaustion. But a little food and drink worked wonders; and before long Allan, who had ridden away full speed for more help as soon as they were found, returned with a doctor and a team and wagon, on which, still side by side, the two sufferers were transported to hospital.

Only a few days passed before Michael was almost as well as ever, though he bears signs of his experiences he will carry with him to the grave. Mary's recovery was slower, and at one time, indeed, her life was almost despaired of. But she passed through the crisis successfully—pneumonia had set in—and though it left her very weak she had no further set-back, and was presently well on the way to complete recovery.

In spite of the fact that Michael found his superior officers fully disposed, in view of all that had happened, to condone his failure to convict the culprits, or to keep securely the two captives he had made—they had both been released by Allan, who had filed through their fetters—and even to admit that perhaps, on the whole, he had not done so very badly, he persisted in his desire to leave the force.

'I'm going into partnership with Allan Tench,' he explained. 'The ranch ought to do well enough with some more capital and two men to work it; and, anyhow, I'll undertake there'll be no more whisky smuggling. Allan's had his lesson all right. He'll run no more risks like that, even if we weren't around to see he kept straight.'

'We?' murmured the inspector to whom Michael was talking.

'Miss Tench and I are thinking of getting married,' Michael explained.

'Ah, well,' said the inspector sagely, 'they say a policeman married is a policeman spoiled, but a rancher married is a rancher made.'

'So he is,' declared Michael fervently, 'when his wife is a girl like Mary.'

Nor is that an opinion he has ever seen any cause to alter. The ranch is doing well; Allan is running straight and thinking of getting married himself; and recently Mary has presented to her husband a son and heir who is a fine tribute to the virtues of prairie sun and air, and whom Michael has determined shall be a horseman worthy of the mother who rode that moonlit night so straight, so fast, and so far.

THE MISSING QUEEN OF DIAMONDS.

By W. D. GRAY.

I.

CAPTAIN VINCENT leaned back in the swing-chair in his private cabin and stared at the deck beams above his head. It was a hot evening, and the captain had removed his coat, for he was not a man who studied appearances. Moreover, this hour after dinner was one of the few periods of time when he might hope to enjoy a little privacy, and be able to get away from his passengers. He held a big curved briar between his teeth, and puffed great clouds of smoke into the heated air. Superficially, his attitude was that of a man at peace with the world, but his dark bearded face had a gloomy, irritable expression, which showed that his thoughts were not of the pleasantest.

The captain was taking the liner *Cambrian* from South Africa to London. She carried a full complement of passengers. It was these passengers who wrinkled the captain's brow and caused him to mutter impatiently into his beard. He was a master of his profession, had spent his life on the great waters, and no man could teach him how to handle a ship. But this was the first time he had had charge of a liner, and there was no man less fitted to be the genial chairman of a saloon full of passengers. How he had obtained his post was something of a mystery. He had commanded one of the older cargo boats belonging to the company, and had been suddenly promoted to his present ship for no particular reason.

Tall, gaunt, sombre, he moved amongst his fellows and his subordinates a lonely, taciturn figure, who gave no confidences and who invited none. In his present command he was obviously the square peg in the round hole. The saloon passengers, expecting a jovial, hearty, courteous sea-officer, were repelled by this black-bearded, swarthy-faced individual, sitting silent and constrained at the head of the main table. He had nothing to say to them, no little marine anecdotes for the men, no polite information for the ladies; he sat and glowered at his plate until the meals were over. If any one spoke to him, he answered shortly in a surly, restrained fashion.

The captain knew his shortcomings well enough, but unhappily he did not regard them as shortcomings. He would have said that he was not paid to be a society entertainer; he had guaranteed to take these people safely to London, as he would have done a full cargo of coal or wheat. He would guarantee to do that all right; he knew his business, he believed.

1924.]

Well, what more did they want? He frowned to himself as he smoked and looked back over the past few days. His eyes and ears missed very little, although his tongue might be a useless member, and he recalled all the covert smiles and whispers at his expense which his passengers fondly supposed had been unseen and unheard.

'What do they take me for?' he growled. 'What's that fool of a purser mean by asking me to unbend a little, as he calls it? I'm not anxious for them to talk to me—they can stand on their heads all day for what I care. Then why the dickens do they want me to talk to *them*? I'm not a shop-walker. Wonder they don't ask me to tuck them in at night and sing them to sleep!'

He knocked the ashes from his pipe abruptly and fiercely, and commenced to refill it from a great sealskin pouch. As he completed the operation and struck a match there came a soft knock at the cabin door. 'Come in!' the captain shouted aggressively. 'Oh, it's you, is it, Mr Wilkinson; what's the matter now? One of the lady passengers lost her vanity bag?'

The short, stout purser stood in the doorway. His face was rather serious, and he did not smile at his commanding officer's sally. 'It's Mr Felling wants to see you, sir,' he answered. 'I tried to put him off, but he says it's important. He's rather urgent about it.'

'Mr Felling?' repeated Captain Vincent, coldly and questioningly.

'One of the first-class passengers,' said the purser, a trifle reproachfully. 'Got one of the single cabins—a pretty big man in Kimberley. Surely you remember, sir——'

'I know him,' the captain broke in hastily. 'Can't recall *all* their dashed names on the instant, Mr Wilkinson. Wants to see me, eh? What about?'

The purser hesitated a moment. 'Well, he didn't say much to me,' he replied at last; 'and as he must see you, I think he'd better tell you his troubles himself, sir. He's waiting outside.'

Vincent frowned. 'Who'd sell a farm and go to sea?' he demanded bitterly. 'All right, let him come in.'

II.

The purser vanished, and then ushered in the visitor. The latter waited until the door had closed upon Wilkinson ere he turned and confronted Captain Vincent. He was a big, portly, middle-aged man, with a rather pallid, clean-shaven face, and cold, keen blue eyes. There

was something about him, an assurance, a self-confidence, which denoted the rich, successful man who was accustomed to tread down obstacles and to dominate over his fellows. He was very smartly dressed, but with a rather too emphatic scarf-pin and watch-chain. A fine diamond ring glittered on his finger.

Captain Vincent considered him in silence. On his side Mr Felling stared at the captain's shirt sleeves, coughed once or twice at the reek of the strong tobacco smoke, and took a seat without waiting for an invitation.

'Good evening, sir,' said the captain gravely. 'I'm told you wish to see me.'

'I do, captain; I do,' replied the other, in a strong, harsh voice. 'Not disturbing you, I hope?'

'No,' returned Vincent slowly. 'No, you're not disturbing me, sir. Of course, the purser is the—'

'He's no good to me,' Felling broke in, with a wave of his hand. 'I've got to see the commander of the ship. My business is urgent and—er—a little difficult and responsible. Yes, Captain Vincent is the man I've got to see.'

'Well, sir,' returned the captain gruffly, 'in that case, here he is, ready to listen to you. What's the trouble?'

Felling stared again at the off-hand tone. 'I'll tell you,' he said, producing a cigar case. 'Mind if I smoke?—I see you're doing so yourself.' He lit a cigar without further permission. 'Don't know if you've heard of me, captain,' he went on. 'I believe my name's fairly well known in South Africa. In case you haven't, I may tell you that I'm—er—a pretty wealthy man. I've retired from business now, except that I do a little in diamonds—in buying and selling diamonds.' He paused, and puffed at his cigar with enjoyment. 'In fact,' he went on, 'I think I should say I do a good deal in them; diamonds are my strong suit, captain—ha! ha! See the joke?'

Captain Vincent's sense of humour was apparently not very strongly developed. 'Very interesting, sir,' he observed shortly. 'Go on.'

Felling glanced at him for a moment, and then suddenly produced a little morocco case from his breast pocket. 'I've got a business deal on at present,' he said; 'that's why I'm going to England. I'm hoping to dispose of this little trifle.'

He opened the case and held it under the captain's nose. Vincent took the pipe from his mouth and bent forward. His bearded lips formed themselves into an involuntary whistle. He was looking at a magnificent diamond, such a jewel as he had never seen before in his life. Indeed, if it had not been lying solidly in the green velvet case beneath his eyes, he would have said such a jewel could not have existed. Vincent knew little of the value of precious stones, but this one spoke for itself. It gave

the captain a queer impression of being alive, of possessing a strange and even sinister vitality of its own. That fragment of carbon held and fascinated him like the eye of a serpent.

'Pretty little thing, eh, captain?' said Felling airily.

The captain drew a deep breath and leaned back in his chair. 'Very pretty indeed, sir,' he agreed. 'If diamonds are your strong suit, I reckon you've got the queen in your hand there.'

Felling nodded his head with a chuckle. 'You're right,' he said emphatically. 'You're right. This is one of the finest stones in the world, barring a few in the possession of reigning sovereigns and Indian princes.'

He closed the case and replaced it in his breast pocket. 'And now to business, captain,' he went on. 'You'll understand that to have such a little plaything in one's possession carries with it a certain feeling of responsibility. I won't tell you what it's valued at, but it's an amount for which plenty of men would be ready to sell their souls. You can imagine that I'm keeping a sharp eye on my neighbours until I've—er—played my queen in London. That's what brings me to you. There are two men on your ship, captain, who I'll swear are jewel thieves. I believe they were dogging my movements in Cape Town, but I never gave them the opportunity they desired. But they've taken passage on your ship, and I tell you they are after that diamond. I want you to take action, captain. I want you to protect me, even if it means going a little beyond your legal rights as the commander of this ship. You won't find me ungrateful.'

Vincent stared at him open-mouthed. 'Two men!' he exclaimed. 'You mean two passengers?'

'Certainly,' said Felling. 'Two saloon passengers. They call themselves Downe and Birchall, but no doubt those are only aliases. Two youngish, dark chaps, very much alike, might be brothers. They sit at the end of the second table in the saloon.'

The captain at once recalled them as two quiet young fellows, almost the only passengers who had not bothered him over something since the voyage started, and to whom he had felt grateful in consequence. 'I know them,' he said. 'But, look here, what proof have you got? I can't take any action on mere suspicion, on your bare word, in fact. You say these men are jewel thieves, are after your diamond. Well, give me proofs of that.'

Felling made an impatient gesture with his hand. 'That's just what I can't do!' he cried irritably. 'Give you proofs, you say! Why, man alive! if I had proofs, do you think these scoundrels would ever have been on this ship! They would have been in prison in Cape Town, I can tell you that.'

'No doubt,' said Captain Vincent drily. 'But
[Christmas Number.]

what reason have you for suspecting them in particular? You must have some reason.'

'They were pointed out to me by a friend in Cape Town,' replied Felling. 'He told me he knew them as being shady characters. Then, as I say, I found them following my movements, and the next thing is, I see them on this ship. That's not proof, perhaps, but it's good enough for me.'

'Well, it's not good enough for me,' said the captain firmly. 'What on earth do you want me to do with them?'

Felling hesitated a moment. 'I want you to—to place them under restraint,' he said slowly.

'To arrest them, in short?' Vincent broke in.

'Well—yes. I'll back you up, captain.'

The captain snorted contemptuously. 'Arrest them!' he sneered. 'Yes, put them in irons—on mere suspicion, on no suspicion at all. And then when we arrive in England have them bring lawsuits against me and be ruined—professionally, legally, morally, in every way ruined. And you'll back me up, will you? Thank you for nothing!'

Felling's cold blue eyes glinted. 'I don't like your tone, captain,' he said angrily. 'I'm not accustomed to be taken up in such a manner. I tell you these two men are thieves, and are after my diamond. And I ask you to do your duty as captain of this ship and have them arrested.'

'And I ask you for proofs of what you say,' returned the captain.

Felling was silent for a few moments. 'You refuse, then?' he demanded. 'You won't do as I ask; you won't take action?'

'I won't,' replied Vincent gruffly. 'For all I know, this may be some cock-and-bull tale of your own, and these men may be quite honest.'

The other rose to his feet. 'All right!' he almost shouted. 'All right, Captain Vincent, if you won't do your duty, I'm not going to sit here and have my word doubted. And I'll tell you one thing, if my diamond is stolen, I'll make you responsible—yes, I'll make it hot for you when we arrive in England.'

The captain also rose to his feet and towered over his visitor. 'I'll trouble you to leave my cabin,' he said briefly. There was something in the way the words were spoken which silenced the other, overbearing and autocratic as he was. He made a last angry gesture and withdrew, slamming the door behind him. Vincent looked after him for a moment, then shrugged his shoulders and sat down again in his swing-chair. 'Nice fellow!' he said aloud, relighting his pipe. 'I wish I had him in my fo'c'sle for a few weeks. I'd rub his nose into it. Don't like my tone, don't he? Tut! Tut! Well, if I liked his own, I'd have told Wilkinson and the stewards to keep their eyes on these two men. But as it is—no, thank you; he can do his own dirty work. Some diamond, though!'

1924.]

III.

The captain was as good as his word. He took no action whatever, and it seemed as though he was justified in so doing. The days went by and nothing happened. The ship's routine continued peacefully, the weather was hot and placid, and the passengers appeared to be sunk into a mild and calm contentment. Felling sought no more interviews; he avoided the captain pointedly, and at meal-times only stared at him vindictively. Vincent was far from complaining of this, and after a few days he had begun to put the man out of his thoughts. He made a few judicious inquiries of the purser and his other officers, and discovered that Felling was what he had proclaimed himself to be, a wealthy man, well known in South Africa, famous for his diamond purchases. As to the supposed jewel thieves, nobody appeared to know anything of them. Vincent watched them covertly, but found nothing suspicious in any of their actions. 'My millionaire pal must have been talking through his hat,' the captain reflected. 'Only wish the rest of the passengers were as little trouble as those two chaps.'

He had commenced to forget the whole incident, when one hot afternoon, as he came down from the bridge to go to the cabin, Felling suddenly rushed up from the promenade deck and confronted him. The dealer in diamonds was flushed and agitated, and his dress was disordered. He gave an angry exclamation as he saw Vincent. 'Ah! I've found you at last,' he exclaimed. 'I've been looking for you, captain. Didn't know you were on the bridge. Come with me, if you please; come with me.'

'Come with you?' repeated the captain, in a surly voice. 'Where to?'

'To my cabin,' said the other excitedly. 'I insist on your coming. I have something to show to you.'

Captain Vincent stared at him for a moment, then shrugged his shoulders and followed him below. Felling led the way hurriedly to a large cabin, one of the best in the ship, which he occupied in solitary state. After closing the door, he produced a bunch of keys and unlocked a leather portmanteau which lay beneath his bunk. From this he took a large brass box like a big cash-box. Unlocking this with another key, he took out of it in turn the famous morocco case. He opened this with a dramatic gesture and pointed to it. It was empty.

The captain had suspected what was wrong, but at this sudden confirmation his heart seemed to give a great leap. He raised his eyebrows and looked questioningly at his companion.

'The diamond's gone,' said Felling fiercely. 'It's been stolen!'

He closed the case again with a sharp click,

and flung it back again into the brass box. 'Yes, it's been stolen,' he repeated. 'Well, you heard what I said a week ago; I warned you of this, captain, and now you know that I was right.'

Vincent looked him in the eyes and instinctively squared his shoulders. 'I remember your words,' he said in his deep tones. 'How did you discover this—loss?'

He emphasised the last word, and Felling glared at him. 'I discovered the theft about half-an-hour ago,' he said. 'I may tell you that every night before retiring I put the case in that strong box, and the box in the portmanteau, locking them both. In the morning I took the case out and carried it about with me all day. This morning I was hurried, and for the first time forgot it, and left it where it was. I recollected this only half-an-hour ago, and at once came down to get it. And I found the diamond had been stolen.'

The captain was silent for a few moments, shooting little glances round the cabin. 'You found your portmanteau and that box locked again?' he said. 'But the diamond was missing?'

'Yes,' said the other. 'That's easy enough—duplicate keys. Perhaps the thieves thought I should not open the portmanteau again for some time when I found it locked.'

'Seems strange,' said Vincent thoughtfully. 'See here, sir, you are absolutely certain you put your diamond there last night?'

'I am.'

'And you are absolutely certain, also, that it is not mislaid?'

'Absolutely,' cried Felling, with a sneer. 'It's the sort of thing you'd mislay, isn't it? What do you take me for? No—it's been stolen, and stolen mighty smartly.'

'And you suspect——?' began the captain slowly.

'I suspect those two men I told you about,' the other broke in. 'Not a doubt of it; they've got it. Who else should it be? You'll take action *now*, captain, I should hope.'

Captain Vincent took a pace or two up and down the cabin floor. 'You've no clues, I suppose?' he asked. 'You saw no one; found no signs of any one having entered your cabin?'

'No,' said Felling, with a shrug. 'But the diamond's gone.'

'Then any one might have stolen it,' returned the captain. 'Not only these two fellows; it might be any one in the ship.'

Felling gave a furious gesture. 'Talk sense, captain!' he cried. 'It might be, but it's not. You know what I said about those two men? It's up to you to have them arrested and searched, and have their cabin thoroughly searched as well. Even then they may have hidden the stone too cleverly; but we *should* find it if you do your duty.'

The captain flushed and bit his lip. 'Possibly,' he said, repressing his anger. 'But it seems to me that we might suspect any of the passengers, or the stewards, for the matter of that. Well, Mr Felling, you need not fear that I won't take action, but I should like to think things over first. We know one thing, that if the diamond is stolen, it is in the ship somewhere. I'll think things over, and let you know what I propose later on to-night. We had better say nothing to any one about it meanwhile. It's somewhere in the ship, and I'll turn the old *Cambrian* upside down for you until we find it.'

Felling shrugged his shoulders again. 'Not much need to do that,' he said sullenly. 'I've told you what to do and where to look. You can think it over as long as you like, but you'll find I'm right in the end.'

IV.

Captain Vincent made no reply, but withdrew to his own cabin. Although his face was as hard and saturnine as ever, inwardly he was profoundly disturbed. He knew little of the law or his legal responsibilities and duties, but he took the old-fashioned view of his position as a ship's captain, and considered himself morally responsible for all that occurred on the *Cambrian*. He had paid scant respect to Felling's story a week ago, and now it appeared that the man's fears had been well grounded.

The captain spent hours that evening pacing up and down the bridge, to the wonder of the officer of the watch. For long he could not come to any decision. Supposing he did as Felling asked, had Downe and Birchall arrested and searched, and then found no diamond in the end? They would probably bring actions against him on arrival in England, and he might be ruined. But, on the other hand, it would be a very large order to search the whole ship, and he might offend a score of passengers instead of only two. He considered it pretty certain that if the diamond was stolen, one of the passengers had it. And Felling seemed so certain about those two fellows. Perhaps, as a choice of evils, it would be best to do as he asked. 'It's about the rottenest job I've ever faced,' said the captain to himself. 'And that Felling man gets my goat, somehow. But I've got to find his diamond, and I'll go and tell him that we'll run in Messrs Downe and Birchall in the morning—or to-night if he likes.'

He looked at his watch, and was surprised to find it was after eleven o'clock. 'Didn't know it was so late,' he muttered. 'However, he may still be waiting for me.'

The captain descended from the bridge along the boat deck and down to the promenade deck. Most of the passengers had retired to their cabins, but a few couples still sat about in low chairs. The night was warm and placid, the

[Christmas Number.]

Cambrian was moving quietly through the calm sea, only the dull, profound beating of her engines and the glimmer of her mast-head and sidelights hinting that she was a great living organism. The captain moved as quietly as his ship; he was wearing his white tropical uniform with light canvas shoes, which made no sound as he walked. The peace of the night contrasted violently with his worries, and he sighed heavily as he stepped down below.

Felling's cabin was at the end of a long passage, and as he came silently up to the door the captain hesitated for a moment. 'Better see if he's gone to bed,' he said to himself. The principal porthole of the cabin, of course, gave on to the sea, but there was a small inconspicuous circle of glass which opened inboard. Vincent peered through this. As he stared his eyes widened, and unconsciously he clenched his big brown fists. The electric light was burning, and Felling stood underneath it in his pyjamas. He had been winding up his watch, and now placed it under the pillow in his bunk. Then, bending down to his coat, he took a little wooden box from a pocket and shook something from it into the palm of his hand. As Felling looked at it he nodded his head and chuckled cunningly to himself. It was the diamond, the famous diamond, which had been reported as being stolen!

The captain, with difficulty, repressed an exclamation. There was no possible doubt—that was the missing queen of diamonds. There were not two jewels in the world like it—that was the diamond. As he still stared through the peephole, he saw Felling replace the stone in the wooden box, stoop down, and roll back the coconut matting from a corner of the cabin floor. Prizing up a small piece of plank, Felling dropped the box into the aperture, rolled back the matting, and stood up. He chuckled once more, like a man enjoying a good joke, then flung himself into his bunk, switched off the light, and the cabin was in darkness.

Captain Vincent stood back from the glass. His first impulse was to kick the cabin door open, pull Felling from out of the bunk, and tell him precisely what he thought of him. But on second thoughts he stole away quietly down the passage without announcing his presence, and gained his own cabin. Arrived there, he dropped into his seat and mopped his forehead. 'What's his game?' he said, in an amazed whisper. 'What's he mean by lying to me and pitching me that yarn? What's the swab after?—it beats me!' He filled and lighted his big pipe, and began to pace up and down. As he smoked he grew calmer, and his brain began to work. 'I can see two things, anyway,' he said to himself. 'First of all, he would score off me and get his own back because I wouldn't bother my head about him a week ago. "All right," he says, "I'll show you,"

1924.]

c

and he comes up and tells me the diamond's stolen. That will upset me, he thinks—and he was right there—I shall be pretty worried, and he'll see it and grin to himself. Yes, but there's more in it than that. Let's assume that those two fellows are really jewel thieves; they may be, for all I know. Well, then, if he announces that his diamond is stolen and that he suspects them, he makes himself safe from them for the voyage. Suppose I do as he asks and arrest them, he's safe that way. And even supposing I don't, he'll tell everybody his diamond is missing; the two'll hear it and think that they've lost their chance—somebody else has got there first. Yes, that will be it—pretty ingenious blighter he is. Then why did he hide it under the floor? Well, I dunno; perhaps he thinks it's safer there. If he carried it about with him, he might get his pocket picked, or fall asleep in his chair and lose it, or have an accident or something. Pretty ingenious, too, for him to think of hiding it in the double flooring; he must have cut that bit of plank out. Of course, when we get to port he could suddenly find his diamond, and say he's sorry to have caused all the bother. Or he could even let the whole thing drop, and clear out with it. Yes, you're a clever lad, Mr Felling, but I swear I'll get even with you. I'll call your bluff. Only question is—how?'

The captain emptied and refilled his pipe time after time as he tried to find an answer to his question. At last he had a sudden glimmer. His thoughts seemed to amuse him, and he smiled rather grimly. 'That's it,' he muttered. 'That's it; I'd give it him back, of course, when we arrived in port—say I'd found it or something. Vincent, you're a great man.' He was still smiling as he flung himself into his cot in the first light of early dawn.

V.

After a few hours of refreshing sleep Captain Vincent rose, dressed, and obtained an interview with the clever Mr Felling before breakfast.

'I'm sorry I could not see you last night, sir,' he said loudly. 'But I was kept on deck until very late. I've been thinking over your unfortunate—er—loss, and I've come to the definite conclusion I cannot have those two men arrested. You've no case at all against them, and I don't believe I've the power to do it. But I'll have the whole ship searched, the passengers' cabins, the stewards' and crews' quarters—everywhere. If we find your diamond, well and good. If we don't, I'm sorry I can do nothing more for you. When we arrive in the Thames you can inform the Customs people, call the police in and let them take the matter into their hands. That's all I can do for you, sir.'

Felling listened attentively. As the captain finished he smiled in a veiled fashion. 'And that's your last word, is it, captain?'

'It is, sir.'

'Well, I must say I'm surprised,' said Felling, with unexpected mildness. 'I tell you those men have the jewel. If you refuse to arrest them, you are incurring a very serious responsibility. You'll hear more of it when we arrive in London and I call the police in, as I certainly shall do. But that's your affair. As to searching the ship, it's useless, and I don't want it done.'

'As you please, sir,' returned Vincent. 'I've offered to do it, but if you object there's no more to be said.'

'It's useless, I tell you,' said Felling. 'I've told you where the diamond is. We'll say no more about it. But there's one thing—I don't see why I should not mention my loss, as you call it, to my friends and acquaintances on board. I'd like to have their opinion.'

'That's as you please,' said the captain.

As he sat at the head of the captain's table at breakfast Vincent thought over the situation. 'Cunning blighter,' he mused. 'He's going to tell his friends, so that Downe and Birchall hear about it.' He gave ear attentively to the hum of talk, chewing his food the while with a wooden face. Felling sat at another table, and the captain could not hear the conversation; but he noticed it grew louder and more excited, and saw that the two supposed jewel thieves heard what was being said. The captain studied their faces attentively. He saw that they took on a look of amazement and chagrin, and then the two whispered to each other in what seemed to be a nervous, uneasy manner.

'By George!' said Vincent to himself; 'I believe he was right. I believe they *were* after it, after all.'

After breakfast, when the passengers dispersed about the decks, the loss of the diamond became the general topic. People split up into groups, talking in low constrained tones. Felling announced pompously that he was not satisfied with the captain's attitude, but would wait until the *Cambrian* arrived in London before taking any further action. Vincent overheard something of this, and again he smiled grimly. 'You wait, my lad,' he said to himself. 'You just wait a little, till I wake you up.'

As a matter of fact it was two days before the captain's opportunity arrived. Felling was fond of bridge, and on the afternoon of the second day Vincent saw him settled comfortably over a rubber with three of his cronies in a corner of the smoking-room. The captain watched them for some five minutes, and then stole away. He walked swiftly below to Felling's cabin. No one was about. He pressed the door gently, and entered as softly as a shadow. His heart beat fast as he dropped to his knees,

pulled away the matting, and gripped the loose plank in the corner. It came away easily. He felt with his fingers in the opening and touched the box. He had it out instantly, opened it, and saw the diamond lying on a pad of cotton-wool. Next instant he had replaced the plank and the matting, and was outside the cabin door with the diamond in his pocket. 'And that's that,' he said, with a grin. 'Perfectly simple. I think burglary's dead easy. Now, Mr Felling, when you finish your game and come to dress for dinner, we'll maybe hear something.'

VI.

The captain took care to be at hand as the dinner hour approached. He had not long to wait. Five minutes after Felling had gone below he shot up on deck again like a cannon-ball. His face was ashen, and his eyes were bloodshot and injected. Captain Vincent encountered him at the head of the companion. 'Hullo, Mr Felling!' he said cheerfully. 'You look excited. Not found your diamond, have you?'

Felling gulped in his throat, and put a hand to his collar. 'Found it?' he almost howled. 'Found it? No, I've not—it's—it's gone—I mean, you know it's been stolen.'

'Of course,' said Vincent lightly. 'We all know that. But I was hoping it might have turned up. Sorry I was mistaken.'

The other seemed to struggle with himself, and regained a little calmness. 'No,' he said, licking his dry lips. 'No, it has not turned up, as you call it. See here, captain, I want to appeal to you once more. I—I'm more certain than ever that those two fellows have got it. I—I have my reasons for thinking so.'

'You have?' exclaimed Vincent. 'Really? What reasons?'

Felling was silent, and his eyes sought the deck. 'Well—nothing definite,' he said at last. 'It's more a question of instinct. For the last time I ask you to arrest them.'

Captain Vincent drew himself up. 'I'm sorry,' he said formally, 'but I've already told you I cannot do it, and I don't see any reason to alter my decision. I can say no more, sir.'

And bowing slightly to the palpitating Felling, he turned his back and left him.

VII.

As the days went by the captain savoured his revenge to the full. Felling appeared to grow more restless and agitated every hour. He seemed unable to sit still, but paced up and down the promenade deck all day long. To friends who consoled with him he gave short answers, so that soon his acquaintances avoided him and left him alone. It was understood that he was going to send to Scotland Yard the instant the boat was in the Thames.

It was when the *Cambrian* drew near to
[Christmas Number.]

home waters, and commenced to cross the Bay, that Captain Vincent's enjoyment began to be a little mingled with uneasiness. He wondered what he should say when he returned the diamond to its owner. 'He'll be glad enough to have it, no doubt,' he said to himself. 'But he'll want to know where I found it. And that will need a bit of answering. He knows where he left it—under the floor in his cabin. And if I tell him I found it in the stokehole, or some other likely place, he'll start wondering. I seem to have got myself into a bit of a mess. But I must trust to something turning up.'

He carried the precious stone about with him in his hip pocket, and discovered that it was no great fun to have a diamond worth thousands of pounds in his possession, especially when it was not his own.

The *Cambrian* passed Ushant, and still he had thought of nothing. The ship called at Cherbourg for a few hours as usual, though all the passengers were booked through to London. The captain had to go ashore on official business. As he left the agents' office and hurried down to the harbour again, he was surprised to encounter Messrs Downe and Birchall. They each carried a small suit-case, and were evidently bound for the railway station. At the sight of the captain they halted, and seemed a good deal perturbed.

'Why, gentlemen,' said Vincent, 'what are you doing here? You both booked your passage to London, didn't you?'

The two looked at each other, and Birchall answered in a hurried, anxious fashion. 'Yes, that's quite correct,' he said. 'But we suddenly remembered we had some business in Paris we ought to attend to, and we took the opportunity of landing. It doesn't matter, does it, captain? We told the purser, and arranged about our heavy baggage being landed in London.'

'No,' said the captain thoughtfully. 'No—it doesn't matter, of course. Hope you've had a pleasant voyage and all that. Good-bye, gentlemen.'

They hurried on, and he stood looking after them. 'Now, what's that mean?' he demanded of the street. 'Well, I think it's pretty evident those fellows are jewel thieves, and they don't want to see the police in London. They haven't got the diamond, because it's in my pocket, but it's likely there are other things against them. And if the Scotland Yard people saw them, those other things might crop up inconveniently. Yes, that's it.'

He walked on thoughtfully. Suddenly he broke into a laugh and smacked his thigh. 'Let's get on board,' he said. 'My stars! I'd like to see Felling's face.'

His wish was granted ten minutes later when he walked up the ladder of his ship. Felling met him as he gained the deck, the purser at his heels, looking pale and uneasy.

'What's this I hear?' shouted Felling fiercely. 'The purser tells me those two scoundrels, Downe and Birchall, have left the ship. Do you understand that, Captain Vincent—they've cleared out and taken the diamond with them. And here's the purser says he had no orders to prevent any one from landing. But you're responsible at all events, captain. I've told you all along they were thieves, and now you let them trick me. By Jove, if I'd only known before I'd have stopped them myself. Well, you'll find you've made the biggest mess of your lifetime over this. You'd better come ashore with me; it may not be too late. We must telegraph to—'

'Calm yourself, sir,' said the captain, tranquilly. 'I met our two friends when I was ashore.'

'You met them?' cried Felling.

'Yes,' said Vincent, 'I met them. And here is your diamond.'

He took the box from his pocket. Felling snatched at it, opened it with trembling fingers, and gave a gasp of joy. 'It's there all right,' he said, in a shaking voice. 'Yes, that's my diamond. So I was right, you see, captain. They had it all the time.'

'So it would appear,' said Vincent gravely.

'And how did you get it, captain—how did you get it?'

'Well,' said the captain, most truthfully, 'it wasn't easy. I had a devil of a job to get that diamond. But I got it.'

'Did you have the scoundrels arrested?'

'Well, no,' answered Vincent. 'No. I thought I'd better let them go. I've told you I had the devil of a job to get it. I hoped you'd be satisfied with regaining it.'

'Oh, of course, I'm satisfied,' said Felling. 'But I should have liked to see those blackguards pay the penalty. However, we can talk of that later. I can't thank you sufficiently, captain. You don't know what the possession of this stone means to me. You'll allow me to show my appreciation of your services, I hope! You won't be too proud to accept, say, a cheque for a hundred pounds?'

Captain Vincent's eyes gleamed, and he drew himself up stiffly. Then a sudden thought seemed to strike him, and his attitude relaxed. 'Well, sir,' he said awkwardly, 'it's very good of you, of course.'

The captain possessed an only sister, a widow, who had lost her husband two years previously, and who was struggling to bring up three small children on what was left of his savings. Vincent gave her what help he could, but that had necessarily not been very great. So that she was the more surprised and gratified to receive a cheque from him for a hundred pounds, together with a letter informing her that it represented profits on a lucky business deal in diamonds.

THE HAPPY LIE.

By CLARE THORNTON.

I.

MISS SINGLETON had always hated Miss Morgan, even before there had been any question of rivalry between them, in the old days when doddering Canon Ackland had been rector of Fawdon St Mary's. It was in the nature of things that Miss Singleton should dislike Miss Morgan. Tall, angular, with sharp gray eyes and thin lips, dressed always in dark-gray clothes, Hester Singleton was a good type of the embittered spinster who possesses a shrewd brain and a merciless tongue. That tongue was often used scathingly at the expense of her fellow-villagers, but since its owner was rich and powerful it was considered politic not to quarrel with her, and an outsider, coming to Fawdon St Mary's, might have taken the mistress of White Hall to be a most popular person. Her 'first Wednesdays' were well attended, and invitations to her lunch and dinner-parties were eagerly sought.

Miss Singleton prided herself on her cynicism. Not that she called it that. 'I see straight!' she would say. Novels she voted 'trash,' and her fellow-members on the library committee were too craven to oppose her, and the rustics were perplexed by being given books of travel or respectable memoirs instead of their favourite romances and detective stories.

The fact that every one called Miss Morgan 'Miss Rose' conveys a good deal. There was no other Miss Morgan, but she looked so obviously a 'Miss Rose.' She was small and plump, with a mincing walk. Plump white hands she had that fumbled with everything she touched, and fair, fluffy hair and a perpetual blush, and short-sighted, child-like blue eyes. She wore a great deal of pink. She loved 'sweet stories,' and the waltzes that the barrel-organs grind out; for her Royal Academicians painted pictures called 'Somebody's Sweetheart.' In short, she was as sentimental and amiable a little spinster as ever fluffed out her curls when the rector lifted the latch of her cottage gate. 'Little simpering fool!' was Miss Singleton's verdict upon her, and as that social pest, the repeater, flourished in Fawdon St Mary's, Miss Morgan was kept informed of every sarcastic speech made at her expense by the other. The poor little woman, who had never disliked any one in her mild life, was horrified to realise that the august Miss Singleton held her in such contempt, and this feeling made her appear at her silliest when in Miss Singleton's company.

Miss Rose was very badly-off, and lived in

a cottage in the main road. She had a small garden where nothing ever grew satisfactorily. Perhaps her hands fumbled and fussed too much with her plants and flowers. Anyway, her garden was always untidy, and her flowers were the poorest in the village.

In 1922 old Canon Ackland died, and the Reverend Robert Rendall came to Fawdon St Mary's. He was a handsome man of forty-five; he had the most charming manners in the world, and he was unmarried. The excitement in the village may be imagined! Of his religious convictions, sufficient it is to say that he steered a tactful course, and was neither too high for the old-fashioned folk in the village, foremost of whom was Miss Singleton, nor too low for those who, like Miss Rose, were inclined to look wistfully towards Rome. He achieved instant popularity among all his parishioners.

It soon became evident that of all the maidens in the village, the two who stood first in Mr Rendall's favour were Miss Singleton and Miss Rose. Constantly was his tall, well-set-up figure to be seen walking up the drive of White Hall; but just as often did Mrs Raines, the super-gossip of the village, who lived next to Miss Rose, report to her friends that he had taken tea at Myrtle Cottage.

Miss Rose had a small but sweet soprano voice, and led the church choir. The new vicar took a keen interest in the music, a fact that was not lost upon the villagers. But, then, Miss Singleton's money it was that paid for the new organ and financed the choir.

Opinion in Fawdon St Mary's on the subject was divided. Miss Rose was the younger, and had more claim to good looks, and was infinitely more gentle and amiable than the other, but Miss Singleton was wealthy, and had the assurance of manner that wealth brings, and a certain bitter wit that could be very amusing. A way of saying what everybody else thinks, but dare not say, can be undeniably attractive—even to a clergyman. Certainly, Mr Rendall seemed to find Miss Singleton good company.

Of course, every one wanted him to marry Miss Rose, not because they liked her, for she was too stupid and shy to be really liked, but because they hated Miss Singleton, whose tongue had in turn lashed every one of them. Miss Singleton, who 'saw straight,' knew perfectly well how things were, and how eagerly her friends longed to hear of the vicar's engagement to Miss Rose. Being, under her harsh manner, an ordinary human woman, she naturally strove her utmost to frustrate their

[Christmas Number.

hopes. Incidentally, she loved Robert Rendall, but of this she gave no sign.

II.

Early in June something happened that ended, for ever, the rivalry between Miss Singleton and Miss Rose. Mr Rendall died suddenly of heart-failure while writing at the desk in his library.

Though he had been only six months in Fawdon St Mary's he had endeared himself to all, and his sudden death plunged the village into sincere mourning. None showed such unashamed grief as did Miss Rose. As, in the lovely sunshine of the June morning, the coffin was lowered into the earth, the little plump figure, in its shabby black, stood shaken with sobs under the cold eye of Miss Singleton, whose face never altered its expression of severity.

The village settled down once more to its placid life. People talked of Mr Rendall's successor. Mrs Raines went about telling everybody that she was quite sure that the dear vicar had been on the verge of proposing to Miss Rose when he was so tragically 'taken off.' Miss Rose continued to wear her shabby mourning.

At about two o'clock on an afternoon a week after the funeral Miss Singleton was sitting in her garden with a book of respectable memoirs, when she saw the little mincing figure of Miss Rose coming up the drive. 'I wonder what the little fool wants!' she muttered.

She beckoned, and the visitor came across the grass to her. Miss Rose's face was deeply pink, and her eyes were feverish with excitement. She held something white in her hand, and when she got close, Miss Singleton saw that it was a letter. Breathless from her quick walk, and from emotion, the little woman broke into agitated speech.

'It's all so wonderful, I can hardly believe it!—like a dream. Sometimes I thought he cared, but I always told myself not to be so silly! He was so clever, and you know I'm stupid! They always said at home I was the stupidest of the family. It's all like a fairy-tale! But I haven't told you! Oh, I hardly know what I'm saying. It's been such a shock!'

Miss Singleton regarded her coldly. 'What in the name of common-sense is all this about?'

'It's this letter!' gasped Miss Rose, laying it on her knee. 'Ellen from the Vicarage brought it round this morning. She'd found it in the blotter on his desk. He'd been writing it when he—Oh, read it, read it, Miss Singleton! Oh, to think of him caring!' Tears were running down her cheeks, and she dabbed her face with a handkerchief in her fumbling way. She sat down next to Miss Singleton on the bench. Round them the sunshine burned down on the trim garden, though the bench stood in the deep shade of a chestnut-tree. The air was full of the sweetness of roses

1924.]

and syringa. With a pinched look about her lips, Miss Singleton read the unfinished letter, written in the vicar's neat, scholarly handwriting:

'DEAR MISS ROSE,—I have been meaning to tell you this for some time past, but when I see you I find that my courage fails me, so I am writing. No doubt you have guessed long ago that I care for you, that my dearest wish is that you will marry me, and——'

That was all.

Miss Singleton's face was utterly expressionless. No one would have guessed that to her those few lines of writing meant tragedy. She had loved the dead man, and it was cruel for her to know that he had loved this little foolish creature whom she had despised. Yet, after the first fierce flame of jealousy had died down, other considerations, more practical, burnt themselves into her mind. This meant utter humiliation for her in the eyes of Fawdon St Mary's. Not by one word or sign would she be shown how the village rejoiced at her defeat at the hands of this despised rival. Well did she realise the universal snobbish fear of her and respect for her position. But they would all gloat over her. She was important and wealthy and proud, yet the vicar had preferred this little blushing fool . . .

Kindly Miss Rose blundered into halting expressions of sympathy. 'I'm sure I always thought it was you—always! I never dreamed it could be *me*! I was always so shy of him—I never knew what to say when he came to tea. Yes, I always told people I was sure it was you he cared for!'

Miss Singleton defended herself as women in her position will always, instinctively, defend themselves. 'You are talking nonsense!' she said drily. 'The vicar and I had a great deal in common, but there was never a question of anything between us but friendship. I was always convinced that you and he would suit each other admirably.'

Miss Rose was folding the letter in her white, ineffectual-looking hands; a few tears still trickled down her cheeks. 'Were you really? I had no idea—Robert was so wonderful; far above me in every way! I know he came a good deal to the cottage, but I thought it was just interest in the music. I never dreamed——'

'Well, everybody else in the village dreamed constantly!' said Miss Singleton in her dry way. 'No one will be surprised. How many people have you told? Or, rather, have you told Susan Raines, for if she knows it will be all over the village in five minutes.'

Miss Rose said that she had told no one, but had come straight over to Miss Singleton. She added timidly, with a deepening of the flush on her face, 'I thought I'd tell them all at the choir-practice this evening, and show them the letter.'

'A good idea,' said Miss Singleton. 'Now,

if you don't mind, I'm afraid I must finish my book, as I promised it to Lady Hill to-night, and I have five chapters to read yet. I shall see you at the choir-practice.'

She rose, holding out her hand. The rudeness of the dismissal did not disconcert Miss Rose. She was accustomed to Miss Singleton's manners. Besides, she was too rapt, too irradiated with the glory of her happiness, to care. 'It'll make such a difference to my life!' she murmured, smiling, and peering at Miss Singleton with her tear-filled, short-sighted eyes. 'In a way—it may sound strange, but I'm almost glad it's happened as it has. I shouldn't have been clever enough to be Robert's wife. Now I know that—that he cared! Nothing can spoil it. If he'd lived, I—I'd have disappointed him. Yes, yes, I'm just going. I think I'll go down to the grave. You see'—a sob choked her for a moment, but she smiled bravely—'it'll always be my grave now—to look after.'

She nodded to Miss Singleton, and her little figure minced away down the drive.

III.

Miss Singleton stared across the blazing garden, and now that there was none to see, an agony of pain burned in her usually cold eyes. Robert Rendall had loved that woman, that little, simpering creature, with her fumbling hands, her blushes, her absurd, girlish dresses. Robert Rendall, a man of culture and insight, a man who must have met many attractive women and remained unattracted. Rose Morgan! Her pride shrivelled within her. And all her world would know—all her world. Day after day she would wake to face them—Mrs Delane, the doctor's wife, a sly woman, whose hatred of her was always masked by servile flatteries; that cat Susan Raines, with her sharp eyes that pried on every one; all the set of so-called friends. She had always prided herself upon 'seeing straight.' This faculty cost her dear now. She saw that, for months and months to come, behind her back, Fawdon St Mary's would be laughing at her.

Miss Singleton was a brave woman, yet her spirit quailed before the prospect of facing those women in a couple of hours' time in the choir-room and hearing Rose Morgan tell them of the vicar's letter.

But she knew that for her pride's sake she must go to the choir-practice and play her part cleverly, so that no one would know for certain that she had cared. Ah, but they were women! They would know! Every one of them!

Her face was hot. Her lips felt dry. Her limbs were trembling.

Later on, Rose Morgan would give up her mourning and wear her pink again, would go about radiant and serene, as befitted a woman who had been loved by such a man as Robert Rendall.

But the picture that caused Miss Singleton to close her eyes and grip her thin hands together was the picture of Rose Morgan tending that grave in the churchyard—'It'll always be my grave now—to look after,' the sob-choked voice had whispered. And that was true. It *would* be her grave. She, Hester Singleton, would have no right to take her splendid hot-house flowers there. Rose Morgan's poor blooms would be in their rightful place.

Miss Singleton felt sick with misery. Tears rushed burningly to her eyes. She was, for the moment, a broken woman. But only for the moment. She saw, through a blur of tears, a figure hurrying up the drive, and determinedly she blinked back her tears. Whatever happened, she must show them that she didn't care. She *must*!

As the figure approached, she recognised Ellen Dawn, the housemaid from the Vicarage. Ellen was a girl whom Miss Singleton had always disliked, a feather-brained creature who hated 'service,' and spent her wages on 'dressing up' and cinema-shows in Ambridge, the nearest town. Just now, the girl's vaguely pretty, silly face was pale, and she appeared agitated.

'Well, Ellen, what's the matter now! How untidy you are—and how hot! Dear, dear! has something happened?'

The girl was hatless, and her yellow 'frized' hair was dishevelled. She wore her cotton dress and apron. Standing before Miss Singleton, whose eyes regarded her disapprovingly, she faltered, 'Oh, I had to come and tell you, miss! I—I began to feel as I ought not to 'ave done it! I didn't *think*. She's always been so kind to me. I wanted to make her happy, and it was so easy. But I got a dreadful feeling as it was wicked to have done it.'

Miss Singleton, standing up, grasped the girl by the arm. Her eyes flashed like steel. 'What's all this? What have you done? Tell me at once!'

'I will, miss. Don't hold my arm so, miss! It hurts! I'm sure I did it all for the best. She put the idea into my head, coming up every day asking me if I was sure the vicar hadn't left any letter for her among his papers. I did like her so. She was so kind when I was ill last year! And I saw a picture on the films last week where some one wrote a letter like that and pretended——'

Miss Singleton almost shook her. 'You mean to say *you* wrote a letter—pretending that the vicar had——'

'Yes, miss!' whispered the girl. 'I—I copied the vicar's writing, miss, and took it to her, saying as I'd found it in his blotter. It made her so happy, miss—and now I'm afraid she'll tell every one. I want you to go and tell her it wasn't true. I'll never rest happy if she doesn't know! It was wicked to do it. I did it for the best, but it wasn't right.'

[Christmas Number.]

Miss Singleton's hand dropped from the girl's arm, and the faltering voice trailed on unheard by her. Over and over again in her mind ran the glorious flaming words: 'He did not love her! Perhaps he loved me—me. . . .' She could have laughed aloud at the splendour of it. The garden seemed to flame with beauty. He had *not* loved that little fool! The grave down in the sunny churchyard was not hers by right.

Why, oh why had she not guessed, as soon as she had read its stilted phrases, that the letter was a forgery? Why had she let it torture her as it had done, and . . .

Ellen Dawn, her eyes full of fear, her lips trembling, was touching her arm. 'You'll stop her telling people, miss! It's wicked for a lie to be told about the dead. I'll never rest in my bed if I think she's telling people! Oh, you'll go at once and find her—'

'Yes, yes!' said Miss Singleton impatiently. 'What on earth possessed you to do such a thing, girl?'

'I saw it done on the pictures,' said the girl miserably; 'and Miss Rose, she's been coming up asking me if the vicar . . . I told you, didn't I? That put it into my head; but I know it was silly and wrong of me. I thought you'd put it right. You will, I know, miss. I'll never dare face Miss Rose again, but I'm going to my new place in London to-morrow. I needn't see her.'

IV.

Miss Singleton was staring in front of her at a bed full of tall blue spires of delphiniums, but she saw only a vision of Miss Rose's face as she learned that the letter that had changed the face of the earth for her was a forgery. The child-like blue eyes would grow dim and dazed; the pink mouth would pucker up; all the glory would go out of everything for the empty-headed, foolish little thing. Yet because she *was* so foolish, it would be all the crueller to shatter her happiness. Half-an-hour ago her face had somehow lost its foolish look, had grown almost dignified, because she had thought that this man had loved her.

Miss Singleton heard her own voice saying characteristic things. 'No one should be allowed to have delusions. People should be made to face the truth. I hate sentimental lies.'

Yes, but the truth could poison life, could kill all that made it sweet. Miss Rose was poor, and had a hard task to make her little income support her. She had no holidays, few pleasures of any sort. This lie had the power to make her supremely happy for the rest of her life, to turn every dull day into a wonder of happy dreams.

And she, who had loved the dead man, whose rival this woman had been, had the power to rob her of those dreams.

'Please, miss, you'll go at once to Miss Rose? 1924.]

It'll be so dreadful if she's gone about telling people! Oh, please, miss!'

Miss Singleton was seeing the choir-practice that evening, seeing Miss Rose's shy, flushed face as she told her story, hearing the congratulations—subdued because of the sad circumstances—of the other women. None of them would convey by the least hint that they rejoiced at her humiliation, but she would see into their hearts, see the malice and triumph.

Miss Singleton was deaf to the girl's whimpering declaration that if Miss Rose wasn't told the truth she'd never dare close her eyes. The vicar would 'appear' to her.

She suddenly saw Miss Rose working in her small patch of untidy garden, as, often, passing in her car, she had seen her, wearing a faded old overall, tying up the unthriving plants with her fumbling hands. She saw her face dreary and old, yet wearing the look of a hurt child, saw the poor starved life robbed of its dream.

She was wealthy. She could travel, indulge every whim. Life had many compensations for her. She saw straight now, as always. She saw that the cruellest thing in life is to rob some one of a dream, some one who has nothing but that dream. She knew what she must do.

Miss Singleton turned to Ellen Dawn. 'Listen, Ellen. I happen to know that the vicar *did* care for Miss Rose. You acted very wrongly in writing that letter, but she must be allowed to think that he wrote it! You understand?'

'Oh, miss!' the girl gasped, her face beaming with relief and rapture. 'Oh, are you *sure*? He really loved Miss Rose?'

'I know he did. He told me so. Remember, not a word of what you've told me to any one! Miss Rose is to think, always, that he wrote the letter. If you dare to breathe a word of this to a soul, you'll have me to reckon with! You see?' Her face looked so fierce as she thrust it forward close to the girl's that Ellen shrank back scared, and promising earnestly that she would never say a word.

'I'm so glad!' she added, 'that it was Miss Rose—at least—' She crimsoned, and glanced fearfully at Miss Singleton, who smiled grimly.

'There, you've said quite enough! You'd better get back to the Vicarage. Remember, you acted very wrongly, and your deed might have had serious consequences. If you girls spent less money on those foolish cinemas you wouldn't get these ridiculous ideas into your heads! Forging your master's handwriting, indeed! It's a punishable offence, I suppose you know?'

Terrified, the girl stammered, 'Is it, miss? I—I didn't know! Oh, you won't tell any one, miss! You won't—'

'I've already told you that I won't. But don't *you* tell any one. If you do, it will be a serious matter for you! There! Run off, now. The housekeeper will be wondering where you are.'

The girl hurried away.

Miss Singleton sat down again on the bench. She drew out a large linen handkerchief and wiped her forehead. She was breathing very fast, and she, who usually held herself erect, sat huddled and limp. The struggle had been brief but violent. It had exhausted her. She felt not only tired, but very, very old.

V.

An hour later, wearing her severe gray coat and skirt and hard black straw hat, Miss Singleton was walking down the fields to the church to the choir-practice. Her lips were grimly compressed as usual, and she walked quickly. Around her stretched the sunny peacefulness of the fields, above which larks sang ceaselessly. It was a typical June evening, calm and gracious.

As the tall figure drew near to the old gray Norman tower that stood so picturesquely among dark trees it stopped. Miss Singleton turned round. She had heard her name called.

Miss Rose, panting, red-faced, waving a shabby black parasol, was running along the path towards her. 'I came this way on purpose. I know you always come this way. So puffed! Had such a run! You see—it—it's about that letter! I—I burnt it. I don't want any one to know that he was writing it to me. No one does know but you! I had meant to tell them all at the practice, but now—I'm not going to.'

A queer look came over Miss Singleton's face as she said sharply, 'Why should no one know? What do you mean?'

Miss Rose stammered, and grew redder than ever. In halting, disconnected sentences she tried to explain what she meant. She was always nervous of Miss Singleton, and she found it hard to express herself at all. 'Well, I—I'd rather people didn't know. I know. That's all that matters. He loved me, and I'll be happy always—happy and so proud. But it's no one else's business. I don't want them to know. I won't mention names, but—but some people in this village talk unkindly. They'd go about saying horrid things about—I couldn't bear that to happen!'

The poor little woman was finding her tactfulness unequal to the difficult occasion. 'You see, I've been thinking it over, and I know I ought not to have told you about the letter! It was wrong! It—it must have seemed as if I wanted to hurt you, and I didn't—oh, truly I didn't!'

Miss Singleton stared at her. She was realising what this meant. Out of the kindness, the pitifulness of her heart, this woman whom she had despised was giving up her triumph, sparing her. 'They'll go about saying unkind things. I couldn't bear that to happen!' Miss Rose was a stupid, sentimental creature; everybody was contemptuous of her, yet she had this

beautiful, tender thought. She did not want to triumph at the expense of some one who, as she knew, was universally disliked. Therefore, she had burnt the letter. She would tell no one of it.

Miss Singleton, who 'saw straight,' saw all this. She was beaten, beaten to her knees, by such undreamed-of generosity. It took her by surprise, left her dazed and defenceless.

Tears stood in her eyes as she looked down at the plump face that was so red and distressed, the blue eyes that avoided hers.

She bowed her head humbly, the proud Miss Singleton who had always despised everybody. 'I know what you mean,' she said huskily. 'Thank you—thank you. It's good of you. I don't deserve . . .'

She could say no more. She put a hand up to her lips, the lips that had said so many clever, cruel things at the expense of the little woman who now, in deep distress, stammered out, 'Oh, please, please don't say things like that! It's not good of me! Don't you see, it doesn't matter about other people knowing that Robert cared. I know. We won't tell any one. We—'

But everything that was fine and brave in Miss Singleton's nature asserted itself now. She spoke with all her old peremptoriness. 'What nonsense! The idea of it! Every one shall be told. It's something to be proud of. A pity that you burned the letter. Still, it doesn't matter.' She was taking Miss Rose's hand, gripping it tightly. 'Of course, every one shall be told—this very evening! I myself will do so if you don't, and——'

'Oh no, please, Miss Singleton!' protested Miss Rose miserably; 'I don't want——'

She stopped. Hurrying towards them was the little spare figure of Mrs Raines, the arch-gossip of the parish. Her eyes bulged at the sight of the two rivals in such friendly converse, Miss Singleton actually holding Miss Rose's hand.

Miss Singleton saw her. Excitedly she said, smiling with a genuine pleasure that made the gossip stare harder than ever, 'Ah, Mrs Raines, good-evening. Miss Rose has just told me something so interesting! Ellen Dawn up at the Vicarage found a letter that Mr Rendall had been writing to her—to Miss Rose, just before he died. But we'll be late for the practice if we don't hurry. Miss Rose will tell you all about it as we go.'

There was nothing else for it. Blushing, faltering, yet unspeakably proud, Miss Rose told her great news.

From that day to this, Miss Singleton and Miss Rose have been close friends. Fawdon St Mary's cannot understand it. Mrs Raines shakes her head and whispers to her cronies, 'Mark my words, there's more in it than meets the eye!'

And, after all, she is quite right.

[Christmas Number.]

THE FARM IN THE MOUNTAINS.

By PETER HAWKER.

I.

'IT'S all very well,' remarked Pedderson, 'for you chaps to keep on saying, "It's your turn—it's your turn; surely you have had one adventure in your life worth recording?" but as it happens, my life has been particularly blameless in that respect.' He knocked the ashes from his pipe and glanced at each of us with a semi-defiant air, which, however, had no effect on us, as we had all done our part, and so did not feel inclined to let him off.

There were six of us all told, and being fishermen with plenty of ardour but not much income, we had pooled our resources and rented for a month four rods on the Test—the best dry-fly river in the south of England, to own a stretch of which many a fisherman would be prepared to sell his soul; I would, at any rate.

However, here we were ensconced in the little inn which stood at the cross-roads about two miles from our beat.

The room we were in was the only one of any size that the inn possessed, and here it was that we spent all the hours that were not occupied in fishing and sleeping. It was a long and narrow room, with an old arched fireplace one end, and a casement window the other—the only window in the room, the result being that the fireplace end was in a perpetual gloom.

This particular evening, I remember, was wet and cold, in spite of its being early June, and so we had ordered a fire, and after dinner sat round it in a half-circle like a lot of old cronies. Usually bridge had been the order of the evening, with two of us cutting in after each rubber: an uncomfortable arrangement at the best. But to-night some one—I think it was Jackson—had suggested that each of us in turn should tell of the most exciting event in his life. This was greeted with practically unanimous approval. Then that ass Jones went and spoilt it all by saying that, as he knew us so well, fishing stories ought to be barred; he looked at me as he said it. The idiot! Just because *he* had never caught a nine-pound trout—. Anyhow, this modification was also approved of, myself alone dissenting, and so we each of us told our meagre story: reminiscences of the war, of course; with fishing cut out, what else exciting could any one have to talk about? Finally it came to Pedderson's turn, and, as I have already mentioned, he said he hadn't a single thing of any interest to tell. We were still arguing with him when Mary, our landlord's daughter, came in with the 1924.]

lamp and the evening mail. The former she put down on the table by the window; the latter, which consisted of only one letter, she handed to Pedderson. He took it and, getting up from his chair, went over to the lamp to read it. As the door closed behind the departing Mary we were suddenly all attracted by a gasp of astonishment from Pedderson.

'What's up?' we cried in one breath.

He took no notice of us, but went on reading his letter. When that was finished he turned his attention to what looked like an enclosure of some sort. After several minutes he folded both the papers and put them in his pocket. He then came back to his chair with a queer smile on his face.

'Extraordinary, extraordinary!' he kept on muttering.

'Come on, Pedder,' I urged; 'tell us all about it.'

'Right, I will,' he replied. 'I said a few moments ago that I had never had any experience worth recording. I was wrong—although, until this letter came to-night, I did not know that I had it to tell. This sounds strange, I know, but you'll see what I mean before I get to the end.'

He ceased speaking to light his pipe. Jackson got up and piled the fire high with logs. Then we all settled ourselves comfortably in our chairs.

'Fire away,' I said; 'you've already whetted our curiosity.'

II.

'It was nearly two years ago,' Pedderson began, 'that the first part of this adventure took place. I remember that I had an awful fit of the blues, and so I decided to get into my little bus, ship her over to France, and just wander wherever the fancy took me; so off I went, and landed one morning with the car at Havre. It was bitterly cold, although quite early in October; in fact, the French had not yet put back their "Summer Time," though we had done so a few weeks earlier. It was that infernal cold that set me thinking of the south and the sun, and that I might as well wander down to the Riviera, get some warmth, and perhaps a bathe or two, have a mild flutter at Monte, and so home once more.

'Old Burton, the Automobile Association representative, supplied me with all my needs, and also advised me to carry as much petrol as I could if I was going any distance, as there was in France at the time what they called a

crise d'essence, and my chances of obtaining any petrol outside the big towns were exceedingly remote.

'This information rather discouraged me, as the big towns were just what I wanted to avoid, and I had already decided in my mind the way I should go: not by the usual road down the Rhone valley, but by a route I discovered just before the war: straight down through Chartres and Clermont-Ferrand to Le Puy, and finally joining the ordinary road at Avignon. A much more mountainous, and incidentally more lonely, route, but infinitely more beautiful; and also possessing a much better surface, as, from what I had heard, nearly all the main roads in France had been cut to bits during the war, and had not yet been repaired. Anyhow, I decided to load up the back of the car with spare tins and trust to luck.

'I got to Chartres the first night, and indeed found that Burton had not exaggerated about the lack of petrol. Even at Chartres, which is a good-sized town, I was unable to get a single drop. So I filled up from some of my spare tins and reached Bourges the second night. Here the same news greeted me; but I was told that if I could get as far as Clermont I should be sure to find some there, as the *crise* was not so bad farther south. So the next morning I emptied the remainder of my spare petrol into the tank, and arrived that night at Clermont with about two inches left.

'Here the hotel manager told me that petrol was very scarce, but that he thought he could get me twenty gallons on the following morning. But, as luck would have it, the railways went on strike in the night, and I woke up to find that all the available petrol had been commandeered by the Town Council, or whoever it is does these annoying things. I am sorry to bore you with these minor phases of French history, but as they were the indirect cause of what befell me later, I thought I had better mention them.

'Anyhow, to continue, this was a bitter blow, you may be sure. It looked as if I should have to stay for an indefinite period at Clermont, not a bad town in its way, but I had set my heart on going south, and south I would go. After breakfast I wandered all over the town in the hope of finding some one from whom I might be able to wheedle some petrol. But I had no success, and about midday I returned disconsolately to the hotel. While I was standing in the hall, cursing my luck, the porter shuffled up to me and wanted to know if monsieur desired any petrol, accompanying his suggestion with a wink. I promptly produced a fifty-franc note. In half-an-hour I had eight gallons in my tank, and three spare tins in the back. It was then about three o'clock, but I decided to start off that day, as I was tired of

Clermont. This I did, and arrived at Le Puy about six o'clock.

'Le Puy is a most quaint little town, situated in a valley with mountains all round. Nearly in the centre of the town are two extraordinary rocks, shooting straight up for several hundred feet. Here I unearthed one five-litre tin in a grocer's shop, and with this and my spare, and what I had in my tank, I decided I ought just to get to Avignon, a distance of about 140 miles. As the hotel accommodation at Le Puy is awful I made up my mind to go right on to Avignon, travelling most of the night if need be. I accordingly emptied all the juice I possessed into the tank, to save me the bother of doing this on the road. I know you are beginning to wonder what all this rigmarole about petrol is leading up to, but I am coming to that now.'

III.

'Let's see, where was I? Oh, I know—Le Puy. Well, I dined there, and about half-past seven I set forth to climb the pass over the mountains. If ever you fellows want a lonely run, I recommend you to try the road I took that night from Le Puy to a place called Alais. You can drive for miles without seeing a sign of a house; only wild mountains towering in every direction.

'The highest point of the pass, something over five thousand feet, is just before you come to a little place named Pradelles, about twenty-five miles from Le Puy, although it always seems twice as far, as it is solid climbing all the way. I remember it was bitterly cold, with a freeing wind; also it began to snow lightly after I had been going an hour. When another half-hour had passed, and still no sign of Pradelles, the thought struck me that I had taken the wrong road. I remembered seeing a turning to the right some kilometres back; perhaps I ought to have gone that way. I went on slowly to the next milestone, but, to my disgust, the stone was as clean as on the day it was quarried, all signs of the number of the road and where the road led to being entirely obliterated. The only thing to do was to turn back and have a look at the signpost at that turning. Many years of motor-ing have taught me the folly of continuing on a road at night if one has any doubts as to whether it is the right one.

'The road was not very wide, and in backing I felt the car bump against the bank of rock which rose up sheer from the side of the road. I chose the rock side to back against, because on the other loomed a black void, which might easily have meant a sheer drop of several hundred feet. As I righted the car to face downhill once more, I heard an ominous dripping sound from the back. I got out to investigate. Then I realised that I was indeed done for. When I backed against the rock the tank had

[Christmas Number.

been the sufferer. It was cracked at the bottom, from which was pouring my hard-earned petrol. Even as I looked, the stream diminished to a few intermittent drops. What a fool I had been to put all my supply in the tank, instead of keeping the spare tins until I wanted them. The usual story of putting all your eggs in one basket.

'It was now snowing fast, and I was becoming horribly cold. Altogether, the prospect was far from alluring, for I couldn't see an end of my troubles, even if I were to spend the night tramping up and down to keep myself warm. I had not seen a house by the roadside for miles, and, even if there had been one, it was unlikely that any one there could mend a petrol tank, or produce any more petrol. My only chance was that another car might pass, but this I considered highly improbable on such a night. I walked slowly down the road in the light of the head-lamps, searching the rock on my left for some sort of nook where I could shelter from the biting wind. As I did so I happened to glance to my right, towards the open side, and then it was that I saw a light. It appeared to emanate from a house some four or five hundred yards distant, and about level with the road I was standing on. But I realised that to reach it I might have to walk a mile or so, as there was a narrow valley between me and the hill on which the house stood. The depth of the valley I could not, of course, see; all I knew was that to get to the light I should have to descend into the black void, and then climb up again on the other side. But a light meant a house; and a house meant warmth and shelter. If only I could find a path.

'I looked down the road, which was brilliantly illuminated by my head-lamps. On the open side was a small stone wall, not more than a foot high. I noticed that about twenty yards in front of the car there was a gap in this wall about three feet wide. I walked towards it; yes, sure enough, there was a narrow track leading down into the darkness. I returned to the car, took the brake off, and let her run down as far as the gap. I switched off the head-lamps, leaving only the side and tail lamps burning. Then, after emptying the water out of the radiator, to prevent the old bus freezing, I started off, torch in hand.

'I had to clamber down very gingerly, as the path was as slippery as the devil; but in a quarter of an hour I found myself on level ground. This was distinctly comforting; the valley was not very deep, after all. I crossed a small stream and then began to climb once more. While in the valley I could see neither the light from the house nor the lamps of the car, but as I mounted they both sprang into view almost at the same instant. Five minutes later I arrived onto the small plateau upon which the house stood.'

1924.]

IV.

'The building was low and squat, and white-washed. Undoubtedly one of those lonely farm-houses one often sees when motoring in this kind of country; houses picturesquely perched half-way up a mountain, with no apparent road leading to them.

'I found I could now look into the room, from which issued the light I had seen from the road—not at all distinctly, it is true, because the window was all misty with condensation; but I obtained a blurred view of three people sitting at a table, on the centre of which stood a lamp. They were presumably at their supper. This cheered me up no end. The thought of a fire and something to eat made me almost forget my car troubles.

'I made for the door and tapped lightly on it. I waited a few moments, and then tapped again, louder this time. Still no one answered. I peered in at the lighted window on my right and saw that none of the occupants had moved; so I decided to take the bull by the horns and march straight in, as I was by this time frozen to the marrow. No doubt the wind, which was howling dismally round the house, had prevented them from hearing my knock.

'The door opened to the touch, and I found myself in a small passage. On the right was a door ajar, obviously leading into the occupied room. It struck me at the time as curious that no one had heard my knock when the door which gave on to the passage was open all the time. I tapped again on this inner door and stepped into the room. It was long and low, evidently used as kitchen and dining-room rolled into one. Farther along, on the same side as the door by which I had entered, was a second door, which suggested that this had originally been two rooms; at the farther end—the kitchen end—I saw with joy the red glow of a fire showing through the grating. On the range itself stood a large black kettle, singing merrily. The front part of the room was presumably the dining and living portion; strangely enough, it was very like the room we are now in.

'As I have said, there were three people sitting at the table, an old man and woman, and a much younger man.

'A deathly stillness greeted me. Not one of them took the slightest notice as I entered. It was then for the first time that an involuntary shudder passed through me; a chill of some indefinable mystery.

'I advanced towards them, and then realised why they had made no response to my knock. Their heads were sunk forward on their chests; they were doubtless all asleep. I decided to tackle the young man first, and with this intention I touched him on the shoulder. This had no effect, so I shook him gently. As I did

so his head rolled over on my hand, and I felt my flesh creep.

'His face was cool to the touch.

'Now my hands were already nearly frozen; therefore his face ought to have felt warm, if not hot. Then the awful truth flashed into my mind. This man was dead. I looked at the old man, even gingerly touched him. He was dead too. My God, they were all three dead, these people who, I thought, were calmly partaking of their evening meal. And yet the lamp was lit and the fire still burning in the grate.

'What could be the meaning of this awful discovery? Had they died naturally? Had they been murdered? Or had they committed suicide?

'Also, however they had died, why had this terrible thing happened?

'I forced myself to look at them again. There was no trace of blood or sign that they had met with any violence. And yet all three had obviously died in the same manner.

'Then, as I began to thaw in the warm atmosphere, the awful horror of the thing took hold of me, and I rushed headlong from the room, trembling in every limb. Yes, I was frightened out of my wits, I admit. For here was I alone, so far as I knew, in a house in the heart of the mountains, miles from another living person; alone in a house whose only other occupants were three dead people sitting at a meal that they would never eat. And to add to the eeriness of it all, the wind was moaning like a thousand devils.'

V.

'I tore out into the night, but was brought up with a gasp as the biting wind and sleet struck me and nearly took my breath away. But this brought me back to my senses. What was the use of rushing away like this from the only shelter available? And where was I to rush to, in any event? No, unless I wished to become like the three in that room, I must go back. For all I knew there might be some one else in the house, asleep perhaps, and therefore as yet ignorant of what had taken place; or if not ignorant, some one who might be able to explain it. So, with chattering teeth, I turned and entered the house again. I like to think that it was the cold that made my teeth chatter. But I know in my heart it wasn't; it was sheer funk.

'There was an easy way of settling to my satisfaction if any member of the household were missing, by glancing at the fourth side of the table to see if another place had been laid there. Needless to say, I had not noticed this on my first visit to that awful room. I must go in again, that's all, and find out. For it occurred to me that if there had been any one else present at that meal he would not be in the

house now, as he would have doubtless rushed off for a doctor, if such a thing existed within a reasonable distance.

'I therefore screwed up my courage, opened the door, and looked in. Nothing would have induced me properly to enter the room. I glanced hurriedly at the fourth side of the table. There was no place laid; no plate, knife, or fork. But, before shutting the door once more on that dreadful sight, I had noticed one curious fact: beside where a fourth place would have been stood a glass of red wine, full. Beside the three who sat so still were three similar glasses of red wine, but all more than half empty.

'What could this signify?

'Had a fourth person come in to have a drink with the owner of the house? If so, why hadn't he drunk anything?

'Was the wine poisoned, and had the fourth person not drunk his wine by design, or by chance?

'Or had there never been a fourth person at all, one of the three having emptied the bottle into a spare glass, to be drunk later?

'These and a hundred other questions thronged my mind; a mind bewildered beyond words, and terrified too, in spite of my mental oburgations not to show the white feather.

'My next course was to search the house. In the passage, facing the door I had just closed, was another door. As I opened it, I sensed that musty smell that comes from a room whose windows are hardly ever opened. My torch showed it to be a sitting-room, evidently what would be termed in England "a best parlour." It contained the usual French arm-chairs—red plush and dark wood—a writing-table, a marble clock, of course, and some impossible photographs. But of humanity there wasn't a sign. I proceeded along the passage and came to another room on the same side, opposite the second door of the long room. This was a bedroom. A double-bed, a large wardrobe, and a table were all that it contained. Certainly no living person there. It was obviously the room of the poor old man and woman. On the right, facing the bed, was a second door, half open. I walked quickly over to it and saw that it led into another room, in which was a single bed: the room, without a doubt, of the younger man—the son, I supposed, of the old couple.

'I left this room by another door and found myself back in the passage. There were no more rooms. It was as I feared. I was alone in this house of terror. I knew for certain then that I could never bring myself to sleep under that roof.

'As I walked back up the passage, I suddenly heard an indescribable noise. My hair literally stood on end, for the noise had come from that ill-fated room. I flew like a mad thing to the

[Christmas Number.

front door, but here I checked myself. No! I must find out what had occasioned that noise. Perhaps I had been mistaken, and they weren't dead at all, and one of them had just recovered. For the third time I summoned up all my fast-waning courage and looked in. Instantly I saw what had happened. The young man whom I had tried to waken was now lying doubled up on the floor. Evidently the shaking I had given him had upset the equilibrium of his body, which had ultimately fallen sideways off the chair. I could just see his face. His eyes were half open and staring, with horror, it seemed, straight at me. My half-turned courage flew sky-high, and the next minute I was scrambling for dear life down the path I had come, heedless alike of slips and bruises. My one desire was to put as great a distance as possible between me and that room of death in the shortest possible time. I thanked my stars that I had left the car facing down-hill. I would let her run as far as she would go. This would, anyhow, take me several miles away. I leapt across the little stream and rushed up the path on the other side, regardless of the dangers of climbing a slippery mountain path at night. I arrived at last at the gap in the wall and stepped out onto the road. Then I got the biggest shock of all.

'My car was not there!'

VI.

Pedderson paused and looked at each of us in turn with that queer smile of his. We glared back at him in breathless excitement.

'Go on, Pedder,' said some one; 'what are you stopping for?'

'Give me a chance, man,' replied Pedderson. 'I've been talking my head off for the last half-hour, and my throat is as dry as a bone.'

Jackson, who was nearest the decanter, poured out a whisky and soda, and handed it to him. When this had gone the way of most whiskies and sodas, Pedderson thoughtfully lit a cigarette and continued his tale.

'As I've told you,' he said, 'my bus was nowhere in sight. I had a wild hope at first that I had ascended the wrong path, but that was at once negatived, as right in front of me my torch showed up the marks in the snow where the car had stood. This was the last straw. I think then I really did go off my head, although I don't remember at all clearly what I did. I have vague recollections of shrieking curses and shaking my fist at that damnable light, which still winked at me through the darkness like an evil eye. I remember running and running, to get away from the sight of it.'

'The next thing I recall is my banging on a door of a house, and stumbling into some one's arms. I suppose I must have fainted, as I next found myself in bed, an old man with a kind face bending over me. My head and hands were burning, and my feet were like ice. I 1924.]

longed to fall into oblivion once more, but first I had to tell of the awful things I had seen. So I struggled up into a sitting position and narrated in disjointed phrases all that had happened.

"Where did you say you left the car when you went to this house?" asked the old man, when I had finished.

"About a mile from here, I should think, but I couldn't say for certain," I managed to stammer in reply.

'He left me, and I was asleep in a moment.'

'The old man, I learnt afterwards, was a well-known Paris doctor, who was spending a holiday in this district. I awoke again about an hour later, and the doctor came over to the bed and told me not to worry, that the car had been found, and found where I had said I left it.'

"But it wasn't there," I almost shrieked at him. "How could you have found it?"

"There, there," he said soothingly, "don't think any more about it. You have got a touch of fever from the cold, and fever sometimes plays strange tricks with the imagination."

"But the house!" I cried. "What about the dead people in the house?"

"Rubbish!" he said. "There is an old farmhouse about where you describe, but it is uninhabited."

"Do you mean to say that I imagined the whole thing?" I murmured weakly.

"Of course," he replied; "just as you had imagined your car had gone; it was there the whole time."

'I sank back in the bed with a sigh. I felt too ill to argue the point further.'

VII.

'From that night I was more or less unconscious for some weeks. I seem to have dim memories of many people in the room, all talking in subdued undertones. The doctor told me afterwards that I had pneumonia and a touch of brain-fever, and that it was about evens whether I recovered at all, and about two to one against my coming out sane. But I pulled through all right, and in due time I was up and convalescing in the doctor's little house, which, by a most happy chance, I had blundered upon on that fatal night. It was just outside Pradelles, so that I had been on the right road all the time.'

'Another fortnight and I was once more well enough to take to the road. The tank had been patched up locally, and not a bad job either, as I have not touched it since. The doctor wangled me some petrol, in return for which I offered to take him back to Paris. He agreed, and so off we went. We had hardly gone a mile when I recognised the place where I had had my seemingly imaginary adventure. Yes, there was a house, sure enough. All the windows were shuttered. It certainly presented a most

forlorn appearance. I pointed it out to my companion.

"Yes," he admitted, "that's the place, but, as I told you, it is uninhabited; and this is where we found your car."

"It really is extraordinary," was all I said, although I never could accept the doctor's statement in its entirety—and for one very good reason. As it was pitch-dark, how had I known there was a house there at all if untenanted, and therefore without a light?

'Anyhow, that is why I have never told this story before, as it appeared, if the doctor's statements were correct, that I had not a true adventure to relate at all, but only a vision of a distorted mind.

'But now I come to the extraordinary sequel, which has arrived this evening in the form of a letter from the old doctor, together with a paper cutting. I can't do better than read them to you. They are, of course, in French, but I will translate them as I go along; so I shall have to go a bit slowly, I'm afraid.'

Pedderson paused, and, getting up from his seat, walked over to the other end of the room and sat down in a chair in front of the table. He then produced the letter he had received and spread it out on the table in the light of the lamp.

It is needless to say that we were all strung up to a high pitch of excitement, and none of us said a word, although a certain restlessness was displayed by a general filling of pipes and striking of matches; then followed a silence supreme, which was at last broken by the welcome sound of Pedderson's voice: 'I will read you first of all the letter, or rather a part of it:

"Dear Mr Pedderson," he says, "now that you are fully recovered, I trust, from your serious illness, from which I had the good fortune to rescue you, it occurred to me that the enclosed cutting from yesterday's paper might interest you. Before reading any further, I should like you first to peruse the cutting."

VIII.

Pedderson looked up from his reading. 'I will now carry out the doctor's suggestion,' he announced, 'and read you fellows the cutting. It starts with large headlines as follows:

"STRANGE SEQUEL TO ARREST OF TRAIN BANDIT.

"FAMOUS MYSTERY SOLVED.

'And it goes on like this:

"What was perhaps one of the most extraordinary mysteries of two years ago was solved to-day in a most unexpected manner.

"We refer to what was called at the time 'The Bonton Farm Mystery.' Our readers will recall that M. Bonton, his wife, and son, who lived in the farm, were found dead late one night at their supper-table. The discovery was

made in the first instance by a young English tourist who had lost his way, but who managed to struggle on to Pradelles to tell his story, although nearly unconscious from his exposure to the cold.

"It was discovered that the family Bonton had been poisoned, enough prussic acid being found in their wine to kill a dozen persons. But whether this was murder or suicide was not disclosed, although each supposition seemed as unlikely as the other. Certainly no motive for the murders, if such they were, could be found, and no proof, even, that any one, save the Englishman, had entered the house that night. In fact, suspicion at first turned on the Englishman, the lack of motive being overruled by the suggestion that he was a homicidal maniac, or at any rate a temporary lunatic, owing to the exposure he had suffered on the mountains. But this surmise was finally discounted by the police, who actually saw the Englishman when he was in a high state of fever, and heard from his own lips the whole story repeated again and again, just as he had told it to the doctor on the first night before he became unconscious. The doctor affirmed that there was no doubt that what the Englishman raved about in his delirium were the facts as they had actually happened to him.

"But to-day comes the amazing sequel. When Henri Dulette was arrested last night for being concerned in the robbery on the Paris-Lyon express on the 3rd inst., he said he had a statement to make, and also, as he could bear the strain no longer, a confession. He first of all gave the names of his accomplices in the train robbery, and then went on with the following strange story.

"His name, he said, was not Dulette at all, but Bonton. It was his father, mother, and brother who had died so mysteriously at their farm, and it was he who had murdered them. His story was that in 1912 he had been turned out of the house by his father for an offence which it was unnecessary to detail. He had gone to America, and had stayed there during the war, but finally had returned to France in 1920. He arrived back with hardly any money, and no friends. His intention was to go straight to his home and beg help from his father. One afternoon in October he arrived at the farm, but his father's manner towards him was the same as when he had left eight years before. In fact, old M. Bonton refused point-blank to help his disgraced son to the extent of a sou, and only by the intervention of Mme. Bonton was he given permission to stay in the house for supper. This, however, led to a stormy scene between father and son, resulting in the latter's immediate dismissal from the house. He left, he said, swearing to be revenged on such unforgiving parents. He waited until nightfall, when he slipped into a small outhouse, where he knew his father used to keep, amongst other things,

[Christmas Number.

some rat poison. He seized the first bottle labelled 'Poison' which came to hand, crept round the outside of the house, and entered by the dining-room window directly that room for a moment became vacant. His mother had laid the table for four, no doubt still under the impression that her erring son was staying for supper. An uncorked bottle of red wine stood upon the table. He emptied some of the contents of his bottle of poison into it, and went out again by the way he had come. Then this murderer, according to his own statement, coolly stood outside in the snow and watched his father, mother, and brother die before his eyes.

"His mother entered the room first, and filled all four glasses with red wine. The other two came in shortly afterwards. He saw his father wave his hand angrily towards the fourth place; his mother promptly removed everything in that place, but for no apparent reason left the glass of wine. (Our readers will remember the countless points that were raised over this extra glass being found on the table.) He watched them begin their meal. In ten minutes they were dead. He stated that he had not meant to murder them, thinking that the small percentage of poison in the wine would only make them ill, and therefore give him time to get what he wanted, namely, a certain box in which he knew his father kept his money. The box was hidden in a small cupboard let into the wall behind the wardrobe in the bedroom. He had found this cupboard by chance years ago when he was a boy.

"When he saw that they were incapable of further action, he crept towards the front door. He still did not realise, he states, that his parents were dead, as he had only a very blurred view of the interior of the room. He was on the point of entering the house when he caught the sound of footsteps coming up the path towards him. He swung round and saw a figure approaching, flashing a torch at frequent intervals. He also noted in the distance, across the ravine, the lights of a car. He waited in the shadows until the stranger entered the house, and then took to flight down the path the stranger had just mounted. He crept cautiously onto the road and approached the car, only to find it unoccupied. He got into it, deciding he might as well use this gift from the clouds to get away in. He took the brake off and let the car run downhill, but before he had gone a hundred yards he changed his mind. What had he to fear, after all, from one stranger? He would not go without that money if he could help it. He accordingly stopped the car, put out all the lights, in order to avoid, he said, the curiosity of any one else who might be about, and cautiously made his way back to the house. As he neared it the stranger rushed out, as if in fright, and tore down the path, looking neither to right nor to left, thereby failing to see Bonton, who had not
1924.]

time to get altogether out of the light from the window. He said that this was the first time that he considered the possibility of his parents being dead. He peered through the window, saw the blurred form of his brother lying on the floor, and guessed that he was indeed a murderer. In spite of this, he went straight to the bedroom and took the money, some fifteen thousand francs, and left again within ten minutes of the stranger's departure.

"This was the terrible story that this robber and murderer had to tell. It is not surprising that the police held no clue to the mystery. The only people even aware of this man's presence in France were his three unfortunate victims. We can only thank Providence and the police that such a scoundrel has been safely brought to justice, and will pay the full penalty of his crimes."

IX.

'There,' remarked Pedderson, 'that's the end of the cutting. I will now finish the doctor's letter, and my tale is told. The letter continues as follows:

"Now that you have read the paper, you are, of course, wondering why I told you what must appear on the face of it to be a colossal lie. As a matter of fact, it was not a lie, but a prevarication. I said 'the house *is* uninhabited' that night, and so it was, for at the moment there was no actual person living there. But be sure that I had a very good reason for telling you this: that good reason was your mental health. As you know, you had a bad touch of brain-fever, and even when you appeared to be quite well again, and drove me back to Paris, I could see that you were still worrying over the affair. If the mystery had been cleared up at the time I would, of course, have told you; but as it was as inexplicable to the world as it was to you, I did not dare tell you the truth for fear that you would get it into your head that in some unaccountable way you had done the deed yourself. In fact, as the paper tells you, this was actually suggested at the time, and I had many official visitors to my little house at Pradelles, who picked up the wandering threads of your mind and pieced them together into the same story as you told me. Only one point in your tale did not coincide with the facts, but I did not mention this to the police, as I was quite satisfied in my own mind that you had nothing to do with the affair, except as having been the first to find the tragedy. That point was about the car—a point now cleared up by the murderer in his confession. If, instead of running *up* the hill when you found the car had gone, you had turned *down*, you would have come across your car in a minute. Your description of where you left it was too vague to tell within a hundred yards, so naturally I thought you really

had imagined that part of the story. But I am sure that what happened was for the best, as otherwise you would have let the car run downhill until you were farther than ever from help. A night spent in the car in the state you were in would certainly have finished you. Again apologising for the little deception I practised on you, and hoping that you are now perfectly sound in health, I am, &c. &c.

“EMILE LAMBERT.”

Pedderson put down the letter, and, picking up a pencil, appeared to write something on the bottom of it. He then came over to us and yawned. ‘There, that’s my yarn,’ he said, ‘and I hope you’re satisfied; and as it’s half-past two, I think I’ll turn in. I’ve left the letter and the newspaper cutting on the table if any of you would care to have a look at them.’ He strolled towards the door. With his hand on the knob, he turned and faced us again. ‘I think you’ll find them interesting,’ he added, with an enigmatic smile. ‘Good-night, all.’

‘Good-night, Pedder,’ we cried, admiration, if not awe, in our voices.

X.

‘And that’s the man who said he had never had an adventure,’ observed Jackson drily, as the door closed.

I got up and went over to the table. I am not much of a French scholar, but the things aroused my curiosity. Perhaps I should say morbid curiosity, for they represented to me the links between my friend Pedderson and a particularly gruesome murder. I picked up the letter, and gasped. I glanced at the cutting, and gasped again. Then I grinned. ‘I say,’ I cried to the others, ‘come and have a look at these; they are well worth it.’

‘But I don’t understand a word of French,’ complained several voices.

‘Never mind,’ I replied. ‘Come on, all of you.’

They came. They looked over my shoulder at the letter. They looked again. Then a roar like that of an angry bull resounded through the room. Many indeed were the adjectives, but in each case the noun was the same. That noun was ‘Liar.’ The ‘letter’ was from a firm of Kingston estate agents recommending several desirable residences to be let in the neighbourhood of Surbiton; the ‘newspaper cutting’ was a printed list giving detailed particulars of the said desirable residences.

At the bottom of the letter, in Pedderson’s scrawly handwriting, we made out the following:

‘You asked for it; and methinks you got it. Good-night.—P.’

CHRISTMAS EVE IN FLANDERS.

THEY do not sleep. Nay! Through the holy pause,

Sad as a wind that calls, and calls, and dies,
Comes there a voice from Time’s unveiling shores,

A voice that in one long beseeching cries:
‘Ye we have loved, who loved us, what of life?

What of the trust we, dying, passed to you?
What of the promised end of all your strife,

The vows ye vowed forever pure and true?

How shall our days in peaceful joy be spent

While to our ears forever cries earth’s wrong?

Sunk are your souls from all their fine intent,

Each for himself, and spoils for all the strong.

Brothers, arise! Your silence wakes to birth

All that may bid ye seek the heights of old;

If ye have loved us, seek ye peace on earth,

That happy peace your gallant dead may fold.’

They *shall* not sleep. Nay! till our crowded days,

Filled with their petty aims, their little lies,
Yield to the still small voice that ever stays,

The voice that to our inmost being cries:

‘Ye who have loved them, visioning new goals,

What of the hopes that paled and died away?

What of the joy that service taught your souls,

The strength that lent to weakness power and stay?

How shall the world to gladsome peace awake,

While in your hearts there lives no breath of
peace?

Lost is the truth that each the whole must make,

And bartered is the key to earth’s release.

Faithless, awake! Through all your clam’rous ways

Hear ye again the call of noble thought;

If ye have loved them, let your lives give praise,

And *live* ye out the truths their glory taught.’
